24 Mayor pro tem Bob Bruesch from the City of Rosemead.

25 MR. BRUESCH: Thank you for the opportunity to

1 testify. I am from the City of Rosemead, and I live in  
2 the same hills that Councilmember Venti alluded to. My  
3 community participated in the sound level studies a few  
4 years ago. We have a vested interest in seeing that the  
5 growth that is surely going to come in the MAP is fairly  
6 distributed throughout the whole region.

7 I am hoping that this growth is distributed  
8 fairly between all airports, Ontario, El Toro, Palmdale  
9 and March for two additional reasons and that being that  
10 it would distribute jobs to those who are in house-rich  
11 areas who would have the additional use of being able to  
12 alleviate -- ameliorate the imbalance in job-housing  
13 ratios in those areas. It also would be evenly  
14 distributing the cost of the security and safety issues  
15 that was alluded to by Mayor Hahn.

16 I also think that if certain areas in our  
17 region promote developments which pull in tourists, that  
18 those certain areas should be responsible for accepting  
19 the additional air passengers that those developments  
20 cause.

21 Finally, if a truly regional airport approach  
22 must be developed, then also the ground level  
23 connections between those airports must be improved.  
24 First, we must correct the mistake that we made many  
25 years ago by not having a terminal for the Green Line at

1 LAX. That has to be part of the new Master Plan.

2 Secondly, let's make all of our light-rail  
3 system more passenger and baggage friendly so that the  
4 passengers have an alternative of getting down there  
5 rather than the freeway.

6 And, finally, I'm hoping that the plan  
7 promotes a regional high-speed rail system which will  
8 interconnect the regional airports and also provide  
9 state air passengers another mode of transportation to  
10 go within the region and within the state. Thank you  
11 very much.

12 MR. WALL: Thank you, Mayor Pro Tem. The next three  
13 speakers will be Doyle Campbell, Tony Miera and Jon  
14 Russell. First, Mr. Campbell. This is Doyle Campbell  
15 representing the L.A. County Sheriff's Department.

16 MR. CAMPBELL: Thank you. I'm representing Sheriff  
17 Lee Baca tonight. He is currently on a plane bound for  
18 LAX coming back from New York where he spent the better  
19 part of the day touring ground zero with Governor Gray  
20 Davis. He asked me to come here this evening and share  
21 some comments about LAX security.

22 LAX may be within the boundaries of L.A. City,  
23 but a safe and secure airport is everyone's  
24 responsibility. At times like these, in particular, the  
25 geographic boundaries that separate the City of

1 Los Angeles from Los Angeles County or the incorporated  
2 cities for which we provide law enforcement  
3 responsibilities are never an issue.

4 The Los Angeles Sheriff's Department work  
5 closely with the LAPD and federal law enforcement  
6 agencies on improving safety and security of all major  
7 institutions in the region during these difficult times.  
8 We will continue to do so in the months and in the years  
9 ahead.

10 I'm not here today to suggest specific new  
11 security procedures for LAX, neither for the near term  
12 or the long term. You already have excellent people  
13 looking into that. I am here to offer the assistance of  
14 our department that we could provide in the coming  
15 months if you develop new security procedures and make  
16 changes to LAX to greatly discourage, if not, prevent  
17 future acts of terrorism.

18 While people may differ precisely on what  
19 needs to be done at LAX, I don't think anyone could  
20 disagree with Mayor Hahn's goals of making the L.A.  
21 Airport the safest in the nation. We owe that to the  
22 public, to the nearly 60,000 employees that work at LAX  
23 and all the communities that surround the airport.  
24 Thank you.

25 MR. WALL: Thank you, sir. Next will be Mr. Tony

1 Miera. That's M-i-e-r-a.

2 MR. MIERA: My name is Tony Miera. I'm a resident  
3 of Monterey Park. I reside at 551 Taylor Drive in  
4 Monterey Park. Just to give you a few notes about me.

5 44 and a half years ago I was recruited from  
6 out of state to come here to live in this area. And I  
7 looked at all the cities around here, and I selected  
8 Monterey Park because it's clean, nice and quiet. Well,  
9 I'm here to protect the turf of my neighbors who have  
10 talked to me about this for a long time.

11 Our neighbors have made thousands of  
12 improvements here in the city. We were hoping that  
13 things would be better, but before the 9/11 problem,  
14 disaster in New York, we sat down and we counted how  
15 many airplanes were coming. For three weeks it was a  
16 constant flow of airplanes. I live up in the 700 and 21  
17 feet level. So you could imagine seeing these planes  
18 coming in all evening long. They are not very quiet.  
19 But this city used to be extremely quiet, nice, clean  
20 city. It has turned out, I have a 93-year-old  
21 mother-in-law who has a hard time sleeping right now  
22 with all the planes coming in.

23 Since 9/11 I have traveled to Ontario, taken a  
24 plane out of there. There's a lot of possibilities in  
25 Ontario. I'll tell you, I'll never go to LAX. I used

1 to go to LAX about seven times a year. I'll never  
2 travel down that way. That's too far, too much traffic  
3 first of all. But I hope that you consider that the  
4 traffic of the planes coming over at one time had to go  
5 over the 60 Freeway. Now they are encroaching way  
6 beyond one and a half miles over my house. You can see  
7 them right over us. All evening long you could just see  
8 those flights. It's not fair for the residents that  
9 have spent a lot of money, a lot of improvements because  
10 we felt Monterey Park was a proper place for us to raise  
11 our family.

12 So my recommendation is that we start  
13 expanding the security at LAX, but also at Ontario.  
14 Let's make some improvements in Ontario so people will  
15 be more apt to drive down to Ontario because I think  
16 it's a lot better facility there than LAX.

17 I'll just tell you about me. I'm the ex-chief  
18 deputy controller for the City of Los Angeles. I worked  
19 for James Hahn for four years. I know the expenditures  
20 that were done in all facilities. I think you should  
21 consider expanding Ontario and come up with some  
22 security issues. Thank you.

23 MR. WALL: Thank you, sir. Our next speaker will be  
24 Mr. Jon Russell representing the Airline Pilots  
25 Association.

1 MR. RUSSELL: Good evening. Thanks for having me.  
2 Because I'm a pilot, I'll start with the aircraft. It  
3 sits parked on the tarmac. Who has access to a parked  
4 aircraft? As it turns out, a lot of people, caterers,  
5 cleaning crews and mechanics among others. Many of  
6 these individuals are neither airline nor airport  
7 employees nor do they have to pass through the same  
8 security screening points that I or my crew or  
9 passengers have to go through. For obvious reasons, I'm  
10 not going to discuss the details of these concerns,  
11 however, I will say that access to aircraft is an area  
12 where we need major improvement.

13 Another aspect of access is identification.  
14 Restricting access to authorized persons is only as good  
15 as the means we use to identify the persons seeking  
16 access.

17 Some of you may remember the PSA incident in  
18 the late 1980's where a fired employee used his ID card  
19 to smuggle a gun around the security checkpoints and  
20 used that same gun to kill the pilots while the aircraft  
21 was airborne. At that time it called for a universal  
22 access system using identification cards that would be  
23 scanned and checked by a computer against the central  
24 database.

25 Since then we have developed so-called "smart

1 cards" which incorporate a small computer chip that can  
2 store information such as a photo of the holder and a  
3 PIN number that would have to be entered by the employee  
4 whenever he passes through a controlled checkpoint.  
5 This would eliminate the use of fraudulent, expired,  
6 lost or stolen cards. It would also reduce or eliminate  
7 the need for pilots and others to carry multiple ID  
8 cards for use at different airports.

9 Moving away from the airplane, we need to talk  
10 about baggage and freight. Bombs on board -- excuse me.  
11 Bombs on board the aircrafts still are a security  
12 concern. To provide maximum protection we're going to  
13 have to move toward screening freight and checking  
14 luggage using the best detection technologies. This is  
15 going to be neither easy or cheap. We need to do it  
16 sooner rather than later. Purchasing these machines is  
17 the easy part. They must then be integrated into the  
18 flow of baggage and freight streams.

19 The other area that needs improvement is the  
20 matching of checked bags to passengers onboard the  
21 aircraft. This is done on many international trips. We  
22 need to expand this to cover domestic flights as well.  
23 As with screening freight and checking baggage, this  
24 will not be cheap or free, especially if we do not want  
25 this to become a major bottleneck to anti-performance.

1 I have to hurry up.

2 I do not want my next point to be taken as a  
3 criticism or a call to end the project. I understand  
4 there is a proposal to create a centralized security  
5 check-in facility for passengers away from the main  
6 terminals. I am not clear as to what all the benefits  
7 of such a facility might be. I would raise the  
8 following question: Given the cost of a particular  
9 project, would the net increase in security be more than  
10 the increase in security that might be realized by  
11 spending the same money on improvements in other areas  
12 such as the ones I've mentioned here?

13 Given there is enough money to do all the  
14 things we want to do, we must be judicious in  
15 prioritizing our needs and expenditures. I hope the  
16 planners and security experts will have done the math,  
17 so to speak, before moving ahead with this particular  
18 project.

19 MR. WALL: Thank you, Mr. Russell. Ladies and  
20 gentlemen, if you have comments more lengthy than three  
21 minutes, feel free to submit them in writing. I'm going  
22 to call two more speakers before we take a ten-minute  
23 break. Those speakers will be Mr. Tom Moxley and  
24 Mr. Douglas Williams. Mr. Moxley.

25 MR. MOXLEY: My name is Tom Moxley. I represent

1 some 4,000 ironworkers here in Southern California  
2 across the entire basin, their wives, their husbands and  
3 their families.

4 We want to see a regional airport created. We  
5 also want to see a modernization of LAX. It means jobs.  
6 It means construction jobs. It means permanent jobs.  
7 Wherever there is an airport, there are jobs.  
8 Businesses traditionally come to where the airports are.  
9 Our desire is for security, for safety, but also this  
10 economic engine needs to keep going. Today I listened  
11 to the news -- and Mayor Hahn says we're going to go  
12 into three quarters of deficit recession. Some 79,000  
13 jobs are going to be lost in the next year. This LAX  
14 modernization, the Regional Airport Plan addresses some  
15 450,000 permanent jobs, good-paying jobs, here in  
16 Southern California. There isn't a city that doesn't  
17 have an ironworker that lives in Southern California.  
18 Thank you.

19 MR. WALL: Thank you. Our last speaker  
20 before taking a break will be Mr. Douglas Williams.

21 MR. WILLIAMS: I'm Douglas Williams, 2057 South  
22 Atlantic Boulevard. I'm also an agent with the  
23 ironworkers.

24 There are a couple of things that have been  
25 brought up that we really need to address, first the

1 safety of the airport, all people flying out of it. I,  
2 too, come in and out of there all the time for two  
3 reasons, the availability of cheaper flights and the way  
4 that flights are structured. You could get a flight  
5 anywhere out of the country almost at any time. Until  
6 we get a regional airport system that will address that,  
7 you know, coast to coast, people are still going to come  
8 to LAX. Let's face it. It's convenient.

9 But I sit on those planes and watch those tips  
10 come real close. Traffic controllers want to see  
11 modernization to take care of that problem. If they  
12 address that, that will take care of the problem of the  
13 delays. There will be less fuel being burnt, the air  
14 will be cleaner, everything. I, for one, do not add to  
15 the problem of traffic at the airport. I like the  
16 off-site airport parking, take the shuttle in. That's  
17 the only way to do it.

18 One thing that everybody has to realize, all  
19 the unions are for the regional airport system, but LAX  
20 is a jewel. As the hub at the center point of the hub,  
21 it has to be the one that we use because people come in  
22 from anywhere in the world there. That's the economic  
23 engine of Southern California, believe it or not. Thank  
24 you very much.

25 MR. WALL: Thank you, sir. I want to congratulate

1 everyone. You've done a marvelous job with your  
2 comments, very clear and succinct. I'm sure the  
3 gentlemen that are receiving comments have gotten a lot  
4 of good information. It's 7:01. We'll start again at  
5 7:11. Let's take a ten-minute break.

6 (Recess was taken.)

7 MR. WALL: Ladies and gentlemen, if I could ask you  
8 to take your seats. We will reconvene the public  
9 hearing. I will welcome you, again, to the continuation  
10 of the public hearing to receive comment on the Master  
11 Plan Environmental Impact Statement and Environmental  
12 Impact Report.

13 Again, our format is that each speaker will be  
14 called to the lectern and given a total of three minutes  
15 to make your presentation. If have you written  
16 comments, please feel free to leave them with us. Those  
17 will be entered into the record as well. If you would  
18 like to leave a business card with the court reporter,  
19 we will make sure we get your business or home address  
20 entered into the record as well.

21 The next two speakers will be Richard Slawson  
22 and Sergio Rascon. Mr. Richard Slawson.

23 MR. SLAWSON: Good evening. My name is Richard  
24 Slawson. I'm the executive secretary of Los Angeles and  
25 Orange Counties Building Construction Trades Council.

1 Our group represents 130,000 craftsmen and women working  
2 throughout this region. Our address is 1626 Beverly  
3 Boulevard in Los Angeles.

4 We've followed the airport plans for a number  
5 of years now and attended quite a few hearings. And  
6 I've testified at quite a few hearings as well. And  
7 we've submitted written comments as well. I want  
8 everyone to know that the building trade's unions  
9 support the idea of regional airport expansion. And in  
10 fact, we worked hard to see that an international  
11 airport is constructed at the El Toro Airforce or Marine  
12 Base in Orange County and as well pushed for further  
13 modernization at Ontario Airport. We know also that  
14 there are many other airports in the area that could  
15 take up some of the slack. However, as was stated  
16 earlier, Los Angeles International is an important part  
17 of the overall air transportation system in Southern  
18 California. And it's vital that it be modernized.

19 Our elected officials need to move forward on  
20 modernization at LAX or it will put thousands of workers  
21 in jeopardy, thousands of families in jeopardy of losing  
22 their jobs. There are 400,000 jobs that are related to  
23 LAX, and the airport is a critical part of our economic  
24 infrastructure. While it is extremely appropriate and  
25 necessary to make sure LAX is the safest and securest

1 airport in the country, we can't lose sight of the fact  
2 that it remains an integral part of our overall  
3 infrastructure. We need a safe and secure airport, but  
4 we have to recognize the safety of our economic future  
5 and the security of working families in this area is  
6 also at stake.

7           There are hundreds and thousands of working  
8 families in our areas whose livelihoods depend on  
9 keeping LAX competitive with other airports in our  
10 region, not just in Southern California, but in the  
11 region of the western states. Let's have a regional  
12 solution to this issue, but LAX must be a major part of  
13 that solution.

14           The workers that we represent are very excited  
15 about the safety and security proposals that Mayor Hahn  
16 has put forth. In fact, tonight, I'm also happy to hear  
17 that Mayor Gordon of El Segundo is supportive of the  
18 possible changes the city will be proposing. I have not  
19 heard that before. Many of the speakers from the area  
20 of the airport have been against any proposals. I am  
21 happy to see there is some breakthrough.

22           The September 11 attacks were devastating,  
23 however, I believe the opposite effect that the  
24 terrorists expected has happened. We are coming  
25 together in this area. Listening to the testimony here

1 tonight I think we're close to a solution. We will come  
2 together on an LAX proposal, and I'm sure with the  
3 leadership of Mayor Hahn it will fulfill the safety,  
4 security and travel needs of our area. Thank you very  
5 much.

6 MR. WALL: Thank you, sir, for your testimony. The  
7 next speaker will be Sergio Rascon.

8 MR. RASCON: Thank you. My name is Sergio Rascon.  
9 I'm the business manager of Laborers Local 300 in  
10 Los Angeles. I represent over 6,000 members in the  
11 County of Los Angeles and, of course, this means a lot  
12 to us. As Dick just mentioned, it means a lot of jobs  
13 to Laborers Local 300.

14 Although we're not ignorant of the fact that  
15 there is a lot of concerns, and we stand with those  
16 concerns, we want to make sure that the people in the  
17 surroundings understand that we're not all about just  
18 jobs, but we are all about security and safety. And we  
19 will stand with them to make sure that their concerns  
20 are heard. But at the same time we must understand one  
21 thing. If we do not go ahead with the modernization of  
22 this airport, you can consider Los Angeles to be a ghost  
23 town. These jobs are much needed. Our people depend on  
24 it. As you can see, before the 9/11 incident, thousands  
25 and thousands of people were working there. Now

1 thousands and thousands of people have been laid off.

2 If we don't do something about it, again, I  
3 must repeat to you, this will be a ghost town. Sure we  
4 can go to Palmdale. Sure we can go to Ontario. Sure we  
5 can go anywhere else, but how many people are willing to  
6 go as far as Palmdale, as far as Ontario, for a job that  
7 only pays \$6, \$7 an hour. We must understand that. We  
8 have to have good paying jobs at this airport and any  
9 other job that is needed to keep the community healthy  
10 and have their benefits.

11 So I encourage each and every one of the  
12 people present that we're with you, even if you have the  
13 concerns and you're opposing it. But we're with you and  
14 we'll stand with you to make sure that you will be heard  
15 and that we can come to the middle of it and work  
16 together, and let's get this airport going, and let's  
17 get the jobs back where they belong. Thank you.

18 MR. WALL: Thank you, sir. Our next three speakers  
19 will be Sotero Lopez, Dan Humber and Eric Jackson.  
20 Mr. Lopez? Mr. Lopez is not here. I will call his name  
21 again later. Mr. Humber, Mr. Dan Humber.

22 MR. HUMBER: My name is Dan Humber. I'm an  
23 ironworker out of Local 433. I live in the Montebello  
24 area, 222 West Via Corona, Montebello.

25 I'm a native Californian here and I'm a

1 construction worker. I've been working construction  
2 here all my life since I got out of high school. L.A.  
3 Airport has been around ever since I can remember. When  
4 I was a kid, we used to go to the beach down there and  
5 by the airport. It's important that we keep this  
6 airport and get this recommendation done and make it  
7 secure for me and my family because when I travel, I use  
8 LAX because it's convenient for me. It's easy access,  
9 and I'm able to get to where I'm going. But we need  
10 these jobs here, and we need to maintain the airport  
11 there, especially if business does pick up in the air  
12 business.

13 I've been in airplanes sitting on that runway  
14 waiting to take off for a long period of time. There's  
15 been -- it's been very crowded. And I feel that we will  
16 need -- this airport needs to be renovated to make it  
17 safe and secure for everybody and -- you know, the  
18 airplanes nowadays are bigger. The stuff I heard here  
19 tonight makes me concerned we need to have an updated  
20 airport, a modern airport that's safe and secure for the  
21 family. Especially nowadays with new security, things I  
22 heard here about security, it's important that we have  
23 the security.

24 I know when I went to pick up one of my  
25 nephews at the airport a couple of weeks ago we went

1 over there to parking lot C. It was very inconvenient  
2 to go to that parking lot and shuttle and go through all  
3 the hassle. Now I understand they opened it up. It  
4 needs to be -- you know, the security needs to be where  
5 we could be safe and the airlines can be safe, but we  
6 don't want to lose this airport. We need to do this  
7 work, the renovation work. I'm just here to state my  
8 case. There's a lot of our members that do a lot of  
9 this renovation work on this airport and has been doing  
10 it for many years. Thank you.

11 MR. WALL: Thank you, sir. Mr. Eric Jackson  
12 followed by Mr. Rodger Visek.

13 MR. JACKSON: Good evening. My name is Eric Jackson  
14 I'm a pipe fitter. I've been a pipe fitter for 28  
15 years. For the last 28 years we've worked at that  
16 airport. The airport expansion is critical for economic  
17 growth, for jobs of people in the community. Safety now  
18 being the grave issue after 9/11.

19 But, again, I'm a pipe fitter. I work hand in  
20 hand with boilermakers, ironworkers, as Dick Slawson  
21 said, over 130,000 people in L.A. basin. We're  
22 constructors. We build things. If we don't have an  
23 opportunity to build things, we have to go somewhere  
24 else. It is vital for the people in the industry, the  
25 building craft industry, to have this airport

1 modernization built and expanded in a professional  
2 manner, fast, efficiently safe. To bring jobs to the  
3 community will help my family, my grandchildren, your  
4 grandchildren and a lot of other people. It's  
5 convenient as all the other people got up here and  
6 spoke. LAX is one of the few airports in Southern  
7 California, you can get a flight almost anytime, anytime  
8 of the day.

9 So I urge you to concur with the people that  
10 are for the airport, and I thank you at this time.

11 MR. WALL: Thank you, Mr. Jackson. Mr. Rodger Visek  
12 followed by Mr. Michael Collins.

13 MR. VISEK: Good evening. My name is Rodger Visek.  
14 I live at 1660 Kempton Avenue in the beautiful City of  
15 Monterey Park. I came to this city because I like the  
16 quality of life, the peace and the quiet that this city  
17 has afforded our family.

18 I attended a meeting of the FAA last year in  
19 which it was conducted in the City Hall of Monterey Park  
20 and it discussed the subject of the flights over the  
21 city and the quality of life. My credentials as far as  
22 knowing anything about aircraft, I served with an  
23 antiaircraft outfit in the United States Marine Corps in  
24 the Marianas in the '40s. So I know a little bit about  
25 tracking aircraft.

1           The aircraft have been coming over our home at  
2 a rate of about 22 to 24 an hour in a fog-bound LAX.  
3 They have been coming in at elevations somewhere between  
4 1,500 feet up to about 2,500 feet above sea level.  
5 However, we know that the topography of Monterey Park is  
6 in the area of 500 to 700, 800 feet. So we've got the  
7 planes coming in real close. Some FAA person came along  
8 and said, "Well, the noise isn't too bad," but the noise  
9 bounces off the walls, the hills and we get the echo  
10 effect.

11           So with that thought in mind, I'm asking that  
12 we propose raising the elevation up to the 3,500- or  
13 4,000-foot level when they are making their pass to  
14 connect into the glidepath which is running about 4,000  
15 or 5,000 feet about ten miles south of Monterey Park.  
16 If this can't be done, I was even thinking in terms of  
17 asking our city counsel to propose that Monterey Park  
18 become a no-fly zone and any aircraft coming over the  
19 city would be fined \$10,000 for soundproofing homes in  
20 the city.

21           I thank you very much for this opportunity to  
22 vent a little bit of frustration about the quality of  
23 life. I hope everybody will concur with it. As far as  
24 the Master Plan and job security and all that, I'm with  
25 that 100 percent. Thank you.

1 MR. WALL: Thank you, sir, for your comments. Next  
2 will be Mr. Michael Collins followed by Merry Norris.

3 MR. COLLINS: Hello. I'm Michael Collins. I'm  
4 executive vice president at the L.A. Convention  
5 Visitors' Bureau. I'll mention a couple of things that  
6 are probably obvious to many people in the room.

7 LAX is the distribution system for our visitor  
8 economy. That economy is a large 123 million visitors,  
9 13.6 billion dollars in direct, unmultiplied, new  
10 revenue coming into this market, 240,000 workers. And a  
11 better way of framing it is for every one percent of  
12 growth in the visitor arrivals, we find ourselves  
13 getting 280 million dollars in new revenue into this  
14 economy.

15 Virtually half of domestic visitors arrive by  
16 air and every single one, for all practical purposes, of  
17 international visitors arrive by air. They account for  
18 those international visitors, about one-third of the  
19 entire 13.6 billion dollars in this economy. And it's  
20 that segment of our economy right now that is in  
21 expansion. And it's that international market and its  
22 current afflictions that are driving the loss of about  
23 2 billion dollars that we anticipate between the end of  
24 September and the beginning of June, and perhaps more  
25 dramatically the loss of 41,000 jobs within Los Angeles.

1           We have to look to a future right now. We  
2 certainly aren't about to define the issues which we  
3 look forward to as being defined by the current status  
4 quo. The goal would be to maintain our Gateway status,  
5 protect share-of-market losses, especially in Asia,  
6 while taking advantage of every option to distribute the  
7 demand for L.A. throughout the LAWA system. To do that,  
8 we believe that security will indeed qualify this  
9 destination as open for business. Without it, any other  
10 considerations will not apply, especially if we're to  
11 address the international market that currently remains  
12 in paralysis largely because of the security concerns.

13           To be secure and user-friendly is the art  
14 form. That is the most difficult challenge that's  
15 facing this particular group. The timing for addressing  
16 that challenge could not be better. Now is that time to  
17 introduce the due dynamic of security into the planning  
18 alternative that is already building on the good work  
19 done to date. You could not pick a better time to  
20 introduce security into the current planning. Thank you  
21 very much.

22           MR. WALL: Thank you, Mr. Collins. Our next speaker  
23 will be Ms. Merry Norris followed by Mr. Nicholas Ragus.

24           MS. NORRIS: Good evening. I'm Merry Norris,  
25 executive director of Gateway to L.A. which is a

1 property-based business improvement district. Our  
2 offices are located at 6151 Century Boulevard in  
3 Los Angeles.

4 By way of explanation, the Gateway to L.A. is  
5 comprised of properties along Century Boulevard between  
6 the 405 Freeway and Sepulveda Boulevard at LAX as well  
7 as several properties on Airport and Aviation Boulevards  
8 between Century and 98 Street.

9 Gateway to L.A. is comprised of 13 hotels,  
10 7,200 hotel rooms, over 15,000 parking spaces and  
11 several million square feet of office and commercial  
12 space. Gateway to L.A.'s goal is to revitalize the  
13 properties and businesses within our borders and to  
14 create a meaningful and recognizable Gateway to the City  
15 of Los Angeles. We have worked successfully with LAWA  
16 on improvements to the LAX Gateway area. I'm sure  
17 you're aware of the beautiful enhancements, recent  
18 enhancements, which include the lighted pylons and palm  
19 trees which have become really a new landmark for the  
20 city.

21 Since well before September 11th, the Gateway  
22 bid has been working with the architecture for DMJM to  
23 develop a vibrant new vision for our area. We are  
24 hoping next to partner with LAWA with these plans  
25 because it is now time to take a different approach at

1 LAX. In considering a new approach, we all know that  
2 the assurance of safety and security is a paramount  
3 importance for all travelers. Any future changes are an  
4 opportunity for a win-win situation for businesses in  
5 and around Los Angeles as well as our neighbors. These  
6 opportunities would create new jobs, provide large scale  
7 entertainment, develop more parking and also to develop  
8 safer modes of ground transportation. In collaboration  
9 with DMJM, we have been developing really big ideas  
10 which we call "Aeratropolis," a Gateway, a destination  
11 point which exemplifies and proliferates the brightness,  
12 the grandness and bigness of the city in which we live.  
13 We look forward to sharing our ideas with you. Thank  
14 you very much.

15 (The statement submitted for the record  
16 was marked as Statement 7.)

17 MR. WALL: Thank you, Ms. Norris. Our next speaker  
18 will be Nicholas Ragus followed by Mr. Wayne Lovett.

19 MR. RAGUS: My name is Nicholas Ragus. I live at  
20 716 Rodman Circle in Monterey Park. I would like to  
21 welcome you here tonight. I want to demonstrate the two  
22 ways we carry on conversations in my neighborhood. This  
23 is the first way, (indicating). And this is the second  
24 way we do it (indicating).

25 Now, this started around 1995. Prior to then

1 I was always traveling. I noticed when I got home that  
2 I was always looking up at aircraft. Anyway, LAX has  
3 already unilaterally expanded operations over Monterey  
4 Park. This was accomplished without an environmental  
5 impact study nor a mention of any Master Plan. So I'm  
6 all for Mayor Hahn's new plan because you've already  
7 expanded over our city anyway. When we citizens called  
8 to complain to the FAA and LAX, the two agencies give us  
9 the City Hall salute.

10 While we may not know who's really in charge  
11 of the aircraft flying over our homes, we are sure of a  
12 few facts. One, outdoor conversations are nearly  
13 impossible now. Two, TV signals inside the house are  
14 interfered with, but that's okay because we can't hear  
15 the TV anyway. And, three, our children at school live  
16 under the shadows of these aircraft and our schools are  
17 not insulated to prevent this sound from interfering  
18 with the classroom time. I've talked to several  
19 teachers there. They stop instruction for these  
20 aircraft to fly over. It takes a long time for a 747  
21 with flaps and slats deployed and gears down to lumber  
22 on over our city. And, also, on Sundays our ministers  
23 have to stop sermons in order to accommodate LAX  
24 traffic.

25 So that's what life has been like here in

1 Monterey Park since 1995. The sound levels are  
2 equivalent to those of the cities adjacent to LAX.  
3 Unfortunately, when we call the FAA and LAX, they say,  
4 "Well the Master Plan and Environmental Impact Study  
5 really doesn't accommodate a city so far away from LAX.  
6 They are only for cities that are directly adjacent to  
7 the airport." See, we're kind of stuck in a Catch 22  
8 situation. While we're all for expansion of LAX, we all  
9 want jobs -- in fact, my career is in commercial  
10 aviation -- but if I wanted to hear airplanes 24 hours a  
11 day, I'd live at LAX. I chose Monterey Park because  
12 that's where I was born and raised and it was a quiet  
13 city at one time.

14 So I hope we can come up with a plan and move  
15 those aircraft north maybe over a small minority  
16 community like San Marino or south over the railroad  
17 yards in the City of Commerce, but keep them away from  
18 our homes here. Thank you.

19 MR. WALL: Thank you for your comments. Mr. Wayne  
20 Lovett followed by Mr. Luis Cabrales.

21 MR. LOVETT: Good evening. My name is Wayne Lovett.  
22 I'm with Mercury Air group which is an aviation service  
23 provider located here in Los Angeles. We have been at  
24 LAX since 1954 when we were founded by several members  
25 of the Flying Tigers Group out of China.

1           Our company is not just at LAX. We also are  
2 at Ontario. We are also at Burbank. We are also all  
3 over the country. So we don't have a particular grief  
4 about any particular place that should or should not be  
5 the Gateway to Los Angeles and Southern California. The  
6 fact of the matter is, LAX is the Gateway to Southern  
7 California. It is the regional airport that we have  
8 today. What we are looking for is a safe, secure and  
9 efficient airport.

10           We applaud the idea that this Master Plan  
11 should move forward. We applaud the idea that Mayor  
12 Hahn has to consider safety and security and going  
13 forward with the Master Plan. Surely anybody can see  
14 that that is necessary given the events of 9/11. Just  
15 as surely, if we needed a demonstration of what happens  
16 when you emasculate our system, you've seen it. You've  
17 seen the job losses. You've seen the economic loss.  
18 You've seen what happens when you don't pay attention to  
19 your economic infrastructure. What we are looking  
20 forward to here is a plan that does just that. It pays  
21 attention to the infrastructure and what is necessary to  
22 make this system work.

23           We believe that Mayor Hahn and LAWA have acted  
24 responsibly in moving forward with the LAX Master Plan  
25 at the same time focusing the process on safety and

1 security. The Mayor's fresh ideas on how to shape the  
2 Master Plan are constructive and most welcome.

3 The bottom line, ladies and gentlemen, all of  
4 us here, is that while some things have changed, other  
5 things have not. LAX is still the Gateway to this area.  
6 At the end of the day something needs to be done.  
7 Studies need to end and decisions need to be made. What  
8 we pay you to do is to make the studies, but at the end  
9 of the day what we pay you to do is to make the  
10 decisions. I would ask you to move forward and do that.  
11 Thank you.

12 MR. WALL: Thank you, Mr. Lovett. Luis Cabrales  
13 followed by Ms. Carole Hossan.

14 MR. CABRALES: Thank you, sir. Good evening, ladies  
15 and gentlemen. My name is Luis Cabrales. I'm an  
16 assistant director of outreach at the California League  
17 of Conservation Voters Education Fund.

18 According to Coalition for Clean Air, the  
19 Los Angeles Airport is the second largest industrial  
20 small source in the Los Angeles area. For many years  
21 low-income communities and communities of color located  
22 under the airport's flight path have endured these  
23 sources of pollution. The proposed expansion will  
24 intensify the airport's environmental impact of those  
25 communities.

1 I am also a resident of Pico Rivera. It's one  
2 of the communities located under the proposed LAX  
3 expansion pathway. But I have lived all my life in  
4 Southeast L.A. For many years I also had to endure the  
5 noise and air pollution created by the airplanes that  
6 flew just above my home, schools and parks where I  
7 lived, played and studied. I was actually living in  
8 Southgate when one of the tires from one of the  
9 airplanes fell not too far away from my house, by the  
10 way.

11 The proposed expansion, which according to the  
12 Environmental Impact Report has significant impacts for  
13 aircraft noise and pollution in low-income communities  
14 and communities of color making it one of the most  
15 important issues this community faces. Thus, it is time  
16 for L.A. officials to pay attention to the environmental  
17 injustice implications that the LAX has had for so many  
18 years and how this expansion will exacerbate this  
19 pollution rate.

20 It is important to mention that many of the  
21 people who have been impacted by health problems from  
22 this pollution are brothers, sisters, siblings,  
23 children, parents of union members and even union  
24 members themselves. So far the jobs and money created  
25 by the LAX have not improved the health status of the

1 Latino and African communities that surround the LAX.  
2 And the pollution increases that will come with the  
3 expansion will only exacerbate this problem. Thank you  
4 very much for your time.

5 (The statement submitted for the record  
6 was marked as Statement 8.)

7 MR. WALL: Thank you, Mr. Cabrales. Next will be  
8 Ms. Carole Hossan followed by Mr. Harry Rose.

9 MS. HOSSAN: Hi. My name is Carole Hossan. I live  
10 in Westchester. As a native of Westchester resident, I  
11 oppose LAWA's preferred Alternative C because it would  
12 remove homes in one-third of our central business  
13 district. I also oppose projects like the proposed  
14 Sepulveda widening, my community becoming a mere  
15 transportation corridor to LAX. In past expansions  
16 Westchester has lost thousands of homes and residents.

17 Frankly, I'm very displeased with the current  
18 situation of having the previous Master Plan alternative  
19 still looming over us. Now, we also have the nebulous  
20 fifth alternative, which according to an article in the  
21 L.A. Times is a proposal for a new security conscious  
22 LAX which exists only in Mayor Hahn's mind and in the  
23 preliminary concepts of airport planners which means the  
24 public is being asked to offer suggestions without  
25 seeing a single picture, map, sketch or even basic

1 description of the mayor's concept. I think we need  
2 more than that to work from. The devil is always in the  
3 details. Briefly, I believe the previous Master Plan  
4 should be officially declared dead in writing. I oppose  
5 the runway extension suggested in Alternative Five. I  
6 oppose incremental expansion and I favor lowering the  
7 noise levels.

8 As for safety improvements at LAX, one, having  
9 the allotted number of air traffic controllers on staff  
10 would be good. Two, adopting the solution proposed by  
11 NASA's Research Center for preventing runway incursions,  
12 and, three, making sure all luggage on domestic flights  
13 is screened. Thank you for your time.

14 MR. WALL: Thank you, Ms. Hossan. Mr. Harry Rose  
15 followed by Ms. Holly Hightower.

16 MR. ROSE: My name is Harry Rose. I live at 7725  
17 Hindry Avenue in the Westchester District in the City of  
18 Los Angeles. Historically, the communities of  
19 Westchester, Playa Del Rey, Inglewood and El Segundo  
20 have born the brunt of LAX expansion. We're the ones  
21 that must bear the increased air pollution, traffic and  
22 noise pollution of any proposed expansion of LAX. We  
23 are the ones who face the destruction of our business  
24 district and many of our homes by the proposed extension  
25 of the north runway.

1                   Last April Southern California Association of  
2 Governments endorsed a regional approach to increase the  
3 airport demand. We currently have only one  
4 international airport to serve a five-county region of  
5 what LAWA calls Ontario International Airport, it has no  
6 customs. From a logistical and safety standpoint,  
7 continued expansion of LAX is senseless. Continued  
8 expansion -- I'm sorry. This region needs another  
9 international airport, not just one in name only. Thank  
10 you.

11           MR. WALL: Thank you, sir. Ms. Holly Hightower  
12 followed by Mr. Darryl Bustamonte.

13           MS. HIGHTOWER: Good evening, gentlemen. Thank you  
14 for the opportunity to testify. My name is Holly  
15 Hightower. I'm the vice president for the Association  
16 of Flight Attendants. More importantly, I am a working  
17 flight attendant. Each day since September 11th myself  
18 and my flying partners have dealt with the grief and the  
19 fear associated in the aftermath of losing our  
20 colleagues to the terrorist attacks, men and women who  
21 went to work feeling safe. On September 10th, I, too,  
22 felt safe. Now we know better. And as the saying goes,  
23 when you know better, you should do better.

24                   There have been some improvements. We have  
25 the National Guard at the security checkpoints. We have

1 the one-bag-maximum imposed on the passengers, and I  
2 have seen that at work. And many items of a dangerous  
3 nature have been banned from the aircraft cabins. The  
4 front door of the airport is deadbolted. But the back  
5 door is swinging open and banging in the wind.

6 There are three simple things that need to be  
7 done to make Los Angeles International the premier  
8 airport for safety and security in the United States.  
9 One, screening checkpoints that can be set up for all  
10 ground personnel, caterers, baggage handlers, et cetera.  
11 Currently these people have access to our aircraft with  
12 only an ID badge too easily replicated. Two, all  
13 checked baggage must be screened. This is not done  
14 domestically and is a gaping hole in our security  
15 system. And, finally, three, passengers and their  
16 checked baggage must fly together. Positive bag match  
17 is essential to the integrity of the aircraft.

18 I'm certain Mayor Hahn and this body will want  
19 the best for the people who work at Los Angeles  
20 International and for those passengers who will be  
21 flying out of that airport. I believe that I will feel  
22 safe at my work place again. And I believe that the  
23 passengers will feel safe again and they will fly again.  
24 And I believe that you can help. Please set the  
25 standard. Thank you.

1 MR. WALL: Thank you, Ms. Hightower. Mr. Darryl  
2 Bustamonte followed by Mr. Bill Luddy.

3 MR. BUSTAMONTE: Good evening, ladies and gentlemen.  
4 My name is Darryl Bustamonte, concerned citizen at-large  
5 and a current user of one of the best aviation systems  
6 in the entire world.

7 I'm a firm supporter of LAX expansion. I'm a  
8 firm supporter of any airport expansion which increases  
9 not only just jobs, but the availability of one of the  
10 greatest commodities that we have. That's an airline  
11 seat. As demand for public transportation rises, that  
12 demand must be met. Regionalization, while may sound  
13 nice on the surface, airlines go where the demand is.  
14 If the demand isn't there, the airlines will not go.  
15 Shifting people and cargo to far out stations such as  
16 Palmdale may alleviate some flights, but they will  
17 increase the traffic on the roads.

18 As a citizen of Monterey Park as well, noise  
19 really is not an issue. Planes have been flying over  
20 Monterey Park for better of 40 years. I've been there  
21 for a good 35 of them. I can tell you today that CFM56  
22 is a lot quieter than a JTAD ever was. The greatest  
23 threat, I believe, as a citizen of Monterey Park is not  
24 airline noise, but people noise. Your gardeners, your  
25 barking dogs, your thumping stereos are a heck of a lot

1 louder than any airplane ever was. I believe that LAX  
2 has been a good citizen. The citizens also need to be  
3 good to the airport because it represents the lifeblood  
4 of the economy, jobs, and we need to travel. Americans  
5 do travel and we should not be stifled in that. And I  
6 thank you for your time.

7 MR. WALL: Thank you, Mr. Bustamonte. Next Mr. Bill  
8 Luddy followed by Luis Marquez.

9 MR. LUDDY: Thank you. My name is Bill Luddy. I'm  
10 representing the Southwest Regional Council of  
11 Carpenters for 533 South Fremont Avenue in Los Angeles.  
12 We represent approximately 50,000 working carpenters who  
13 live and work throughout this region. All of the cities  
14 that are represented, all of the cities that are  
15 impacted, we have members in there. We have members  
16 working there.

17 We've been in support of this plan for  
18 sometime now. We recognize the benefits of a regional  
19 approach and improvements in some of those airports and  
20 support that. But when all is said and done, there is  
21 nothing that is going to change the fact that LAX is, in  
22 fact, the central regional airport. With that said, I  
23 think the arguments that were presented by Mr. Collins,  
24 the economics out there, the job impacts, the economic  
25 engine that that represents is indisputable. It cannot

1 be ignored. It cannot be let run down.

2 We've seen since September 11th the types of  
3 impacts on the economy that are happening and that  
4 people have when they are unsure and unwilling to spend  
5 money or willing to move forward or willing to travel  
6 because they are not clear on their safety. This plan  
7 needs to be readdressed and has been refocused by Mayor  
8 Hahn's statement and by your actions on the question of  
9 safety and security. The traffic controllers, the  
10 Pilots Association, the attendants have all laid out an  
11 excellent list of issues that need to be addressed.  
12 None of that can be addressed at the facility as it  
13 stands now. It requires a new plan. It requires work.  
14 We do not have the luxury of another ten years to think  
15 about this. The economics, the safety, the security and  
16 the confidence of the public regionally and the  
17 travelers requires that we look at this issue, formulate  
18 the plan and move forward on it now. Thank you.

19 MR. WALL: Thank you, Mr. Luddy. Next will be Luis  
20 Marquez followed by Denny Schneider

21 MR. MARQUEZ: Good evening. My name is Luis  
22 Marquez. I'm a resident of the Los Angeles  
23 Florence-Graham area directly under the airport flight  
24 path. My family and neighbors, friends have been  
25 directly impacted by the airport's noise, traffic and,

1 of course, the fear of an airline air traffic tragedy  
2 directly over our houses. We have been bearing more  
3 than our fair share of the burden for a very, very long  
4 time. It's time for a truly Regional Airport Plan. We  
5 need a regional system that spreads the burdens of  
6 traffic, air pollution, noise and other impacts  
7 throughout the communities in the region. Keep LAX  
8 constrained to its physical capacity that does not go  
9 beyond the 78 million annual passengers.

10 Security and environmental justice in our  
11 airport systems have everything in common. A more  
12 decentralized airport system with LAX constrained is the  
13 best way to achieve both. Assuring maximum security  
14 dictates that we develop a more regional aviation system  
15 and not expand LAX. It makes no sense to expand LAX as  
16 it should make it a super target with no reasonable  
17 back-up options. It makes no sense to create an  
18 overcrowded LAX where the security challenges is made  
19 too complex, a security that is inevitably compromised  
20 to increased passengers throughout. It makes no sense.  
21 Common sense tells us that there is a regional planning  
22 dimension to our airport security. Common sense tells  
23 us a more decentralized airport system will be a safer,  
24 more secure airport system. Thank you.

25 MR. WALL: Thank you, Mr. Marquez. Mr. Denny

1 Schneider followed by Ms. Nora Frye.

2 MR. SCHNEIDER: Hi. I'm Denny Schneider. I come  
3 from the Westchester area. I've spoken before this  
4 board several times. I am a member of the LAX Community  
5 Noise Roundtable. I'm the subcommittee chair for the  
6 north and east sectors. I applaud the people that came  
7 out to this meeting and appreciate all of their efforts.

8 We have spoken many times about the expansion  
9 and the previous four alternatives that call for  
10 wholesale expansion of LAX. I'm glad to hear the Mayor  
11 has decided that it is unacceptable. I applaud the  
12 decision to try to make LAX safer. We look forward to  
13 working with LAWA and look forward to hearing some of  
14 the details which in the past have been very difficult  
15 to get before they were in firm concrete.

16 I also would like to commend the FAA for  
17 helping since 9/11. They are creating more jobs for the  
18 Hollywood industry because they are creating what we  
19 call the "Hollywood effect." That is, at night the  
20 planes are going every which way and making the stars  
21 look like they are moving all over the sky. In other  
22 words, the FAA has done less, not more, to control the  
23 noise in our communities. And we wish to get more  
24 control, not less.

25 We urge you to look at a regional solution

1 that spreads out the traffic, that allows people to go  
2 to an airport closer to their home so they don't have to  
3 spend two and a half hours on a freeway to get to LAX.  
4 Thank you.

5 MR. WALL: Thank you, Mr. Schneider. Next will be  
6 Ms. Nora Frye. You will be followed by Mr. Daniel  
7 Shriver.

8 MS. FRYE: Good evening. My name is Nora Frye. I  
9 live at 7844 Midfield Avenue, Westchester, California,  
10 home of the Los Angeles International Airport. I'm here  
11 all the way from Westchester. That's a long way in the  
12 evening to be driving, although I did get a ride, but  
13 I'm here in support of the people that live here locally  
14 in Monterey Park. I know what they are talking about  
15 noise. And any way that they can be helped, I'm for it.

16 I'm also here for safety and health situations  
17 at LAX International without any type of expansion.  
18 We've had enough. It's been expanded, expanded,  
19 expanded. And I personally know someone who has had to  
20 give up her home twice. As you get older, it's harder  
21 to do. I am for the Regional Airport Plan. And from my  
22 understanding, Ontario has room for a third runway  
23 within safety constraints. I think the question is how  
24 to get the airlines there. Well, where are the  
25 salespeople? Where are the salespeople to get the

1 people outside of California to fly into Ontario? I  
2 know my son has flown there on United two years ago and  
3 he had a better price than flying into LAX. Plus, he  
4 made it to our house in the same amount of time because  
5 it wasn't such a hindrance getting out of LAX.

6 Ontario is realistic for expansion. And I  
7 think every effort should be made to build the business  
8 so the airlines feel the need to go there. Thank you.

9 MR. WALL: Thank you, Ms. Frye. Mr. Daniel Shriver  
10 followed by Ada Wong..

11 MR. SHRIVER: Hello. My name is Daniel Shriver.  
12 And I'm here representing Atemi-Ryu JuJitsu, which is a  
13 close-range martial art that would be highly appropriate  
14 for flight attendants and flight crews. We've given  
15 information to Congressman Waxman. We've done a  
16 demonstration for his office, and he thinks it's highly  
17 effective and should be considered. It is a close-range  
18 combat skill. It is not a sport. It is something that  
19 is being trained right now in Fort Bragg. If we're  
20 going to have our flight attendants and flight crews to  
21 be on the front line of this new war, we should give  
22 them the tools to succeed.

23 If you have a sister or a mother or someone  
24 that you care about, you would want them to know this  
25 skill. It is a skill that uses leverage and knowledge

1 over size and strength. It is very effective. It is  
2 not a sport. It can take care of the drunken executive  
3 who is trying to take a crap on the tray. It could take  
4 care of the crazy man who is trying to pull a copilot  
5 out of the seat or it can take care of the deadly  
6 terrorist. Please consider this. We have given  
7 information to the FAA. We have given information to  
8 the Flight Attendants Association, and we are serious.

9           September 11th I lost a dear friend to the  
10 World Trade Center. He was a guy that lived in  
11 Los Angeles and got a great opportunity to be a  
12 stockbroker with his brother in the World Trade Center.  
13 He was a fighter. He was able to make some phone calls  
14 and talk about, "It doesn't look good and give everybody  
15 my best and let them know that I love them." This is a  
16 personal mission for me to see if you guys will take the  
17 opportunity to learn the skill or at least get a  
18 demonstration. It is effective. It is the real deal,  
19 and it is something that my friend from the Flight  
20 Attendants Association said, "We need to start that  
21 measure."

22           If we introduce a gun into the system, it can  
23 be used against you. A Taser is a one-fire shot. Cords  
24 come out. What if you miss the wrong person? You're  
25 done. We've eliminated pocketknives, all this stuff.

1 With a pen you can do the same damage that you could do  
2 with a box cutter. Every martial artist across the  
3 country when 9/11 happened said, "If the flight  
4 attendant that had the first box cutter to her neck only  
5 had simple martial arts, this would be a different world  
6 we're living in. I am genuine. I am sincere. This is  
7 effective. Please consider it, Atemi-Ryu LA.com is --  
8 Atemi-RyuLA@AOL.com is the way to get to me. My name is  
9 Daniel Shriver. My phone number is 310-871-9015.

10 Again, this is a personal mission. Once you  
11 see it, you'll see how effective and appropriate it is.  
12 A person could take multiple attackers. You don't have  
13 to worry if there are eight strong people in the cabin  
14 hoping they are brave and strong enough to pull somebody  
15 off. They are on the front lines. This is where the  
16 rubber meets the road. Let's give them the tools to  
17 succeed so we can all get back to flying and get back to  
18 the way we remember life.

19 MR. WALL: Thank you, sir. Ada Wong followed by  
20 Kevin Finney. Ada, are you here this evening?  
21 Mr. Kevin Finney. He'll be followed by Sotero Lopez.

22 MR. FINNEY: Kevin Finney representing the Coalition  
23 For Clean Air, 30 years of experience in Southern  
24 California working for practical solutions to our air  
25 pollution problems.

1                   Coalition for Clean Air firmly believes  
2 Southern California's future aviation demand must be met  
3 by a regional solution that will share both the  
4 substantial burdens of mitigation needed to reduce the  
5 significant environmental impacts associated with  
6 modern-day airport operations.

7                   Well before Los Angeles World Airports and the  
8 FAA proposed a massive expansion of LAX's facilities,  
9 Los Angeles International Airport was already identified  
10 as the second largest emissions source for smog-forming  
11 gases in the Los Angeles area. Currently only emissions  
12 from Chevron U.S.A. surpassed the levels of smog-forming  
13 emissions generated at LAX. The future of the airport  
14 is likely to surpass all emissions sources for  
15 smog-forming chemicals in the southcoast air basin,  
16 especially if the facility expands as proposed under the  
17 Draft Master Plan and Draft EIS/EIR as future regulatory  
18 actions where aircraft emission standards is restricted  
19 by international law.

20                   Although the Coalition is not opposed to a  
21 limited expansion scenario for the LAX facilities to  
22 help meet future aviation demand, none of the build  
23 alternatives presented in the Draft Master Plan and  
24 Draft EIS/EIR should be considered limited nor do they  
25 adequately mitigate the substantial environmental

1 impacts that will be brought upon the residential and  
2 business communities surrounding the airport and under  
3 its established flight paths.

4 If any of the three build alternatives are  
5 pursued, as described under the Draft EIS/EIR, the  
6 result is likely to be a significant increase in air  
7 toxics, fine particles, smog-forming chemicals, noise  
8 and other human health hazards. And since these impacts  
9 will fall most heavily on the low-income and minority  
10 communities surrounding the airport, they would seem to  
11 constitute a clear case of environmental injustice.

12 What is needed is, indeed, to focus on airport  
13 security and a regional solution with Los Angeles  
14 International Airport constrained in terms of its  
15 passenger capacity. The Coalition hopes that the  
16 airport authority and the FAA will consider the comments  
17 that we have submitted and will move forward on, both,  
18 adopting more significant mitigation measures and  
19 developing a new proposal that the public can comment on  
20 and a new Environmental Impact Report for that proposal.  
21 Thank you very much.

22 MR. WALL: Thank you, sir, for your comments. Is  
23 Sotero Lopez here? Mr. Verne Heitman.

24 MR. HEITMAN: My name is Vern Heitman. I live in  
25 Monterey Park under the glide path. I oppose expansion

1 of LAX. Future growth in this area is to the east and  
2 to the north in the region. Each area needs to take its  
3 share of the traffic and the economic opportunities with  
4 expansion in their areas. The current EIR needs to stop  
5 for Mayor Hahn's new proposals and to do a new EIR.  
6 Thank you.

7 MR. WALL: Thank you, sir for your comments. Is Ada  
8 Wong here? That's the last of the cards that I have.  
9 For those who wish to speak, we will remain open until  
10 9:00 o'clock in case there are others that want to come.  
11 Are there any other speakers who wish to speak.  
12 All right. We'll remain here, gentlemen, until 9:00.  
13 And we'll see if anybody else would like to join us and  
14 make a comment or presentation. Why don't we take a  
15 ten-minute stretch break. It's now 8:03. We'll be back  
16 at 8:13.

17 (Recess was taken.)

18 MR. WALL: Ladies and gentlemen, we will reconvene  
19 our public hearing. Our first speaker will be  
20 Counselwoman Norma Reid followed by Joy Rowe. Ms. Reid,  
21 are you ready? Welcome.

22 MS. LOPEZ-REID: Thank you. Good evening, everyone.  
23 My name is Norma Lopez-Reid, and I'm councilwoman from  
24 the City of Montebello. I'm also a member of the  
25 Airport Noise Community Roundtable. I would like to

1 talk about the residents of Montebello and how they have  
2 expressed ongoing legitimate concerns over this proposed  
3 expansion of LAX. In fact, the counsel and the staff  
4 receive noise and safety complaints regularly.

5 Our primary concern is the low overflights  
6 over our community. And, basically, to let you know,  
7 every time I look up in the sky, it feels like the  
8 airplane is going to land on my roof. And, you know,  
9 I'm a person who travels a good bit. So if I had wanted  
10 to live near the airport for convenience, I think I  
11 would have bought a house there. At this point in time  
12 it's not only annoying, but it's also, we believe, a  
13 safety factor.

14 At the airport's current operation,  
15 Montebello's residents as well as surrounding  
16 communities are severely impacted by the noise of low  
17 overflights. Expansion of LAX would compound the  
18 existing noise, safety and reduce quality of life  
19 issues. Because of the concerns, in August of 2000 the  
20 Montebello City Council adopted a resolution supporting  
21 a Regional Airport Plan. As such, the City Council --  
22 the City of Montebello remains steadfast in voicing our  
23 concerns and we are vehemently opposed to the expansion.

24 At this time we ask you to readdress your  
25 plan, spend time, perhaps a day in our city, and to

1 please listen to our concerns. Thank you.

2 MR. WALL: Thank you Councilmember Lopez-Reid. We  
3 appreciate your participation. Next will be Joy Rowe  
4 from Monterey Park.

5 MS. ROWE: Good evening. I'm Joy Rowe. 30 years  
6 ago the FAA designated this area Monterey Park,  
7 Montebello as a corridor, alternate corridor. Since  
8 then the demographics have greatly changed because it  
9 used to be cow pastures and hills, vacant hills.

10 We live in Monterey Park on a hill overlooking  
11 a school. We have jets going -- jumbo jets coming over  
12 at 2,500 feet. It's not 2,500 feet, it's 1,600 feet  
13 where they are coming over. The kids are stopping and  
14 looking up and waiving at the passengers in the plane as  
15 these big jets are banking and turning to go -- because  
16 we're in the downwind right now. That means they are  
17 coming -- they are going to start their landing pattern.  
18 And they are coming in not every 30 seconds, which I  
19 understand is like a mile apart. They are coming in at  
20 15 to 20 seconds over and over and over again. And I'm  
21 wondering why you have the EIR study for LAX and L.A.  
22 City, but you have not included EIR studies for out here  
23 where we are -- where we have been greatly impacted and  
24 the our kind of life has greatly changed with all the  
25 noise that we're having. Sometimes at 5:00 o'clock in

1 the morning -- we understand they are not supposed to  
2 fly after 10:00 o'clock or before 6:00 o'clock in the  
3 morning, but they do all the time. When we complain, we  
4 get no results whatsoever. So I don't know. I know  
5 L.A. City is getting money, not just LAX, but they are  
6 getting revenue. So if you're going to continue this, I  
7 propose that Monterey Park gets at least two cents per  
8 passenger that comes over Monterey Park in the planes  
9 because I know the bottom line is money. Thank you.

10 MR. WALL: Thank you for your testimony, Ms. Rowe.  
11 Our next speaker will be Marcus Hough.

12 MR. HOUGH: Good evening. My name is Marcus Hough.  
13 I am a resident of Lennox, California, which is adjacent  
14 to the L.A. Airport. We went to a lot of these meetings  
15 that the airport has been putting on, and we're trying  
16 to build a relationship with them in good faith. So  
17 what we did in Lennox is we came up, as with per the  
18 Mayor's direction as soon as he was elected, he said  
19 that he would make the airport a good neighbor or a  
20 better neighbor to the surrounding communities.

21 So what we drafted in Lennox is what we call a  
22 Good Neighbor Policy. We would like to submit that for  
23 the Mayor's consideration. We read in the paper on  
24 Sunday that he will be taking into consideration our  
25 comments. So we will submit our policy that we would

1 like him to look at and just to start working with the  
2 surrounding communities instead of having an adversarial  
3 relationship, to sit down and actually see what the  
4 Lennox community and what everybody else around the  
5 airport really wants and really could do for the airport  
6 as far as telling them how the airport is affecting us  
7 instead of just, you know, these things and meeting  
8 places that nothing really gets done, but you record and  
9 we say stuff and there's no back and forth. Thank you.

10 MR. WALL: Thank you, Mr. Hough. That's H-o-u-g-h?

11 MR. HOUGH: Correct.

12 MR. WALL: Thank you, sir. Our next speaker will be  
13 Daniel Walker. Daniel Walker.

14 MR. WALKER: Good evening. I'm Daniel Walker.  
15 Tonight I'm speaking on behalf of the Friends of the  
16 Green Line. We're a new organization this year that  
17 recently came out, basically transit users and people  
18 that ride the metrolines and the buses in the  
19 Los Angeles Airport area. And we would like to see the  
20 Green Line extended into LAX. Not necessarily the plan  
21 that was proposed originally in the Master Plan going  
22 around behind the airport to a new western terminal  
23 which might not be built now, but rather using the  
24 original concept of having the Green Line go into the  
25 front of the airport, the existing airport, maybe not

1 even the expanded airport.

2           The MTA owns a 26-mile long railroad track  
3 that runs in front of the airport right on Aviation  
4 Boulevard. It runs from L.A. Harbor to Alameda and  
5 Torrance. It runs right past the airport through  
6 Inglewood and eventually connects to the Union Station.  
7 We think that would be the ideal place to connect the  
8 Green Line from the current Aviation Station about a  
9 mile up Aviation Boulevard where they own the  
10 right-of-way to some kind of people mover or into  
11 parking lot C where you could easily connect the  
12 automated people mover system. I know there's been some  
13 articles in the L.A. Times that Mayor Hahn wants to look  
14 at improved security and improved access from the  
15 eastern side of the airport where they own some property  
16 now, where they are acquiring some property. So I think  
17 this makes sense.

18           I live about ten blocks north of the airport  
19 in Westchester. A lot of my neighbors would like to see  
20 reduced congestion, reduced air pollution. So the Green  
21 Line going into LAX is, I think, one thing that does  
22 that. It doesn't necessarily require an expansion. In  
23 fact, if the airport is smaller, it's still, I think, a  
24 good thing. Just last week the MTA voted to study for  
25 60 days extending the Green Line out to Norwalk to

1 connect to the Metrolink. In this part of town,  
2 Metrolink zooms by the freeway here. Metrolink connects  
3 to all of L.A. County and five counties in Southern  
4 California. So rather than having all these buses and  
5 cars congesting our streets in around the airport and  
6 throughout Southern California, if this Green Line is  
7 extended and improved, I think everyone benefits.

8 So we would like the airport to consider that  
9 seriously. We think it improves the safety in the area.  
10 It certainly can improve security. We could have  
11 security checkpoints where the Green Line enters the  
12 airport. It reduces congestion, noise in the area. So  
13 we're eager to work with LAX and MTA and local city  
14 officials to make the Green Line to go where it's meant  
15 to go all along, where it was originally designed to go.  
16 Thank you very much.

17 MR. WALL: Thank you, Mr. Walker. I have no other  
18 cards at this time. We'll take a five-minute break in  
19 anticipation of others that may want to arrive this  
20 evening.

21 (Recess was taken.)

22 MR. WALL: Our next speaker will be Mr. Hugo  
23 Bustamonte.

24 MR. BUSTAMONTE: Thank you, sir. Hugo Bustamonte,  
25 1451 Park Avenue, Monterey Park, California. What I

1 hear today, there is something wrong. I can't  
2 understand it. This afternoon I was reading a book of  
3 Shakespear or King Henry with a coffee and cigar. Every  
4 time a 747 went by my house I would look at it going by.  
5 To me these aircraft could be Beethoven, Bach. I enjoy  
6 the airplanes going by the houses. The Los Angeles  
7 Airport is fine where it is there, there's -- you don't  
8 have to make any additions. What you have to do is  
9 rearrange the buildings. The terminals should be pushed  
10 in. They are too far out. One of the AOPA fellows was  
11 talking about the runways are too short or too close  
12 together. They are not. I think an experienced pilot  
13 should know how to handle aircraft. Sometimes you get a  
14 good cross wind.

15           The problem is you have your freight lines.  
16 You have your little small -- we call them feeders, and  
17 your regular airlines. And you have the big one, the  
18 big troublesome one of all, the international.  
19 Regarding the lack of terminal space, the international  
20 should be pushed as far to the ocean as you can to the  
21 sand dunes. That's the best place. What I had seen,  
22 sometimes half-a-dozen small feeder lines from the  
23 skyways and American Eagle Airlines blocking 747s and  
24 their burning fuels standing there 10, 15 minutes.

25           So the problem is, L.A. Airport as the airport

1 is all right as it is, the trouble is -- reshuffle some  
2 of the buildings. There's one more thing that should be  
3 done, the island of hotel and buildings in the center of  
4 the airport between 25 and 24, they should be removed.  
5 They are in the way. That's where your problem is, if  
6 you have an accident there. That's all have I to say.  
7 There's no reason for any regional airport. These  
8 people, they are not aviation people. I'm 72 years old.  
9 That doesn't bother me. I love the airplanes, just  
10 reshuffle some of the buildings. That's all. Thank you  
11 very much, gentlemen.

12 MR. WALL: Thank you, Mr. Bustamonte. Are there any  
13 other speakers? Hearing none, I'll turn the public  
14 hearing over to Mr. Kessler and Mr. Ritchie.

15 MR. KESSLER: Thank you, Tom. I'll ask, is there  
16 anyone else who has not had an opportunity to speak  
17 concerning information on the Draft EIS/EIR? Not seeing  
18 anybody else, I would like to remind everyone that if  
19 you feel you're unable to provide us with verbal  
20 comments today, we are accepting written comments until  
21 5:00 p.m. Pacific Standard Time, Friday, November 9,  
22 2001. You can mail your comments to either me at the  
23 Federal Aviation Administration or to Jim Ritchie at the  
24 City of Los Angeles. Mailing addresses are listed on  
25 the cover of the Draft EIS/EIR.

**U.S. DEPARTMENT OF TRANSPORTATION  
Federal Aviation Administration**

**Los Angeles International Airport  
Los Angeles, California**

**Draft Environmental Impact Statement/Environmental Impact Report  
Public Hearing Remarks**

**October 30, 2001**

**AT THE LUMINARIAS RESTAURANT  
Monterey Park**

**David B. Kessler  
Environmental Protection Specialist**

Good evening ladies and gentlemen, my name is David Kessler; I'm an Airport Planner from the Federal Aviation Administration, Western-Pacific Region. I would like to welcome you to the sixth of a total of nine Public Hearings the FAA and the city of Los Angeles are conducting for the Draft Environmental Impact Statement/Environmental Impact Report or EIS/EIR for the proposed master plan at Los Angeles International Airport. The first three public hearings on this topic were held on Saturday, June 9<sup>th</sup> in Inglewood, Manhattan Beach, and Westchester. This is the first of a second set of hearings being held this week and next week. These hearings were originally scheduled for early September; however, they were postponed due to the terrorist attacks in New York and Washington, D.C. The next hearing will be held on Thursday, November 1<sup>st</sup> at Peck Park in San Pedro.

The purpose of these hearings is to collect comments from the general public, concerning the adequacy of the information disclosed in the Draft EIS/EIR. The FAA and the City of Los Angeles along with the Federal Highway Administration, as a cooperating agency, have prepared the Draft EIS/EIR.

I would like to take this opportunity to make sure that everyone understands that **NO** decisions will be made today regarding the proposed project. Today's hearing is **not** a question and answer type of forum. Our job is to listen to what you have to say about the adequacy of the information in the Draft EIS/EIR. In other words, it's your turn to talk to us. Since we are here to listen, we are not going to respond to questions about

the pros and cons of the proposed project. Since 5 o'clock this afternoon, the city has held a public workshop just outside of this room for anyone to ask questions about the master plan, the environmental process and the various proposed projects.

Following publication of the Draft EIS/EIR for comment, the next step in the joint federal and state environmental disclosure process is holding this and the other public hearings during this week and next week. The environmental disclosure process for this project began in 1997 with the publication of a Notice of Intent to prepare the joint EIS/EIR in the *Federal Register*. In July of 1997, we held a series of meetings with members of the public and governmental agencies to receive comments on the scope of the Draft EIS/EIR. Following those meetings, the Draft EIS/EIR was prepared considering the comments received during the scoping meetings and those submitted in response to the Notice of Intent. The document has also been prepared pursuant to the National Environmental Policy Act of 1969 or "NEPA", the Council on Environmental Quality Regulations, which are the implementing regulations for NEPA, the California Environmental Quality Act of 1970 or "CEQA", and the Airport and Airway Improvement Act of 1982, as amended.

Following today's hearings and the close of the comment period, we will then correct, and revise the EIS/EIR as necessary based on the comments received. We will also prepare responses to the comments we receive and include those responses in the **Final EIS/EIR**.

Before we begin receiving verbal comments, we would like to let you know the ground rules of this hearing. First, as I said earlier, we are not here to respond to questions about this project. We are only here to listen to your comments and take notes. We also have a court reporter present to ensure that we have an accurate transcript of this hearing.

For anyone who would like to speak, we ask you to fill out a speaker card, like this one and give it to the person at the sign in desk. That person will bring the speaker cards up to our facilitator who will call the names of each speaker so we can proceed in an orderly fashion. So that everyone gets an opportunity to provide verbal comments,

everyone will get three minutes to speak. To be fair to everyone, we are not going to allow people to transfer their allotted time to someone else. I ask that when you speak, you give us your name and address for the record. We also have a Spanish language translator for anyone wishing to provide comments in Spanish.

If there is anyone who uncomfortable speaking in front of a group or if you need more than three minutes to provide your comments, we ask that you provide your comments in writing. We have comment sheets, like this one, available for your use at the sign-in desk. You can leave your comments in the large box in the back of the room, or you can mail your written comments using the comment sheet or a letter to either address listed at the top of the sheet. I would like you to understand that a verbal comment is just as important as a written comment. So please feel free to provide any comments on the document you may have to us either verbally today, or in writing. Comments are due by **5:00 p.m., Pacific Standard Time, on Friday, November 9, ██████████, 2001.**

Lastly I would like everyone to know that even though we have this hearing scheduled until 9 o'clock this evening, we will stay here as long as necessary for everyone to get a chance to provide verbal comments on the Draft EIS/EIR. As I said earlier, our job here today is to listen to your comments.

Now, I will turn the Hearing over to our facilitator, **Tom Wall**, who will collect the speaker cards and call the name of our first speaker.

Thank you.

Is there any one else who has not had an opportunity to speak concerning the information in the Draft EIR/EIS? **[wait for anyone to speak up]** Not seeing anyone else, I will remind everyone that if you feel that you are unable to provide us with verbal comments, today, we will be accepting written comments until 5:00 p.m. Pacific Standard Time, Friday, November 9, 2001. You can mail your comments either to me at the FAA or to Jim Ritchie with the City of Los Angeles. The mailing addresses are listed on the cover of the EIS/EIR. I want to thank everyone for your comments today, this public hearing for the Draft EIR/EIS at Los Angeles International Airport is now concluded.

Statement of Mayor James K. Hahn  
LAWA Public Hearing  
October 30, 2001

- Mr. Kessler, Mr. Ritchie. As the Mayor of the City of Los Angeles, I appear before you this evening to reaffirm my request that you fully develop a Fifth Alternative to the LAX Master Plan that focuses on increased safety and security at LAX.
- As you may know, I have historically supported a regional approach to accommodating growth in aviation demand. I favor expanding air service at Ontario and restarting service at Palmdale. In order for a regional plan to work, other airports in the region must also take their fair share of future traffic.
- However, the tragic events of September 11<sup>th</sup> have shown us that our nation's aviation system continues

to be a vulnerable target. Those events have caused me to focus my attention, first and foremost, on the changes that must be undertaken immediately to ensure safe and secure operations at LAX.

- As the third busiest airport in the Country, LAX is a unique and vital asset for the Southern California region. Immediately following the terrorist attacks and the FAA mandate that our national aviation system be shut down, it became abundantly clear how important LAX is to the City of Los Angeles.
- More than 400,000 regional jobs have been associated with the airport and LAX has generated \$60 billion of economic activity annually. However, in the wake of September 11<sup>th</sup>, the shipment of goods and the course of business operations dependent on aviation services came to a stunning halt, placing the benefits of a strong LAX beyond our immediate grasp. Our travel and tourism industries were gravely impacted. Most importantly, hundreds of Angelenos

found themselves out of work or in real danger of losing their jobs. Although I am sure all Angelenos had some sense of LAX's value to our City, the events of mid-September made clear that its contribution to our livelihoods can never be disputed.

- In the aftermath of the terrorist attacks — and after conferring with Federal authorities — we took some immediate steps to protect the safety of passengers and employees at LAX. We made a difficult decision to keep the Central Terminal Area and parking garages at LAX closed.
- That very necessary decision resulted in the loss of jobs for numerous airport workers. Thankfully, with new security guidelines, we have now relaxed some of the restrictions that were in place and many people have been able to return to work.
- But as airport employees return to their jobs, we must continue to remain diligent about protecting LAX. We

can never allow the events of September 11<sup>th</sup> to be repeated, and I believe that the first line of defense for safe and secure airplanes is safe and secure airports.

- That is why a few weeks ago, I announced a new vision for LAX, one that would create safe and secure terminals as well as a safer airfield that would accommodate 78 million annual passengers. I would like to take this opportunity to outline some of that vision to protect LAX employees, passengers and neighboring airport communities.
- First, our terminals must be as safe and secure as we can possibly make them. My vision is to move all ticketing and baggage check-in facilities to a location away from the existing terminals. This facility would allow passengers to park, check their bags and then pass through security checkpoints away from LAX's central terminal area. Once passengers and their baggage are thoroughly checked, they would board secure transportation to the terminal areas. This

separate facility will eliminate the need for cars inside the Central Terminal Area, providing maximum protection from the threat of explosives inside a car being near the terminals.

- Second, concerns of airport communities need to be addressed. To avoid disruptions to communities close to the airport, my vision would eliminate the need for a Ring Road around LAX. This costly project, part of the current Draft LAX Master Plan, would only serve to disrupt traffic patterns in these communities.
- Third, the LAX airfield needs to be reconfigured to increase safety. Airfield safety problems, that existed before September 11<sup>th</sup>, continue to plague LAX. My vision would seek to reduce so-called runway incursions and create safer conditions on the airfield. I am also hopeful that the new alternative to the Master Plan would not move any of the runways closer to the communities around the airport, thereby

avoiding increased noise over our neighborhoods surrounding LAX.

- My intent is to help restore confidence to the flying public so that Los Angeles and LAX become, once again, a destination of choice for business and leisure travelers.
- Along with the public comments you receive about the LAX Master Plan, I would ask that you also consider my vision for a safe and secure LAX that would serve to grow our economy and create thousands of needed jobs in our region.

Thank you.

**Mike Gordon  
LAX Public Hearing  
Monterey Park, CA  
October 30, 2001**

- Good evening. I'm Mike Gordon, Mayor of the City of El Segundo
- The City of El Segundo is pleased that Mayor Hahn has agreed to set aside the current LAX Master Plan
- And is now committed to developing a new plan for LAX that
  - Limits growth to 78 MAP
  - Eliminates the airport ring road,
  - the new west terminal, and
  - the new cargo facilities
  - And focuses on security and safety at the airport
- We agree that ensuring security and safety should be the highest priority in planning the future of LAX.
- truly regional system is the best way to secure these objectives.
- We know with certainty that LAX was a terrorist target even before the events of September 11.
- Common sense tells us that continuing to concentrate aviation activity at LAX will continue to provide an inviting target for terrorists.
- Developing a truly regional airport system reduces vulnerability at LAX and reduces the vulnerability of our regional economy.
- We also know with certainty that LAX has had more runway incursions than any other US airport for the last two years.
- Here, common sense tells us that preventing taxiing aircraft from crossing active runways by employing end-around taxiways will go a long way to reducing the incursion risk.
- Although we applaud Mayor Hahn's shift in focus, we have several key concerns

- First and foremost, the heavily impacted communities under and near the LAX flight path must be assured that the new plan will not permit LAX to grow beyond 78 MAP.
- Unfortunately, the new plan comes with few specifics and few assurances, particularly about runway modifications.
- Press reports indicate that LAWA may still plan to separate runways and may include extending a north side runway to 12,000 feet.
- Such runway modifications will create significant additional capacity at LAX and, therefore, are a cause for concern.
- **Mayor Hahn cannot constrain LAX to 78 million passengers and also increase runway capacity. You cannot have it both ways.**
- We also question the need to modify runways and gates to accommodate larger aircraft.
- The events of September 11 have seriously affected airlines and aircraft manufacturers.
- Airlines are canceling orders for new aircraft and delaying delivery of new aircraft that have already been ordered.
- New projections of fleet mix must reflect the financial downturn within the aviation industry
  - which is poorly positioned to acquire larger aircraft,
  - and unlikely to clamor for the next generation of Super Jumbo aircraft soon.
- This hearing is being held in the midst of some of the most heavily impacted communities under or near the LAX flight path.
- These and more than 100 cities, counties, transportation agencies and others in the region believe that a decentralized, *truly* regional airport

plan that absolutely constrains LAX to 78 MAP is the right plan for Southern California.

- More than 80% of the families living under the flight path are members of a minority community. Many are low income.
- A truly regional airport plan improves environmental justice by reducing the share of the aviation burden borne by low income and minority communities in the region.
- **We can have it both ways: A truly regional airport system with LAX constrained is both a more fair system, it is also a safer and more secure system.**
- It will reduce vulnerability in our airports system by adding regional airports in Southern California that can handle significant passengers and cargo - and thereby create flexibility and redundancy in the region's aviation system.
- It will reduce our vulnerability by allowing greater opportunities to separate passengers from mail and cargo by using specialty cargo airports in the Inland Empire.
- A truly regional plan will help to ensure that security will not take a back seat to passenger throughput.
- It will help to ensure that LAX receives only as much air traffic as it can safely handle.
- We are grateful to Mayor Hahn for setting aside the previous four Master Plan alternatives for LAX expansion.
- We are pleased to offer this preliminary public input for the Mayor's new plan.
- But the public expects and deserves the opportunity to review the details of the new plan once completed,

- and the opportunity to comment on an entirely new environmental impact review that must be undertaken for this entirely new plan.
- We look forward to participating in future public hearings once the details of the new plan are drafted and LAWA completes the new EIR that must be undertaken.

Thank you.

EXHIBIT 4

PHMP

**Airport Chief Wilson Notes**

- I'm Airport Police Chief Bernard Wilson. I've been chief for the last two and one half years and have 26 years of experience in law enforcement. *22 YEARS @ EMPLOYED IN AVIATION SINCE '86, LICENSED PILOT SINCE '87*
- I am not here to endorse any particular option of the LAX Master Plan under study.
- Am here to provide an update on major security steps we have taken at LAX and areas of concern for the future.
- I'm sure you are aware of the stepped up security measures that have been implemented since Sept. 11.
  - There is increased scrutiny of carry-on baggage
  - The ban on curbside check in continues to apply to private vehicles, though buses, shuttles, limos and taxis may unload passengers curb side.
  - After a period of closure, we have reopened all but one of the parking structures inside the Central Terminal Area while keeping the open-air parking lots and one other parking structure closed.
  - Private vehicles may only enter LAX from Century and Sepulveda Blvds.
  - Commercial vehicles must use the 96<sup>th</sup> St. entrance where there is a security checkpoint.
  - Random vehicle searches may be conducted.
  - LAPD Police canine patrols capable of detecting explosives are deployed at LAX with additional canine units for Airport Police under review.

*BY AIRPORT POLICE*

- California National Guard troops are monitoring baggage check in and have been requested to be used for patrol and other duties.
- There is an increase in the presence of LAPD officers beyond our normal complement in and around the airport.
- These steps and others have been taken to make LAX safe and secure for its passengers, employees and visitors. The leadership at LAWA is determined to do its part to make this airport the safest in America so passengers will again feel comfortable flying again.
- But we fully expect new federal regulations relating to safety and security to be issued in the coming weeks and months and much more needs to be done looking to the long term.
  - We expect in the coming months to be working even more closely with federal agencies, including U.S. Customs, Immigration and Naturalization, U.S. Marshal Service and the FBI regarding possible new security procedures.
- Chief Parks has raised the issue of better technological surveillance of the perimeter of the LAX. *AND WE ARE ENGAGED IN DAILY DIALOGUE WITH LAPD*
- Mayor Hahn has asked LAWA to review removal of all the parking structures in the Central Terminal Area in the long term and a new terminal built east of the current facility that would serve as the check in point for all passengers and baggage.
- The Airport Police stand ready to work with all these agencies to make LAX the safest airport in America.

Testimony of Dick Stanford, Councilmember, City of Azusa, California  
[1023 Lakeview Terrace, Azusa, CA 91702, 626/334-7335]  
Re: the Draft EIS/EIR for the Draft LAX Master Plan  
At the hearing by Los Angeles World Airports and the Federal Aviation Administration  
Baldwin Park, California  
October 30, 2001

**REGIONAL AIRPORT SYSTEM STILL BEING SHORTCHANGED**

Honorable Hearing Officers, my name is Dick Stanford. Thank you for the opportunity to testify.

Although I am a member of the Southern California Association of Governments' Regional Council and Transportation and Communications Committee, my testimony is presented solely in my capacity as a City Councilmember of the City of Azusa and for the City of Azusa.

Azusa is one of some 100 cities and other entities that respectfully request the City of Los Angeles to terminate plans for LAX expansion and concentrate, instead, on developing a truly regional airport system.

I hope I speak with some credibility. I helped build D/FW. I coordinated Friends of Mueller Airport in Austin, TX. I served on Ontario's Blue Ribbon Airport Committee,. And, I am a former Marine Corps fighter pilot.

In 1988, my friend, Don Ameche, now deceased, starred in a movie called "Things Change." In the movie, his life was changed drastically.

Well, since we last met, things have changed drastically in our own lives. Mayor Hahn, whom I believe is no friend of LAX expansion, has replaced Mayor Riordan, who championed LAX expansion.

The events of September 11, by extension, ended our trust in major hub airports. We are now well aware that grouping our air transportation assets makes its easier for terrorists to impact than if our air transportation system is regionalized into several airports.

Quite simply, if you put your eggs all in one basket and drop that basket, you are truly out of luck

The local example is overpowering. LAX is still trying to deal with security issues. Meanwhile, ONT almost overnight installed its hard and soft security measures and is now operating well.

That is one of the results almost all Southern California air travelers would be enjoying had regionalization of our airport system occurred long ago.

It was specifically because of the exclusion of the alternative of regionalization that the original draft EIR/EIS for the LAX expansion was inadequate. All alternatives are to be seriously addressed in an EIR; regionalization of the airport system was not.

Now, it is terribly disappointing that even though LAX expansion has been pronounced DOA, there are still projects which are part and parcel of expansion that keep popping up. Hydra is active right in Los Angeles. You cut off the LAX expansion head only to turn around and find another head that is Sepulveda widening, or another head that is changing rules to reinstate the Arbor Vitae intersection.

We respectfully ask Mayor Hahne to indicate to his many staffs that **NO LAX EXPANSION** means **NO LAX EXPANSION**...please ask the LAWA staff to quit trying to bring pieces of the expansion in via various and sundry back doors.

Remember, the Ontario Airport serves a population mass that would make that airport much more profitable for many more airline flights than presently operate there. Many more passengers would spend considerably less time on the freeway and concurrently less time fouling the air if their ground travel was to ONT instead of LAX.

But, the beautiful terminal there tends to be a ghost town because the flights are not there because the more convenient schedules are given to LAX, and because relative fare pricing deliberately forces passengers to use LAX.

LAWA, despite its protestations, can massively impact scheduling and which flights serve the Los Angeles area from which airport. We ask that they act accordingly.

Thus, we respectfully request that LAWA and the FAA join the many cities, Mayor Hahn, the Los Angeles County Board of Supervisors, a number of Members of Congress, and the Southern California Association of Governments in supporting a truly regional system which would be more efficient and less polluting for air travel in the greater Los Angeles region.

Thank you.

PHMP

Comments of Robert L. Rodine, Chairman, Aviation Committee, Valley Industry and Commerce Association ("VICA") at public hearing for LAX Master Plan before FAA and LAWA, October 30, 2001

I am Robert Rodine, speaking before you tonight as the Chairman of the Aviation Committee of the Valley Industry and Commerce Association, a business advocacy organization representing approximately 325 member companies.

In 1999, following numerous analyses, expert presentations and extensive discussion, VICA adopted a position supporting a Master Plan for LAX insuring capacity for 92 Million Annual Passengers.

With all due respect for those who hold visions for the need of less capacity, we must impose upon you to recognize two immutable facts -

We are a resilient and resourceful society, and with our economy intact, we have rebounded from far worse disasters than the Al Qaeda threat,

and,

The demographic factors fueling the need for improved facilities at LAX are ever present and will relentlessly challenge the capacity of that facility on into the future.

The only thing that has changed in the Al Qaeda era is the need for significantly heightened focus on safety and security.

Local self interest driving airport constraint is choking air commerce and the freedom of all citizens to travel expeditiously in our once proud air commerce system. This region suffers not less than three major regional commercial airports so constrained, and another has yet to be established due to the same forces. If we fail to modernize LAX, to serve the ever growing demand, and to compensate for the refusal of regional airports to serve the full demand of their constituents, then we will all be the losers, and that loss will be the equivalent of the planned capacity of LAX today and all of the benefits accruing to that capacity.

VICA strongly urges you to accept only a plan that will fully service this region's needs, and to reject any plan based on non-existent, unrealistic and phantom alternatives.

Regional Airport Capacity Analysis

Area/Factor	<u>Losses at Other Regional Airports</u> <u>Unacceptable Growth Above Current Loads</u>				<u>LAX 1995</u>	<u>ONT</u>	<u>TOTAL REGIONAL IMPACT</u>

**Subject:** PUBLIC TESTIMONY

GOOD EVENING!

I am Merry Norris, Executive Director of GATEWAY TO L.A.

which is a property-based Business Improvement District.

Our offices are located at 6151 Century Boulevard, Los Angeles.

The GATEWAY TO L.A. BID is comprised of properties along Century Boulevard between the 405 Freeway and Sepulveda Boulevard at LAX, as well as several properties on Airport and Aviation Boulevards between Century and 98th Street.

GATEWAY TO L.A. is comprised of 13 hotels, 7,200 hotel rooms, several million square feet of office and commercial space and contains over 15,000 parking spaces

GATEWAY TO L.A.'s goal is to revitalize the properties and businesses within our borders and to create a meaningful and recognizable "GATEWAY" to the city of Los Angeles.

We have worked successfully with LAWA on improvements to the LAX Gateway area. I am sure you are aware of the beautiful enhancements including lighted pylons and majestic palm trees which have quickly become a dramatic landmark for Los Angeles.

11/4/01

PHMP

Since well before September 11th, the GATEWAY BID has been working with the architecture firm of DMJM to develop a vibrant new vision for our area. We are hoping to partner with LAWA on these plans.

It is now very clearly time to take a different approach at LAX.

In considering a new approach, we all know that the assurance of safety and security is of paramount importance for all travelers

Any future changes are an opportunity for a win-win situation for businesses in and around LAX and for our neighbors- these opportunities would create new jobs, provide large scale entertainment, develop more parking and produce safer modes of transportation.

In collaboration with DMJM we have been developing BIG IDEAS which we call: AEROTROPOLIS - a gateway, a destination point which exemplifies and proliferates the brightness, the grandness and the bigness of the city in which we live: LOS ANGELES.

We look forward to sharing our vision with you.

Thank you for your time.

Rpt: Ungus  
WWW.DEPOBOOK.COM

Good evening ladies and gentlemen ~~\_\_\_\_\_~~ My name is Luis Cabrales, I am Assistant Director of Outreach at the California League of Conservation Voters Education Fund.

~~\_\_\_\_\_ today, the park on behalf of the underrepresented communities of color \_\_\_\_\_~~

According to the Coalition for Clean Air, the Los Angeles International Airport is the second largest industrial smog source in the Los Angeles area.

For many years low income communities and communities of color located under the airport's flight path have endured this source of pollution. The proposed expansion, ~~\_\_\_\_\_~~ will intensify the airport's environmental impact in those communities.

<sup>ALSO</sup>  
~~\_\_\_\_\_~~ I am a resident of Pico Rivera, one of the many communities of color located under the proposed LAX expansion plan's path way. But I have also lived all my life in Southeast L.A. For many years I too, had to endure the noise and air pollution created by the airplanes that flew just above my home, school and parks where I lived, studied and played.

The proposed expansion of LAX, which according to the environmental impact report, acknowledges significant impacts from aircraft noise and pollution on low income communities and communities of color, ~~\_\_\_\_\_~~ <sup>MAKING IT ONE OF</sup> the most important issues the communities under the airport's flight path face.

Thus, it is time for L.A. officials to pay attention to the environmental justice implications that the LAX has had, and how its expansion will exacerbate the pollution rates of the communities of color under its path way.

IT IS IMPORTANT TO MENTION THAT MANY OF THE PEOPLE WHO HAVE BEEN IMPACTED BY HEALTH PROBLEMS DUE TO POLLUTION ARE THE CHILDREN, ~~THE~~ SPOUSES & PARENTS OF UNION MEMBERS AND EVEN UNION MEMBERS THEMSELVES.

SO FAR THE JOBS & MONEY CREATED BY THE LAX HAVE NOT IMPROVED THE HEALTH STATUS OF THE LATINO & AFRICAN AMERICAN COMMUNITIES THAT SURROUND THE AIRPORT, AND THE INCREASE IN POLLUTION RATES THAT WILL RESULT FROM THE EXPANSION WILL ONLY EXACERBATE THOSE HEALTH PROBLEMS.

1 SAN PEDRO, CALIFORNIA, THURSDAY, NOVEMBER 1, 2001

2 6:00 O'CLOCK P.M.

3 ---oOo---

4

5 MR. KESSLER: Good evening, ladies and gentlemen.

6 My name is David Kessler. I'm the airport planner from

7 the Federal Aviation Administration Western-Pacific

8 Region. I would like to welcome you to the fifth of a

9 total of nine public hearings the FAA and the City of

10 Los Angeles are conducting on the Draft Environmental

11 Statement, Environmental Report of the EIS/EIR for the

12 proposed Master Plan of the Los Angeles Airport. The

13 first three public hearings on this topic were held on

14 Saturday, June 9th in Inglewood, Manhattan Beach and

15 Westchester. This last Tuesday was in Monterey Park.

16 Today's hearing is the second of six additional hearings

17 being held this week and next week. These hearings were

18 originally scheduled for early September; however, they

19 were postponed due to terrorist attacks of New York and

20 Washington D.C. The next hearing will be on Saturday,

21 November 3rd at Los Angeles High School located at 4650

22 West Olympic Boulevard in the Mid-Wilshire District of

23 the city of Los Angeles.

24 The purpose of these hearings is to get

25 comments from the general public concerning the adequacy

1 of the information disclosed in the Draft EIS/EIR. The  
2 FAA and City of Los Angeles along with the Federal  
3 Highway Administration as a cooperating agency has  
4 prepared the Draft EIS/EIR.

5 I would like to take this opportunity to make  
6 sure that everyone understands that no decisions will be  
7 made today regarding the proposed project. Today's  
8 hearing is not a question-and-answer type of forum. Our  
9 job is to listen to what you have to say about the  
10 accuracy of the information of the Draft EIS/EIR. In  
11 other words, it is your turn to talk to us. Since we're  
12 here to listen, we're not going to respond to questions  
13 about the pros and cons of the proposed project. This  
14 afternoon the City has held a public workshop just  
15 outside the room for anyone to ask questions about the  
16 Master Plan, the environmental process and the various  
17 proposed projects.

18 Following publication of the Draft EIS/EIR for  
19 comment, the next step in the joint federal and state  
20 environmental disclosure process is holding this hearing  
21 and other public hearings during this week and next  
22 week. The environmental disclosure process for this  
23 project began in 1997 with the publication of the Notice  
24 of Intent to prepare the joint EIS/EIR in the Federal  
25 Register. In July of 1997 we held a series of meetings

1 for members of the public and governmental agencies to  
2 receive comment of the scope of the Draft EIS/EIR.  
3 Following those meetings the Draft EIS/EIR was prepared  
4 considering the comments received during the scope of  
5 the meetings and those who submitted responses to the  
6 Notice of Intent. The document has also been prepared  
7 pursuant to the National Environmental Policy Act of  
8 1969 or NEPA, the California Environmental Quality Act  
9 of 1970 or CEQA, the Council on Environmental Quality  
10 Regulations, which are implementing regulations for  
11 NEPA, and the Airport and Airway Improvement Act of  
12 1982, as amended.

13 Following these hearings and the close of the  
14 comment period, we will direct and revise the EIS/EIR as  
15 necessary based upon comments received. We will also  
16 prepare responses to comments we receive and include  
17 those response in the final EIS/EIR. Before we begin  
18 receiving verbal comments, we want to let you know the  
19 ground rules of the hearing.

20 As I said earlier we're not here to respond to  
21 questions about the project. We're only here to listen  
22 and take notes. We also have a court reporter present  
23 to ensure we have an accurate transcript of this  
24 hearing. For anyone who wishes to speak, we're going to  
25 ask you to fill out a request-to-speak card, like this

1 one, that's available at the sign-in desk. The person  
2 at the sign-in desk will bring the speaker card to the  
3 facilitator who will call the name of the person so we  
4 can proceed in an orderly fashion. So that everyone  
5 gets an opportunity to provide verbal comments, everyone  
6 will get three minutes to speak. To be fair, we're not  
7 going to allow let them transfer their allotted time to  
8 someone else. I ask that when you speak, you give us  
9 your name, your address for the record. We also have a  
10 Spanish language translator for anyone wishing to  
11 provide their comments in Spanish.

12 If there is anyone who is uncomfortable  
13 speaking in front of a group or you need more than three  
14 minutes to provide your comments, we ask that you  
15 provide your comments in writing. We have comment  
16 sheets, like this one, available for you to use at the  
17 sign-in desk. You can leave your comments at the  
18 sign-in desk or you can mail your written comments using  
19 your comment sheet or a letter to either address listed  
20 on the cover of the Draft EIS/EIR. The city's address  
21 is listed at the top of the comment sheet. I would like  
22 you to understand that a verbal comment is just as  
23 important as a written comment. So please feel free to  
24 provide any comments on the document you may have to us  
25 and give it to us verbally today or in writing.

1 Comments are due by 5:00 p.m. Pacific Standard Time on  
2 Friday, November 9, 2001.

3 Lastly, I want people to know that although we  
4 have this meeting scheduled until 9:00 this evening, we  
5 will stay here as long as necessary for everyone to get  
6 a chance to provide verbal comments on the Draft  
7 EIS/EIR. As I said earlier, our job here today is to  
8 listen to your comments.

9 Now, I'm going to turn the hearing back over  
10 to the facilitator Shauna Bain to introduce Mr. Ritchie  
11 who will provide some introductory comments from the  
12 City of Los Angeles. Following Mr. Ritchie's comments,  
13 we'll collect the speaker cards and call the name of our  
14 first speaker. Thank you.

15 (The statement submitted for the  
16 record was marked as Statement 1.)

17 MS. BAIN: Thank you, Dave. Good evening. We have  
18 Jim Ritchie here. He's the deputy executive director of  
19 Los Angeles World Airports, and has some introductory  
20 remarks. Mr. Ritchie.

21 MR. RITCHIE: Thank you, Shauna. As Shauna said,  
22 I'm Jim Ritchie, deputy executive director for  
23 long-range planning for LA World Airports for the  
24 department of the city of Los Angeles. We received  
25 guidance from our mayor to expand opportunities for

1 public input into the LAX Master Plan process. And  
2 tonight we will receive your comments.

3 More recently the mayor identified a number of  
4 objectives to be incorporated into another alternative  
5 for the future planning of LAX. On November 9th this  
6 public comment period will close. After the close of  
7 public comment period, we will incorporate the mayor's  
8 guidance along with comments that we received throughout  
9 this process and move into the development of the new  
10 alternative. This alternative will undergo a rigorous  
11 environmental analysis, as did other alternatives, and a  
12 supplemental environmental document will be distributed  
13 for public review and comment. Very likely the  
14 development of this new alternative will necessitate  
15 another public hearing, similar to this, to comment on  
16 this new alternative as we finalize the environmental  
17 process. With that, I'll turn it over to Shauna.

18 MS. BAIN: Thank you. Again, I will be the  
19 facilitator this evening. My purpose here is to ensure  
20 that everyone gets to make their comments in a timely  
21 fashion and have your comments recorded by the court  
22 reporter. As Mr. Kessler mentioned, these are the  
23 comment cards. If you fill out one of these, they will  
24 give it to me and I will call your name. You can come  
25 up to any one of these podiums and make your comments.

1 You will have three minutes. You have a clock to refer  
2 to if you don't know how much time you have left. When  
3 you have one minute left, a light will show up. When  
4 you're out of time, it will beep. At that time if you  
5 still feel you have further comments to make, you're  
6 more than welcome to fill out another comment card, and  
7 we will call you after everyone has had a chance to make  
8 their verbal comments.

9 With that, I will start calling the first  
10 name. Also, I would also like to reiterate, we do have  
11 court reporters here. And if you could please speak  
12 your name clearly and slowly as possible in the  
13 beginning and give your address to the court reporter so  
14 they can record that. If you have any written comments  
15 or anything that you wrote down that you're saying that  
16 you can provide to us, we would appreciate that. You  
17 could give it to the court reporter here. That will  
18 help them complete the record. Okay. Thank you very  
19 much. I will start the time after you say your name for  
20 the record.

21 Our first speaker is Daniel Shriver.  
22 Mr. Shriver? And our second speaker will be Sensei  
23 Vince Cecere.

24 MR. SHRIVER: Did you want to change the order?

25 MR. RITCHIE: I think we better, Shauna, if we could

1 leave him for last. He would like to request a  
2 demonstration.

3 MS. BAIN: So I'm going to have Meryt McGindley,  
4 please, and Denny Schneider will speak after that.

5 MS. MCGINDLEY: Hi. My name is Meryt McGindley.  
6 I'm legislative deputy for policy and communications for  
7 Los Angeles Councilmember Ruth Galanter who chairs the  
8 Commerce Energy and National Resources Committee of the  
9 city council which oversees the Los Angeles World  
10 Airports Department.. The address is City Hall, Room  
11 475. I would like to read a statement by Councilmember  
12 Galanter on the record here tonight.

13 Thank you very much for being here tonight.  
14 In light of the events of September 11th the entire  
15 Master Plan is most likely obsolete. The assaults of  
16 the World Trade Center and the Pentagon have  
17 demonstrated that airports must operate differently or  
18 they may not be able to operate at all.

19 Even before September 11th, trends within the  
20 airline industry were unclear. While the LAWA-proposed  
21 Master Plan includes in all its alternatives runways to  
22 accommodate planes carrying 600 passengers or more,  
23 airlines have, in fact, been flying and buying more 757s  
24 and 767s. Certainly since September 11, demand has  
25 fallen off the charts and the demand forecasts that the

1 entire Master Plan is based on are no longer useful. In  
2 fact, the EIR is so flawed in its conception and current  
3 relevance, that the environmental assessment is  
4 inherently flawed as well.

5 I'm concerned that we are now being asked to  
6 comment on a Fifth Alternative that is conceptual, at  
7 best, with no opportunities to inspect any analysis on  
8 its impacts on the surrounding communities, businesses  
9 or residents. I'm concerned as long as this EIR process  
10 is on the table, the door is still open for incremental  
11 expansion later in this decade. I am also concerned  
12 that nowhere in the existing Master Plan document or in  
13 the proposed Fifth Alternative is there an overarching  
14 plan to address projected growth and demand in the  
15 Southern California region using LAWA's other airports,  
16 Ontario and Palmdale.

17 I urge you to reject this planning process and  
18 begin anew with a true regional plan assessed with a new  
19 environmental document that adequately addresses impacts  
20 on a regional basis. Thank you very much.

21 (The statement submitted for the  
22 record was marked as Statement 2.)

23 MS. BAIN: Mr. Denny Schneider.

24 MR. SCHNEIDER: Good evening. I'm Denny Schneider.  
25 My address is 7929 Breen, B-r-e-e-n, Avenue in

1 Los Angeles in Westchester. I'm here this evening with  
2 several hats on. Three and a half years ago I started  
3 out in favor of controlled expansion of LAX. The more I  
4 learned about it from heading up our neighborhood  
5 community organization, the more concerned I became  
6 because it was getting noisier and noisier. I  
7 discovered very rapidly that there is no way in which to  
8 control the amount of planes that are coming to LAX  
9 under the present circumstances. And so when someone  
10 tells you that the capacity of one level or another is  
11 our target for LAX, it's just an objective. It's not a  
12 thing that could be held accountable.

13 As we've seen, obviously, on the 11th the idea  
14 of expanding LAX has sort of gone away temporarily, at  
15 least. And what we really need is a regional solution  
16 whereby we build up our infrastructure all over the  
17 region and we spread the risks of a problem. Right now  
18 LAX is a single-point failure potential. If LAX has  
19 major damage, even from an earthquake, we in Southern  
20 California will have a major problem.

21 The environmental impacts on this area from  
22 the airport is of grave concern. For the people in this  
23 area you should be concerned of the way in which noise  
24 is defined. They use the number 65. My neighborhood  
25 happens to be 63. We are subjected to a number of

1 airplane noise and we've had things fall off the walls,  
2 but we don't qualify for soundproofing. We have on the  
3 average of 40 to 50 events per hour at 50 DBs, and at  
4 least one every hour of the night and day at 70 DBs.  
5 That's a very loud vacuum cleaner.

6 What we've been told by the FAA in the  
7 roundtable discussions is that LAX will get as many  
8 flights as airplanes want to fly there. That means more  
9 flights over you folks as well, and you won't be counted  
10 as being impacted. Thank you.

11 MS. BAIN: Thank you. Kenneth Alpern. After  
12 Mr. Alpern, we'll have Noel Park.

13 MR. ALPERN: Good evening. My name is Kenneth  
14 Alpern. I'm part of a voluntary organization called  
15 Friends of the Green Line. I've been objected to  
16 expanding the Green Line in LAX. My address is 3222  
17 Military Avenue, Los Angeles, California. I also wear  
18 more than one hat. I'm a physician who treats mostly  
19 Medi-Cal transit-dependent individuals. So the  
20 infrastructure that was alluded to by the previous  
21 speaker is very, very important to me, especially  
22 because we're so many decades behind in creating an  
23 appropriate infrastructure for the size and complexity  
24 of Southern California.

25 First off, as envisioned by Mayor Riordan, the

1 LA Master Plan is pretty much going to be a thing of the  
2 past especially after 9/11. Secondly, we're entering a  
3 recession. That's no secret, especially here in  
4 Southern California. Thirdly, Mayor Hahn, now the MTA,  
5 are indeed committed to connecting the Green Line to LAX  
6 to both enhance LAX security and our local economy which  
7 relies a lot on LAX.

8 For getting to and from LAX is a nightmare,  
9 afternoon driving on the 405, South Bay or the west side  
10 or pretty much anywhere between Long Beach and the  
11 valley, and a large part because of LAX. And the last  
12 of my first initial point is that we have two competing  
13 extremes. We have many within the LAWA that want to  
14 extend without really considering the impact on the  
15 neighbors and also neighbors who are so against  
16 expansion that they are unwilling to improve or update  
17 LAX for the future. My main point is to have LAWA and  
18 Californians to work together. To go correct the  
19 inadequacies by more security and efficiency for LAX.

20 Certainly expedition of linking LAX to the  
21 Green Line, we need to be helped by federal  
22 representatives, representatives and senators giving us  
23 the moneys to do this. This requires millions of  
24 dollars, if not billions. Furthermore, let's consider  
25 giving LAWA a great partnership in operating just the

1 parking lots, Norwalk, South Bay, so that they can  
2 comment and, therefore, put into the Green Line so they  
3 can be a positive cooperating partner to building a  
4 Green Line that will help Southern California and  
5 enhance LAX.

6 And I wanted to thank you very much for your  
7 time. Have a good evening.

8 MS. BAIN: Thank you.

9 MR. PARK: My name is Noel Park. I live at 3233  
10 South Walker Avenue in San Pedro. I'm the president of  
11 the San Pedro Peninsula Homeowners Coalition which  
12 represents 14 resident associations.

13 San Pedro -- some three years ago we got  
14 response from increasing noise issues in our community,  
15 especially Southern San Pedro and Palos Verdes, of  
16 aircraft noise. It's no coincidence that the highest  
17 noise levels in the 1999 Peninsula Noise Study was South  
18 Shores. We joined RSAC, which is the Alliance for  
19 Regional Solution to Airport Congestion, mainly  
20 consisting of people from Westchester to Playa Del Rey  
21 and surrounding areas. And I'm a member of the board of  
22 RSAC and, as such, Mayor Gordon of El Segundo and  
23 various other people. I just want to say, we stand here  
24 in total solidarity with RSAC, with El Segundo and all  
25 other 65 governmental entities that are assigned on to

1 their proposed regional plan of air travel expansion.

2 We submitted a written comment on this plan,  
3 as it's displayed in the lobby. I don't think I need to  
4 belabor any of that. We feel that the only alternative  
5 there acceptable is the no-project alternative. I have  
6 a document here I want to share with you. I'll leave it  
7 with the court reporter. It's called "As Inland Empire  
8 Grows, Freeway Commute Slows" from the Tuesday, October  
9 30 Los Angeles Times, which is about excruciating length  
10 of congestion on the 91, 60 and 10 Freeways as people  
11 try to head back to the evergrowing Inland Empire. I  
12 think that's just indicative. The same type of thing is  
13 going on in Santa Clarita, Valencia. Now, they are  
14 going to do a huge housing development on the Cajon  
15 Ranch. For all those people expected to drive to LAX to  
16 go on air travel, we don't think that's acceptable, the  
17 freeways, some of you on the 405, it just doesn't make  
18 any sense to us.

19 I want to say, I want to quote to you just  
20 from this Sunday, October 28th Los Angeles Times article  
21 entitled "Focus Shifts Hearings on LAX Expansion Plan."  
22 Does that mean that the public is being asked other  
23 suggestions at six public hearings beginning Tuesday,  
24 and doesn't have a single picture, map or sketch or  
25 basic description of the mayor's concept. We don't know

1 what to say about this new concept. It's hard for us to  
2 understand how the whole thing could be reconfigured and  
3 taken forward under this whole Master Plan with the old  
4 Environmental Impact Report still in compliance with the  
5 California Environmental Quality Act.

6 As far as the 78 map cap, if that could be  
7 somehow guaranteed, we could look at that. We've seen  
8 the airport grow from 40 of the existing Master Plan to  
9 68 (timer beeping over his words.) We're afraid it's  
10 going to happen again. Thank you.

11 MS. BAIN: Thank you. If I could have Daniel  
12 Shriver.

13 MR. SHRIVER: Hello. My name is Daniel Shriver. I  
14 live at 4741 Ben Avenue, Valley Village, California.  
15 I'm here representing Ateimi-Ryu JuJitsu. It is a  
16 close-range combat style of martial arts. It could be  
17 highly effective and appropriate to train flight crews.  
18 This is the same martial art that is being taught to  
19 special forces in Fort Bragg and it uses pressure points  
20 and joint locks.

21 The reason I'm here telling you this is has  
22 nothing to do with airport expansion. Everyone has been  
23 affected by 9/11. I've lost a friend in the World Trade  
24 Center. He had enough time to make some phone calls and  
25 tell his family that he loves them and his last words

1 was "It doesn't look good." His name is Joe. He used  
2 to live here . He's not with us anymore. He was a  
3 fighter, and we're fighters. We're going to pick up the  
4 fight where he left off for him and 6,000 other people.  
5 My mission, I'm spearheading a movement to raise  
6 awareness that this is a highly effective martial art.  
7 What we're going to do, we have people from our school  
8 that are going to be doing a small demonstration to show  
9 you people how effective it is.

10 We have flight attendants out there on the  
11 front lines. We need to give them the tools and  
12 training and be innovative how we approach the  
13 situations. My friend, the president of the Flight  
14 Attendants Association, testified when asked about  
15 introducing guns to the cabins, she had security experts  
16 across the country to come up with some ideas. There is  
17 a green laser light someone came up with. You could go  
18 blind, maybe. There are Tasers, two darts firing gun.  
19 They are attached, what happens if you miss? What  
20 happens if there are two pairs, two attackers? What if  
21 there's a crazy man with fear, breaks into the cabin and  
22 pulls off -- tries to pull off the co-pilot. Do you  
23 kill him? This is appropriate for the drunken executive  
24 who is trying to make a jerk of himself or the deadly  
25 terrorist. This is effective, a submission technique

1 that you don't have to worry about, are there eight  
2 brave, strong people in the cabin? One flight attendant  
3 of any size could take care of multiple attackers. It  
4 does not take size or strength. It takes skill and  
5 knowledge.

6 You've heard the expression, knowledge is  
7 power. It has never been more clear with Atemi-Ryu  
8 JuJitsu, which means a strike to the body's weak spot or  
9 pressure points. Jujitsu means "gentle art." We're not  
10 trying to sell you on the idea of getting a kickboxer in  
11 there and having them do high kicks and do something  
12 they can't do. This is something within your ability  
13 and something you should consider and debate and  
14 discuss, this highly effective skill. Mr. Ritchie, is  
15 this a good time to do the demonstration?

16 MR. RITCHIE: Yes. You might want to take advantage  
17 of the stage.

18 MR. SHRIVER: All right this is Vince Cecere who is  
19 a Sinsei. He is a third-degree black belt in Sanuces  
20 Ryu and second-degree in Jujitsu. The skills you are  
21 about to see are literally state of the art. There are  
22 very few people that could even teach this. There were  
23 725 different styles of Jujitsu. This is a gentle,  
24 appropriate one.

25 (Demonstration took place on the stage.)

1 MS. BAIN: Thank you. At this time I would like to  
2 remind anyone in the audience that wishes to comment to  
3 please fill out one of these yellow comment cards so  
4 that we can hear your comments here. If you do not wish  
5 to comment, do not forget that we do have written  
6 comment forms that you may use, and they are recorded  
7 just the same. They carry the same weight, if you want  
8 to write your comments down. We'll take a short break  
9 right now.

10 (Recess was taken.)

11 MS. BAIN: Just to reiterate some of the logistics.  
12 We have a timer. You have three minutes to make your  
13 comments as the time allows. When you have one more  
14 minute remaining, a yellow light will blink. When your  
15 time expires, you will hear a beep tone. If have you  
16 not had a chance to fill out a card and would like to  
17 make a public comment orally, please write out a card  
18 and give it to us. You can make your comment. If you  
19 do not want to make an oral comment, please fill out one  
20 of the forms and make your comment. It will be recorded  
21 just the same. I think we will begin now with Mr. Tom  
22 Politeo. And, Mr. Politeo, if you could state your name  
23 for the record and address, if you don't mind. Once you  
24 state your name and address for the record, we will  
25 start your time.

1 MR. POLITEO: Hi. My name is Tom Politeo. I live  
2 in San Pedro. My mailing address is P.O. Box 1256,  
3 San Pedro, 90733. I would like to start out by thanking  
4 Don Knabe for his leadership in supporting solutions for  
5 air travel in Southern California. In almost every  
6 corner in Southern California we are facing a  
7 transportation crunch. To ensure cities are attractive  
8 to live in and our region is prosperous, to ensure that  
9 we aren't wasting our lives stuck in traffic and in long  
10 lines at the airports, we need to explore a  
11 comprehensive transportation solution.

12 With new technology knocking on the door and  
13 especially after the tragedy of September 11, we need to  
14 look under every planning rock, security, convenience,  
15 diversity, competition, economics, technology,  
16 restructure management, redistricting, power-sharing  
17 livable communities and the environment so that we find  
18 good answers that work locally and regionally.

19 I think we should scrap our current plans for  
20 LAX and take a deep breath. So I'm supporting a no-plan  
21 option, but start planning anew. We need time after  
22 September 11th to develop perspective on important  
23 issues so we can act with enough understanding to avoid  
24 overreaction or missing points that might not yet be  
25 obvious.

1           We should look at diversity and good  
2 distribution, key planning points. For the sake of  
3 security, both against natural disasters and terrorist  
4 threats, it makes sense to distribute air travel use  
5 fairly, evenly throughout Southern California. If we do  
6 this, travelers may find airports conveniently close to  
7 home or work. On the other hand, the economies of scale  
8 for airlines may suggest greater service consolidation.  
9 Some airport neighborhoods may welcome expanded travel  
10 and others may reject it. We need to explore these  
11 issues to find optimal answers.

12           As part of travel needs, we should explore a  
13 high-speed rail network that links San Diego,  
14 Los Angeles, Las Vegas, San Fransisco and Sacramento.  
15 This could provide convenience and security. We cannot  
16 study our airports in a vacuum that does not consider  
17 this option.

18           Our planning should also be comprehensive. We  
19 should consider all of our seaports as part of  
20 transportation network that could serve Southern  
21 California. Business passengers, vacationers, tourists  
22 and cargo should move easily between these facilities  
23 and major destinations.

24           We should look at an automated electric-rail  
25 between moving cargo, between our air and seaports and

1 key industrial locations. Such a system could speed up  
2 cargo transit, improve security, help government  
3 inspections, improve street traffic and help clean up  
4 our air. It could be a vital cog in a powerful Southern  
5 California economic engine.

6 Exploring such an option will also have an  
7 impact on how we plan individual ports. We must  
8 modernize our plans. The city of Los Angeles is too  
9 small to be inclusive enough to be a good regional  
10 planning authority, and it is too large and  
11 geographically disjointed to serve the local needs  
12 properly. The City of Los Angeles is not a good  
13 authority to maintain such regionally-important  
14 facilities. Can I have a few seconds to go over,  
15 please? Thank you.

16 The City should transfer its land and seaports  
17 to the County. The County should run them as part of a  
18 regional network system in a framework with other  
19 Southern California counties. Each individual facility  
20 should be administered by a joint powers authority which  
21 the County is one partner and local neighborhoods near  
22 the facility are another.

23 The quality of our lives, our prosperity and  
24 the environment depend on what we do here. Let's take  
25 the time and develop the leadership and vision to move

1 us wisely into a future that will serve us well. I  
2 think a lot of good work has been done planning  
3 proposals for the airport. Thank you.

4 (The statement submitted for the  
5 record was marked as Statement 3.)

6 MS. BAIN: Thank you. Again, if you have some  
7 comments that you would like to make orally, these cards  
8 are available at the sign-in desk. Please fill out the  
9 card and we will call your name. We are here for the  
10 duration until 9:00 p.m., and we will stay here as long  
11 as we have cards to keep coming. With that, any  
12 comments from Mr. Kessler, Ritchie? We're going to take  
13 another break.

14 MR. SCHNEIDER: (Raised hand.)

15 I'm Denny Schneider. Again, I would like to  
16 take a couple more seconds to add a few more comments.  
17 One of the suggestions and concerns that we have is  
18 low-frequency noise around the airport. When you're  
19 considering all of your security issues, one of the  
20 things that we definitely want to see, according to the  
21 experts on noise transmission, is a sound -- is a berm  
22 of land that's about eight feet thick and probably at  
23 least 10 to 15 feet high. You could use it as a  
24 security wall, and it will protect the local  
25 neighborhoods from the low frequency noise that goes

1 right through buildings and travels for many, many miles  
2 and keeps many of us up at night.

3 In addition to that, this one is just specific  
4 about the EIR itself, and that is that there are a lot  
5 of mistakes in the EIR that needs to be addressed such  
6 as the one that defines how many people are impacted.  
7 The EIR states that about 40,000 people are impacted.  
8 When the airport and FAA came out and spoke to my  
9 community about a year and a half ago or two years ago  
10 now, they indicated in a view graph it was 87,000. We  
11 also took a census. We took the census charts and  
12 overlaid it with the charts that the airport puts out on  
13 a quarterly basis, and it also was in the 80- to  
14 90,000-people range. So there's a lot of questionable  
15 pieces of data.

16 In terms of the FAA, I would just encourage  
17 you to look at the flight paths and to try to tighten  
18 them up a little bit and, specifically, to go back and  
19 ask for the ability to limit the number of flights  
20 coming to any one airport. This area on this side of  
21 the airport, our area, are all going to be inundated  
22 when the economy picks up again. And because of the way  
23 the noise is calculated, it just isn't going to help.

24 We're told, for instance, by the FAA folks  
25 that the flights coming in along the Santa Monica

1 Freeway from the west to the east get in line and go  
2 around Monterey Park to get in line to land. Our  
3 eyesight is improving dramatically because we can now  
4 see those planes from Westchester going from the west to  
5 the east. At night the stars move in our sky in all  
6 directions. We call it the Hollywood effect. We're  
7 promoting it to promote tourism. Thank you.

8 MS. BAIN: Thank you. Jerry Gaines, can you please  
9 state your name and address for the record, and then  
10 I'll start the time. Thank you.

11 MR. GAINES: My name is Jerry Gaines. I'm at 2101  
12 West 37th Street, San Pedro in Los Angeles. Just a  
13 couple of brief comments. My many years of living in  
14 this area, I've been involved in a lot of landuse issues  
15 both as a taskforce chair for three council people -- I  
16 served on the charter commission -- and I'm also  
17 currently planning commissioner on the Harbor Planning  
18 Commission. So I have some city rep, but I also bring  
19 to you my wisdom, for whatever it's worth, in terms of  
20 the Harbor area as perceptions go.

21 You heard earlier about many of the homeowner  
22 groups being concerned about the impacts of any changes  
23 at LAX. I would also point out that we have a lot of  
24 experience with the other big industrial proprietorship  
25 organization called the Harbor at the World Port. Just

1 recently through Mayor Hahn's efforts and others, we  
2 adopted a standing committee in the Harbor Commission to  
3 put together about 30 stakeholders from a variety of  
4 different entities in areas here in the region and try  
5 to address the various kind of environmental issues of  
6 an industrial operation of the LAX complex itself. It's  
7 a new process. It's one that we look optimistic to  
8 because of the fact that all lines of communication are  
9 critical as you go through the pressures of economic  
10 growth, the entities these organizations represent, and  
11 the like.

12 I also, obviously, address as a citizen what  
13 I'm sure the draft process of any new plans that are  
14 trying to, transportation and egress. Security issues  
15 are obviously on everybody's minds now. The regional  
16 focus is critical. I know SCAG worked on this for  
17 years. It's difficult when you have multiple government  
18 and jurisdictions and groups that try to mitigate and  
19 get everybody to come together. But I think Supervisor  
20 Knabe is doing his best. I commend him for that.

21 As one person living in the Harbor area, I go  
22 back to this very room we're in when we first came here  
23 25, 30 years ago you were talking about an off-shore  
24 airport. That was a very strong meeting in this room  
25 that we're standing in -- about people's feelings about

1 an off-shore airport. You could see that airport issue  
2 has been going for many, many years as how you could do  
3 it, where you would put it, how you make it bigger. I  
4 just urge you to think about some of these suggestions,  
5 particularly the process of getting all of people's  
6 stakeholders involved. Thank you very much.

7 MS. BAIN: Thank you. Again, we have the yellow  
8 cards at the sign-in desk. If you wish to make a  
9 comment, please fill out the card and it will be given  
10 to us. We will call your name. If there are no  
11 comments right now, we will take a break. And we'll  
12 reconvene in ten minutes. Thank you.

13 (Recess was taken.)

14 MS. BAIN: We are reconvening at this moment. We  
15 have public comment that is in hand from Mr. Daniel  
16 Walker. Mr. Walker, can you please state your name and  
17 address for the record.

18 MR. WALKER: Sure. My name is Daniel Walker, 7416  
19 West 82nd Street.

20 MS. BAIN: Thank you.

21 MR. WALKER: Thanks for sticking around. I know I'm  
22 a little bit late. I represent a group called Friends  
23 of Green Line. We're mostly the West Los Angeles  
24 residents, and we would like to see the Green Line  
25 extend into LAX. That's the main reason why I came here

1 to talk to people, people of San Pedro, and also the  
2 staff here. I brought a little handout which kind of  
3 describes our group. We're volunteers, local residents.  
4 We use mass transit. We wanted to talk about the Green  
5 Line and also possibly extending mass transit to other  
6 areas of Los Angeles like the San Pedro area. The MTA  
7 owns the Harbor subdivision railroad tracks that run  
8 from San Pedro right to LAX and it runs further north  
9 from Inglewood and to Union Station. A lot of us  
10 residents of that area don't really want to see an  
11 expansion of LAX, but would like to see less cars and  
12 less pollution. So I think there's been some steps  
13 taken recently toward that end.

14 Just last week the MTA approved a study to  
15 extend the Green Line out from Norwalk to the Norwalk  
16 transportation center of Santa Fe Springs. Here's the  
17 EIR that they did a few years ago. They are going to  
18 revisit this. We would like them, also, to take a look  
19 at extending the Green Line to LAX, not necessarily to  
20 the Master Plan location on the western terminal, that  
21 implies there's going to be a larger expansion, but up  
22 the Harbor subdivision train tracks, perhaps up to  
23 Century, people would move there and go into LAX, take a  
24 lot of traffic off the street and reduce pollution and  
25 noise.

1           So we're a volunteer group. None of us are  
2 paid. We're users of mass transit. In fact, this  
3 Sunday we're going take a bike ride of the route at  
4 11:00 o'clock for everybody that wants to come and join  
5 us. We think this should be studied, at least looked  
6 at.

7           In fact, today we went and looked at the  
8 railroad tracks as they go past the runway just to get a  
9 look to see if there would be any concerns there. We  
10 studied them. We are going to submit some comment about  
11 that. There certainly are some issues that need to be  
12 looked at in terms of runway safety. This should be  
13 done in the most safest possible way. We think it's  
14 feasible. The railroad tracks run right next to the  
15 Aviation Boulevard, right next to the airport, so it  
16 should be a feasible project. And we want to work with  
17 the airport, work with other local residents that I  
18 recognize here, to make it happen, not for an expanded  
19 airport necessarily, but to alleviate traffic in the  
20 area. We think it could be done. Thank you very much.

21           MS. BAIN: Thank you. Again, if there is anyone  
22 that would like to fill out one of these yellow comment  
23 forms, it is 9:00 p.m. now. We would like to give you  
24 an opportunity to make any comments that you have.  
25 We'll wait a few moments and see if anyone turns in a

1 card. Thank you.

2 MR. KESSLER: Is there anyone else that has not had  
3 an opportunity to speak concerning the information about  
4 the Draft EIS/EIR? Not seeing anyone else, I will  
5 remind everyone, if you feel you are unable to provide  
6 us with verbal comments today, we will be accepting  
7 written comments until 5:00 p.m. Pacific Standard Time,  
8 Friday, November 9th, 2001. You can mail your comments  
9 either to me at the FAA or to Jim Ritchie with the City  
10 of Los Angeles. Mailing addresses are listed on the  
11 cover of the EIS/EIR. I want to thank everyone for your  
12 comments today. This public hearing for the Draft  
13 EIS/EIR for the Los Angeles Airport is now concluded.

14 (Whereupon the proceeding adjourned

15 at 9:00 o'clock p.m.)

**U.S. DEPARTMENT OF TRANSPORTATION  
Federal Aviation Administration**

**Los Angeles International Airport  
Los Angeles, California**

**Draft Environmental Impact Statement/Environmental Impact Report  
Public Hearing Remarks**

**Thursday, November 1, 2001**

**Peck Park Auditorium  
San Pedro**

**David B. Kessler  
Environmental Protection Specialist**

Good evening ladies and gentlemen, my name is David Kessler; I'm an Airport Planner from the Federal Aviation Administration, Western-Pacific Region. I would like to welcome you to the 5<sup>th</sup> of a total of nine Public Hearings the FAA and the city of Los Angeles are conducting for the Draft Environmental Impact Statement/ Environmental Impact Report or EIS/EIR for the proposed master plan at Los Angeles International Airport. The first three public hearings on this topic were held on Saturday, June 9<sup>th</sup> in Inglewood, Manhattan Beach, and Westchester. The fourth was held this past Tuesday in Monterey Park. Today's hearing is the second of six additional hearings being held this week and next week. These hearings were originally scheduled for early September; however, they were postponed due to the terrorist attacks in New York and Washington, D.C. The next hearing will be held on Saturday, November 3<sup>rd</sup> at Los Angeles High School located at 4650 West Olympic Boulevard in the Mid-Wilshire District of the city of Los Angeles.

The purpose of these hearings is to collect comments from the general public concerning the adequacy of the information disclosed in the Draft EIS/EIR. The FAA and the City of Los Angeles along with the Federal Highway Administration as a cooperating agency have prepared the Draft EIS/EIR.

I would like to take this opportunity to make sure that everyone understands that **NO** decisions will be made today regarding the proposed project. Today's hearing is **not** a question and answer type of forum. Our job is to listen to what you have to say about

the adequacy of the information in the Draft EIS/EIR. In other words, it's your turn to talk to us. Since we are here to listen, we are not going to respond to questions about the pros and cons of the proposed project. Since 5 o'clock this afternoon, the city has held a public workshop just outside of this room for anyone to ask questions about the master plan, the environmental process and the various proposed projects.

Following publication of the Draft EIS/EIR for comment, the next step in the joint federal and state environmental disclosure process is holding this and the other public hearings during this week and next week. The environmental disclosure process for this project began in 1997 with the publication of a Notice of Intent to prepare the joint EIS/EIR in the *Federal Register*. In July of 1997, we held a series of meetings with members of the public and governmental agencies to receive comments on the scope of the Draft EIS/EIR. Following those meetings, the Draft EIS/EIR was prepared considering the comments received during the scoping meetings and those submitted in response to the Notice of Intent. The document has also been prepared pursuant to the National Environmental Policy Act of 1969 or "NEPA", the Council on Environmental Quality Regulations, which are the implementing regulations for NEPA, the California Environmental Quality Act of 1970 or "CEQA", and the Airport and Airway Improvement Act of 1982, as amended.

Following today's hearings and the close of the comment period, we will then correct, and revise the EIS/EIR as necessary based on the comments received. We will also prepare responses to the comments we receive and include those responses in the **Final EIS/EIR**.

Before we begin receiving verbal comments, we would like to let you know the ground rules of this hearing. First, as I said earlier, we are not here to respond to questions about this project. We are only here to listen to your comments and take notes. We also have a court reporter present to ensure that we have an accurate transcript of this hearing.

For anyone who would like to speak, we ask you to fill out a speaker card, **like this one** and give it to the person at the sign in desk. That person will bring the speaker cards

up to our facilitator who will call the names of each speaker so we can proceed in an orderly fashion. So that everyone gets an opportunity to provide verbal comments, everyone will get three minutes to speak. To be fair to everyone, we are not going to allow people to transfer their allotted time to someone else. I ask that when you speak, you give us your name and address for the record. We also have a Spanish language translator for anyone wishing to provide comments in Spanish.

If there is anyone who uncomfortable speaking in front of a group or if you need more than three minutes to provide your comments, we ask that you provide your comments in writing. We have comment sheets, **like this one**, available for your use at the sign-in desk. You can leave your comments at the sign in desk, or you can mail your written comments using the comment sheet or a letter to either address listed on the cover of the EIS/EIR. The city's address is listed at the top of the comment sheet. I would like you to understand that a verbal comment is just as important as a written comment. So please feel free to provide any comments on the document you may have to us either verbally today, or in writing. Comments are due by **5:00 p.m., Pacific Standard Time, on Friday, November 9, 2001.**

Lastly I would like everyone to know that even though we have this hearing scheduled until 9 o'clock this evening, we will stay here as long as necessary for everyone to get a chance to provide verbal comments on the Draft EIS/EIR. As I said earlier, our job here today is to listen to your comments.

Now, I will return the Hearing back to our facilitator, **Shauna Bain**, to introduce Mr. Ritchie who will provide some introductory comments from the city of Los Angeles. Following Mr. Ritchie's comments, we will collect the speaker cards and call the name of the first speaker.

Thank you.

Is there any one else who has not had an opportunity to speak concerning the information in the Draft EIR/EIS? **[wait for anyone to speak up]** Not seeing anyone else, I will remind everyone that if you feel that you are unable to provide us with verbal comments, today, we will be accepting written comments until 5:00 p.m. Pacific Standard Time, Friday, November 9, 2001. You can mail your comments either to me at the FAA or to Jim Ritchie with the City of Los Angeles. The mailing addresses are listed on the cover of the EIS/EIR. I want to thank everyone for your comments today, this public hearing for the Draft EIR/EIS at Los Angeles International Airport is now concluded.

I am Mike Salk, District Deputy to Councilmember Ruth Galanter who chairs the Committee on Commerce, Energy, and Natural Resources, which oversees the airport.

Thank you very much for being here today. In light of the events of September 11<sup>th</sup>, the entire LAX master plan is most likely obsolete. The assaults on the World Trade Center and the Pentagon have demonstrated that airports must operate differently or they may not be able to operate at all.

Even before September 11<sup>th</sup>, trends within the airline industry have been unclear. While the LAWA proposed master plan includes in all its alternatives runways to accommodate planes carrying 600 passengers or more, airlines have in fact been flying (and buying) more 757's and 767's. Certainly, demand has fallen off the charts and the demand forecasts that the entire master plan is based on are no longer useful. In fact, the EIR is so flawed in its conception and current relevance, that the environmental assessment is inherently flawed as well.

I am concerned that we are now being asked to comment on a fifth alternative that is conceptual at best, with no opportunities to inspect any analysis on its impacts on the surrounding communities, businesses and residents.

I am concerned that as long as this EIR process is on the table, the door is still open for incremental expansion later in this decade.

Finally, I am concerned that nowhere in the existing master plan document or in the proposed fifth alternative is there an overarching plan to address projected aviation demand in the Southern California region using LAWA's other airports -Ontario and Palmdale.

I urge you to reject this planning process and begin anew with a true regional plan assessed with a new environmental document that adequately addresses impacts on a regional basis.

November 1, 2001

I'd like to thank Supervisor Don Knabe for his leadership in exploring a regional solution for air travel in Southern California.

In the air and on the streets, in almost every corner of Southern California, we are facing a transportation crunch. To ensure that our cities are attractive to live in and our region is prosperous, to ensure that we aren't wasting our lives stuck in traffic and in long lines at the airports, we need to explore a comprehensive transportation solution.

With new technologies knocking on our door, and especially after the tragedy of September 11th, we need to look under every planning rock: security, convenience, diversity, competition, economics, technology, restructured management, redistricting, power-sharing, livable communities and the environment so that we find good answers that work locally and regionally.

We should scrap our current plans for LAX and take a deep breath. We need time after September 11th to develop perspective on important issues, so we can act with enough understanding to avoid overreaction or missing points that might not yet be obvious.

Hasty action may commit us to spending that doesn't pay off. Mayor Hahn has proposed facial-recognition systems be used at LAX. We should take time to explore major projects like this. England has been using such systems for years now, and not one terrorist has been caught. Two reasons are given. First, the systems are easily fooled by changing hair, dress and makeup. Second, the identity of most terrorists aren't known until after they commit a terrorist act.

We should look at diversity and good distribution as key planning points. For the sake of security, both against natural disasters and terrorist strikes, it makes sense to distribute our air travel use fairly evenly throughout Southern California. If we do this, travelers may find airports conveniently close to home or work. On the other hand, economies of scale for airlines may suggest greater service consolidation. Some airport neighborhoods may welcome expanded travel and others may reject it. We need to explore these issues to find optimal answers.

As part of our travel needs, we should explore a high-speed rail network that links San Diego, Los Angeles, Las Vegas, San Francisco and Sacramento. This could provide more diversity than air transit alone, and hence more convenience and security. We cannot study our airports in a vacuum that does not consider this option.

Our planning should also be comprehensive. We should consider all of our air and sea ports as part of a transportation network that serves Southern California. Business passengers, vacationers, tourists and cargo should move easily between these facilities and major destinations.

We should look at an automated, electric-rail system for moving cargo between our air and sea ports and key industrial locations. Such a system could speed up cargo transit, improve security, help government inspections, improve street traffic and help clean up our air. It could be a vital cog in a powerful Southern California economic engine. Exploring such an option will also impact how we

plan individual ports.

We must also modernize planning authority over our ports. The City of Los Angeles is too small to be inclusive enough to be a good regional planning authority. And, it is too large and geographically disjointed to serve local need properly. The City of Los Angeles is not a good authority to manage such regionally-important facilities.

The City should transfer its land and sea ports to the County. The County should run them as part of a regional system in a framework with other Southern California counties. Each individual facility should be administered by a joint powers authority in which the County is one partner and local neighborhoods near the facility are another.

The quality of our lives, our prosperity and the environment depend on what we do here. Let's take the time and develop the leadership and vision to move us wisely into a future that will serve us well.

3 ---oOo---

4  
5 MR. KESSLER: Good morning, ladies and gentlemen.  
6 My name is David Kessler. I'm an Airport Planner from  
7 the Federal Aviation Administration, Western-Pacific  
8 Region. I would like to welcome you to the sixth of a  
9 total of nine public hearings the FAA and the City of  
10 Los Angeles are conducting for the Draft Environmental  
11 Impact Statement, Environmental Impact Report or EIS/EIR  
12 for the proposed Master Plan at Los Angeles  
13 International Airport.

14 The first three public hearings on this topic  
15 were held on Saturday, June 9th in Inglewood, Manhattan  
16 Beach and Westchester. The fourth and fifth were held  
17 this past week in Monterey Park and San Pedro. Today's  
18 hearing is the third of six additional hearings being  
19 held this week and next week. These hearings were  
20 originally scheduled for early September, however, they  
21 were postponed due to terrorist attacks in New York and  
22 Washington, D.C. The next hearing will be held on  
23 Monday evening, November 5th at Palmdale Regional  
24 Airport in Palmdale.

25 The purpose of these hearings is to collect

1 comments from the general public concerning the adequacy  
2 and the information disclosed in the Draft EIS/EIR. The  
3 FAA and the City of Los Angeles along with the Federal  
4 Highway Administration, as a cooperating agency, have  
5 prepared the Draft EIS/EIR.

6 I would like to take this opportunity to make  
7 sure that everyone understands that no decisions will be  
8 made today regarding the proposed project. Today's  
9 hearing is not a question-and-answer type of forum. Our  
10 job is to listen to what you have to say about the  
11 adequacy of the information in the Draft EIS/EIR. In  
12 other words, it is your turn to talk to us. Since we  
13 are here to listen, we are not going to respond to  
14 questions about the pros and cons of the proposed  
15 project. Since 9:00 o'clock this morning, the City has  
16 held a public workshop just outside of this room for  
17 anyone to ask questions about the Master Plan, the  
18 environmental process and the various proposed projects.

19 Following publication of the Draft EIS/EIR for  
20 comment, the next step in the joint federal and state  
21 environmental disclosure process is holding this and  
22 other public hearings during this week and next week.  
23 The environmental disclosure process for this project  
24 started in 1997 with the publication of a Notice of  
25 Intent to prepare the joint EIS/EIR in the Federal

1 Register. In July of 1997 we held a series of meetings  
2 with members of the public and governmental agencies to  
3 receive comment on the scope of the Draft EIS/EIR.  
4 Following those meetings, the Draft EIS/EIR was prepared  
5 considering the comments received during the scoping  
6 meetings and those submitted in response to the Notice  
7 of Intent. The document has also been prepared pursuant  
8 to the National Environmental Policy Act of 1969 or  
9 NEPA, the Council on Environmental Quality Regulations,  
10 which are the implementing regulations for NEPA, the  
11 California Environmental Quality Act of 1970 or CEQA and  
12 the Airport Airway Improvement Act of 1982, as amended.

13 Following today's hearing and the close of the  
14 comment period, we will then correct and revise the  
15 EIS/EIR, as necessary, based on the comments received.  
16 We will also prepare responses to the comments we  
17 receive and include those responses in the final  
18 EIS/EIR.

19 Before we begin receiving verbal comments, we  
20 would like to let you know the ground rules of this  
21 hearing. First, as I said earlier, we are not here to  
22 respond to questions about this project. We are only  
23 here to listen to your comments and take notes. We also  
24 have a court reporter present to ensure we have an  
25 accurate transcript of this hearing.

1           For anyone who would like to speak, we will  
2 ask you to fill out a speaker card, like this one, and  
3 give it to the person at the sign-in desk. That person  
4 will bring the speaker cards up to our facilitator who  
5 will call the names of each speaker so we can proceed in  
6 an orderly fashion. So that everyone gets an  
7 opportunity to provide verbal comments, everyone will  
8 get three minutes to speak. To be fair to everyone, we  
9 are not going to allow people to transfer their allotted  
10 time to someone else. I ask that when you speak, give  
11 us your name and address for the record. We also have a  
12 Spanish language translator for anyone wishing to  
13 provide comments in Spanish.

14           If there is anyone who is uncomfortable  
15 speaking in front of a group or you need more than three  
16 minutes to provide your comments, we ask you provide  
17 your comments in writing. We have comment sheets, like  
18 this one, available for your use at the sign-in desk.  
19 You can leave your comments at the sign-in desk or you  
20 can mail your written comments using the comment sheet  
21 or a letter to either address listed on the cover of the  
22 EIS/EIR. The City's address is listed at the top of the  
23 comment sheet. I would like you to understand that a  
24 verbal comment is just as important as a written  
25 comment. So please feel free to provide any comments on

1 the document you may have to us either verbally today or  
2 in writing. Comments are due by 5:00 p.m. Pacific  
3 Standard Time on Friday, November 9, 2001.

4 Lastly, I would like everyone to know that  
5 even though we have this hearing scheduled until 1:00  
6 this afternoon, we will stay here as long as necessary  
7 for everyone to get a chance to provide verbal comments  
8 on the Draft EIS/EIR. As I said, our job today is to  
9 listen to your comments.

10 Now, I will turn the hearing back over to our  
11 facilitator, Shauna Bain, to introduce Mr. Ritchie who  
12 will provide some introductory comments from the City of  
13 Los Angeles. Following Mr. Ritchie's comments, we will  
14 collect the speaker cards and call the name of our first  
15 speaker. Thank you.

16 (The statement submitted for the  
17 record was marked as Statement 1.)

18 MS. BAIN: Thank you, Dave. Again, as David said, my  
19 name is Shauna Bain. I will be the facilitator today.  
20 But before I begin, I would like to introduce Jim  
21 Ritchie, the Deputy Executive Director of  
22 Los Angeles World Airports, and he has some introductory  
23 remarks for you.

24 MR. RITCHIE: Good morning. Thank you for joining  
25 us. I'm glad to see some of our community friends in

1 the audience, Roy, Denny, Cecil. More importantly, I'm  
2 glad to see a Trojan sweatshirt out there. We have a  
3 big game at the Colosseum on 12-30. So we'll have to  
4 monitor that closely.

5 By way of introduction, I am Jim Ritchie.  
6 Shauna introduced me and, again, welcome and thank you  
7 for joining us this morning. We have received guidance  
8 from our mayor, Jim Hahn, to expand the opportunities  
9 for public input into the LAX Master Plan process. And  
10 today we will receive your comments.

11 More recently the mayor identified a number of  
12 objectives to be incorporated into another alternative  
13 for the future planning of LAX. On November the 9th of  
14 next Friday the public comment period will close. After  
15 the close of the public comment period, we will  
16 incorporate the mayor's guidance along with comments  
17 received from sessions like this into the development of  
18 a new alternative. This alternative will undergo a  
19 rigorous environmental analysis, as did the other  
20 alternatives, and a supplemental environmental document  
21 will be distributed for public review and comment. Very  
22 likely the development of this new alternative will  
23 necessitate another public hearing to comment on this  
24 new alternative as we finalize the environmental  
25 process.

1           Before I turn this session over to you, I  
2 would like to thank all those folks you see out there  
3 wearing a Staff button, Phil our audio man. The lady  
4 out front has provided us refreshments so we can make  
5 this an enjoyable morning session. With that, I turn it  
6 over to Shauna, and the morning is yours.

7           MS. BAIN: Thank you. As Dave already told you, my  
8 name is Shauna Bain. I'll be your facilitator today.  
9 My only purpose here is to ensure all of you have an  
10 opportunity to make your comments in a timely fashion.  
11 If you have one of these yellow cards, please fill it  
12 out, turn it into the sign-in desk. I will receive it,  
13 and we will call your name.

14           When we call your name, we would like you to  
15 come up to the microphone, speak as clearly and loudly  
16 and slowly as possible for the court reporter to get  
17 your full name and address. I will start the time after  
18 you have given your name and address to the court  
19 reporter, and you will have three minutes. When you  
20 have a minute of time left, if you look at this clock  
21 here, which will count down your time for you, you will  
22 see a yellow light flash. Then you can start wrapping  
23 up. When your time is expired, you'll hear a beep tone.  
24 And at that time if you still feel like you have further  
25 comments to make and you didn't have sufficient time to

1 do so, you're welcome to fill out another yellow card.  
2 And as soon as we are finished with the first round of  
3 everyone having had an opportunity to speak at least  
4 once, we will call your name again.

5 And without any further ado, I will call the  
6 first few names in the order that we received them so  
7 you can prepare for the next speaker. Tessie Crowder,  
8 Roy Heffner and Dana Gabbard. Ms. Crowder.

9 MS. CROWDER: My name is Tessie Crowder. I live at  
10 9622 7th Avenue, Inglewood, 90305. I would like them to  
11 hold the expansion just like it is as the airport was  
12 built for 40 million passengers a year. We're now up to  
13 68. They want to expand to 79. This will mean  
14 extending runways, and that will put a whole lot of  
15 people out of their homes, plus the noise will be very  
16 bad. It's already bad. It would be worse. And the  
17 traffic will be bad. The pollution will increase more  
18 so than what it is now. And that's why I would like  
19 them to hold to the regular plan like it is. Thank you.

20 MS. BAIN: Thank you. Mr. Heffner.

21 MR. HEFFNER: Hi. I'm Roy Heffner at 6548 West 80th  
22 Place, Westchester, California 90045. I am a member of  
23 the LAX Area Advisory Committee. In fact, at the  
24 present I'm the chair of that committee. We have  
25 submitted a long list of written comments comprised of

1 about 44 pages; however, I felt incumbent upon me to  
2 represent my committee to come at least to one of these  
3 activities. And seeing as how L.A. High School, the  
4 bravest high school in the city of Los Angeles, was my  
5 alma mater, I could not avoid coming back here.

6 I want to congratulate David and Jim for going  
7 to all these meetings and sitting here with great  
8 patience listening to many of the same stories over and  
9 over, and I will not disappoint. There are certain  
10 questions that we are still very concerned about.

11 In all of the alternatives that you have at  
12 the present time -- and I assume in Mayor Hahn's one,  
13 that you're going to have listed some type of maximum  
14 capacity both in tons of cargo and in flight operations  
15 and in number of passengers. However, as has happened  
16 back with the 40 million annual passengers, when the  
17 City Council agreed, 40 million annual passengers, when  
18 the Board of Airport Commissioners agreed to the number  
19 of annual passengers, when we reached that point, there  
20 was no cap. I want to know how you're going to cap  
21 these figures that you have in the Environmental Impact  
22 Report. I think there are 78.9. There is 89 something.  
23 There is 98 million. There is 4.2 million tons of  
24 cargo.

25 Mayor Hahn's last proposal, which is verbal

1 and not in written form -- we're very happy with the  
2 fact they are not going to have a Ring Road; that they  
3 are not going to have a west terminal; that they are  
4 going to not add anymore gates. But throughout the  
5 years we would like to see that, as you have indicated,  
6 will come about in very a firm fashion, in written  
7 capacity.

8           Going back to this particular EIR/EIS, I want  
9 to trace the world of history for the record. In 1986  
10 the 40 million annual passengers were surpassed. I  
11 believe it was around November of that year. In 1988 in  
12 February the Department of Airports submitted an EIR  
13 called 2000. That was supposed to take care of  
14 passengers up to the year 2000 and the expansion up to  
15 the year 2000. The City Council decided that they did  
16 not like that, and they wanted LAX to be part of the  
17 City. So it was submitted down to the City Planning  
18 Department around 1989. They held a couple of meetings,  
19 nothing to speak of any importance. And finally the  
20 airport said, "You're not doing anything. So we're  
21 going to take it back."

22           And back around 1994, 1995, the airport, once  
23 again, picked this up. They hired consultants and came  
24 up with four concepts. And at the time they were  
25 presented to the general public, there was comment made.

1 Since that time, though, two of those were reduced. My  
2 time has expired. If I could continue, I will. If I  
3 can't, I won't. Your choice.

4 MR. KESSLER: Come back after everyone else has  
5 spoken.

6 MS. BAIN: Thank you. Dana Gabbard.

7 MR. GABBARD: Good morning. My name is Dana  
8 Gabbard. I'm executive secretary of Southern California  
9 Transit Advocates. I currently reside at 2424 Wilshire  
10 Boulevard, Los Angeles. I'm going to try to speak a  
11 little slowly since I can see our court reporters are  
12 working diligently, but it makes their lives a little  
13 easier to not speak so fast, which is my habit.

14 Well, you know, it's very hard to know what to  
15 comment on because we're being handed material that  
16 we're being told is obsolete. And it's rather  
17 discouraging to hear that there may be additional  
18 hearings after this mysterious Fifth Alternative is  
19 formulated. That's just a sort of bureaucratic hedging  
20 that really discourages the public. I mean, you better  
21 be more forthcoming in saying "we're going to have  
22 meetings about the Fifth Alternative" because we have no  
23 ability to comment on it because there's nothing in  
24 writing. How can we comment on something that the mayor  
25 is sort of pulling out of his hip pocket and just sort

1 of blowing the breeze with? We're going to have to have  
2 meetings. You're going to have lawsuits over that,  
3 otherwise. I think you have to admit that.

4 We're concerned about the ground  
5 transportation component. The original plan, in my  
6 opinion, stunk. It served bureaucracies. They were  
7 going to hold the Green Line extension hostage to the  
8 dubious extra terminal they wanted to the west. I think  
9 it's incumbent now to relook at what we're going to do  
10 about connecting the Green Line. I think we need to  
11 understand what we'll need to do is get it close to the  
12 airport and have some sort of people mover arrangement  
13 because of various constraints on curvatures, et cetera.  
14 What we hope we can have is a regional transportation  
15 center that will be multi-mobile for the buses and  
16 trains that meet there and have the people mover serve  
17 that. That would be a logical thing to do, and it would  
18 actually probably be an improvement and hopefully will  
19 facilitate getting more people out of their cars when  
20 they are going to the airport.

21 I just hope maybe after the meeting I could  
22 ask Mr. Kessler a question or two just personally about  
23 one or two things I've heard about what's going on at  
24 the Department of Transportation with the meeting in  
25 Washington with Mr. Menetta and congressmen about a

1 month and a half ago. No big deal, but I'm just curious  
2 about what's going on there. We're watching the  
3 process.

4 I'll just conclude. It amazes me how clueless  
5 bureaucrats are. For three years the people around the  
6 airport were organizing and the bureaucrats basically  
7 seemed totally full of themselves. We are the ones who  
8 make the decisions, and the public is there after the  
9 fact. It's already proven we have a voice in these  
10 issues, and bureaucracy has now been shown they have to  
11 answer to the public concerns.

12 My only concern is that the logical  
13 alternative, El Toro, is now being held hostage by  
14 certain people down there. Without that alternative, I  
15 don't know what the hell we're going to do. Thank you.

16 MS. BAIN: Thank you. Denny Schneider, Judi  
17 Russell. Mr. Schneider, if you could excuse me for one  
18 moment. You can stay there. I just want to add, if any  
19 of you have any of your comments in a written form that  
20 you don't mind providing to the court reporters, that  
21 would help them with their transcribing as well. Okay.  
22 Mr. Schneider.

23 MR. SCHNEIDER: My name is Denny Schneider. I've  
24 spoken before more than a few times. In my capacity as  
25 the subcommittee chair for the LAX Community Roundtable,

1 Noise Community Roundtable and other capacities in the  
2 Westchester Playa del Rey neighborhood. We, obviously,  
3 have been concerned about expansion for years and years  
4 and the environmental noise and all the other traffic  
5 issues that are aligned with any of the expansion  
6 alternatives.

7 What I'm addressing, myself today, is to  
8 Alternative Five and, specifically, although we don't  
9 have anything in writing at this point, we are providing  
10 just simply suggestions of what we would like to see and  
11 hope to review at some point in the future at another  
12 hearing. Basically, I've mentioned that we could have  
13 some larger berms around with larger sound walls.

14 I applaud the mayor in his decision to remove  
15 the Ring Road in any of the west terminals. Also, we  
16 would like to -- as the gentleman before me said, it  
17 would be nice to have a multi-mobile transportation  
18 center someplace in the area locally. I brought some  
19 pictures of what they've done in Minneapolis for the  
20 record so you could take a look at what they've done. I  
21 think that would help considerably.

22 In addition to that, we would just like to  
23 thank you for your efforts in advanced because we are  
24 concerned about expansion and the regional solution.  
25 And we hope that what you write into your final comments

1 supports the regional solution and ties it in very  
2 effectively. That's what we're looking forward to.  
3 Thank you.

4 MS. BAIN: Thank you, Mr. Schneider. Judi Russell.  
5 Is Judi Russell available?

6 MS. RUSSELL: I have this in written form. I am  
7 going to read it. Then I'll give it to you afterwards,  
8 if you want. My name is Judi Russell. I live at 724  
9 Milwood Avenue in Venice, 90291. This is a letter that  
10 we wrote to Mayor Riordan when he was still around. It  
11 still applies as our response to this Master Plan.

12 "We are two artists who are lucky enough to  
13 own a house and a studio in Venice. We moved here in  
14 1993 because it was quiet, had good air and was close to  
15 the ocean, a good environment to create in. The coast  
16 of Southern California is one of the best places in the  
17 world to live. We are privileged and don't take it for  
18 granted. About three years ago, in August when we  
19 usually sleep with the windows open, all of a sudden  
20 during the whole night there was a constant roaring  
21 sound and vibration much like a continuous thunder. We  
22 found out after many calls that some Class-B airspace  
23 had been opened up over our area. We live about 20  
24 minutes north of LAX. And it often keeps us awake all  
25 night long. Closing the windows doesn't help enough and

1 sound proofing with dual-glazing is effective only if  
2 you don't open your windows and never spend time outside  
3 in your yard. But this is Southern California. And we  
4 do that. Now they've added a couple of flight patterns  
5 over our area during the day and a dreadful holding  
6 pattern at night. It's definitely been getting worse,  
7 and this is without the expansion.

8 We had always supported you as mayor until  
9 now. It is so hard to believe the compassionate  
10 conservative could not only allow but actually promote  
11 and support the expansion of LAX. It is going to have  
12 such an obviously negative impact on so many residents,  
13 not only the noise, but the traffic and pollution will  
14 be unbearable. Have you tried driving down Lincoln  
15 Boulevard lately? It's uncomfortably packed almost all  
16 the time, not to mention the effect on our property  
17 value. There must not be any flight patterns over your  
18 homes, Mayor Riordan, or you would never consider this  
19 project. We are miles away. Think of how it is for the  
20 residents that live closer.

21 We invite you to spend the days with us to get  
22 a real flavor of what it's like. We are unfortunately  
23 also under a flight pattern from  
24 Santa Monica Airport, but we are very aware of the  
25 differences between those flights and those of LAX.

1 They are at least not asking to double their size.

2 The major airports around the world are all  
3 outside of town. It always takes at least a half hour  
4 to one and a half hours to get into the city. This  
5 doesn't seem to interfere with people traveling.  
6 Palmdale wants it. That's important. All we need is  
7 some quick transportation.

8 Our peaceful lifestyle is being threatened,  
9 and we are very concerned and upset about that. It's  
10 cancelled out all the good you've done. Hopefully you  
11 read this and maybe reply, which of course he didn't.  
12 Thank you.

13 (The statement submitted for the record  
14 was marked as Statement 2.)

15 MS. BAIN: Thank you. Anne Clark. And Darrell  
16 Clark after Anne, please.

17 MS. CLARK: Good morning.

18 MS. BAIN: Good morning.

19 MS. CLARK: My name is Anne Clark. I'm a new  
20 resident of Westchester at 7717 Dunbarton Avenue. I'm  
21 not a president or chair of anything. I'm merely a  
22 citizen who's concerned. I'm not used to public  
23 speaking, so I wrote a few notes if you don't mind.

24 I've been confused by about why common sense  
25 is called common sense because it does not appear to be

1 very common. I am at a loss to understand how the  
2 expansion of LAX or the increase of traffic to LAX and  
3 the surrounds of traffic can benefit anybody. The  
4 following are just a few obvious reasons why this whole  
5 Master Plan and any considered incremental additions are  
6 in no way advantageous to the local public.

7 First, most people who live close to the  
8 airport are low-income working-class people. The  
9 reasons for this are obvious; those who can afford to,  
10 live further away from the noise and the airport. If  
11 the residents of the LAX Airport and areas are  
12 displaced, where can they go? Where can they afford to  
13 buy or rent? I know of no place. In a time when there  
14 is a resurgence of gang activity in the area probably  
15 due to poor education, dilapidated school buildings and  
16 a lack of cohesiveness in the city, how could we  
17 possibly justify subjecting our youngsters to additional  
18 pollution. Pollution takes many forms, poor air  
19 quality, additional noise, disregard for our fellow  
20 citizens, and the worst pollution of all, the haves  
21 versus the have-nots. Do you think we would be having  
22 this discussion if the airport abutted up Bel Air or  
23 Beverly Hills?

24 I don't know if there is any scientific  
25 evidence, but I would guess living in an environment

1 filled with all the mentioned pollutions and violations  
2 of human needs must surely result in psychological  
3 despair. Again, it appears to be an overpowering of the  
4 less advantaged. I would like each of the decision  
5 makers to take a moment and reflect, how would you feel  
6 if it were your children or your grandchildren were  
7 being forced to live in this environment? It is not in  
8 their best interest. What kind of message do you think  
9 we are sending to our youngsters and how do you think it  
10 will affect their self esteem if we go on and pulverize  
11 our city? Can we adopt a policy of sanity, one that's  
12 in the best interest of all our citizens?

13 Orange County and El Toro can and must handle  
14 their own residents' air needs and not expect  
15 Los Angeles to carry the whole load. It's not right.  
16 It's not fair, and it certainly makes no sense, common  
17 or otherwise. Thank you.

18 (The statement submitted for the record  
19 was marked as Statement 3.)

20 MS. BAIN: Thank you. Darrell Clarke.

21 MR. CLARKE: Thank you. Okay. I am Darrell Clarke  
22 at 339 10th Street, Santa Monica, 90402. I'm cochair of  
23 the Sierra Club Angeles Chapter Transportation  
24 Committee, vice chair of the City of Santa Monica  
25 Planning Commission and newly appointed to the Lincoln

1 Corridor Task Force Citizens' Advisory Committee,  
2 although speaking here as an individual.

3 I don't need to repeat the major impact LAX  
4 has on its neighbors, the pollution of jet fuel dumped  
5 over Inglewood, jet exhaust and, of course, oppose its  
6 further expansion. I would like to make a few specific  
7 points.

8 First, from where I am, LAX is my most  
9 convenient airport, but it certainly isn't that close to  
10 many other people in the L.A. basin, which is in and of  
11 itself a major argument for Palmdale, for Orange County,  
12 other locations where the airports are closer to people  
13 who live there. I'm glad the Ring Road is gone because  
14 it struck me as absurd to add capacity to roads going  
15 from LAX to the 405 Freeway when the 405 is gridlocked  
16 already. You just get to the gridlock a little faster.  
17 That was a pointless way of mitigating traffic issues to  
18 the airport itself and, in fact; this Monday of this  
19 week in the evening there was an excellent meeting in  
20 Westchester on the subject of widening Sepulveda  
21 Boulevard from Westchester up to Howard Hughes Center.  
22 And the community got together behind a livable-streets  
23 approach as opposed to turning it into another Wilshire  
24 Boulevard.

25 There absolutely needs to be a Green Line

1 connection to LAX. There also needs to be a north-south  
2 connection, say, from LAX up the 405 Freeway to the  
3 San Fernando Valley as an alternative to driving to LAX.  
4 These are farther down the road, but they absolutely  
5 need to be done, and not as to support future growth of  
6 LAX, but to mitigate the impact that LAX already has on  
7 its immediate neighbors. LAX needs to step up and  
8 mitigate and help fund the rail alternatives to traffic  
9 gridlock that's there now.

10 As an example for the sort of support in  
11 L.A. -- this is a book of 3,000 signatures we submitted  
12 to the MTA in support of the exposition light-rail line  
13 from downtown L.A. to Santa Monica. This is the support  
14 of the expanded light-rail network in L.A. And, of  
15 course, we need a high capacity people mover moving  
16 through the airport. It's ridiculous. The terminal  
17 loop is jammed with cars, shuttles, big buses when we  
18 need a very high-capacity, reasonable people mover going  
19 through that terminal loop to connect these rail lines  
20 to connect with off-site use.

21 And, finally, I'm absolutely looking forward  
22 to the next round of public hearings when we have a more  
23 detailed proposal to review. Thank you.

24 MS. BAIN: Thank you. Again, I would like to remind  
25 you that if you have collateral materials that you would

1 like submitted to the record in addition to your oral  
2 comments, if you have a written comment that you read  
3 from when you provided your oral comments, you can  
4 provide those to the court reporter, and that will help  
5 us with the record. Next, I would like Mike Salk. And  
6 after that Roger Rudick, please.

7 MR. SALK: My name is Mike Salk. I'm a District  
8 Deputy to Councilmember Ruth Galanter who chairs the  
9 Committee on Commerce, Energy and Natural Resources  
10 which oversees the airport. Thank you all for being  
11 here today.

12 In light of the events of September 11th, the  
13 entire LAX Master Plan is most likely obsolete. The  
14 assault on the World Trade Center and the Pentagon have  
15 demonstrated the airports must operate differently or  
16 they may not be able to operate at all. Even before  
17 September 11th trends within the airline industry have  
18 been unclear. While the LAWA proposed Master Plan  
19 includes in all of its alternatives runways to  
20 accommodate planes carrying 600 passengers or more,  
21 airlines have, in fact, been flying and buying more 757s  
22 and 767s. Certainly demand has fallen off the charts  
23 and the demand forecasts that the entire Master Plan is  
24 based on are no longer useful. In fact, the EIR is so  
25 flawed in its conception and current relevance that

1 environmental assessment is inherently flawed as well.

2 I am concerned we are now being asked to  
3 comment on a Fifth Alternative that is conceptual, at  
4 best, with no opportunities to inspect any analyses on  
5 its impacts on the surrounding communities, businesses  
6 and/or residents. I am concerned as long as this EIR  
7 process is on the table, the door is still open for  
8 incremental expansion later in this decade.

9 Finally, I'm concerned nowhere in this  
10 existing Master Plan document or in the proposed Fifth  
11 Alternative is there an overarching plan to address  
12 projected aviation demand in the Southern California  
13 region using LAWA's other airports like Ontario and/or  
14 Palmdale.

15 I urge you to reject this planning process and  
16 begin anew with a true regional plan assessed with a new  
17 environmental document that adequately addresses impacts  
18 on a regional basis. Thanks a lot.

19 MS. BAIN: Thank you. Roger Rudick. After  
20 Mr. Rudick we'll have Richard McNish.

21 MR. RUDICK: Hi, Roger Rudick, 1943 Rodney Drive,  
22 Los Angeles. I'll be real brief.

23 I moved here a little over a year ago from New  
24 York City and noticed right away that you have a bit of  
25 a traffic problem. I got a flyer from Darrell Clark

1 shortly after moving here asking for people to support  
2 the building of the exposition line, which is a  
3 light-rail line which has been approved, from downtown  
4 almost all the way to Santa Monica. In the course of  
5 going through that and taking signatures for the expo  
6 line, I find overwhelming support for the Green Line  
7 going all the way to LAX to the terminals. This wasn't  
8 something I solicited. It came up over and over again.  
9 People would say, "What's with the Green Line?" I don't  
10 think this really has anything to do with whether or not  
11 you expand the airport. The bottom line is, you have a  
12 tremendous traffic problem for people getting to the  
13 airport. I know. I've done it several times, even  
14 before I moved here. It's almost painful to stand on  
15 Aviation Station platform and watch the planes land, and  
16 you have another half hour to get to the airport because  
17 of the shuttle bus is sitting in traffic with everybody  
18 else.

19 I think you guys should explore the simplest  
20 way to get the Green Line to the terminals, which may be  
21 just going along the road where the Harbor subdivision  
22 is, if you know the area I'm talking about. And I also  
23 don't think you should preclude the idea of the Green  
24 Line itself actually going and circling around the  
25 terminals. I heard someone say it can't be done, but

1 I'm almost sure it can. There are plenty of places  
2 where light-rail lines make sharp 90-degree turns. I  
3 don't see why it couldn't make the loop itself. Of  
4 course, I agree, you should look into extending  
5 northward. That's all I have to say. Thank you very  
6 much for your time.

7 MS. BAIN: Thank you. Richard McNish.

8 MR. MCNISH: I'm Richard McNish. I'm with the City  
9 of Inglewood. It appears from everything that I've  
10 looked at or read in recent weeks that the expansion  
11 plan has been stopped. That doesn't stop the increase  
12 in demand for airport-related services. And it  
13 creates -- September 11th, in my opinion, creates what  
14 we look at as a regional problem.

15 City of Inglewood's proximity to the airport  
16 ought to make it a player in the resolution to that  
17 problem. The restrictions that are placed on ingress  
18 and egress in the airport for passenger traffic, for  
19 pick-ups and drop-offs for off-site parking create  
20 problems from the standpoint that the service demand  
21 continues to increase and the service capabilities have  
22 been restricted. It would seem to me that the City and  
23 the airport need to be sitting at the table together to  
24 figure out how resources that we have and other abutting  
25 jurisdictions have to solve what the airport faces which

1 now is a larger regional problem. As many people have  
2 suggested here, to seriously address mitigating the  
3 kinds of problems that are going to occur now that we're  
4 not going to be able to expand the airport under any  
5 circumstances. Thank you.

6 MS. BAIN: Thank you. Cecel Carpio or Cecil?

7 MS. CARPIO: Cecil.

8 MS. BAIN: And Brian Weiss after Cecil.

9 MS. CARPIO: Yes. Good morning. I'm from the city  
10 of Inglewood. The reason I'm up here right now is I'm  
11 concerned about the Arbor Vitae interchange. It seems  
12 to me that Mayor Hahn's idea of holding back that Ring  
13 Road is disingenuous because if you look at the Ring  
14 Road, you'll see that it's about seven-eighths,  
15 nine-tenths two-thirds already built. We have  
16 Westchester Parkway, Pershing and Imperial Highway. We  
17 just need to hook up here and there. So when people are  
18 real happy that the Ring Road is dead, I say that it's  
19 alive and kicking.

20 And MTA, L.A. Dot and Caltrans are doing their  
21 best to try to get a project reinstated. That's the  
22 Arbor Vitae interchange. According to Alternative A --  
23 and why anybody says Arbor Vitae has nothing to do with  
24 LAX expansion plans, here on figure three nine,  
25 "Landside access projects," it says on number eight is

1 "build more Arbor Vitae 405 interchange." What a  
2 surprise.

3 Southern California Association of Governments  
4 understood that link and went through a long process  
5 with the community, with the public, with MTA, Caltrans  
6 and L.A. Dot, who would say different, and pull that  
7 project from their long range -- excuse me, from their  
8 Regional Transportation Plan for the year 2001. And now  
9 L.A. Dot, Caltrans and MTA are doing everything they can  
10 to get that little puppy back into the RTP.

11 So I am concerned that Mayor Hahn says, "No  
12 Ring Road," when, in fact, the Ring Road is just about  
13 finished being built. And there are just a few key  
14 projects that need to be implemented. And when the  
15 representatives from the Sixth District, from L.A.  
16 Transportation agencies say that that needs to be put  
17 back into the SCAG Regional Transportation Plan, it  
18 concerns me. That's for my first card. I'll be putting  
19 in another card shortly. Thank you.

20 MS. BAIN: Thank you. Brian Weiss.

21 MR. WEISS: Yeah, my name is Brian Weiss. I live at  
22 8836 Croydon Avenue. That's Westchester, California  
23 90045.

24 MS. BAIN: Excuse me, Brian, can we adjust your  
25 mike?

1 MR. WEISS: I would like to comment to the mayor's  
2 statement about the new focus is on airport security  
3 being the number one priority. By definition, security  
4 means restricting access in some way, shape or form.

5 One of the fundamental problems that I see  
6 that LAX has in terms of security, especially in light  
7 of terrorist types of situations, is the fact that two  
8 of its runways run over top of a major road. I've  
9 traveled dozens of airports within the United States and  
10 probably over a dozen international airports. I can't  
11 remember ever finding one of those same situations where  
12 the runways run over top of a major road. So it's not  
13 beyond imagination that some terrorists could have --  
14 make a truck-type bomb similar to the one used in  
15 Oklahoma City driving a truck into the Sepulveda Tunnel  
16 at the appropriate time, blowing up the two -- you know,  
17 the two south runways. It could be done, you know, at a  
18 time when either jets are taking off or landing.

19 I don't think that if you talk to any airplane  
20 designer or commissioned airport designer and just gave  
21 them a blank sheet of paper and said "design me an  
22 airport," I don't think there would be any way somebody  
23 would consider trying to put two runways over top of a  
24 major road like that for that reason to restrict that  
25 access. And one -- a number of the plans call for doing

1 the same mistake again to try to put a third runway over  
2 Sepulveda Boulevard. It's just blatantly ludicrous to  
3 think that those kinds of things could be allowed. The  
4 thing you need to concentrate on, focus on, is  
5 alleviating these kinds of situations that terrorists  
6 could take advantage of. You need to not have a roadway  
7 under a runway. It is just fundamentally not a good  
8 idea.

9 Another situation that's probably of major  
10 security problem is the fact that the fuel depot -- I  
11 don't know how many hundreds of gallons, maybe millions of  
12 gallons of fuel are situated adjacent to Bradley  
13 Terminal and they are above ground. Some terrorist  
14 could get in there and take that fuel, too. It should  
15 be restricted somehow.

16 MS. BAIN: Thank you. Ronald Murphy.

17 MR. MURPHY: Good morning. My name is Ronald  
18 Murphy. I live at 3310 West 74th Street. I'm not going  
19 to bore you with all these facts and figures, but I do  
20 have some concerns. My main concern is, you know, when  
21 you start talking expansion, you're talking about moving  
22 people away from homes that they've been in for years,  
23 although I read in the L.A. Times where 57 people are  
24 going to lose their homes because of expansion.

25 I live on -- as I said, I live on 74th Street,

1 four houses away from Crenshaw Boulevard. I'm right in  
2 the midst of air traffic. Not only that, I have to deal  
3 with bus traffic, being an ex-bus driver myself,  
4 retired. We get a lot of noise. Every five minutes my  
5 house is shaking due to noise. That is mainly my  
6 concern. Not only the air pollution, it's the noise  
7 pollution and the traffic. It goes along with it. With  
8 LAX expansion it's going to bring more headaches, more  
9 problems and problems that seem like no one is willing  
10 to solve. And with that, I would like to thank you very  
11 much.

12 MR. KESSLER: Thank you.

13 MS. BAIN: Thank you. Mr. Heffner. And after that  
14 Mr. Schneider again, please.

15 MR. HEFFNER: The continuing saga, part two. I was  
16 in the midst of tracing the history of the EIR process  
17 at LAX. I had gotten up to the point whereby there had  
18 been four concepts originally presented. Two of those  
19 concepts ended up in the final EIR. Two of them had  
20 been eliminated and two additional ones added. However,  
21 the two additional ones, there was no public input in  
22 the process of determining them. It ends up it started,  
23 in essence, in 1986. We're now in the year 2001. It  
24 appears that we're not going to get anything done until  
25 2002. So we're talking 16 years for this particular

1 process. In the meantime that airport has grown from  
2 40 million to over 67 million. I think we can safely  
3 say that the airport is not going to increase this year  
4 and probably not next year.

5 One of the things that they talk about is  
6 regional airports. And you want regional airports. We  
7 want regional airports. Everybody wants regional  
8 airports, except if the airport is in your region.

9 Back in 2000 the executive summary of the EIR  
10 Draft 2000, it states, as follows -- and I would like to  
11 read this.

12 "A Master Environmental Impact Report that  
13 contained an assessment of the impacts associated with  
14 Los Angeles International Airport accommodating  
15 approximately 40 million annual passengers was certified  
16 by the City of Los Angeles, the Board of Airport  
17 Commissioners in 1978. The approximate 40 AMP level of  
18 service was planned and analyzed on the basis of a  
19 number of regional perimeters."

20 Next paragraph, "LAX has been forced to go  
21 faster than originally anticipated and has to  
22 accommodate a portion of unmet regional demand that  
23 other regional carrier airports were unable to satisfy.  
24 These are the same arguments presented today that were  
25 presented in 1988. It's not a question that LAX goes

1 out and tells fables to people. They usually tell the  
2 truth, but they don't tell the whole truth. We come  
3 back down here. They are in favor of regional  
4 development, but there is really no way they can't  
5 enforce regional development. The flight paths are not  
6 taken into account in these activities."

7           Mentioning very briefly about the Green Line.  
8 We had the representative from MTA prior to the Green  
9 Line being built. We asked them if the cars were going  
10 to have spaces on the cars for luggage. They were  
11 shocked. You're going to come out and this is going to  
12 help alleviate the traffic, but you have no place to  
13 place the luggage. To this day no plans for luggage.

14           My final statement what I started off with,  
15 how are you going to cap the number of passengers? How  
16 are you going to cap the amount of cargo, and how are  
17 you going to cap the number of operations? Thank you.

18           MS. BAIN: Thank you. Mr. Schneider.

19           MR. SCHNEIDER: If there are not a lot of speakers,  
20 I would give up my time to extend my remarks for Roy.

21           MR. KESSLER: You can't do that.

22           MS. BAIN: And if you could repeat your name again.

23           MR. SCHNEIDER: Denny Schneider, 7929 Breen,  
24 Los Angeles, Westchester, 90045. I just have one more  
25 suggestion that might be useful for Alternative Five.

1           There are several areas that are fairly  
2 blighted around the airport along Century. There are  
3 areas that those could be used for an off-site. We  
4 would not want to use necessarily Manchester Square, but  
5 it would make a nice park. And Westchester and Playa  
6 del Rey has the lowest ratio of parks anywhere in the  
7 city which is less than most of the country. Thank you.

8           MS. BAIN: I think can take a 10- or 15-minute break  
9 right now -- a 10-minute break. We'll reconvene at  
10 11:00 o'clock exactly. Again, if you have public  
11 comments to make, please fill out the yellow card and  
12 turn them into the sign-in desk, and we will call your  
13 name.

14                   (Recess was taken.)

15           MS. BAIN: We will reconvene. If I could get  
16 everyone to take their seats, please. Just to go over  
17 the timer for everyone that is just joining us. You  
18 have three minutes to make your comments. When you have  
19 a minute left, you'll see a yellow light, and you can  
20 start wrapping up. At the end of three minutes, if you  
21 feel you need more time to make your comments, you're  
22 welcome to fill out a yellow card, and we'll call you  
23 again. If you come to the mike, please speak your name  
24 clearly with your address so the court reporter can  
25 record it. I will start the timer after that. If you

1 have written comments you want to submit to the court  
2 reporter for the record, we would like those as well.  
3 We will begin with Daniel Shriver. Mr. Shriver.

4 MR. SHRIVER: Hello. My name is Daniel Shriver.  
5 I'm with the Ate-mi-Ryu JuJitsu. I'm here to speak of  
6 the issue -- oh, you need to know my address; 4741 Ben  
7 Avenue, Valley Village, California 91607.

8 MS. BAIN: Can you adjust your mike up a little bit?  
9 Perfect.

10 MR. SHRIVER: I lost a friend at the World Trade  
11 Center. He's not with us today. One of the things that  
12 could have changed that was self defense, a simple  
13 close-range combat style Ate-mi-Ryu JuJitsu. I've given  
14 a demonstration to -- we've given a demonstration to  
15 some of the people that were here last Thursday. This  
16 morning I understand we are going to be able to do that.

17 What we want to show is that security is a big  
18 thing. We're talking about, what's the cost of  
19 security? What's the cost of expansion? United  
20 Airlines lost a billion dollars last quarter. What if  
21 they lose another billion next quarter and next quarter  
22 and the other airlines? We're not going to be talking  
23 about airline expansion, but bus expansion. We're not  
24 going to be flying as much because of no confidence in  
25 the flights.

1           We have a simple, effective easy-to-use  
2 martial art that is not only appropriate for the sky  
3 marshals -- if you know about the sky marshals right  
4 now, your chance of being on a plane with a sky marshal  
5 is two percent. You see the National Guard in the  
6 airports. You see them with guns, but no bullets. They  
7 weren't issued with bullets. We're talking about making  
8 the airports safer, but we have the attendant's  
9 association saying the flight door, attendant back door,  
10 is open; people are getting in. We have to check bags.  
11 Will screeners be Federal employees or overseen by  
12 Federal employees? Would you feel safer if you knew the  
13 check was coming from the government or private  
14 individual or would you feel safer that the people that  
15 are in the front line of the new war we're on had enough  
16 training to keep from being captured or being kept from  
17 having an airplane taken over?

18           It's easy to do. It's easy to learn and  
19 appropriate. It uses joint lock and strikes to pressure  
20 points or weak spots on the body that allows a smaller,  
21 slighter person overtaking a larger more aggressive  
22 person and multiple attackers. You'll see this for  
23 yourself. The other day we had Susan, one of the staff  
24 here, take five minutes. She learned enough to possibly  
25 save her life. It doesn't take long. It's simple.

1 It's effective, and it's easy to use. I have an  
2 information packet I want to submit into the record,  
3 including a letter from Congressman Waxman's office.

4 "I want to say thank you for coming to my  
5 district office to give my staff a demonstration of  
6 JuJitsu techniques. I know my staff was very impressed  
7 and felt these techniques would be very beneficial to  
8 the airline industry."

9 They forward it on to the FAA, Mr. Kessler.  
10 And I want thank you for forwarding it on to the  
11 security people involving sky marshals. We shouldn't  
12 stop with the sky marshals because they are not going to  
13 be on every flight. If we could train every flight  
14 attendant, that's one less seat that has to be taken up  
15 by a sky marshal, and it increases the odds against the  
16 terrorists. We're not looking for just one sky marshal.  
17 We're looking for everybody.

18 I want to introduce Sensei Vince Cecere, who I  
19 believe will be conducting the next demonstration.

20 MS. BAIN: Thank you. Mr. Cecere.

21 MR. CECERE: My name is Sensei Vince Cecere. I live  
22 at 4463 Laurel Canyon Boulevard, Studio City, 91607. I  
23 am a third-degree black belt in Sanuces Ryu JuJitsu,  
24 combat JuJitsu under Grand Master Moses Powell, and I'm  
25 a second-degree black belt, chief founder of Atemi-Ryu

1 JuJitsu of

2 Los Angeles. I am also amongst the men who were  
3 implemented to train people at Fort Bragg, and various  
4 police tactical units.

5 As of September 11th everyone knows that we  
6 live in a new world. Former Governor Tom Ridge, the  
7 chief of homeland security, was on television yesterday  
8 saying how the public needs to help the government with  
9 the security problems and issues that we're having with  
10 the airline industry. I assure you that everything that  
11 we're talking about is not just for the airline  
12 industry, but any person who lives in a home or is  
13 underneath an airline that could possibly come down on  
14 their house is a possible victim.

15 Every good mechanic knows that you use the  
16 right tool for the right job. You don't ask a doctor to  
17 tune your car. You don't ask a fireman to represent you  
18 in court. If you have a combat and security problem,  
19 you go to a combat expert. You go to somebody that  
20 knows what they are talking about and could see through  
21 the loopholes of the individuals that think they are  
22 going to create terror on the airlines. The only way  
23 that you're going to absolutely control incidents aboard  
24 an aircraft is to train the crew with the knowledge to  
25 deal with the situation. Empower them. Don't let the

1 flight crew, the American people, innocent children,  
2 people that are on the ground for plane crashes be lambs  
3 for the slaughter anymore. We want to get all Americans  
4 as well as all human beings to live in peace and  
5 security and not deal with these problems where we could  
6 enjoy our lives again. Thank you. And may God continue  
7 to bless America.

8 MS. BAIN: Thank you. Michael Cecere.

9 MR. CECERE: My name is Michael Cecere. I live in  
10 Murrieta, California, which is a long way from here.  
11 And the closest that planes fly above my house are  
12 30,000 feet. I'm here at this expansion meeting, once  
13 again, to support the Atemi-Ryu JuJitsu and proper  
14 security in the airline industry. What I'm here to say  
15 is that these meetings might be an exercise in futility  
16 if the airlines don't start getting passengers on board  
17 again and flying up to the standards that they were  
18 before this terrorist attack.

19 I've been in the security industry almost 20  
20 years now. I'm familiar with all types of executive  
21 protection, asset protection, electronic security and as  
22 well as hand-to-hand combat and various types of martial  
23 arts. I'm familiar with Tia Kwondo and Aikido and  
24 everything else. Basically, the security and the  
25 techniques that you see here displayed by Sensei Vince

1 Cecere are the only techniques that could work aboard an  
2 airplane. You can't do a high kick aboard an airplane.

3           Once again, it comes down to money. There  
4 will be no expansion on LAX, Ontario, Palmdale or  
5 anywhere else if the airlines don't start picking up  
6 passengers and getting back to where they were before.  
7 Everyone makes a commitment to security, but believe me,  
8 we've been working on both ends of this country with  
9 a lot of political officials, and we're getting a lot of  
10 lip service, but nothing more than that so far. I  
11 believe that the flying public is not going to go back  
12 to the way it was before unless they are assured that  
13 there is a program in place to certify all these  
14 qualified people. You will make your airline crews feel  
15 a lot safer. And, basically, I truly believe that a  
16 person cannot totally be free unless they can defend  
17 themselves.

18           You can be the most intellectual person in the  
19 world, the most spiritual person in the world; but if a  
20 thug comes up and lays his hands on you and you can't  
21 protect yourself physically, which does not require  
22 a lot of size and strength but strictly technique, then  
23 you will never truly be free. Before you talk about  
24 airplane and airport expansion, once again, you're going  
25 to have to talk about getting the flying public back up

1 in the skies. Until we make our airports and planes  
2 safe, that will not happen. Thank you.

3 MS. BAIN: Thank you. Bryan Clark and James Karin  
4 after that.

5 MR. CLARKE: I want to know if I could use my time  
6 and James Karin's time in order to demonstrate what  
7 we're trying to do for the security of the FAA and what  
8 we're trying to demonstrate for the JuJitsu?

9 MR. KESSLER: Okay.

10 (Demonstration took place.)

11 MS. BAIN: Thank you. Next we will have Stacy  
12 Brown. And after Stacy we'll have Cecil Carpio.

13 MS. BROWN: Good afternoon. My name is Stacy Brown;  
14 2727 Butler Avenue, Los Angeles, 90064. I have  
15 submitted written comments in a prior comment period.

16 I have one comment or two for today. And that  
17 has to do with the current trends in aviation, that they  
18 tend to be toward the smaller jets, whether that be  
19 regional or private business jets. The use of private  
20 and business jets is increasing rapidly at a phenomenal  
21 rate. These jets are currently using small -- what I  
22 would call -- neighborhood airports. That's having a  
23 huge impact on surrounding communities. In my case that  
24 would be Santa Monica Airport, which is surrounded on  
25 three sides within 500 feet, I believe, of the runways

1 with homes.

2 The LAX Master Plan appears to reduce services  
3 to general aviation. These smaller jets are covered  
4 under general aviation rules and regulations. What we  
5 would like to see, what my neighbors and I would like to  
6 see, would be for LAX to increase, not decrease,  
7 services to the private and business jets and take them  
8 from Santa Monica Airport and from whatever other  
9 airports are being impacted.

10 LAX theoretically has the ability to provide  
11 appropriate security. One of these jets here is  
12 certainly much smaller than commercial aircraft, but  
13 used strategically we know can be done. They can still  
14 cause great damage to local facilities, local buildings.  
15 And this is a huge concern of mine as well as just the  
16 nuisance value and the health values -- or the health  
17 impacts on myself and my community. Thank you.

18 MS. BAIN: Thank you. Cecil Carpio.

19 MS. CARPIO: Cecil Carpio, resident of Inglewood.

20 After September 11th we live in the exact same  
21 world we've always lived in. It's just that now maybe  
22 some people have awakened to reality. A strong push for  
23 a regional solution is the only answer in response to  
24 LAX expansion. LAX expansion plans are obviously  
25 obsolete, but not dead. I urge community outreach and

1 community participation in formulating Plan Five. What  
2 I would also like to know, perhaps you'll have this  
3 information at the next public hearing, is how do I  
4 review the transcripts of previous public hearings?  
5 Thank you.

6 MS. BAIN: Thank you. At this time I do not have  
7 any more public comment cards. If you still wish to  
8 make a public comment, please fill out this yellow card  
9 and bring it to us. We will call your name. If you  
10 have a written comment, please fill out one of these  
11 cards. They have one of these sheets at the sign-in  
12 table. It is recorded with the same weight and value as  
13 your oral comments. Until we get some more comment  
14 cards, we will be here awaiting any more oral comments.  
15 And we will take a break until then. Thank you. I'm  
16 sorry, we have one more comment, Mr. Brian Weiss.

17 MR. WEISS: The name is B-r-i-a-n. Last name Weiss,  
18 W-e-i-s-s, 8836 Croydon Avenue, Westchester, California  
19 90045. I want to ask a few questions -- or to bring up  
20 a few comments about LAX just dealing with the public in  
21 general.

22 Two of the biggest complaints that the  
23 citizens surrounding LAX has had over the last decades  
24 is the fact that the jets continue to do early turns.  
25 And the second big complaint is sound mitigation. I

1 think it's really pretty poor how LAX has dealt with the  
2 community on these -- both of these issues. For  
3 instance, with regard to early turns, it's difficult to  
4 understand how -- how the airport can control or the  
5 airlines and the air traffic controllers can control  
6 with such accuracy the takeoff and landing and how close  
7 they are spacing each other and all the traffic on the  
8 ground. But yet, it seems that as soon as the plane is  
9 off the ground, they have no control over when the plane  
10 does early turns. The people in El Segundo have had to  
11 spend their own taxpayer's money from the City of  
12 El Segundo to install video cameras. The LAX's solution  
13 has been to have a round-the-clock toll free number you  
14 can call to try to report the time of day, and so on and  
15 so forth, so they can try to figure out what airline it  
16 was that was doing the early turn.

17 I mean, trucking fleets, if you call Fedex or  
18 UPS or a lot of these trucking fleets, they have GPS  
19 tracking systems on board their trucks so they know that  
20 the drivers aren't off goofing off at the beach or  
21 something all day. They know exactly where every single  
22 truck is. Why is it that you can do that on a \$20,000  
23 truck, but you can't do it on a hundred-million-dollar  
24 aircraft to know exactly the flight projectory so that  
25 as soon as somebody veers on one the designated air

1 spaces, that you send the airline \$100,000 bill for  
2 violating the traffic. I mean, these people need to be  
3 able to fly their planes and control air space to know  
4 where they are going.

5 With respect to sound mitigation, the Federal  
6 Government had billions of dollars set aside to  
7 soundproof homes. Why is it it took years and years and  
8 years to have this money become available? Why is it if  
9 I wanted sound mitigation, I have to sign away my future  
10 rights that says the airport could revise the runways so  
11 they land across the street from my house, and I have  
12 nothing to say about that. Why is it that the airport's  
13 response is so one-sided, overwhelming, unfair to the  
14 surrounding communities? The cities of Boston, Logan  
15 Airport, Chicago, Denver, a whole list of airports,  
16 other airports, don't have aggregation easement that  
17 takes away the rights of the citizens. I think it's a  
18 poor instance on any kind of business to propose that  
19 they want to do good for everybody, and then turn around  
20 and just give them the worst deal that they can possibly  
21 come up with.

22 MS. BAIN: Thank you, Mr. Weiss. Again, do we have  
23 any more cards? We don't have any cards in right now.  
24 Please feel free to fill out a card if you have some  
25 oral comments to make. We will take another

1 15-minute break. We'll reconvene at 11:45. Thank you.

2 (Recess was taken.)

3 MS. BAIN: Okay. If we can begin, my name is Shauna  
4 Bain. I'm your facilitator this morning and this  
5 afternoon. I'm going to turn the mike over to Mr. David  
6 Kessler. He's here from FAA. He will give you some  
7 introductory remarks again.

8 MR. KESSLER: Good morning, ladies and gentlemen.  
9 My name is David Kessler. I'm an Airport Planner from  
10 the Federal Aviation Administration, Western-Pacific  
11 Region. I would like to welcome you to the sixth of a  
12 total of nine public hearings the FAA and the City of  
13 Los Angeles are conducting for the Draft Environmental  
14 Impact Statement, Environmental Impact Report or EIS/EIR  
15 for the proposed Master Plan at Los Angeles  
16 International Airport.

17 The first three public hearings on this topic  
18 were held on Saturday, June 9th in Inglewood, Manhattan  
19 Beach and Westchester. The fourth and fifth were held  
20 this past week in Monterey Park and San Pedro. Today's  
21 hearing is the third of six additional hearings being  
22 held this week and next week. These hearings were  
23 originally scheduled for early September, however, they  
24 were postponed due to terrorist attacks in New York and  
25 Washington, D.C. The next hearing will be held on

1 Monday evening, November 5th at Palmdale Regional  
2 Airport in Palmdale.

3 The purpose of these hearings is to collect  
4 comments from the general public concerning the adequacy  
5 and the information disclosed in the Draft EIS/EIR. The  
6 FAA and the City of Los Angeles along with the Federal  
7 Highway Administration, as a cooperating agency, have  
8 prepared the Draft EIS/EIR.

9 I would like to take this opportunity to make  
10 sure that everyone understands that no decisions will be  
11 made today regarding the proposed project. Today's  
12 hearing is not a question-and-answer type of forum. Our  
13 job is to listen to what you have to say about the  
14 adequacy of the information in the Draft EIS/EIR. In  
15 other words, it is your turn to talk to us. Since we  
16 are here to listen, we are not going to respond to  
17 questions about the pros and cons of the proposed  
18 project. Since 9:00 o'clock this morning, the City has  
19 held a public workshop just outside of this room for  
20 anyone to ask questions about the Master Plan, the  
21 environmental process and the various proposed projects.

22 Following publication of the Draft EIS/EIR for  
23 comment, the next step in the joint federal and state  
24 environmental disclosure process is holding this and  
25 other public hearings during this week and next week.

1 The environmental disclosure process for this project  
2 started in 1997 with the publication of a Notice of  
3 Intent to prepare the joint EIS/EIR in the Federal  
4 Register. In July of 1997 we held a series of meetings  
5 with members of the public and governmental agencies to  
6 receive comment on the scope of the Draft EIS/EIR.  
7 Following those meetings, the Draft EIS/EIR was prepared  
8 considering the comments received during the scoping  
9 meetings and those submitted in response to the Notice  
10 of Intent. The document has also been prepared pursuant  
11 to the National Environmental Policy Act of 1969 or  
12 NEPA, the Council on Environmental Quality Regulations,  
13 which are the implementing regulations for NEPA, the  
14 California Environmental Quality Act of 1970 or CEQA and  
15 the Airport Airway Improvement Act of 1982, as amended.

16 Following today's hearings and the close of  
17 the comment period, we will then correct and revise the  
18 EIS/EIR, as necessary, based on the comments received.  
19 We will also prepare responses to the comments we  
20 receive and include those responses in the final  
21 EIS/EIR.

22 Before we begin receiving verbal comments, we  
23 would like to let you know the ground rules of this  
24 hearing. First, as I said earlier, we are not here to  
25 respond to questions about this project. We are only

1 here to listen to your comments and take notes. We also  
2 have a court reporter present to ensure we have an  
3 accurate transcript of this hearing.

4 For anyone who would like to speak, we will  
5 ask you to fill out a speaker card, like this one, and  
6 give it to the person at the sign-in desk. That person  
7 will bring the speaker cards up to our facilitator who  
8 will call the names of each speaker so we can proceed in  
9 an orderly fashion. So that everyone gets an  
10 opportunity to provide verbal comments, everyone will  
11 get three minutes to speak. To be fair to everyone, we  
12 are not going to allow people to transfer their allotted  
13 time to someone else. I ask that when you speak, give  
14 us your name and address for the record. We also have a  
15 Spanish language translator for anyone wishing to  
16 provide comments in Spanish.

17 If there is anyone who is uncomfortable  
18 speaking in front of a group or you need more than three  
19 minutes to provide your comments, we ask you provide  
20 your comments in writing. We have comment sheets, like  
21 this one, available for your use at the sign-in desk.  
22 You can leave your comments at the sign-in desk or you  
23 can mail your written comments using the comment sheet  
24 or a letter to either address listed on the cover of the  
25 EIS/EIR. The City's address is listed at the top of the

1 comment sheet. I would like you to understand that a  
2 verbal comment is just as important as a written  
3 comment. So please feel free to provide any comments on  
4 the document you may have to us either verbally today or  
5 in writing. Comments are due by 5:00 p.m. Pacific  
6 Standard Time on Friday, November 9, 2001.

7 Lastly, I would like everyone to know that  
8 even though we have this hearing scheduled until 1:00  
9 this afternoon, we will stay here as long as necessary  
10 for everyone to get a chance to provide verbal comments  
11 on the Draft EIS/EIR. As I said, our job today is to  
12 listen to your comments.

13 Now, I will turn the hearing back to Shauna  
14 Bain to reintroduce Mr. Ritchie who will provide some  
15 introductory comments from the City of Los Angeles.  
16 Following Mr. Ritchie's comments, we will collect the  
17 additional speaker cards and call the name of our first  
18 speaker. Thank you.

19 MS. BAIN: Thank you, Mr. Kessler. We have Mr. Jim  
20 Ritchie, Deputy Executive Director of Los Angeles World  
21 Airports here to make some further introductory remarks.  
22 Mr. Ritchie.

23 MR. RITCHIE: Yes, thank you, Shauna. Very briefly,  
24 I am Jim Ritchie from Los Angeles World Airports. And  
25 on behalf of the City of Los Angeles, we appreciate your

1 interest and your involvement this morning. So with  
2 that, let's go to work. And Shauna, would you read the  
3 next comment for us, please.

4 MS. BAIN: Certainly. Again, I would just like to  
5 reiterate the timer and how it works. You have three  
6 minutes. When you're down to one minute of time, which  
7 is your summation time, you will see a yellow light  
8 blink here on the timer. When your time is expired, you  
9 will hear a beep tone. After the beep tone, if you  
10 still feel you need further time for comment, please  
11 fill out your comment card, and we will call your name  
12 again. If you could, again, speak your name loudly and  
13 clearly at the beginning and spell your name, if  
14 necessary, for the court reporters. We would appreciate  
15 it. The first name is Mr. Brian Weiss. After Mr. Weiss  
16 we'll have Mr. Vince Cecere.

17 MR. WEISS: Yeah. I would like to comment on --  
18 Brian Weiss, W-e-i-s-s, 8836 Croydon Avenue,  
19 Westchester, California 90045. I would like to comment  
20 on part of the sound study environmental -- I guess it  
21 would be the EIR.

22 A portion of the study referred to the loudest  
23 impacted area of the sound contour being cited at  
24 sometimes at being 109 DBs, decibels. And that was  
25 along the Imperial Highway and El Segundo. I'm certain

1 that all that data that was obtained for that study was  
2 done with the flights taking their normal straight line  
3 flight path. It probably didn't address what typically  
4 happens -- well, may not typically happens, but it  
5 doesn't frequently capture the fact that there are these  
6 early turns. The studies really need to include the  
7 worst-case situation, not just what the ideal is and  
8 whether or not there was any filtering of that data. In  
9 other words, the people conducting the sound study, they  
10 may have recorded data that was worse than that and  
11 thrown it out. Basically, when I review a report, it's  
12 nice to know where the raw data and the technical  
13 information came from. With just kind of a synopsis of  
14 what's given there without being able to see any of the  
15 actual data taken, there's no indication of what was  
16 really done.

17 Just as a general comment about all of the  
18 reports, I'm sure there is some -- the agencies or the  
19 companies that work on, I'm sure they have some kind of  
20 letter of certification in there. I would think as a  
21 matter of report -- I do a lot of technical work  
22 involved with the government. And, typically, we submit  
23 reports from my company. And when other test labs  
24 submit reports, there is some signature in there from  
25 some authority at that company, an officer of the

1 company, that states that all information in there is  
2 true and correct to the best of their knowledge and all  
3 that. And along with all that, there should be the  
4 calibration, traceability. I didn't see any of that in  
5 any of those reports.

6 One of the things that was cited in the sound  
7 report, which I found kind of ironic, was that they  
8 referred to a 75 DB outside noise level as being  
9 equivalent to like a 65 DB interior sound level. They  
10 also trying to put that in perspective or justify that  
11 wasn't too loud. They cited a British sound study that  
12 was done that said for 100 -- a sample of 100 people,  
13 only two percent woke up for a noise between 70 and 80  
14 decibels. An average alarm clock is far less than that.  
15 So are telephones. So the problem that I see with that  
16 data is that the average noise that wake people up are  
17 lower than what the study said. Only two percent of  
18 people woke up. There are blatant errors in this. It  
19 makes you wonder how accurate that information is that  
20 was provided by that whole agency.

21 MS. BAIN: Thank you, Mr. Weiss. Vince Cecere.  
22 After Mr. Cecere, Roy Heffner.

23 MR. CECERE: Good afternoon. My name is Sensei  
24 Vince Cecere. I'm a combat instructor. I'm  
25 third-degree black belt in Sanuces Ryu JuJitsu, head

1 representative of JuJitsu under Grand Master Moses  
2 Powell as well as being the founder, chief instructor of  
3 second-degree belt in Ateimi-Ryu combat JuJitsu systems.  
4 We trained the very same people, a million of our  
5 associates, same men that are on the ground right now in  
6 Afghanistan. We trained at Fort Bragg. We trained many  
7 street tactical units.

8 As of September 11th we all know we live in a  
9 new world, as former governor and chief of security Tom  
10 Ridge has asked, to get the public involved because the  
11 government can't handle all the problems. So that's the  
12 reason why we're here.

13 Every mechanic will tell you, you need the  
14 right tool for the right job. We have a security  
15 problem aboard an aircraft. You don't ask a cook to fix  
16 your car. You don't ask a fireman to represent you in  
17 court. The only ways to control incidents of aircraft  
18 is to train them to deal with the situation and empower  
19 them. Don't let the flight crew and innocent American  
20 people or anyone that lives in a place where an airline  
21 is going to fly over their house be victimized or be a  
22 lamb to the slaughter again. We're all in this  
23 together. This is not just an airline problem. This is  
24 an every American citizens' problem because we're all at  
25 risk. Together we should be able to solve this problem.

1           We have an illness of security, and this is a  
2           cure. We have to live together as residents of  
3           Los Angeles of the State of California of the great  
4           country of America. And we're all human beings, and we  
5           must live together in peace and enjoy it because without  
6           freedom and being in fear, which is what the terrorists  
7           are looking for, fear -- I assure you if they take a  
8           chance and take a look at what we have proposed, there  
9           shouldn't be fear aboard aircraft anymore. Don't fear  
10          anybody. You don't have to. Thank you.

11          MS. BAIN: Thank you. Mr. Roy Heffner. Can you  
12          please state your name for the record.

13          MR. HEFFNER: Roy Heffner, 6548 West 80th Place,  
14          Westchester, California 90045. I'm glad to be back  
15          again. This is series number three now of the saga.  
16          This will be a little fragmented because I never  
17          anticipated having an opportunity to speak three times  
18          at this meeting after attending the first one way back  
19          at the Airport Marina Hotel.

20                 I would like to first deal with the concept of  
21          the Regional Airport Authority. When we talk about  
22          expansion of any airport, it seems today that the  
23          Southern California Regional Airport Authority under the  
24          leadership of Supervisor Don Knabe of Los Angeles  
25          County, this would be a place that regional activity

1 would be emphasized. I realize they have no authority,  
2 but there's not too many outfits that have authority. I  
3 would like to emphasize that LAX does have not any  
4 authority over any plane that takes off.

5 I hear people talk about noise and aircraft  
6 flying over their homes. LAX cannot control that.  
7 That's under jurisdiction of the Federal Aviation  
8 Administration.

9 We know that at one time the Federal Aviation  
10 Administration was concerned with promoting air  
11 commerce. Since some time ago they have been eliminated  
12 of the responsibility to control or to promote air  
13 commerce. The only problem is the bureaucracy has been  
14 so set in that they still think that is their job. We  
15 would like to see the FAA in this expansion process set  
16 down some ridged rules as far flight paths are  
17 concerned, where they come in and where they go out.  
18 The global system is certainly something that should be  
19 involved with every particular plane.

20 We would also like to see -- seeing as how we  
21 have in 1984 the part 150 study there to create  
22 capability between the airport and the surrounding  
23 community pertaining to noise, those are supposed to  
24 only last for a few years. We are now in the year 2001,  
25 17 years later. We're still operating under that same

1 guideline as part 150. Many of those have not been  
2 adopted or incorporated in a proper fashion. The  
3 Variance Hearing -- following comment made by another  
4 person, the Variance Hearing of 1990 we would encourage  
5 the Board of Airport Commissioners to eliminate the  
6 aggregation easement for sound insulation, which they  
7 did. The Board of Airport Commission did not require  
8 aggregation easements. In 1993 or 4, one of those  
9 years, they reinstated aggregation easement. However,  
10 they know have a memorandum of understanding in  
11 Inglewood where Inglewood will not have to sign an  
12 aggregation easement, yet the citizens of the city of  
13 Los Angeles, which are owners of that particular  
14 airport, still have to sign that airport -- that's that.

15 The Board of Airport Commissioners changes.  
16 They don't always know what has always happened before.  
17 Since I've been involved in the LAX Area Advisory  
18 Committee, I have experienced 35 different  
19 commissioners, and those commissioners truly try to do a  
20 good job, but they don't know what has happened before  
21 and, thus, they cannot continue. I don't plan to be  
22 back for a fourth.

23 MS. BAIN: Thank you very much. Stacy Brown,  
24 please.

25 MS. BROWN: Good afternoon, Stacy Brown, West

1 Los Angeles. My second round of comments is relating to  
2 the plan itself. The assumption underlying the existing  
3 Master Plan has changed dramatically. Part of that  
4 change is the remix that we're looking at into the  
5 future. And the Master Plan and EIR must address the  
6 likely difference in the fleet mix, which will certainly  
7 be included in many more smaller jets that will be used  
8 regionally as well as the private and business jets that  
9 I mentioned earlier. The truly Regional Plan proposed  
10 by the City of El Segundo and, also, I believe, by Mayor  
11 Hahn is the best means of achieving security for the  
12 region. And decentralizing air traffic and use of  
13 airports provides an alternative if one airport is  
14 somehow damaged. It also makes it much less likely that  
15 the airports are going to be the main target of  
16 terrorist attack only because we are not putting all  
17 our eggs in one basket. They will not be able to create  
18 the same type of havoc as would happen if the original  
19 LAX Master Plan would be put into effect.

20 In addition to that, I think we've seen a part  
21 of the problem that we were looking at today. And we  
22 saw on September 11th that's due to the amount of  
23 control having been given to the airlines. And I  
24 believe that control over the airport and over air  
25 traffic, in general, needs to be taken from the airlines

1 and also that local communities be given some amount of  
2 control in the way the airports in their communities are  
3 developed and are operated.

4 The idea of having the Federal Government come  
5 in and fully control the operations at the airport,  
6 which severely impact the surrounding communities, is  
7 not acceptable. There are health effects. There are  
8 quality of life issues that all need to be addressed.  
9 This is why the communities need to be involved as well  
10 as the FAA, and the FAA does need to have far more  
11 control over how the airlines are used in the airports.  
12 Thank you.

13 MS. BAIN: Mr. Weiss again. Brian Weiss.

14 MR. WEISS: Brian Weiss, 8836 Croydon, Westchester,  
15 California 90045. I would like to just continue a  
16 little bit with some thoughts as far as the legal issues  
17 regarding any actions that happen out of LAX.

18 One of the things I talked about in my  
19 previous statement was making sure that all the reports  
20 and every -- all the documents are actually signed by  
21 someone to validate that the work was done by, you know,  
22 an official company so that in the future when -- if and  
23 when there are any class action lawsuits, the airport  
24 won't be trying to figure out who it was that actually  
25 wrote some report and approved it, and why is it that

1 this report is full of bad data. And if something  
2 expansion-wise occurs, we need to have people that are  
3 definitely known to be able to be held accountable for  
4 their actions in that respect.

5 The same thing is true with many of the people  
6 that provided any of the work in any of those reports.  
7 There had been what, 40 or 50 companies that contributed  
8 to the EIR and EIS materials. My comments earlier about  
9 how one of the studies that was cited in there was  
10 just -- there were things that were just blatantly  
11 contradictory to what someone that's knowledgable in  
12 that field would know to be incorrect with respect to  
13 what average kinds of sound levels are.

14 When somebody in technical is commenting on a  
15 sound report is telling me that a noise that's between  
16 70 and 80 decibels only wakes up two people out of 100  
17 people that are sleeping, and when I know that an alarm  
18 clock is 65 decibels, you know, average maybe 65 to 75.  
19 I tested all the ones in my home at the same distance  
20 that I would be from the device when I was sleeping or  
21 for the same thing with the telephone, and they were all  
22 the way below 75 decibels. I know that my phone and  
23 alarm clock wake me up all the time. So for somebody to  
24 be in that capacity of writing a report, commenting with  
25 things that are just blatantly incorrect, it really

1 scares me to think that the City would just blindly  
2 accept all this data, and then there's no signed  
3 signatures or authority that say the report was done by  
4 somebody. And down the road we end up in some big class  
5 action lawsuit. Who's going to pay the bill for that?  
6 Is that going to be the taxpayers? The same thing on  
7 funding. Is that going to be fully funded? Anything  
8 that happens is going to be fully funded so the  
9 taxpayers don't end up bearing the burden on this. Can  
10 I be allowed to continue to speak or is there more  
11 people that want to talk? Do people want to me hear me  
12 ramble on?

13 MR. KESSLER: You could make more verbal comments or  
14 you could also write them down. You have a lot of  
15 comments directed toward the information. We would  
16 encourage you to write them down, if you would like to  
17 do that, and submit them to us if that would help also.

18 MR. WEISS: I've already submitted about 40 or 50  
19 comments with all kinds of backup data support, but I'm  
20 working on more. Okay.

21 MR. KESSLER: Okay. Thank you, Mr. Weiss.

22 MS. BAIN: Mr. Vince Cecere.

23 MR. CECERE: Yes. We're back. I'll take a chair.

24 (Demonstration was done.)

25 MS. BAIN: Thank you. Do we have any more comment

1 cards? There are more comment cards at the sign-in  
2 desk. If you want to continue with your comments,  
3 please fill out another card, and we will call your  
4 name. Cecil Corpio.

5 MS. CORPIO: Cecil Corpio, resident of Inglewood.  
6 This is short. This is an interesting opportunity to  
7 have an official monologue with the FAA and LAWA. And  
8 I'll use it as such.

9 The presentation we just have seen reminds me  
10 of the first thing I thought of after the September 11th  
11 attacks. And, basically, how much safety and how much  
12 security are we really going to ask for? Tooth brushes,  
13 pencils, Popsicle sticks, they are all lethal weapons  
14 when someone knows how to use them. In the same light,  
15 eyeglasses, take off your eyeglasses, break out the  
16 glasses and you have a sharp object. How far do we go  
17 when it comes to what do we let on an airplane? So we  
18 really have to think about just how much security is  
19 enough. When is safety brought to the point where it's  
20 just ludicrous and it's more about bringing fear into  
21 the hearts of people rather than a sense of safety?

22 So I hope to see LAWA and the FAA working  
23 together along with the community to really, truly  
24 address the issues of what is -- how much safety is  
25 needed, how much security is needed and what price are

1 we going to pay for the safety and security. Remember,  
2 what we're trying to do is get the people to feel  
3 confident in the system again, and so trying to  
4 alleviate worries that nothing is 100 percent safe. So  
5 let's realize that and just try to do what we can.

6 I'm just going to waste a little time and say,  
7 remember, this gentleman just showed a toothbrush, a  
8 hairbrush, not even a fingernail file is necessary.  
9 When somebody wants to do a little harm or a lot of  
10 harm, there are a lot of avenues that can be taken. So  
11 it is a matter of more education, perhaps for the public  
12 who is using the airways, as well as any other  
13 transportation mode. Thank you for the time again.

14 MS. BAIN: Thank you. Brian Weiss, please.

15 MR. WEISS: Brian Weiss, 8836 Croydon, Westchester,  
16 California 90045.

17 With respect to any kind of project that goes  
18 on at LAX, one of the concerns I have is that as a  
19 taxpayer, I don't want some project that starts and gets  
20 halfway completed and then some event happens like the  
21 recent terrorist attack that all of a sudden causes a  
22 huge drop in traffic. I don't know what the actual  
23 number is. I hear numbers out of the news and from out  
24 of LAX that says travel is down some 30 percent. I  
25 think it's almost the inverse of that. I hardly hear

1 any planes over there. I flew out of there last week  
2 myself to Canada and, you know, there was hardly anybody  
3 there. It was like a ghost town.

4 So how does the City mitigate an expenditure  
5 like that when they get committed -- partway committed  
6 into a project? Is this going to be something that is  
7 fully funded and fully guaranteed to have the funds to  
8 be able to cover whatever kind of costs would occur  
9 prior to the start of the project? Because it's obvious  
10 that you can't rely on many passenger revenue and  
11 landing fees and concession fees in order to fund some  
12 type of project. Who's going to really underwrite all  
13 that? Is it just bonds or are you able to sell 12  
14 billion dollars worth of bonds up front in order to  
15 fully guarantee and assure the people of the community  
16 that it will be able to be completed. That's one of my  
17 big concerns.

18 And then, along with that, the mitigation of  
19 any problems down the road -- you know, there's been all  
20 these studies done. I've commented in my previous  
21 comments that when there's apparently no assigned  
22 responsibility or somebody that authenticates that the  
23 test -- all the tests were valid and certification from  
24 the testing, the agencies and authorities, calibration  
25 certificates that prove that all the instrumentation and

1 everything used that was done in the course of their  
2 study was within calibration guidelines.

3 Today many of the companies that do this type  
4 of work, they are ISO certified, which means they have  
5 processes in place within their company that assures  
6 that things are done in accordance with procedures. And  
7 the report, you know, it was basically a synopsis of  
8 what came out of the result of all of this. I guess the  
9 City boiled that down.

10 My question is, is the City then taking a  
11 responsibility for the correctness of all of that  
12 information that was provided therein because that's the  
13 legal issue that five years, ten years after a project  
14 is done and all the lawsuits are -- how is that going to  
15 be sorted out and who is going to have to pay the brunt  
16 of that? Is that taxpayers as a result of having  
17 incomplete information or is all that information  
18 available? Can I review that information? Is there  
19 some place I can go to review it because it's not in the  
20 21 volumes of the EIR, EIS that I've seen? Thank you.

21 MS. BAIN: Thank you. We have no other cards right  
22 now. We will take another 15-minute break and reconvene  
23 at 12:20 -- 12:20 now. We'll reconvene at 12:35.

24 (Recess was taken.)

25 MS. BAIN: We're about to reconvene the public

1 comment portion of this hearing. If we could get  
2 everyone to take their seats. I will call the names of  
3 the cards we receive. Please don't forget we do have  
4 these comment cards at the sign-in desk. They are still  
5 available for you to fill out your name and address so I  
6 can call your name for your oral comments. If you do  
7 not wish to make an oral comment, you're welcome to put  
8 it provide comments in.

9 We're about to begin public comment session.  
10 If I could have Christopher Weiss -- if you could give  
11 me one second Christopher. I'm going to repeat how the  
12 timer works. We have three minutes. You can look at  
13 the timer. Your time will start winding down. When you  
14 hear the beeping sound, it means your time has expired.  
15 When you come to the mike, will you please state your  
16 name and spell your last name for the record so the  
17 court reporter sitting there can get everything down.  
18 Christopher Weiss.

19 MR. WEISS: My name is Christopher Weiss. And I  
20 don't want to move away from my friends. And they are  
21 going to take a lot of houses. And they are going to  
22 take a lot of houses. And they are also going to take  
23 a lot of money away from us. If they -- they are going  
24 to make us move. They are going to have to give us all  
25 the money to buy the next house.

1 MS. BAIN: Thank you. Mr. Kessler and Mr. Ritchie  
2 just had to make some brief introductory remarks because  
3 we do have some new people here.

4 MR. KESSLER: Good morning, ladies and gentlemen.  
5 My name is David Kessler. I'm an Airport Planner from  
6 the Federal Aviation Administration, Western-Pacific  
7 Region. I would like to welcome you to the sixth of a  
8 total of nine public hearings the FAA and the City of  
9 Los Angeles are conducting for the Draft Environmental  
10 Impact Statement, Environmental Impact Report or EIS/EIR  
11 for the proposed Master Plan at Los Angeles  
12 International Airport.

13 The first three public hearings on this topic  
14 were held on Saturday, June 9th in Inglewood, Manhattan  
15 Beach and Westchester. The fourth and fifth were held  
16 this past week in Monterey Park and San Pedro. Today's  
17 hearing is the third of six additional hearings being  
18 held this week and next week. These hearings were  
19 originally scheduled for early September, however, they  
20 were postponed due to terrorist attacks in New York and  
21 Washington, D.C. The next hearing will be held on  
22 Monday evening, November 5th at Palmdale Regional  
23 Airport in Palmdale.

24 The purpose of these hearings is to collect  
25 comments from the general public concerning the adequacy

1 and the information disclosed in the Draft EIS/EIR. The  
2 FAA and the City of Los Angeles along with the Federal  
3 Highway Administration, as a cooperating agency, have  
4 prepared the Draft EIS/EIR.

5 I would like to take this opportunity to make  
6 sure that everyone understands that no decisions will be  
7 made today regarding the proposed project. Today's  
8 hearing is not a question-and-answer type of forum. Our  
9 job is to listen to what you have to say about the  
10 adequacy of the information in the Draft EIS/EIR. In  
11 other words, it is your turn to talk to us. Since we  
12 are here to listen, we are not going to respond to  
13 questions about the pros and cons of the proposed  
14 project. Since 9:00 o'clock this morning, the City has  
15 held a public workshop just outside of this room for  
16 anyone to ask questions about the Master Plan, the  
17 environmental process and the various proposed projects.

18 Following publication of the Draft EIS/EIR for  
19 comment, the next step in the joint federal and state  
20 environmental disclosure process is holding this and  
21 other public hearings during this week and next week.  
22 The environmental disclosure process for this project  
23 started in 1997 with the publication of a Notice of  
24 Intent to prepare the joint EIS/EIR in the Federal  
25 Register. In July of 1997 we held a series of meetings

1 with members of the public and governmental agencies to  
2 receive comment on the scope of the Draft EIS/EIR.  
3 Following those meetings, the Draft EIS/EIR was prepared  
4 considering the comments received during the scoping  
5 meetings and those submitted in response to the Notice  
6 of Intent. The document has also been prepared pursuant  
7 to the National Environmental Policy Act of 1969 or  
8 NEPA, the Council on Environmental Quality Regulations,  
9 which are the implementing regulations for NEPA, the  
10 California Environmental Quality Act of 1970 or CEQA and  
11 the Airport Airway Improvement Act of 1982, as amended.

12 Following today's hearings and the close of  
13 the comment period, we will then correct and revise the  
14 EIS/EIR, as necessary, based on the comments received.  
15 We will also prepare responses to the comments we  
16 receive and include those responses in the final  
17 EIS/EIR.

18 Before we begin receiving verbal comments, we  
19 would like to let you know the grounds rules of this  
20 hearing. First, as I said earlier, we are not here to  
21 respond to questions about this project. We are only  
22 here to listen to your comments and take notes. We also  
23 have a court reporter present to ensure we have an  
24 accurate transcript of this hearing.

25 For anyone who would like to speak, we will

1 ask you to fill out a speaker card, like this one, and  
2 give it to the person at the sign-in desk. That person  
3 will bring the speaker cards up to our facilitator who  
4 will call the names of each speaker so we can proceed in  
5 an orderly fashion. So that everyone gets an  
6 opportunity to provide verbal comments, everyone will  
7 get three minutes to speak. To be fair to everyone, we  
8 are not going to allow people to transfer their allotted  
9 time to someone else. I ask that when you speak, give  
10 us your name and address for the record. We also have a  
11 Spanish language translator for anyone wishing to  
12 provide comments in Spanish.

13 If there is anyone who is uncomfortable  
14 speaking in front of a group or you need more than three  
15 minutes to provide your comments, we ask you provide  
16 your comments in writing. We have comment sheets, like  
17 this one, available for your use at the sign-in desk.  
18 You can leave your comments at the sign-in desk or you  
19 can mail your written comments using the comment sheet  
20 or a letter to either address listed on the cover of the  
21 EIS/EIR. The City's address is listed at the top of the  
22 comment sheet. I would like you to understand that  
23 today's hearing what we have, a verbal comment is just  
24 as important as a written comment. So please feel free  
25 to provide any comments on the document you may have to

1 us either verbally today or in writing. Comments are  
2 due by 5:00 p.m. Pacific Standard Time on Friday,  
3 November 9th, 2001.

4 As we said earlier, we have this hearing  
5 scheduled until 1:00 today. We are prepared to stay  
6 here as long as necessary for anyone to provide verbal  
7 comments.

8 Now, I will turn the hearing back to our  
9 facilitator, Shauna Bain, to introduce Mr. Ritchie who  
10 will provide some introductory comments from the City of  
11 Los Angeles. Following Mr. Ritchie's comments, we will  
12 collect any other speaker cards and call the name of the  
13 next speaker. Thank you.

14 MS. BAIN: Thank you. Mr. Ritchie.

15 MR. RITCHIE: Thank you, Shauna. I am Jim Ritchie  
16 representing the Los Angeles World Airports. And on  
17 behalf of the City of Los Angeles, we appreciate your  
18 interest and welcome you to our public comment period.  
19 Thank you. Shauna.

20 MS. BAIN: Thank you. Ellen Weiss, please. Do you  
21 need help with that microphone?

22 MRS. WEISS: Thank you.

23 MS. BAIN: Mrs. Weiss, if you could just state your  
24 name and address for the record, we would appreciate it.  
25 And I'll start the time.

1 MRS. WEISS: My name is Ellen Weiss. I live at 8836  
2 Croydon.

3 Basically, first, the expansion was needed as  
4 it was advertised due to capacity, the large capacity of  
5 people and large planes. Now it's advertised as safety.  
6 It appears that LAX is manipulating the term to get the  
7 same results as they initially intended to do. LAX is  
8 already a target for terrorists. Now we will have a  
9 bigger target. LAX shows little concern for the  
10 surrounding area.

11 The environmental mitigation is basically to  
12 take homes, schools and whatever else lies in the path  
13 of LAX to expand. To me this does not appear to be  
14 very -- have any concern for the environment or the  
15 surrounding area. The 405 is already overcrowded.  
16 Removing the need by encouraging alternative airport use  
17 rather than adding vehicles and off-ramps will solve the  
18 problem. So, again, the point is getting people off the  
19 405 alternative directions. Going in other ways is  
20 what's going to really solve the problem. Providing  
21 off-ramps is just a symptom, and getting more people at  
22 LAX is the problem.

23 Again, expanding the LAX Airport shows the  
24 airport's lack of concern for the environment, the  
25 people who live in the surrounding area. It shows

1 disregard for its neighbors that they continue to cave  
2 into businesses, especially when there are other areas  
3 requesting airport expansion in their area. Thank you.

4 MS. BAIN: Thank you. Brian Weiss, please.

5 MR. WEISS: Brian Weiss, 8836 Croydon, Westchester,  
6 California 90045. With respect to the traffic problems  
7 that currently exist on the 405 Freeway, there needs to  
8 be extremely detailed studies done that show what the  
9 affect would be of any increased traffic for expanding  
10 capacity at LAX. Currently it takes people that live in  
11 Orange County and work in the El Segundo area -- my wife  
12 works there and those people that currently do this, it  
13 takes them many times over two hours a day to get to or  
14 from work, you know, from Orange County. Any additional  
15 capacity that's placed on LAX is only going to further  
16 increase that.

17 The figures that are cited in the report, I  
18 believe, were about 18 million annual passengers a year  
19 from Orange County. I think that's the current figures.  
20 That equates to, if you use the numbers, also, I guess,  
21 provided by, I guess it was SCAG, that was like 1.4 --  
22 or car trips per passenger, that equates to about 81,000  
23 car trips a day from people in Orange County. There  
24 just -- there isn't a good way to mitigate that traffic  
25 on the 405 Freeway. There's just way too much traffic

1 there now. And the entire report really doesn't address  
2 that. It talks about things like buses and train  
3 service and things like that, but the reality is that  
4 people in California just don't use that. And you ask  
5 yourself, why. Well, it's because the train system  
6 doesn't provide good enough coverage.

7           What Mr. Heffner said earlier, you can't take  
8 your luggage on the Green Line train. Then another  
9 person commented that it takes you a half an hour to get  
10 from the end of the train to the airport. So the  
11 reality of it is all those mass transit systems don't  
12 work. As a result, people continue to use their cars,  
13 and it's just worse and worse and worse. And the same  
14 thing with parking. As the price of parking goes up,  
15 what happens is people -- and depending on how long  
16 their trips are going to be -- will have the neighbor  
17 drive them or a friend or a spouse. All those things  
18 mean more and more traffic on the 405 Freeway.

19           Studies need to be done that will evaluate  
20 what the true impact is. When I talked to people in  
21 past meetings about the traffic impact, they tell me  
22 that they've looked at it and it -- when it gets over a  
23 peak number of cars per hour is when it just suddenly  
24 collapses into like no capacity at all or gridlock.

25           These are just some of the problems, people

1 coming from the valley have the same problems. And it's  
2 ridiculous to think that you need to expand an airport  
3 when people can't currently get there now. Thank you.

4 MS. BAIN: Thank you, Mr. Weiss. Nicholas Weiss.

5 MR. WEISS: I am Nicholas Weiss. I live at 8836  
6 Croydon. And my dad made a big LAX sign. And it's 12  
7 feet high and 24 feet long. And it says "LAX  
8 Expansion."

9 MS. BAIN: Thank you. At this time we don't have  
10 any more comment cards awaiting their oral comments.  
11 And we will sit here until some more arrive. We will be  
12 here until 1:00 o'clock. We have one more comment.  
13 Mr. Weiss, Brian Weiss.

14 MR. WEISS: Brian Weiss, 8836 Croydon, Westchester,  
15 California 90045. Continuing on with my last comment in  
16 regard to the traffic on the 405 Freeway, a lot of the  
17 assumption that is made in the EIS/EIR Report is that  
18 the traffic will be mitigated through the use of buses  
19 and commuter shuttle and things like. One of the  
20 benefits of living by the airport is you get to see what  
21 everybody's commute is like going to the airport because  
22 I leave the airport area in the morning, and I come home  
23 that night. So the typical traffic flow is just  
24 opposite that. So it serves as a really good point of  
25 reference for what the reality of traffic is like for

1 people trying to get to LAX. There are many times when  
2 the Super Shuttle buses, you know, that have a capacity  
3 of like 12 people or some number like that, there's only  
4 one or two people in them. It's basically the same  
5 thing as getting in your car and driving to the airport.  
6 They get curbside service, but other than it's just not  
7 mitigating traffic. It's just another vehicle there  
8 because it doesn't consolidate and pick up quantities of  
9 people that are going to the airport. It just happens  
10 time and time again. I fail to see how the -- you know,  
11 how any study can be accurately made that assumes what  
12 the ridership and what the usage of these things will  
13 be. The ones that seem to have the best usage are the  
14 Santa Barbara and the San Fernando Valley bus. Those  
15 have a lot better ridership. But a lot of these other  
16 buses, there just isn't the people on them.

17 The problem I have with these kinds of  
18 studies, as I've commented before, is it's just kind of  
19 a synopsis what's given in the 21 volumes. Actually,  
20 a lot of the material is repeated over and over again.  
21 There isn't enough meat in there to really be able to  
22 get into and refute. That's a concern because from my  
23 standpoint it says that the problems and the  
24 alternatives weren't really fully studied and evaluated.

25 That leads back to my other comment about the

1 risk for the City undertaking any kind of a project that  
2 isn't -- the thing hasn't fully been adequately studied  
3 and competently because California, Los Angeles  
4 especially, is a land of litigation. And there's a lot  
5 of lawyers that live in Westchester, Playa del Rey area.  
6 Some of them are kind of asleep, but if there is a north  
7 runway that changes the flight pattern and flights start  
8 flying over homes as a result of any changes, those  
9 people will be woken up and there will be lawsuits.  
10 That's why it's extremely important for these studies to  
11 be fully done properly and certified and well done so  
12 that the City doesn't put themselves at risk for giant  
13 class action lawsuits.

14 MS. BAIN: Thank you, Mr. Weiss. One last speaker,  
15 I do believe. If you could get the assistant to adjust  
16 the mike.

17 MR. WEISS: This is Christopher Weiss. I live at  
18 8836 Croydon Street and I am not -- if they move all our  
19 houses, then and I'll move away my friends.

20 MS. BAIN: Thank you.

21 MR. KESSLER: Thank you.

22 MS. BAIN: If there are no further comments -- it's  
23 about 1:05. Are there any further comments? I'll turn  
24 it over to you, Mr. Kessler.

25 MR. KESSLER: Thank you. I want to thank everyone

1 for providing comments today. I'll ask if there's  
2 anybody else who has not had an opportunity to provide  
3 verbal comments? Not seeing anyone, I'll remind you  
4 that if you feel you're unable to provide us with verbal  
5 comments today, we will be accepting written comments  
6 until 5:00 p.m. Pacific Standard Time, Friday, November  
7 9th, 2001. You can mail your comments either to me at  
8 the FAA or to Jim Ritchie at the City of Los Angeles.  
9 Mailing addresses are listed on the cover of the  
10 EIS/EIR.

11 I want to thank everyone for your comments  
12 today. This public hearing for the Draft EIS/EIR for  
13 the Los Angeles International Airport is now closed.

14 (Whereupon the proceeding adjourned  
15 at 1:06 o'clock p.m.)

**U.S. DEPARTMENT OF TRANSPORTATION  
Federal Aviation Administration**

**Los Angeles International Airport  
Los Angeles, California**

**Draft Environmental Impact Statement/Environmental Impact Report  
Public Hearing Remarks**

**Saturday, November 3, 2001**

**Los Angeles High School  
Mid-Wilshire District of Los Angeles**

**David B. Kessler  
Environmental Protection Specialist**

Good morning ladies and gentlemen, my name is David Kessler; I'm an Airport Planner from the Federal Aviation Administration, Western-Pacific Region. I would like to welcome you to the 6<sup>th</sup> of a total of nine Public Hearings the FAA and the city of Los Angeles are conducting for the Draft Environmental Impact Statement/ Environmental Impact Report or EIS/EIR for the proposed master plan at Los Angeles International Airport. The first three public hearings on this topic were held on Saturday, June 9<sup>th</sup> in Inglewood, Manhattan Beach, and Westchester. The fourth and fifth were held this past week in Monterey Park and San Pedro. Today's hearing is the third of six additional hearings being held this week and next week. These hearings were originally scheduled for early September; however, they were postponed due to the terrorist attacks in New York and Washington, D.C. The next hearing will be held on Monday evening, November 5th at Palmdale Regional Airport in Palmdale.

The purpose of these hearings is to collect comments from the general public concerning the adequacy of the information disclosed in the Draft EIS/EIR. The FAA and the City of Los Angeles along with the Federal Highway Administration as a cooperating agency have prepared the Draft EIS/EIR.

I would like to take this opportunity to make sure that everyone understands that **NO** decisions will be made today regarding the proposed project. Today's hearing is **not** a question and answer type of forum. Our job is to listen to what you have to say about the adequacy of the information in the Draft EIS/EIR. In other words, it's your turn to

talk to us. Since we are here to listen, we are not going to respond to questions about the pros and cons of the proposed project. Since 9 o'clock this morning, the city has held a public workshop just outside of this room for anyone to ask questions about the master plan, the environmental process and the various proposed projects.

Following publication of the Draft EIS/EIR for comment, the next step in the joint federal and state environmental disclosure process is holding this and the other public hearings during this week and next week. The environmental disclosure process for this project began in 1997 with the publication of a Notice of Intent to prepare the joint EIS/EIR in the *Federal Register*. In July of 1997, we held a series of meetings with members of the public and governmental agencies to receive comments on the scope of the Draft EIS/EIR. Following those meetings, the Draft EIS/EIR was prepared considering the comments received during the scoping meetings and those submitted in response to the Notice of Intent. The document has also been prepared pursuant to the National Environmental Policy Act of 1969 or "NEPA", the Council on Environmental Quality Regulations, which are the implementing regulations for NEPA, the California Environmental Quality Act of 1970 or "CEQA", and the Airport and Airway Improvement Act of 1982, as amended.

Following today's hearings and the close of the comment period, we will then correct, and revise the EIS/EIR as necessary based on the comments received. We will also prepare responses to the comments we receive and include those responses in the **Final EIS/EIR**.

Before we begin receiving verbal comments, we would like to let you know the ground rules of this hearing. First, as I said earlier, we are not here to respond to questions about this project. We are only here to listen to your comments and take notes. We also have a court reporter present to ensure that we have an accurate transcript of this hearing.

For anyone who would like to speak, we ask you to fill out a speaker card, **like this one** and give it to the person at the sign in desk. That person will bring the speaker cards up to our facilitator who will call the names of each speaker so we can proceed in an

orderly fashion. So that everyone gets an opportunity to provide verbal comments, everyone will get three minutes to speak. To be fair to everyone, we are not going to allow people to transfer their allotted time to someone else. I ask that when you speak, you give us your name and address for the record. We also have a Spanish language translator for anyone wishing to provide comments in Spanish.

If there is anyone who uncomfortable speaking in front of a group or if you need more than three minutes to provide your comments, we ask that you provide your comments in writing. We have comment sheets, **like this one**, available for your use at the sign-in desk. You can leave your comments at the sign in desk, or you can mail your written comments using the comment sheet or a letter to either address listed on the cover of the EIS/EIR. The city's address is listed at the top of the comment sheet. I would like you to understand that a verbal comment is just as important as a written comment. So please feel free to provide any comments on the document you may have to us either verbally today, or in writing. Comments are due by **5:00 p.m., Pacific Standard Time, on Friday, November 9, 2001.**

Lastly I would like everyone to know that even though we have this hearing scheduled until 1 o'clock this afternoon, we will stay here as long as necessary for everyone to get a chance to provide verbal comments on the Draft EIS/EIR. As I said earlier, our job here today is to listen to your comments.

Now, I will return the Hearing back to our facilitator, **Shauna Bain**, to introduce Mr. Ritchie who will provide some introductory comments from the city of Los Angeles. Following Mr. Ritchie's comments, we will collect the speaker cards and call the name of the first speaker.

Thank you.

Is there any one else who has not had an opportunity to speak concerning the information in the Draft EIR/EIS? **[wait for anyone to speak up]** Not seeing anyone else, I will remind everyone that if you feel that you are unable to provide us with verbal comments, today, we will be accepting written comments until 5:00 p.m. Pacific Standard Time, Friday, November 9, 2001. You can mail your comments either to me at the FAA or to Jim Ritchie with the City of Los Angeles. The mailing addresses are listed on the cover of the EIS/EIR. I want to thank everyone for your comments today, this public hearing for the Draft EIR/EIS at Los Angeles International Airport is now concluded.

12 May 2001

Dear Mayor Riordan,

We are 2 artists who are lucky enough to own a house and studio in Venice. We moved here (in 1993) because it was quiet, had good air and was close to the ocean... a good environment to create in. The coast of Southern California is one of the best places in the world to live...we are privileged and don't take it for granted. About 3 years ago in August when we usually sleep with the windows open, all of a sudden during the whole night there was a constant roaring sound and vibration very much like a continuous thunder. We found out later after many calls that some "Class-B airspace had been opened up over our area." We live about 20 minutes north of LAX and it often keeps us awake all night. Closing the windows doesn't help enough...and soundproofing with dual-glazing is effective only if you don't open your windows and never spend time outside in your yard. But this is S. California! Now they've added a couple of flight patterns over our area during the day and a dreadful holding pattern at night. It's definitely been getting worse...and this is WITHOUT EXPANSION!

We had always supported you as mayor until now. It is so hard to believe that the "compassionate conservative" could not only allow but actually promote and support the expansion of LAX. It is going to have such an obviously negative impact on so many residents...not only the noise but the traffic and pollution will be unbearable. Have you tried driving down Lincoln Blvd. lately? It's uncomfortably packed almost all the time. And this is not to mention the effect on our property value. There must not be any flight patterns over your homes or you would never consider this project. We are miles away. Think how it is for the residents that live closer? We invite you to spend a few days with us to get a real flavor of what it's like. We are unfortunately also under a flight pattern from Santa Monica airport, but we are very aware of the differences between those flights and those of LAX. They at least are not asking to double their size.

The major airports around the world are outside of town...it always takes at least 1/2 - 1 1/2 hrs to get into the city. This doesn't seem to interfere with people traveling. Palmdale WANTS IT! That's important. All we need is quick transportation...like a high speed monorail for instance.

It is still so hard to believe you can view yourself as compassionate...compassion for big business is all we can see in your eyes. Our peaceful lifestyle is being threatened and we are very concerned and upset about that. For us it has canceled out all the good you've done. Hopefully you will actually read this and maybe even reply.

Sincerely,

Lies Kraal and Judi Russell 310/305-8710 boaconstruction@mediaone.net

I have always been confused about why common sense is called common sense as it just does not appear to be very common. I am at a loss to understand how the expansion of LAX or the increase of traffic through LAX and surrounds could make any sense to any one. The following are just a few of the obvious reasons why this whole Master Plan and any considered incremental additions are in no way advantages to the local public.

Most people who live close to the airport fall into the lower income bracket. The reasons for this are obvious – people with money will buy and rent in areas as far from the airport as possible.

If residents of the LAX area are displaced, where can they go and what can they afford to buy or rent?

In a time when there is a resurgence of gangs in LA probably due to poor education, dilapidated school buildings, lack of cohesiveness in the city, how can we justify subjecting youngsters in these areas to more pollution. This pollution takes many forms: poor air quality, additional noise, disregard for our fellow citizen, and the worst pollution of all - the haves vs the have-nots. Do you think we would be having this debate if the airport backed up to Brentwood or Bel Air?

I don't know if there is any scientific evidence, but I would guess that living in an environment filled with the above mentioned pollutions and violations of human needs must surely result in psychological despair. Again, it appears to be an overpowering of the less advantaged.

I would like each of you to take a moment and reflect how you would feel about your children being forced to live in an environment that is not in their best interest. What kind of message do you think that would send to them and how do you think it would affect their self-esteem and their attitude towards society? Are we trying to further polarize our city or can we adopt a policy of sanity that is in the best interest of ALL of our citizens.

Orange County and El Toro can and must handle their own residents' air travel needs and not expect Los Angeles to carry the whole load. It's not right, it's not fair and it certainly makes no sense, common or otherwise.

Sincerely,  
Anne Clark

**Official Hearing Transcript  
Palmdale Regional Airport  
Palmdale, California  
Monday, November 5, 2001**

Following this page is the transcript of the oral testimony taken at the above hearing. Each speaker at the hearing has been assigned a unique identification number. The numbers assigned to each speaker for this hearing are:

<b>Number</b>	<b>Speaker</b>	<b>Affiliation</b>

3 ---oOo---

4  
5 MS. BAIN: Good evening, ladies and gentlemen, if we  
6 can have your attention. We are about to begin our  
7 public comment portion this evening. And I would like  
8 everyone to take a seat. We're going to begin shortly.  
9 My name is Shauna Bain. I will be your facilitator this  
10 evening. We have Mr. Richard Dykas from the FAA and Mr.  
11 Jim Ritchie, deputy executive director of Los Angeles  
12 World Airports.

13 MR. DYKAS: Good evening, ladies and gentlemen. My  
14 name is Richard Dykas. I'm an airport planner from the  
15 Federal Aviation Administration Western-Pacific Region.  
16 I would like to welcome you to the seventh of a total of  
17 nine public hearings the FAA and the City of Los Angeles  
18 are conducting for the Draft Environmental Impact  
19 Statement, Environmental Impact Report for EIS/EIR for  
20 the proposed Master Plan of the Los Angeles National  
21 Airport. The first three public hearings on this topic  
22 were held on Saturday, June 9th in Inglewood, Manhattan  
23 Beach and Westchester. Pubic hearings on the Draft  
24 EIS/EIR were held last week in Monterey Park, San Pedro  
25 and the Mid-Wilshire District of the City of

1 Los Angeles. Today's hearing is the fourth of six  
2 additional hearings that began last week and will be  
3 completed this week. These hearings were originally  
4 scheduled for early September; however, they were  
5 postponed due to terrorist attacks of New York and  
6 Washington D.C. The next hearing will be held on  
7 Wednesday, November 7th at the Ontario Airport Marriott,  
8 located at 2200 East Holt Boulevard in Ontario.

9 The purpose of these hearings is to collect  
10 comments from the general public concerning the adequacy  
11 of the information disclosed in the Draft EIS/EIR. The  
12 FAA and City of Los Angeles along with the Federal  
13 Highway Administration as a cooperating agency have  
14 prepared the Draft EIS/EIR.

15 I would like to take this opportunity to make  
16 sure that everyone understands that no decisions will be  
17 made today regarding the proposed project. Today's  
18 hearing is not a question-and-answer type of forum. Our  
19 job is to listen to what you have to say about the  
20 adequacy of the information in the Draft EIS/EIR. In  
21 other words, it is your turn to talk to us. Since we're  
22 here to listen, we're not going to respond to questions  
23 about the pros and cons of the proposed project. Since  
24 5:00 this afternoon the city has held a public workshop  
25 for anyone to ask questions about the Master Plan, the

1 environmental process and the various proposed projects.

2           Following publication of the Draft EIS/EIR for  
3 public comment, the next step in the joint federal and  
4 state environmental disclosure process is holding this  
5 and the other public hearings during this week and next  
6 week. The environmental disclosure process for this  
7 project began in 1997 with a publication of the Notice  
8 of Intent to prepare the joint EIS/EIR in the Federal  
9 Register. In July of 1997 we held a series of meetings  
10 with members of the public and governmental agencies to  
11 receive comments on the scope of the Draft EIS/EIR.  
12 Following these meetings, the Draft EIS/EIR was prepared  
13 considering the comments received during the scope of  
14 the meetings and those submitted in response to the  
15 Notice of Intent. The document has also been prepared  
16 pursuant to the National Environmental Policy Act of  
17 1969, or NEPA, the Council on Environmental Quality  
18 Regulations which are the implementing regulations for  
19 NEPA, the California Environmental Quality Act of 1970,  
20 or CEQA, and the Airport and Airway Improvement Act of  
21 1982, as amended.

22           Following today's hearings and the close of  
23 the comment period, we will then correct and revise the  
24 EIS/EIR as necessary based upon comments received. We  
25 will also prepare responses to the comments we receive

1 and include those responses in the final EIS/EIR.

2 Before we begin receiving verbal comments, we want to  
3 let you know the ground rules of this hearing.

4 First, as I said earlier, we're not here to  
5 respond to questions about this project. We're only  
6 here to listen to your comments and take notes. We also  
7 have a court reporter present to ensure that we have an  
8 accurate transcript of this hearing. For anyone who  
9 would like to speak, we ask that you fill out a speaker  
10 card, like this one, and give it to the person at the  
11 sign-in desk. That person will bring the speaker cards  
12 up to our facilitator who will call the names of each  
13 speaker so we can proceed in an orderly fashion. So  
14 that everyone gets an opportunity to provide verbal  
15 comments, everyone will get three minutes to speak. To  
16 be fair to everyone, we are not going to allow people to  
17 transfer their allotted time to someone else. I ask  
18 that when you speak, you give us your name and address  
19 for the record. We also have a Spanish language  
20 translator for anyone wishing to provide comments in  
21 Spanish.

22 If there is anyone who is uncomfortable  
23 speaking in front of a group or if you need more than  
24 three minutes to provide your comments, we ask that you  
25 provide your comments in writing. We have comment

1 sheets, like this one, available for your use at the  
2 sign-in desk. You can leave your comments at the  
3 sign-in desk or you can mail your written comments using  
4 the comment sheet or a letter to either address listed  
5 on the cover of the Draft EIS/EIR. The city's address  
6 is also listed at the top of the comment sheet. I would  
7 like you to understand that a verbal comment is just as  
8 important as a written comment. So please feel free to  
9 provide any comments on the document you may have to us  
10 either verbally today or in writing. Comments are due  
11 by 5:00 p.m. Pacific Standard Time on Friday, November  
12 9, 2001.

13 Lastly, I would like everyone to know that  
14 even though we have this meeting scheduled until 9:00  
15 this evening, we will stay here as long as necessary for  
16 everyone to get a chance to provide verbal comments on  
17 the Draft EIS/EIR. As I said earlier, our job here  
18 today is to listen to your comments.

19 Now, I will return the hearing back over to  
20 the facilitator, Shauna Bain, to introduce Mr. Ritchie  
21 who will provide some introductory comments from the  
22 City of Los Angeles. Following Mr. Ritchie's comments,  
23 we will collect the speaker cards and call the name of  
24 the first speaker. Thank you.

25 (The statement submitted for the

1 record was marked as Statement 1.)

2 MS. BAIN: Thank you. Mr. Jim Ritchie, deputy  
3 executive director of Los Angeles World Airports, he has  
4 brief introductory remarks for you. Then he will turn  
5 it back over to me. I will give you some verbiage of  
6 how the timer works and all that good stuff.

7 Mr. Ritchie.

8 MR. RITCHIE: Thank you, Shauna. It's a pleasure to  
9 see all of our friends at Palmdale, particularly city  
10 officials tonight, a lot of friends that we've developed  
11 over our tenure at Palmdale Regional Airport. Of  
12 course, Brandon opened up the terminal. I would ask  
13 them where the airplanes are, but we will work on that  
14 at a different time. Seriously, thank you, Staff, for  
15 putting together this public hearing tonight. We  
16 welcome your comments.

17 My prepared comments are, as you know, we have  
18 received guidance from our mayor to expand opportunities  
19 for public input into the LAX Master Plan process. And  
20 tonight we will receive your comments. More recently  
21 the mayor identified a number of objectives to be  
22 incorporated into another alternative for the future  
23 planning of LAX. On November the 9th the next Friday --  
24 or this Friday, the public comment period will close.  
25 After the close of the public comment period, we will

1 incorporate the mayor's guidance along with other  
2 comments received from forums, like this tonight, into  
3 the development of a new alternative. This alternative  
4 will undergo the same rigorous analysis, as the previous  
5 alternatives did, and a supplemental environmental  
6 document will be distributed for future public review  
7 and comment. Very likely the development of this new  
8 alternative will necessitate another public hearing to  
9 comment on this new alternative as we finalize the  
10 environmental process, to put those formal comments in  
11 plain speech, if you will, because I know there has been  
12 confusion from previous public hearings.

13 Had not the events of September 11th occurred,  
14 these public hearings would have already occurred and  
15 comments would have been made on the previous plan. The  
16 mayor at the time rightfully cancelled those public  
17 hearings and rescheduled them, the process, being,  
18 requiring 30 days notification. Here we are 30 days out  
19 having public hearings on an event that occurred -- that  
20 was triggered from September 11th. So while we're  
21 following the process, you will see as we accumulate  
22 comments from groups like this, as you're aware, the  
23 mayor has given us some definitive guidance on how to  
24 improve safety and security at LAX. We will take those  
25 two sets of comments and guidance and merge them into

1 the existing process with the development of a new  
2 alternative. That new alternative, some of you might  
3 say, "Well why isn't it here tonight? Why can't we  
4 comment on it?" It's not developed. That's the reason  
5 we will repeat this forum at a later date, probably not  
6 until the summer as that new alternative comes together.

7 We are excited about the refinements and the  
8 opportunities to modernize LAX. We would like to hear  
9 from you this evening on just how to do that. Shauna,  
10 can we proceed?

11 MS. BAIN: Sure can. Thank you. Just to reiterate  
12 a couple of the ground rules, again my name is Shauna  
13 Bain. I'm the facilitator. Everyone gets three minutes  
14 to make their comments. That's just to ensure everyone  
15 gets the opportunity to speak and some of us can go home  
16 for dinner hopefully before midnight.

17 I will call the names of three speakers. You  
18 can proceed your way to the front. In the order that I  
19 call your name, that's the order I would like you to  
20 speak. If you speak your name loudly and clearly, as  
21 slowly as possible for the court reporters and give your  
22 address, we would appreciate it. If your name is  
23 difficult to spell or somebody may not figure out how to  
24 spell it, usually if you could spell your name as well,  
25 that would help the court reporters greatly. If you are

1 reading from something you prepared or you have written  
2 comments as well that you would like to include as part  
3 of your public oral comment, if you could provide those  
4 to the court reporters, that would help them with their  
5 transcripts.

6           Once your time begins, which is after you  
7 stated your name and address, I will start the timer.  
8 When you have a minute left, you will see the yellow  
9 light on the timer. Can everyone see the timer? You  
10 will see a yellow light flash. When your time has  
11 expired, you'll hear a beep tone. At that time we would  
12 like you to wrap up, if possible. If you feel that  
13 three minutes isn't enough, please feel free to fill out  
14 one of these forms and provide your comments in a  
15 written fashion. They are weighed in the same manner as  
16 the oral comments. With that, I will call the first  
17 three names. That's Robert, a wonderful coordinator.  
18 Can I have Kathleen Burr, please? And after that, we'll  
19 have Harvey Holloway and Ron Emard.

20           MS. BURR: Kathleen Burr, executive manager of the  
21 Los Angeles County Farm Bureau, 1006 West Lancaster  
22 Boulevard in Lancaster. I prepared a written statement.

23           As you know, Palmdale Regional Airport sits on  
24 approximately 17,000-plus acres of land, which according  
25 to the airport agriculture people 8,000 to 10,000 acres

1 could be potential agricultural leases. Even though our  
2 area is growing by leaps and bounds, we are still a  
3 rural community with a huge emphasis on agriculture.  
4 Agriculture jobs in Los Angeles County comprise jobs of  
5 production, transportation, processing, marketing, and  
6 the farmer and rancher. The state of California  
7 produces half of all the nation's fruits and vegetables,  
8 nuts, not to forget the best alfalfa in the United  
9 States is produced right here in the Antelope Valley.

10 78 percent of wildlife species occupy private  
11 lands with over 90 percent of listed species relying  
12 partially on private lands for survival. And a vast  
13 majority of these private lands are owned by the farmers  
14 and ranchers. No one is more interested in maintaining  
15 the integrity of the land and the health of our water  
16 resources than those who directly rely on these  
17 resources for their livelihoods. The farmers and  
18 ranchers, who in some cases are second and third  
19 generations, preserve the integrity for their children.

20 Maintaining an adequate water source is utmost  
21 on everyone's minds, but there are options that have  
22 been on the planning table for several years. It is a  
23 shame to let the potential income for not only the  
24 airport, but the farmers and ranchers who provide a  
25 multitude of jobs, go to waste because those who make

1 the decision may not fully comprehend the issues facing  
2 agriculture and/or the potential they hold in their  
3 hands. They do not realize the regulations that each  
4 grower must adhere to. They do not realize that just  
5 because it is cheaper to import a crop from another  
6 country -- that country does not impose the same safe  
7 growing regulations that are imposed on us. They do not  
8 adhere to the same health standards we do.

9 And I feel these are issues that need to be  
10 looked into and understood fully before -- a finger is  
11 always pointed at our agriculture stating, "You are the  
12 problem." The loudest proponent is the one that does not  
13 fully understand the issues.

14 I can only see the potential for agriculture  
15 leases. I would be happy to host the LAWA members to  
16 spend the day with me talking to the farmers and  
17 ranchers in the area. If there are problems or unknown  
18 financial factors, compromises can be reached, issues  
19 can be worked out and problems solved. I think you  
20 would be surprised at the number of farmers, ranchers,  
21 agriculture-related businesses in Los Angeles County.  
22 It is a shame not to promote agriculture and promote it  
23 here. Thank you for the time to speak, and I look  
24 forward to hosting the Airport Board in the future.

25 (The statement submitted for the

1 record was marked as Statement 2.)

2 MS. BAIN: Thank you. Harvey Holloway.

3 MR. HOLLOWAY: I'm Harvey Holloway with the Greater  
4 Antelope Valley -- excuse me, just the Antelope Valley  
5 Chamber of Commerce, 4202 10th Street West, Suite Number  
6 E, Lancaster 93534.

7 The Antelope Valley Chamber of Commerce  
8 supports a regional approach to resolving the issue of  
9 increasing air capacity in Southern California. A  
10 regional airport approach that would include the  
11 utilization of this facility here in Palmdale could  
12 better serve the flying public than any type of  
13 expansion at LAX.

14 There is a legitimate concern that adding  
15 additional air traffic, arriving and departing from LAX,  
16 could infringe on the safety of those flights. No  
17 matter what changes are made on the ground, there is  
18 still a fixed amount of airspace available. And by  
19 adding more traffic into this fixed area, the odds of a  
20 major catastrophe will increase. Palmdale is capable of  
21 managing an increase in air traffic without decreasing  
22 safety, and utilization of our airport could provide the  
23 airspace around L.A. -- around Los Angeles -- actually,  
24 the whole basin with some much needed relief.

25 Palmdale Regional Airport features this

1 terminal and capability of handling up to 300,000  
2 passengers annually. This facility could be used to  
3 establish a pattern of airline service into Palmdale.  
4 And as passenger traffic increases, Los Angeles World  
5 Airports already owns the adjacent property just under  
6 18,000 acres that is available for development.

7 Palmdale Airport would serve a far greater  
8 geographic area than just the Antelope Valley.  
9 According to a study by the Los Angeles International  
10 Airport Expansion Task Force, using Palmdale Airport  
11 could save an average of 35 minutes for passengers that  
12 live an equal distance from Palmdale and LAX. Flight  
13 delays and airport closures due to fog would be  
14 virtually eliminated. Palmdale would quickly become the  
15 airport of choice for the millions of people that reside  
16 within a proximity that would allow them to take  
17 advantage of our airport.

18 A regional approach that includes Palmdale  
19 Airport is vital to improving passenger and cargo  
20 movement in Southern California. If the Los Angeles  
21 World Airports continues to defer the utilization of  
22 Palmdale Airport, we would urge their consideration of a  
23 "friendly takeover" of this facility by the Southern  
24 California Regional Airport Authority. This action  
25 could allow Palmdale Airport to become part of the

1 solution rather than an untapped asset.

2 On behalf of Antelope Valley Chamber of  
3 Commerce and the millions of people that could utilize  
4 Palmdale Airport, I urge you to focus on a regional  
5 approach in resolving the need for increased air  
6 capacity in Southern California. Thank you.

7 (The statement submitted for the  
8 record was marked as Statement 3.)

9 MS. BAIN: Thank you. Ron Emard. Is Mr. Emard  
10 here? Roger Ziemer. After Mr. Ziemer, Garry Cope.

11 MR. ZIEMER: My name is Roger Ziemer. It's spelled  
12 Z-i-e-m-e-r. I live at 32748 Dorama Avenue, Acton,  
13 93510. I have a prepared statement and have a copy for  
14 your use.

15 First of all, I would like to thank you for  
16 the opportunity to speak for the group. As a homeowner  
17 and a citizen of the area for quite some time, I'm very  
18 interested in the betterment of this valley.

19 The terrorist attacks of September 11th, 2001  
20 had a profound impact on the airline industry and the  
21 flying public. I understand the LAX expansion  
22 priorities have shifted from expansion to safety and  
23 security elements as identified by Mr. -- by the Mayor  
24 Hahn. However, caution needs to be exercised when  
25 considering any changes to the existing LAX-EIR proposal

1 that is going to have fundamental changes without a good  
2 public and professional input.

3 As a private citizen I find it difficult to  
4 rally around proposed changes for LAX and its expansion  
5 without first having an opportunity to review the  
6 details of the proposed changes. Without seeing details  
7 of the proposed changes to the LAX plan, there really is  
8 nothing to discuss. On the other hand, the option that  
9 includes the proposed Palmdale Regional Airport is a  
10 logical alternative and requires a serious  
11 consideration.

12 The traffic getting to and from LAX using the  
13 405 San Diego Freeway is awful, say nothing for the --  
14 or about the difficulties of getting in and out of LAX  
15 itself. Just as an example, last month I had an  
16 opportunity to host a group of people in downtown  
17 Los Angeles at the Biltmore Hotel. And one of my guests  
18 coming in from Brentwood had to travel -- it took him,  
19 rather, an hour and a half just to get from the  
20 Brentwood area. Another guest traveled from Encino  
21 using the 405 and had a similar story. Traffic  
22 congestion on the 405 at any time day or night requires  
23 that I consider other airport locations for my personal  
24 and business and travel.

25 I believe the ever-expanding borders of the

1 San Fernando Valley, Santa Clarita and Antelope Valleys  
2 would support a more conveniently located Regional  
3 Airport located in Palmdale. Long-term major airline  
4 lease agreements and a commitment towards future growth  
5 would be essential to the success of a regional airport  
6 in Palmdale.

7 In addition, the FAA or an appropriate airport  
8 authority needs to make commitments to conduct and  
9 operate a safe and modern airport facility here in  
10 Palmdale. I would recommend an aggressive advertising  
11 campaign promoting the benefits of traveling from the  
12 Palmdale Regional Airport versus having to navigate the  
13 certain freeways leading to Los Angeles Airport.

14 The Antelope Valley with its available land  
15 and receptive communities would welcome support of a  
16 regional airport. With few exceptions, Los Angeles  
17 County has run out of available open space that  
18 qualifies for open airport construction.

19 In conclusion, I would like you to take into  
20 account the Lockheed-Martin JSF Contract Agreement, the  
21 existing enterprise-zone benefits, the availability of  
22 an aerospace labor force, the expanded and improved I-14  
23 Antelope Valley Freeway, a receptive community and local  
24 governments, and the existence of Plant 42 airport  
25 facilities that are proposed -- rather, that are

1 proposed for the airport location. I would like to  
2 thank you very much.

3 (The statement submitted for the  
4 record was marked as Statement 4.)

5 MS. BAIN: Thank you. Mr. Garry Cope.

6 MR. COPE: My name is Garry Cope. I'm an applicant  
7 for the Palmdale City Council. I live at 38008 12th  
8 Street, East Palmdale, California 93550-5354.

9 In Palmdale here the regional airport has been  
10 a buzzword issue for many, many years. We need to do  
11 something or stop talking about it and just let it drop  
12 and die.

13 I'm for a regional airport if the  
14 environmental concerns are met. The air quality in this  
15 valley, the way it's constructed, I've read may  
16 inhibit -- that we need to ensure the environment, the  
17 air quality -- if the airport continues to be made here  
18 that needs to be observed. Also, they've mentioned  
19 Plant 42. Plant 42 also provides us opportunity for  
20 space, but it also in its past has left us a record of  
21 environmental incidents and accidents that may endanger  
22 the safety of people. And those issues will have to be  
23 addressed by this community.

24 You mentioned the environmental acts. You  
25 have not mentioned the TEA 21 where people more than

1 property and items are of a concern that need to be  
2 addressed. As you proceed with this project, the people  
3 here in Palmdale and how it will affect the people needs  
4 to be considered. Also, the safety, bringing in more  
5 airplanes and everything, the people will have to be  
6 notified of the new environmental -- or the aircraft  
7 protection zones that may have to be developed as you do  
8 this regional airport. Right now the city government  
9 and local government entities ignore the Crash  
10 Protection Zones Site Recommendations of the Air Force  
11 and they put in different things or have projected to  
12 put in things under the umbrella of where it  
13 shouldn't be recommended -- or where it has not been  
14 recommended by the Air Force.

15 To make sure the development works, we need to  
16 throw in enough developmental funds from both the City  
17 of Los Angeles, the City of Palmdale and any other  
18 governmental entity that make this work so real industry  
19 and real business can establish around the airport and  
20 make all mobile transportation connections here at the  
21 airport rather than scattering them throughout the  
22 Antelope Valley, as has been suggested so far in the  
23 City of Palmdale. We need to make sure the jobs that  
24 are brought in are not imported but brought to the  
25 people, the local work force and that we won't have like

1 the SR Technics jobs being laid off now. 75 jobs are  
2 being lost by a firm that was talking so much to bring  
3 in technologies and industry and jobs here in the  
4 Antelope Valley. If you can address that, then the  
5 airport should work here after so many tries. I've read  
6 the accounts from 1955 on up through the (timer beeping)  
7 that needs to be done. Thank you very much for the  
8 opportunity.

9 MS. BAIN: Thank you.

10 MS. WILLIAMSON: My name is Marta Williamson with  
11 the Homeowners Group, Inc. Our address is PO Box  
12 900724. Our ZIP Code is 93590. I would like to address  
13 some of these things myself.

14 One of the things we're concerned with is air  
15 quality. The air will just sit because this is a  
16 valley, and mountains will hold all the things, all the  
17 residue from the aircraft. Unless there's a really big  
18 wind that comes through, it will sit there, and our air  
19 quality will be gone. You couldn't see the foothills  
20 when the jet fuel was burning, and we'll go back to  
21 that.

22 Plant 42 and NASA, those provide jobs in the  
23 Antelope Valley. I was raised in the Air Force. I was  
24 an Air Force brat. Wherever the air quality went down  
25 and wherever airports came in, military jobs left.

1 All right. The TEA 21 impact on human life,  
2 they are building homes right here at the end of the  
3 runway off Avenue N. Now, you have a thing about how  
4 the homes that are going to be around those places are  
5 supposed to have things put in for the noise, right, the  
6 way they are built where you would do something for  
7 noise abatement? None of that has been addressed. And  
8 those homes are going in and they are right near that  
9 runway. When you go out, those homes are there on  
10 Avenue N, brand-new homes going in, people buying them  
11 not knowing what's going to go on here that are just now  
12 coming up. They are not up-to-speed with what's going  
13 on in this community.

14 Impact on wildlife, we have a lot of wildlife  
15 here, and we know it will impact because every time we  
16 pollute the environment, whether you pollute the air,  
17 which later comes down as acid rain, it will impact the  
18 wildlife. It will impact the farms and the ranches.  
19 Someone already spoke to that. I'll just go on.

20 Many moved here leaving the L.A. lifestyle  
21 behind. People living in flight zones do not support  
22 this project. It's cost-prohibitive. Side election and  
23 what people told me about this side election, when I  
24 went out and I was knocking on doors because this is an  
25 election year and I'm handing out pamphlets for one of

1 the candidates, people told me, "Well, we don't want it  
2 here." The reason they don't want it there is because  
3 how it will impact where they live. So I was surprised.  
4 I thought everybody was for the airport. It's also  
5 inconvenient for a lot of people because if they were to  
6 use this area for commuting, or whatever they do about  
7 cars, and to rent cars is expensive. So many people  
8 would still have a problem unless they are connecting  
9 for a flight at LAX to go somewhere else.

10 After September 11th many became concerned  
11 over making us a target with this project. We now have  
12 to look at development of airports and transportation  
13 centers. And how long will this last? This facility  
14 has failed three times. Oldtown Homeowners Group is  
15 against this project. We will be sending a full  
16 comprehensive packet addressing all pertinent  
17 information to you. Thank you.

18 MS. BAIN: Thank you. We have Rick Norris. John  
19 Maurer is after Mr. Norris, and Jason Zink.

20 MR. NORRIS: Good evening. My name is Rick Norris.  
21 I'm a city councilmember with the City of Palmdale.  
22 Whether I disagree with Marta, there are tens of  
23 thousands of people here that are relying upon the  
24 aerospace industry and airline industry and the  
25 thousands of jobs it will bring to the city and the tens

1 of millions of dollars it will bring to our local  
2 economy. So we do have some areas of disagreement.

3 And contrary to popular belief, the air  
4 doesn't stand still very long in this region. We are  
5 not against the expansion of LAX, but our real interest  
6 is in Palmdale Airport and how the airport will help  
7 relieve some of the traffic that's generated from LAX.  
8 It will take thousands and thousands of people that are  
9 commuting from here to LAX and to fly out of  
10 Los Angeles. Our real interest is in the development of  
11 the airport and the economic benefits that it brings to  
12 us. Yes, we feel that they can address the  
13 environmental concerns and the environmental issues that  
14 may crop up.

15 But more importantly, we're working on ground  
16 transportation. We're working on a high-speed rail  
17 alignment from Northern California through the Antelope  
18 Valley down to LAX or the L.A. area. We're working with  
19 the San Joaquin Valley Rail Community, which is a State  
20 Rail Committee, in developing passengers and cargo rail  
21 service through the Antelope Valley. All of that will  
22 benefit and serve the Palmdale Airport. We need LAWA to  
23 issue the RFP that has been held up for the Palmdale  
24 Master Plan. We need that out there so that the  
25 decision on the high-speed rail alignment is going to be

1 made in January of this year. We need to determine the  
2 route prior to that time, if possible. So we need that  
3 RFP out. It will assist us a great deal in getting the  
4 ground transportation and developing our community.

5 Ladies and gentlemen, we want the regional  
6 airport. We are very interested in all of the benefits  
7 that it brings. We need to take those commuters off of  
8 the freeway that are going down to LAX and hurting the  
9 environment with all the transportation issues that they  
10 generate. But we also understand that as long as the  
11 LAX expansion occurs and you make it easier for the  
12 airlines to stay there, there is no incentives for them  
13 to go out to regional airports. So we need that  
14 addressed. We need the expansion addressed, but we need  
15 the transportation, the airlines to not make it so  
16 comfortable that they don't want to leave. We need you  
17 to be able to help them decide that they need to come  
18 out and service these outer -- outlying areas.

19 So the critical issues is that we need your  
20 commitment to us to help us develop a relief for LAX and  
21 an alternative to LAX congestion. Thank you.

22 MS. BAIN: Thank you. Mr. John Maurer.

23 MR. MAURER: My name is John Maurer. I live at  
24 12318 East Avenue X-8, Pearblossom, California 93553. I  
25 was just curious that the previous speaker was speaking

1 in the "Royal we." If you weren't and were  
2 speaking only -- if you were speaking for a large group,  
3 I think those people should show up and speak for  
4 themselves.

5 I would like to state that anybody who would  
6 like to see what the area will look like if this airport  
7 comes into existence, they should go down to Cucamonga  
8 on a hot summer day and see the air quality in  
9 Cucamonga, Redlands, Riverside, that's coming out from  
10 the Ontario Airport. . It's unbreathable.

11 As you can tell from my opening statement, I'm  
12 totally against this idea. Ruth Galanter has done  
13 everything to shove that mess up here, but I'm going to  
14 attack it from the point of view of the type of writing  
15 that you have in your brochures. Since we're supposed  
16 to comment on this plan, I will give you some quotes.

17 Under "Purpose and Need for Master Plan,"  
18 quote, "Regional air service is expected to increase by  
19 54 percent by 2015. Master Plan moves center airport  
20 activities away from communities." This is the part I  
21 find very interesting. "New large aircraft are quieter,  
22 cleaner." When you use the comparative form, it means  
23 they are already clean and they are already quiet, which  
24 they are not. When I go down to LAX -- I know you have  
25 addressed that 95 percent of the airplanes take off over

1 the water. You fail to include that as many come into  
2 the airport from the east and they make a lot of noise.

3 My other issue is with some of your language  
4 on page 16. "Overall air quality in our five-county  
5 region has improved due to the many air quality measures  
6 implemented over the last three decades; however, the  
7 region has not attained air quality standards for three  
8 pollutants, ozone, PM, particulate matter less than ten  
9 microns in size, and carbon monoxides. In other words,  
10 the reason is called a non-attainment status for carbon.  
11 A non-attainment status is a nice euphemism. It's a  
12 nice word, but it doesn't quite make me feel very  
13 confident.

14 Later on page 35, "Improved technology is on  
15 the way just as newer aircraft produce less noise. The  
16 newer airplanes that will come into service in coming  
17 years will also produce less air pollution." How do we  
18 know that? That's just your claim. How can we be  
19 assured of that?

20 I really feel that in this instance that, you  
21 know, this valley is almost pristine. And you can still  
22 breathe the air. I would like it to stay that way.  
23 Thank you.

24 MS. BAIN: Thank you. Mr. Jason Zinc.

25 MR. ZINK: Jason Zink, Z-i-n-k, PO Box 295,

1 Littlerock, California 93543.

2 For people that don't want the airport in  
3 Palmdale, they can move to Montana, as far as I'm  
4 concerned. What happened on September 11th has changed  
5 all our lives. We realize the terrorists can and will  
6 affect America. And what's even worse here is that it  
7 was planned for a bombing at LAX on New Year's Eve of  
8 2000 the Millennium. They would have had enough  
9 explosives in that vehicle to blow up a great deal of  
10 the terminal at LAX and would economically devastate  
11 L.A. County. I think our leaders shouldn't put all our  
12 eggs in one basket. We need to diversify. We have ten  
13 million people in this county. Why would we build  
14 something so big and put all our eggs in one basket. We  
15 must diversify this county. Ten million people count on  
16 it as far as investments.

17 As far as investments, people have been  
18 waiting for this airport for 30 years. I'm in real  
19 estate. Nine out of ten times people call and talk to  
20 me. They are asking me, "Jason, what's going on with  
21 the airport? When is it going to happen?" I have  
22 clients all the way from Australia to Germany to Hong  
23 Kong that talk to me on a daily basis asking me about  
24 the airport and what's going on in Palmdale. You will  
25 create such an economic investment in this county, in

1 the Antelope Valley, that we haven't seen in a long  
2 time.

3 Quality of life, this is really about the  
4 quality of life issue, if nothing else. Forget about  
5 air transportation or anything like that. Forget about  
6 the other passengers from across the board. This is  
7 about quality of life for the people of L.A., the people  
8 in the City of L.A. There is no reason why people  
9 should live in apartments, two to three families in  
10 apartments down in L.A. when we have the American Dream  
11 sitting right here for the last 20 years. This is the  
12 place. This is where people are going to prosper.  
13 Young, growing entrepreneurs, they'll never be able to  
14 afford a house in L.A. for \$300,000 or more. It's  
15 leadership's responsibility for economic stimulus to  
16 create jobs, create housing. It's the leadership's  
17 responsibility to do this. You are oppressing the  
18 people of L.A. by not building this airport here.

19 Secondly -- I lost my train of thought. We  
20 must do everything we can -- oh, the ten million -- I  
21 believe that it's probably going to take a  
22 ten-million-dollar subsidy to subsidize the airlines up  
23 here. We have to ensure that. We have to guarantee  
24 that -- would it be the cheapest investment we've ever  
25 made. What's ten million dollars? You can't even buy a

1 decent house in Bel Air for ten million dollars anymore.  
2 What's ten million dollars when you consider a  
3 12 billion-dollar expansion plan or a billion-dollar  
4 county budget? What's ten million dollars of that? I  
5 will tell you, if the board members, they can say  
6 that -- because they voted for an airport in Palmdale,  
7 they've made a difference in this life and changed the  
8 quality of life for millions of its citizen in L.A.  
9 Thank you.

10 MS. BAIN: Thank you. Niki Tennant. And after  
11 Ms. Tennant is Greg Anderson. Can you spell your name  
12 for the court reporters, please.

13 MS. TENNANT: Hi. My name is Niki, N-i-k-i,  
14 Tennant, T-e-n-n-a-n-t, with Los Angeles City  
15 Councilmember Ruth Galanter.

16 First of all, I want to thank everyone here  
17 for being here tonight. I'm especially pleased to be  
18 here in the Palmdale Regional Airport Terminal. I wish  
19 to convey Councilmember Galanter's appreciation for the  
20 opportunity for this additional public hearing in order  
21 to get public input from this region.

22 Two points that I wish to convey to you  
23 tonight. After the events of September 11th, the  
24 aviation industry has been unequivocally changed and all  
25 alternatives displayed here tonight are obsolete.

1           The second point is, this is our golden  
2 opportunity to actually plan for the region's aviation  
3 demands for the near and not so near future. The Master  
4 Plan process for our Los Angeles International Airport  
5 was begun in the early '90s and is based on flawed and  
6 outdated data. In fact, the EIR is so flawed in its  
7 conception and current relevance after the events of  
8 September 11th that the environmental assessment is  
9 inherently flawed as well. This Master Plan does not  
10 include relevant planning for Ontario International  
11 Airport or Palmdale Regional Airport, and it completely  
12 leaves out data for the 2000 census that show this  
13 region is one of the fastest growing regions in the  
14 state.

15           With regard to planning for the state's  
16 future, many people here are familiar with  
17 Councilmember's Galanter's speech that makes the  
18 argument, Palmdale Regional Airport is well-situated to  
19 serve the aviation needs of a growing San Fernando  
20 Valley, Santa Clarita Valley, Antelope Valley and the  
21 Central Valley of the state of California.

22           Right now leisure and business travelers from  
23 this region use Burbank and LAX for their air travel  
24 needs. The result is miles and miles of congestion  
25 along the 14 and the 5 as people have to drive long

1 distances to get to a usable airport, as well as jobs in  
2 the L.A. basin.

3 With careful planning and cooperation between  
4 the cities of Los Angeles, Palmdale, Lancaster and the  
5 County of Los Angeles, we can produce a viable airport  
6 to serve this region that may well be the first  
7 well-designed airport in this nation that could provide  
8 jobs, take cars off the freeway and continue the fine  
9 aviation tradition of this area. Thank you.

10 MS. BAIN: Thank you. Mr. Anderson. Is  
11 Mr. Anderson here? If Mr. Anderson isn't available, we  
12 are thinking this is a good time to take a break. Does  
13 everyone feel like taking a short break, getting some  
14 refreshments? Just a quick break, ten-minute break and  
15 we'll reconvene in ten minutes. I'll start the counter  
16 now.

17 (Recess was taken.)

18 MS. BAIN: Okay. Thank you. If I could get  
19 everyone's attention. We are going to reconvene the  
20 public comment session.

21 Mr. Jim Ritchie, the deputy executive director  
22 of Los Angeles World Airports, is going to reintroduce  
23 himself and reiterate some of the rules and why we're  
24 here very briefly for the record.

25 MR. RITCHIE: Thanks again. Welcome back from our

1 previous break. I should not only welcome you again,  
2 but I, also, not to put one of our commissioners on the  
3 spot, but I noticed Mahalia Walters (phonetic) in the  
4 group. Mahalia, if you would raise your hand, not that  
5 I want you to be a target tonight. This lady has  
6 followed us around to these six public hearings. We're  
7 actually in the seventh public hearing in a series of  
8 nine. Thank you, Commissioner. It's always great to  
9 have your support.

10 A reminder, while it may be a little clumsy in  
11 the process, we are here to comment on the LAX Master  
12 Plan given the events of September 11th and that  
13 tragedy. As a direct result of comments we receive from  
14 you and the rest of our audiences and the variety of  
15 places around the region, we will refine an alternative  
16 and very likely I would hope we could come back to this  
17 very terminal in about six months and discuss with you  
18 this new alternative. Your comments are important, and  
19 we appreciate you taking the time to present those to  
20 us. With that, I'll put Shauna back to work, and we'll  
21 listen to our next speaker.

22 MS. BAIN: Thank you. Again, my name is Shauna  
23 Bain. I will be your facilitator for the rest of this  
24 evening. I don't want to forget Richard Dykas. He's  
25 here from the FAA. He is also reporting your comments

1 and taking note of them. I want to reiterate some of  
2 the rules as far as timing.

3 Everybody has three minutes to make their  
4 comments. When you have a minute left for your  
5 summation, you'll see a yellow light flash here on the  
6 timer. When your time has expired, you will hear a beep  
7 tone. If you could sort of cut short when you start  
8 hearing the beep, we would appreciate it. I don't want  
9 to cut anybody off, but we have to make sure everybody  
10 has an opportunity to get their three minutes in.

11 If you fill out one of these yellow cards  
12 here, that's what you turn in to me, we will call your  
13 name for comments. If you don't feel comfortable  
14 speaking aloud, we have forms here where you can present  
15 your comments in a written fashion, and they are taken  
16 just as seriously and put into the record in the same  
17 manner as oral comments. If you could state your name  
18 and address before you begin, if you could spell your  
19 name if it's not a very common easy-to-spell name. If  
20 you have written comments that you would like to turn  
21 into the court reporter, you could turn it in there.

22 Without further ado, I would like George Bud  
23 Reams. Mr. Reams? Joseph Yore?

24 MR. YORE: Yore.

25 MS. BAIN: Yore.

1 MR. YORE: My name is Joseph Yore, Y-o-r-e, like the  
2 days of yore. Mr. Ritchie and the general people, I've  
3 come here tonight -- I'm not running for office. You'll  
4 have some people come up here tonight and speak. They  
5 are running for office. I'm here to save the lives --  
6 I've done my own survey. I live just down the street  
7 here, 38753 26th Street East. It's Avenue 26th and Q.  
8 I live closest to the airport than anybody here in this  
9 room.

10 Why are you sitting here tonight? Because  
11 it's an empty airport. It's failed three times. Nobody  
12 wants to come here and fly out of here. I'm a member of  
13 Plant 42 Wright-Patterson Air Force Base Environmental  
14 Group. I called Ruth Galanter's office several times  
15 and invited her to come to our rap group on  
16 environmental issues. Plant 42 is contaminated. Every  
17 military base is contaminated.

18 I'm for the expansion of LAX and El Toro Air  
19 Force Base. I believe LAX could be one of the greatest  
20 airports in the whole world if it's expanded and planned  
21 right by the city planners. Many of the city officials  
22 here never go to an environmental group, while you had  
23 one lady come up here and speak about the farmers  
24 coming, wanting the land for the farms. We are running  
25 out of water in the Antelope Valley.

1 I did my own scientific survey many years ago.  
2 I laid glass in my backyard. When they were flying out  
3 of here, when Plant 42 was burning jet fuel in the air,  
4 my whole backyard was covered with glass and the jet  
5 fuel did not go up in the air and disappear like some  
6 people think it does. It fell to the ground right by my  
7 property.

8 I'm for the military Air Force base. There is  
9 nothing more beautiful than seeing a B-2 fly by my  
10 house. I run out of my house every time I see a B-2 or  
11 a military plane fly and cheer those boys on. This is a  
12 military base. They shouldn't have parties out here  
13 like SR. SR has failed the people. There is going to  
14 be nobody working within a month at SR.

15 Antelope Valley is like a bowl. It was built  
16 many years ago. Antelope Valley is shaped like this  
17 (indicating). When you land in like this, you come into  
18 a bowl. Nothing moves out of it. It settles down into  
19 the valley. Nothing moves out of it. This is no place  
20 for an airplane, airport. This place is for Air Force  
21 and Air Force only, not a place to have many planes  
22 coming and going for cargo. These people that have  
23 realtors out here, like Greg Anderson didn't show up,  
24 they are here to sell property. They are here to make  
25 the buck.

1           LAX is the place for expansion. If it's done  
2 properly, it could be the best place in the world.  
3 Thank you kindly, and I saved you 14 seconds.

4           MS. BAIN: Thank you. Carole Hossan. And after  
5 Ms. Hossan, we'll have Ms. Agnes Numer.

6           MS. HOSSAN: Hello. I'm Carole Hossan, 7725 Hindry  
7 Avenue, Los Angeles. I'm a Westchester resident.

8           First I have to state my objection to having  
9 to attempt to comment on a Fifth Alternative to the LAX  
10 Master Plan, thus far it is only a nebulous concept in  
11 Mayor Hahn's and his airport planners' minds. I keep  
12 hearing that the LAX expansion plans are dead, but they  
13 are here in this room still being commented upon. Since  
14 the fifth safety and security alternative is not in any  
15 written form, I am not sure if the extension of the  
16 northern runway is a part of that plan. Rumor has it  
17 that it is.

18           For we Westchester residents, the extension of  
19 the north runway is an expansion. It would remove one  
20 third or about 235 of our central businesses in our  
21 central business district as well as some homes. In  
22 past expansions Westchester has lost thousands of homes  
23 and residents. We and other LAX-adjacent communities  
24 have warned and are bearing more than our fair share.  
25 The City of Los Angeles runs Ontario and Palmdale

1 Airports. The Southern California Association of  
2 Governments, known as SCAG, this year espoused a  
3 regional approach to increased air traffic. And, yes,  
4 now air traffic is down, but it won't be that way  
5 forever.

6 I believe that the City of Los Angeles and  
7 LAWA must do what is necessary to help Ontario and  
8 Palmdale Airports become airports that complement the  
9 needs of citizens of Ontario and Palmdale instead of  
10 concentrating all cargo and passengers at LAX. LAX  
11 needs to share the wealth.

12 On the safety and security note for LAX, I  
13 would say that LAX should have the proper allotment of  
14 air traffic controllers. All baggage should be screened  
15 and runway incursions can be mitigated by means other  
16 than runway extensions. Thank you for your time. Thank  
17 you.

18 MS. BAIN: Thank you. Ms. Numer, if you would like,  
19 we could bring a chair and have someone hold the mike  
20 for you. Would you like that?

21 MS. NUMER: That's okay. I can stand.

22 I am Agnes Numer. I lived in Antelope Valley  
23 for 47 years. I've seen it grow to what it is right  
24 now. We also have a very important ministry of Antelope  
25 Valley. They've helped people very -- I should say in

1 very dire circumstances and needy people, and we were  
2 able to help many thousands of them. And I feel we are  
3 going to expand very quickly in many areas, that we  
4 would like cargo planes. We are going to Long Beach or  
5 somewhere else to send out air cargo, but it would be  
6 nice to have it in Antelope Valley. We would appreciate  
7 it very much. I appreciate the airport. I've been  
8 honored to be on that airport for 47 years. Now I'm  
9 relocating. So we can have the airport there.

10 MS. BAIN: Thank you. Jackie -- I can't read the  
11 name, I'm sorry. Is it Schneider or Shider? Jackie  
12 from the Palmdale Chamber. Drew Angel. Is Mr. Angel  
13 here? Daniel Shriver.

14 MR. SHRIVER: Hi. My name is Daniel Shriver. I'm  
15 at 4741 Ben Avenue in Valley Village, 91607. My last  
16 name is spelled S-h-r-i-v-e-r. I'm here to talk about  
17 airport security and the illusion that is being  
18 perpetrated of airport security.

19 September 11th I lost a friend at the World  
20 Trade Center. And I'm a martial artist. I'm here to  
21 represent the Ateimi-Ryu JuJitsu, which is a close-range  
22 combat style of martial art that many people think will  
23 be highly effective and appropriate for close-range  
24 situations like an airport. My friend was in the World  
25 Trade Center. If he had been on a plane, he would have

1 jumped to his feet and fought to the end. He didn't get  
2 a chance. So I'm here to pick up the fight for him and  
3 the 6,000 other people.

4 The FAA has looked at our information packet  
5 that I have here. We've done two demonstrations at two  
6 other public hearings. The responses we get from  
7 everybody that sees it is "It's very impressive and  
8 should be considered." At this time we would like to  
9 offer an invitation to any airline. We will train a  
10 flight crew at no cost to them so that they can see --  
11 judge for yourself; is this effective, is it not  
12 effective? We also -- the idea -- there's a  
13 revolutionary war, I believe, an Arab Poem that said  
14 "for the won of the nail, the shoe was lost, for the won  
15 of the shoe, the horse was lost, for the won of the  
16 horse, the rider was lost, for the won of the rider, the  
17 battle was lost. For the won of the battle, the war was  
18 lost.

19 We have simple effective ways we can keep the  
20 airlines safe. They are looking at technology. They  
21 are looking at 20 years, 10 years in the future when the  
22 technology exists where you could remotely control a  
23 plane from the ground, while the terrorists will  
24 probably learn how to override that and highjack planes  
25 from the ground. And that's ten years away. Laser

1 light to blind the passengers, gas flooding the cabins,  
2 ice hammers and fire extinguishers, they are all things  
3 they said, "Maybe we could solve the problem with this."

4 The FAA is dedicated to making the travel safe  
5 for the public. In their own documents they talk about  
6 how simple is good, about how we learn from our mistakes  
7 and how we need to ensure the flying public is safe, and  
8 it's our obligation to do that. We have a gift of  
9 knowledge, and knowledge is power. We are here to raise  
10 awareness and introduce this concept into the general  
11 discussion. If you feel that you would be safer knowing  
12 that the flight crews have been trained in very  
13 effective martial arts that are the same martial arts  
14 that are being used by special op forces in Afghanistan  
15 right this minute, being taught to women of all ages in  
16 rape-prevention classes across the country, being taught  
17 to little girls to keep them from being abducted.

18 This is the real deal. We're genuine. Please  
19 take us up on our offer to show you just how effective,  
20 how cost-effective it is. With airlines losing billions  
21 of dollars, we won't be talking about airplane expansion  
22 for very much longer. Thank you very much.

23 MS. BAIN: Ron Emard. Greg Anderson. George Reams.  
24 Jackie Schneider. Drew Angel.

25 MR. ANGEL: Good evening. I'm Drew Angel. I'm

1 running for mayor of the City of Palmdale. My address  
2 is 38611 Jacklin Avenue in Palmdale, 93550.

3 I'm sure it's very difficult for you to  
4 assimilate all these many points of view. I would just  
5 like to take a couple of minutes to explain, first of  
6 all, it seems this plan is a 15-year program of  
7 expansion. And I understand that the total life cycle  
8 of the plan would be many decades. Well, let's just  
9 divide what kinds of time we're dealing with. The  
10 short-term I would call 1 to 12 years, and then this  
11 not-so-future maybe 10 to 25, and then long-term we're  
12 looking at 10 to 50 years. That's about how long the  
13 airport has been really operating since the DC6's has  
14 been running. What about 50 years from now?

15 First of all, airline traffic is going to be  
16 greatly diminished because ground transit is going to  
17 take over. The next big generation of these big jets,  
18 they are going to be still running them. It's probably  
19 the last new big -- I mean, they'll be advanced many  
20 times, but air travel pollutes tremendously.

21 LAX contributes 30 percent of all the air  
22 pollution in California. California -- I mean, in  
23 Los Angeles. California contributes 10 percent of the  
24 world's air pollution. That's significant. And we're  
25 just one of many airports. Okay. I'm going to have to

1 go real quick through this.

2           The high-speed ground transit, which was  
3 already mentioned, will be coming up here. If we have  
4 any plan here, it has to be integrated with the idea  
5 mach speed ground transit. I think for the future of  
6 airlines corporate-wise and the facilities, we have to  
7 integrate those kinds of systems with the airport. It's  
8 got to be part of your plan. Let's say for Palmdale,  
9 the local authorities have said that -- Mr. Ledford, has  
10 suggested we could have as many as 400 flights up here.  
11 As I understand, that would be one quarter of the  
12 present traffic of LAX. That's impossible. We couldn't  
13 really tolerate it up here. 50 flights a day, I think,  
14 would be the maximum for a cargo facility at a peak,  
15 unless it becomes a space port, in which case perhaps an  
16 entirely new site for a new airport might be considered  
17 somewhere up here in the high desert. If we have really  
18 high speed ground transit like 600 miles an hour from  
19 LAX up to here or up to, say, California City, that  
20 might be the future in 20, 30 years. But right now 50  
21 planes a day to summon traffic off your runways down  
22 below and maybe expanding this facility a little bit so  
23 that the locals could get out on a limited number of  
24 actual passenger flights, that might work. Thanks.

25           MS. BAINS: Thank you. Again, I'm going to call

1 Ron Emard, Greg Anderson. George Bud Reams. Jackie.  
2 If there is a Jackie in the room and I'm mispronouncing  
3 your last name, I apologize. With that, we don't have  
4 any new comments. We're going to take another break  
5 until we receive some more, but we're here for the  
6 duration. So if you have some comments, please fill out  
7 one of these yellow cards and bring them up to us. If  
8 you want to submit one of your written comments, do that  
9 as well.

10 (Recess was taken.)

11 MS. BAIN: We are about to reconvene. If we could  
12 get everyone to take their seats, we are about to begin.

13 MR. RITCHIE: By reintroduction, my name is Jim  
14 Ritchie with the City of Los Angeles. We'll open this  
15 session on the same guidelines as Shauna so clearly  
16 announced the three-minute rule, and we welcome any  
17 other comments during this period. Thank you.

18 MS. BAINS: Thank you. Domingo Adkins. When you  
19 come up, can you please speak your name. We have three  
20 minutes on the timer. When you have a minute left,  
21 you'll see the yellow light and can you spell Domingo.

22 MR. ADKINS: Domingo, D-o-m-i-n-g-o, Adkins,  
23 A-d-k-i-n-s. Our address 541 East Ivesbrook Street,  
24 Lancaster, California 93535. I came down here today  
25 because I used to live here in Palmdale and I'm a

1 resident now in Lancaster. I grew up right by the LAX  
2 Airport for years since I was a little kid. I see no  
3 problems with the airplanes flying overhead and with the  
4 noise. I'm here just to let the people know that, you  
5 know, it's no problem to have the airport here. I am  
6 for the airport to be here in Palmdale. I'm a witness  
7 to let the people know it's a good thing to have it here  
8 in Palmdale because L.A. is growing. And being a native  
9 to Los Angeles, I have seen L.A. grow from big to bigger  
10 to enormous.

11           And I lived all over Los Angeles, the Valley  
12 to Pomona, by Orange County, everywhere. We have an  
13 overflow of people everywhere here in Southern  
14 California. Lancaster is the place with Palmdale to  
15 just make this whole valley grow. I'm not ashamed to  
16 say I'm a Californian, but I have seen traffic and  
17 traffic and more traffic. It's not the problem about  
18 the airplanes. It's the problem about the people.  
19 Where are we going to fit all these people, cars? We  
20 have many, many cars, but we know the future is going to  
21 get better. We see electric cars coming, and even  
22 planes are going to be coming. And they will get  
23 better, but we need to give the people of  
24 Los Angeles opportunities to spread out so then they can  
25 have a safer place to actually live. I'm not a

1 scientist, but I do know when you put rats in a cage and  
2 they all clump together, they will attack each other.

3 So I'm here to say, hey, give it a chance out  
4 here. Let Palmdale have this airport, and I believe  
5 it's not the airport that the people are complaining  
6 about, it's just the expansion of the people that will  
7 come out here. We need to grow. That's what Southern  
8 California and United States is all about, to let the  
9 people understand that we are a nation that will grow  
10 and it will be done..

11 I've been waiting for this airport. I lived  
12 here since 19 -- well, not since. I lived here in 1994  
13 because I was expecting this airport to come. And I  
14 have seen great people move here and then leave this  
15 city because they were expecting this airport to come.  
16 I believe this will be a great place and for a lot of  
17 great people. Let this airport come. Thank you.

18 MS. BAIN: Thank you. James Hull. And after  
19 Mr. Hull, we'll have Vianna Friss. And then I'll  
20 reintroduce Mr. Dykas. We have Mr. Dykas here from the  
21 Federal Aviation Administration as well.

22 MR. HULL: My name is James Hull. I'm a travel  
23 agent with Sierra Travel in Lancaster and, also, at the  
24 present time chairman of the Palmdale Regional Airport  
25 Advisory Council. I moved here in 1965 from Seattle,

1 went to work at Edwards Air Force base. And in 1992  
2 after retiring and working with some other people, I  
3 went into the travel business.

4 At the present time Sierra Travel is one of  
5 the few travel agencies left in the valley because of  
6 the things going on with the airlines, and so forth. We  
7 book people, of course, out of LAX, Burbank, Ontario,  
8 sometimes Long Beach and once in a while out of  
9 Bakersfield. I try to avoid that. We are very anxious  
10 to have something come out of Palmdale.

11 When I moved here in '65, the airport, of  
12 course, had already the property of 17,700 acres that  
13 had existed. And so we've been looking forward to this  
14 for a long time. As you well know, we had two airlines  
15 up here at one time. There was not enough traffic. It  
16 just went over the hill. That's all it did.

17 People were speaking about down below how bad  
18 it's got. I used to live in the Redlands at one time.  
19 I moved out of there in '57. I was at Norton Air Force  
20 base working there. The smog used to move in there in  
21 mid '50s bad enough in the summertime that it would  
22 blacken -- darken the mountains, but then again the  
23 Inland Empire had a barrier, just like Pasadena has a  
24 barrier, like other places have barriers. So there's  
25 not much air circulating through that entire area. But

1 out here the air does circulate. I've seen it circulate  
2 plenty. Once in a while it's stagnant, but we need some  
3 help out here.

4 We have an airport, as you see, building. We  
5 need some help here. I would plead with the L.A. World  
6 Airways to consider Palmdale as a very viable terminal  
7 even if we have limited amount of aircraft out here,  
8 airlines to go to San Francisco, Oakland, Reno, Denver,  
9 Dallas, Fort Worth, maybe Phoenix, wherever. We need  
10 help. We don't want it to go from here over the hill  
11 again. We want it to go out there and maybe go to  
12 Vegas, who know. But we do need some help. I  
13 appreciate the time that you've given me here. Thank  
14 you.

15 MS. BAIN: Thank you. Vianna Friss. Can you spell  
16 your name.

17 MS. FRISS: Yes, Vianna, V-i-a-n-n-a, and Friss is  
18 F-r-i-s-s. I have Post Office Box 900696 in Palmdale,  
19 California 93590. And I've been here since 1947. My  
20 folks came here when it was just a small town for a  
21 weekend retreat. And then we'd move back to Santa  
22 Monica, and then we'd move back and forth. I've seen  
23 the influence of Lockheed and Plant 42 on the  
24 environment, and I never saw anything that was really  
25 harmful to our environment.

1           My late husband and I worked at FAA over here  
2 for five years. So I've seen that influence. I think  
3 they are very protective of the environment so far. And  
4 there are already 300,000 people in this valley which  
5 could be prospective customers to you people. And we  
6 have Antelope Valley College. We have the University of  
7 California at Bakersfield. We have a Performing Arts  
8 Center. We have Edwards Air Force base, and we have  
9 that aerospace industry right here. And the airlines  
10 are already here using the Plant 42 to train their  
11 pilots for take off and landing. I've seen them for  
12 years here taking off and landing. So what's the  
13 problem with having your airline industry here? They've  
14 already adjusted to the winds and everything.

15           And this is not a bowl. This is not a dust  
16 bowl. There's wide-open, flat desert. We have constant  
17 winds here that blow the exhaust from the aircraft out  
18 into the desert. So it's not a dust bowl. And it goes  
19 all the way to Death Valley, so we would not have the  
20 element of smog here.

21           These were just some of my ideas I didn't  
22 think but to speak here, but I've seen this valley. I  
23 am a proponent of the airport if we can have heavy  
24 environmental assurances. And I think that LAX in  
25 Inglewood needs an expansion to Palmdale. I've been

1 here for 40 years. I've heard about the airport, but  
2 when are you going to do something about it? How long  
3 does it take to go to the airport now? Are you going to  
4 keep letting the bombs in there? You've got to spread  
5 it out. You put everything in one place -- even the  
6 military know this, not to put everyone in one place.  
7 You have to spread out the population. So thank you  
8 very much for being here.

9 MS. BAIN: Thank you. Ron Emard, Greg Anderson.  
10 George Reams. Jackie Schneider. Again, we're here  
11 until 9:00 p.m. If you would like to make a public  
12 comment, an oral comment, please fill out one of these  
13 yellow cards. They are still at the sign-in desk. We  
14 will take them. I'll call your name. You will have  
15 your three minutes to make your oral comment. If you do  
16 not wish to make an oral comment, you're welcome to fill  
17 out one of these sheets at the sign-in desk. It will be  
18 put in the record same as your oral comment. Thank you.

19 MR. DYKAS: Is there anyone else concerning the  
20 Draft EIS/EIR? Not seeing anyone else, I will remind  
21 everyone that if you feel that you are unable to provide  
22 us with verbal comments today, we will be accepting  
23 written comments until 5:00 p.m. Pacific Standard Time,  
24 Friday, November 9, 2001. You can mail your comments to  
25 either David Kessler at the FAA or to Jim Ritchie with

1 the City of Los Angeles. The mailing addresses are  
2 listed on the cover of the EIS/EIR.

3 I want to thank everybody for your comments  
4 today. This public hearing for the Draft EIR/EIS at Los  
5 Angeles International Airport is now closed.

6 (Whereupon the proceeding adjourned  
7 at 9:00 o'clock p.m.)

**Los Angeles International Airport  
Los Angeles, California**

**Draft Environmental Impact Statement/Environmental Impact Report  
Public Hearing Remarks**

**Monday, November 5, 2001**

**Palmdale Regional Airport  
Palmdale, California**

**Richard Dykas  
Supervisor, Capacity Section**

Good evening ladies and gentlemen, my name is Richard Dykas; I'm an Airport Planner from the Federal Aviation Administration, Western-Pacific Region. I would like to welcome you to the 7<sup>th</sup> of a total of nine Public Hearings the FAA and the city of Los Angeles are conducting for the Draft Environmental Impact Statement/Environmental Impact Report or EIS/EIR for the proposed master plan at Los Angeles International Airport. The first three public hearings on this topic were held on Saturday, June 9<sup>th</sup> in Inglewood, Manhattan Beach, and Westchester. Public Hearings on the Draft EIS/EIR were held last week in Monterey Park, San Pedro and in the Mid-Wilshire District of the city of Los Angeles. Today's hearing is the fourth of six additional hearings that began last week and will be completed this week. These hearings were originally scheduled for early September; however, they were postponed due to the terrorist attacks in New York and Washington, D.C. The next hearing will be held on Wednesday, November 7<sup>th</sup> at the ONTARIO AIRPORT MARRIOTT, located at 2200 East Holt Boulevard In Ontario.

The purpose of these hearings is to collect comments from the general public concerning the adequacy of the information disclosed in the Draft EIS/EIR. The FAA and the City of Los Angeles along with the Federal Highway Administration as a cooperating agency have prepared the Draft EIS/EIR.

I would like to take this opportunity to make sure that everyone understands that **NO** decisions will be made today regarding the proposed project. Today's hearing is **not** a

**EXHIBIT 1**  
Deponent Heating  
11-5-01 Lisa  
Date Rptr/LAmp  
WWW.DEPONOR.COM

question and answer type of forum. Our job is to listen to what you have to say about the adequacy of the information in the Draft EIS/EIR. In other words, it's your turn to talk to us. Since we are here to listen, we are not going to respond to questions about the pros and cons of the proposed project. Since 5 o'clock this afternoon, the city has held a public workshop just outside of this room for anyone to ask questions about the master plan, the environmental process and the various proposed projects.

Following publication of the Draft EIS/EIR for comment, the next step in the joint federal and state environmental disclosure process is holding this and the other public hearings during this week and next week. The environmental disclosure process for this project began in 1997 with the publication of a Notice of Intent to prepare the joint EIS/EIR in the *Federal Register*. In July of 1997, we held a series of meetings with members of the public and governmental agencies to receive comments on the scope of the Draft EIS/EIR. Following those meetings, the Draft EIS/EIR was prepared considering the comments received during the scoping meetings and those submitted in response to the Notice of Intent. The document has also been prepared pursuant to the National Environmental Policy Act of 1969 or "NEPA", the Council on Environmental Quality Regulations, which are the implementing regulations for NEPA, the California Environmental Quality Act of 1970 or "CEQA", and the Airport and Airway Improvement Act of 1982, as amended.

Following today's hearings and the close of the comment period, we will then correct, and revise the EIS/EIR as necessary based on the comments received. We will also prepare responses to the comments we receive and include those responses in the **Final EIS/EIR**.

Before we begin receiving verbal comments, we would like to let you know the ground rules of this hearing. First, as I said earlier, we are not here to respond to questions about this project. We are only here to listen to your comments and take notes. We also have a court reporter present to ensure that we have an accurate transcript of this hearing.

For anyone who would like to speak, we ask you to fill out a speaker card, **like this one** and give it to the person at the sign in desk. That person will bring the speaker cards up to our facilitator who will call the names of each speaker so we can proceed in an orderly fashion. So that everyone gets an opportunity to provide verbal comments, everyone will get three minutes to speak. To be fair to everyone, we are not going to allow people to transfer their allotted time to someone else. I ask that when you speak, you give us your name and address for the record. We also have a Spanish language translator for anyone wishing to provide comments in Spanish.

If there is anyone who uncomfortable speaking in front of a group or if you need more than three minutes to provide your comments, we ask that you provide your comments in writing. We have comment sheets, **like this one**, available for your use at the sign-in desk. You can leave your comments at the sign in desk, or you can mail your written comments using the comment sheet or a letter to either address listed on the cover of the EIS/EIR. The city's address is listed at the top of the comment sheet. I would like you to understand that a verbal comment is just as important as a written comment. So please feel free to provide any comments on the document you may have to us either verbally today, or in writing. Comments are due by **5:00 p.m., Pacific Standard Time, on Friday, November 9, 2001.**

Lastly I would like everyone to know that even though we have this hearing scheduled until 9 o'clock this evening, we will stay here as long as necessary for everyone to get a chance to provide verbal comments on the Draft EIS/EIR. As I said earlier, our job here today is to listen to your comments.

Now, I will return the Hearing back to our facilitator, **Shauna Bain**, to introduce Mr. Ritchie who will provide some introductory comments from the city of Los Angeles. Following Mr. Ritchie's comments, we will collect the speaker cards and call the name of the first speaker.

Thank you.

Is there any one else who has not had an opportunity to speak concerning the information in the Draft EIR/EIS? **[wait for anyone to speak up]** Not seeing anyone else, I will remind everyone that if you feel that you are unable to provide us with verbal comments, today, we will be accepting written comments until **5:00 p.m. Pacific Standard Time, Friday, November 9, 2001**. You can mail your comments either to David Kessler at the FAA or to Jim Ritchie with the City of Los Angeles. The mailing addresses are listed on the cover of the EIS/EIR. I want to thank everyone for your comments today, this public hearing for the Draft EIR/EIS at Los Angeles International Airport is now closed.

**END OF COMMENTS**

My name is Kathleen Burr and I am the executive manager of the Los Angeles County Farm Bureau. As you know Palmdale Regional Airport sits on approximately 17,000+ acres of land which according to the airport agriculture people - 8 to 10,000 acres could be potential agricultural leases. Even though our area is growing by leaps and bounds, we are still a rural community with a huge emphasis on agriculture. Agriculture jobs in Los Angeles County comprise jobs in production, transportation, processing, marketing, and the farmer and rancher. The State of California produces half of all the nations' fruits and vegetables. Not to forget the best alfalfa in the United States is produced right here in the Antelope Valley. 78% of wildlife species occupy private lands with over 90% of all listed species relying partially on private lands for survival. And a vast majority of these private lands are owned by the farmers and ranchers. No one is more interested in maintaining the integrity of the land and health of our water resources than those who directly rely on these resources for their livelihoods! The farmers and ranchers - who in some cases are 2<sup>nd</sup>, 3<sup>rd</sup>, & 4<sup>th</sup> generation preserving this integrity for their children.

Maintaining an adequate water source is utmost on everyone's minds. But there are options that have been on the planning table for several years. It is a shame to let the potential income for not only the airport but the farmers and ranchers who provide a multitude of jobs, go to waste because those that make the decision may not fully comprehend the issues facing agriculture and/or the potential they hold in their hands. They do not realize the regulations that each grower must adhere to. They do not realize that just because it is cheaper to import a crop from another country - that country does not impose the same safe growing regulations that are imposed on us. They do <sup>not</sup> adhere to the same health standards we do. And I feel these are issues that need to be looked into and understood fully before a finger is always pointed at agriculture stating, "You are the problem". The loudest proponent is the one that does not fully understand the issue.

I can only see the potential for the agriculture leases. I would be happy to host the LAWA members to spend the day with me talking to the farmers and ranchers in the area. If there are issues, problems, or unknown financial factors - compromises can be reached, issues worked out, and problems solved. I think you would be surprised at the number of farmers/ranchers/agricultural related business in Los Angeles County. It is a shame not to promote agriculture and promote it here. Thank you for the time to speak and I look forward to hosting the airport board in the near future.

PHPD

The Antelope Valley Chamber of Commerce supports a regional approach to resolving the issue of increasing the air capacity in Southern California.

A Regional Airport approach that would include the utilization of this facility here in Palmdale, could better serve the flying public than any type of expansion of LAX.

There is a legitimate concern that adding additional air traffic, arriving and departing from LAX, could infringe on the safety of those flights. No matter what changes are made on the ground, there is still a fixed amount of airspace available and by adding more traffic into this fixed area, the odds of a major catastrophe will increase. Palmdale is capable of managing an increase in air traffic, without decreasing safety, and utilization of our airport could provide the airspace around LAX some much needed relief.

Palmdale Regional Airport features this newly refurbished 9,000 square foot terminal and is capable of handling up to 300,000 passengers annually. This facility could be used to establish a pattern of airline service into Palmdale and, as passenger traffic increases, Los Angeles World Airports already owns just under 18,000 acres of adjacent land that is available for development.

Palmdale Airport would serve a far greater geographic area than just the Antelope Valley. According to a study by the Los Angeles International Airport Expansion Task Force, using Palmdale Airport could save an average of 35 minutes for passengers that live an equal distance from Palmdale and LAX. Flight delays and airport closures due to fog would be virtually eliminated. Palmdale would quickly become the Airport of choice for the millions of people that reside within a proximity that would allow them to take advantage of our airport.

A regional approach that includes Palmdale Airport is vital to improving passenger and cargo movement in Southern California. If the Los Angeles World Airports continues to defer the utilization of their Palmdale Airport, we would urge their consideration of a "friendly takeover" of this facility by the Southern California Regional Airport Authority. This action could allow Palmdale Airport to become part of the solution rather than an idle asset.

On behalf of the Antelope Valley Chambers of Commerce, and the millions of people that could utilize Palmdale Airport, I urge you to focus on a regional approach in resolving the need for increased air capacity in Southern California.

Thank you

**REGIONAL AIRPORT vs. EXPANSION OF LAX**

The Terrorist attacks of September 11, 2001 had a profound impact on the airline industry and the flying public.

I understand the LAX expansion priorities have shifted from Expansion to Safety and Security elements as identified by Mayor Hahn.

However, caution needs to be exercised when considering any changes to the existing LAX - EIR proposing fundamental changes without public and professional input.

As a private citizen, I find it difficult to rally around any proposed changes to the changes proposed for the LAX expansion plan without first having an opportunity to review details of the proposed changes.

Without seeing details of the proposed changes to the LAX plan, there really is nothing much to discuss.

On the other hand, the option that includes the proposed Palmdale Regional Airport is a logical alternative and requires your serious consideration.

The traffic getting to and from LAX using the 405 (San Diego Fwy.) awful say nothing about the difficulties of getting in and out of LAX itself.

As an example, I hosted a dinner at the Downtown LA Biltmore Hotel last month and one of my guests spent 1½ hours just getting from Brentwood to Downtown LA. Another of my guests traveled from Encino using the 405 and had a similar horror story.

Traffic congestion on the 405 at any time of day or night requires that I consider other Airport location for my personal or business travel.

I believe the ever expanding borders of the San Fernando, Santa Clarita and Antelope Valley's would support a more conveniently located Regional Airport located in Palmdale.

Long term Major Airline lease agreements and a commitment toward future growth would be essential to the success of a Regional Airport

EXHIBIT	4
Deponent	Heard
Date	11-5-01
Rate	OLISE

In addition, the FAA or appropriate Airport authority needs to make commitments to construct and operate a safe and modern airport facility.

I would recommend an aggressive advertising campaign promoting the benefits of traveling from the Palmdale Regional Airport vs. navigating the uncertain freeways leading to LAX.

The Antelope Valley with its available land and receptive communities would welcome and support Regional Airport.

With few exceptions, Los Angeles County has run out of available open space that qualifies for airport construction.

In conclusion:

Taking into account:

- The Lockheed-Martin JSF contract agreement
- The existing Enterprise Zone benefits
- The availability of an aerospace savvy labor force
- The expanded and improved I-14 (Antelope Valley Freeway)
- A receptive Community and Local Governments
- And the existence of the Plant 42 airport facilities at the proposed airport location site

*Stopped Here*

A decision to select Palmdale as the site for a Regional Airport will be in the public's interest relieving LAX congestion while supporting profitable and sustained future growth within Los Angeles County.

Any long or short-term plan targeting Southern California **must not** overlook the obvious geographic and other fundamental advantages the cities of Palmdale & Lancaster and the entire Antelope Valley offer as the site for a Regional Airport.

Thankyou

1           ONTARIO, CALIFORNIA, WEDNESDAY, NOVEMBER 7, 2001

2                           6:00 O'CLOCK P.M.

3                           ---oOo---

4  
5           MR. WALL: Good evening, ladies and gentlemen.  
6 Welcome to a public hearing to receive written and  
7 verbal comments concerning the Los Angeles Airport  
8 Master Plan Environmental Impact Report and  
9 Environmental Impact Statement. You'll be providing  
10 testimony, as I said, written or oral to the two  
11 gentlemen seated to my left.

12                   I want to introduce first from the Federal  
13 Aviation Administration Mr. David Kessler, Airport  
14 Environmental Protection Specialist. Mr. Kessler.

15           MR. KESSLER: Thank you, Tom. Good evening ladies  
16 and gentlemen. My name is David Kessler. I'm an  
17 Airport Planner from Federal Aviation Administration,  
18 Western-Pacific Region. I would like to welcome you to  
19 the eighth of a total of nine public hearings the FAA  
20 and the City of Los Angeles are conducting for the Draft  
21 Environmental Impact Statement, Environmental Impact  
22 Report or EIS/EIR for the proposed Master Plan at  
23 Los Angeles Airport. The first three public hearings on  
24 this topic were held on Saturday, June 9th in Inglewood,  
25 Manhattan Beach and Westchester. During the past two

1 weeks, public hearings on the Draft EIS/EIR were held in  
2 Monterey Park, San Pedro, the Mid-Wilshire District of  
3 the City of Los Angeles and in Palmdale. Today's  
4 hearing is the fifth of six additional hearings that  
5 will be completed this week. These hearings were  
6 originally scheduled in early September, however, they  
7 were postponed due to terrorist attacks in New York and  
8 Washington, D.C. The next hearing will be held  
9 tomorrow, Thursday, November 8th at the Airtel Plaza  
10 Hotel next to Van Nuys Airport. The address of the  
11 Airtel Plaza Hotel is 7277 Valjean Avenue in Van Nuys.

12 The purpose of these hearings is to collect  
13 comments from the general public concerning the adequacy  
14 of the information disclosed in the Draft EIS/EIR. The  
15 FAA and the City of Los Angeles along with the Federal  
16 Highway Administration, as a cooperating agency, have  
17 prepared the Draft EIS/EIR.

18 I would like to take this opportunity to make  
19 sure that everyone understands that no decisions will be  
20 made today regarding the proposed project. Today's  
21 hearing is not a question-and-answer type of forum. Our  
22 job is to listen to what you have to say about the  
23 adequacy of the information in the Draft EIS/EIR. In  
24 other words, it is your turn to talk to us. Since we  
25 are here to listen, we are not going to respond to

1 questions about the pros and cons of the proposed  
2 project. Since 5:00 o'clock this afternoon the City has  
3 held a public workshop just outside of this room for  
4 anyone to ask questions about the Master Plan, the  
5 environmental process and the various proposed projects.

6           Following publication of the Draft EIS/EIR for  
7 comment, the next step in the joint federal and state  
8 environmental disclosure process is holding this and the  
9 other public hearings during the past week and this  
10 week. The environmental disclosure process for this  
11 project began in 1997 with the publication of a Notice  
12 of Intent to prepare the joint EIS/EIR in the Federal  
13 Register. In July of 1997 we held a series of meetings  
14 with members of the public and governmental agencies to  
15 receive comments on the scope of the Draft EIS/EIR.  
16 Following those meetings, the Draft EIS/EIR was prepared  
17 considering the comments received during the scoping  
18 meetings and those submitted in response to the Notice  
19 of Intent. The document has also been prepared pursuant  
20 to the National Environmental Policy act of 1969 or  
21 NEPA, the Council on Environmental Quality Regulations,  
22 which are the implementing regulations for NEPA, the  
23 California Environmental Quality Act of 1970 or CEQA,  
24 and the Airport Airway Improvement Act of 1982, as  
25 amended.

1           Following today's hearings and the close of  
2 the comment period, we will then correct and revise the  
3 EIS/EIR as necessary based on the comments received. We  
4 will also prepare responses to the comments we receive  
5 and include those responses in the final EIS/EIR.

6           Before we begin receiving verbal comments, we  
7 would like to let you know the grounds rules of this  
8 hearing. First, as I said earlier, we are not here to  
9 respond to questions about this project. We are here  
10 only to listen and take notes. We also have a court  
11 reporter present to ensure we have an accurate  
12 transcript of the public hearing.

13           For anyone who would like to speak, we ask  
14 that you fill out a speaker card and give it to this  
15 person at the sign-in desk. That person will bring the  
16 speaker cards up to our facilitator who will call the  
17 names of each speaker so we can proceed in an orderly  
18 fashion. So that everyone gets an opportunity to  
19 provide verbal comments, everyone will be given three  
20 minutes to speak. To be fair to everyone, we are not  
21 going to allow people to transfer their allotted time to  
22 someone else. I ask that when you speak, you give us  
23 your name and address for the record. We also have a  
24 Spanish language translator for anyone wishing to  
25 provide their comments in Spanish.

1           If there is anyone who feels uncomfortable  
2 speaking in front of a group or you need more than three  
3 minutes to provide your comments, we ask you to provide  
4 your comments in writing. We have comment sheets  
5 available for your use at the sign-in desk. You can  
6 leave your comments at the sign-in desk or you can mail  
7 your written comments using the comment sheet or a  
8 letter to either address listed on the cover of the  
9 EIS/EIR. The city's address is listed at the top of the  
10 comment sheet. I would like you to understand that a  
11 verbal comment is just as important as a written  
12 comment. So please feel free to provide any comments on  
13 the document you may have to us either verbally today or  
14 in writing. Comments are due by 5:00 p.m. Pacific  
15 Standard Time on Friday, November 9, 2001.

16           Lastly, I would like everyone to know that  
17 although we have this meeting scheduled until 9:00 this  
18 evening, we will stay here as long as necessary for  
19 everyone to get a chance to provide verbal comments on  
20 the Draft EIS/EIR. As I said earlier, our job today is  
21 to listen to your comments.

22           Now, I will turn the hearing back to our  
23 facilitator, Tom Wall, who will introduce Mr. Ritchie  
24 who will provide some introductory comments from the  
25 City of Los Angeles. Following Mr. Ritchie's comments,

1 we will collect the speaker cards and call the name of  
2 our first speaker. Thank you.

3 (The statement submitted for the  
4 record was marked as Statement 1.)

5 MR. WALL: Representing Los Angeles World Airports  
6 this evening is the Deputy Executive Director, Mr. Jim  
7 Ritchie.

8 MR. RITCHIE: Thank you, Tom. I appreciate the  
9 attendance tonight. We welcome our friends from  
10 Ontario, from Westchester, a lot of familiar faces  
11 tonight. I would like to take the opportunity to  
12 introduce one of our commissioners Ms. Walters  
13 (phonetic) who has joined us as we have marched around  
14 the countryside for the last -- what is tonight, number  
15 five? -- in a series of six hearings. So certainly take  
16 advantage of her presence if you have any additional  
17 comments you would like to raise.

18 As you know, we have received guidance from  
19 our mayor to expand the opportunities for public input  
20 for the LAX Master Plan process. Tonight we will  
21 receive your comments. More recently Mayor Hahn  
22 identified a number of objectives to be incorporated  
23 into another alternative for the future planning of LAX.  
24 On November 9th, this Friday, the public comment period  
25 will close. After the close of the public comment

1 period, we will incorporate the mayor's new guidance  
2 along with other comments we have received in forums  
3 like this to include written comments into the  
4 development -- formulate that into the development of a  
5 new alternative. This alternative will undergo the same  
6 rigorous analysis as the previous alternatives. And a  
7 supplemental environmental document will be distributed  
8 for public review and comment. Very likely the  
9 development of this new alternative will necessitate  
10 another public hearing, much the same as this, to  
11 comment on the new alternative as we finalize the  
12 environmental process.

13 I'm going to take my prepared comments and add  
14 in the form of plain speech, that is, we have had from  
15 the events, the tragedy of September 11th, Dave and I  
16 had originally scheduled these public hearings during  
17 that time frame. They were cancelled for the obvious  
18 reasons it would have been insensitive for us to  
19 continue the public hearing process given those events.  
20 So we, rescheduling with 30 days delay, it may appear a  
21 little clumsy that we're having a public comment period  
22 with due guidance we received. We will take due  
23 guidance the mayor has given us shortly after September  
24 11th and, likewise, comments from groups such as this  
25 that are important to the process, and we will take

1 those two and put them into a new document. If some of  
2 your comments are "where is the new plan," they are not  
3 there yet, but there will be ample opportunity at a  
4 future date to take a look at that and comment, much as  
5 you are on the existing plan.

6 With that, I will turn it over to Tom, and the  
7 evening is yours.

8 MR. WALL: Thank you, gentlemen. I would like to  
9 encourage everyone who has not done so to fill out a  
10 yellow speaker card if you would like to make comments  
11 tonight. Again, if you have comments in excess of three  
12 minutes, please turn them into writing to the court  
13 reporters. We have two court reporter this evening,  
14 Lisa and Kim. When their knuckles turn red, it means  
15 you're speaking too fast. So I would like you to speak  
16 slowly and clearly. Be certain to identify yourself so  
17 we can get your name on the record. I will provide them  
18 with a copy of the speaker cards. So if they could read  
19 your handwriting, they will enter your name in the  
20 record along with your verbal comments.

21 I have a large clock in front of me with a  
22 three-minute timer. I will start the timer when you're  
23 comfortable and ready to speak. The timer will issue an  
24 alarm at the end of three minutes. Please don't let  
25 that worry you. I would like you to sum up at that

1 point, and we'll move on to the next speaker.

2 Our first speaker will be Councilman Paul Leon  
3 from the City of Ontario.

4 MR. LEON: First off, I would like to say thank you  
5 for coming to our city to hold these hearings. It's a  
6 pleasure to have you here, an honor. I want to greet  
7 you on behalf of the Ontario City Council and Mayor Gary  
8 Oritt .

9 Once again I want to say, good evening. I'm  
10 Paul Leon, an Ontario City Councilmember and the airport  
11 liaison for the Ontario City Council. I'm here this  
12 even to speak in support of Los Angeles Mayor James  
13 Hahn's recently articulated plan to upgrade security at  
14 LAX and to express appreciation for his statements and  
15 actions in support of a regional approach to the air  
16 passenger and cargo needs of Southern California. We  
17 are especially appreciative of his efforts to expand  
18 service at Ontario International Airport and his recent  
19 marketing trip to Mexico which resulted in daily  
20 Aeromexico flights between our Ontario and Hermosillo  
21 beginning in January 2002.

22 The City of Ontario values owner partnership  
23 with the City of Los Angeles and Los Angeles World  
24 Airports, and stands ready to work with the entire  
25 region to accommodate our share of Southern California

1 air traffic at Ontario International Airport. Thank you  
2 very much.

3 (The statement submitted for the  
4 record was marked as Statement 2.)

5 MR. WALL: Thank you, sir. Our next speaker will be  
6 Councilmember Bill Ruh, R-u-h, from the City of  
7 Montclair. Welcome, sir.

8 MR. RUH: Thank you. I am Bill Ruh, Councilmember  
9 from the City of Montclair. I am also a member of the  
10 Board of Directors for the Friends of the Ontario  
11 Airport.

12 I'm here tonight to express to you that there  
13 is regional support for this airport. I know as a  
14 councilmember that there is a 5.5 billion dollar-impact  
15 to our local economy. We know that whatever happens  
16 here to this airport will drive our local economy. I  
17 believe that every city that borders Ontario Airport and  
18 every city in the sphere of the Ontario Airport is aware  
19 of the strength of our economy that relies on the  
20 day-to-day traffic, both passenger and cargo, at Ontario  
21 Airport.

22 We must look at expansion and be very, very  
23 clear that with the expansion we must make sure there  
24 are dollars in place for the regional infrastructure,  
25 the freeways and the regional surface arteries that lead

1 in and out of the airport must be adequate to handle the  
2 growth in that expansion in a very timely and  
3 well-planned manner. Because if that isn't done, what  
4 happens is a tremendous amount of congestion that then  
5 translates to frustration for residents who will find  
6 other means and other airports to use.

7 We view regionally that this airport is the  
8 key to the future success of the entire Inland Empire.  
9 We realize that without the airport, there is a domino  
10 effect to our economy, that we must work regionally to  
11 keep this strong. And I'm proud to say that most of the  
12 cities here do work very closely with Ontario on this  
13 issue, and we certainly appreciate what our colleagues  
14 are doing. And we stand ready to lend a hand to help  
15 continue to keep this vital economic factor moving  
16 forward. Thank you.

17 MR. WALL: Thank you, sir. Our next speaker will be  
18 Mr. Keith Metzler representing the City of Victorville  
19 Southern California Logistics Airport Authority.  
20 Mr. Metzler.

21 MR. METZLER: Good evening. And thank you. Again,  
22 my name is Keith Metzler. I'm from the City of  
23 Victorville. I'm here to indicate that Southern  
24 California Logistics Airport is prepared to play a role,  
25 again, accommodating the aviation -- the aviation

1 demand.

2           Currently Southern California Logistics  
3 Airport operates as a fully dedicated logistics  
4 facility. Southern California Logistics Airport  
5 previously operated as a former George Air Force Base.  
6 Currently we are accommodating all facets of logistics  
7 integrating cargo with rail and truck transport. We  
8 have the infrastructure and we're prepared to expand on  
9 our infrastructure to accommodate regional growth.

10           We currently have two runways. We have  
11 inherited two 10,000 lineal foot runways. We just  
12 recently expanded one of those runways to 13,000 lineal  
13 feet and we're in the process of expanding that same  
14 runway into 15,000 fully accommodated, fully dedicated  
15 air cargo, transport and getting fully loaded 747s up  
16 and across the nation.

17           The City of Victorville wishes that  
18 decentralized airport plan provide for greater  
19 coordination pushing air cargo to outerlying airports,  
20 thus, relieving the transportation congestion in  
21 Southern California and mitigating some of the impacts  
22 of our highway system. Therefore, we are in support of  
23 Mayor Hahn's approach to a decentralized airport  
24 aviation. Thank you.

25           MR. WALL: Thank you, sir. Our next speaker is

1 Niki. I have to apologize, Niki, I can't read your  
2 handwriting, Niki Tennant, representing Councilmember  
3 Ruth Galanter.

4 MS. TENNANT: Sorry about that. I wrote it a little  
5 bit crooked. Yes, my name is Niki Tennant. I'm with  
6 Los Angeles City Councilmember Ruth Galanter.

7 And first of all, I would like to thank  
8 everyone for attending tonight, such as the attendance  
9 is, and to LAWA for holding the extra public hearings  
10 accessible for people of this region.

11 First and foremost, I would also like to  
12 remind you all that this is a public hearing on the  
13 Master Plan to expand LAX in the preferred alternative  
14 to the 98 million annual passengers. This is not a  
15 hearing on the Fifth Alternative proposed by Mayor Hahn.  
16 We hope to see such a public hearing soon, and we'll  
17 look forward to reviewing that as well.

18 In light of the events of September 11th, this  
19 Master Plan is obsolete. And, in fact, it now contains  
20 assessments that may be fatally flawed. Now more than  
21 ever it is imperative that our air capacity should be  
22 planned for and implemented so that it allows people to  
23 utilize airports that are closer to where they live and  
24 work and can reduce the environmental impacts on those  
25 folks as well as easing the burden on an area that is

1 already suffering the dramatic impacts of more than  
2 67 million annual passengers per year, many of whom  
3 drive across the country to Los Angeles International  
4 Airport.

5 We also have this opportunity to reduce the  
6 security threat of only having one major international  
7 airport. Although the aviation industry has been  
8 dramatically changed since the events of September 11th,  
9 demand will creep back up as travelers begin to feel  
10 more comfortable with the security measures that are  
11 being implemented in airports around the world. So it  
12 is very important that we seize this opportunity to  
13 truly plan for a regional system of airports that best  
14 serve the interest of the traveling public and business  
15 and industry. Thank you.

16 MR. WALL: Thank you very much. Do we have any  
17 other speaker cards? Anyone else that would like to  
18 speak at this time? Gentlemen, I have one remaining  
19 card for Mr. Daniel Shriver. Daniel has requested the  
20 opportunity to provide a demonstration that will last  
21 longer than three minutes. If we have no one else in  
22 the audience that would like to speak at this time, I  
23 will call Mr. Shriver forward. Okay. Daniel.

24 MR. SHRIVER: Hello. Thank you for having this  
25 public hearing and allowing us to do a demonstration.

1 My name is Daniel Shriver, 4741 Ben Avenue, Valley  
2 Village, California 91607. I'm here representing the  
3 Atemi-Ryu JuJitsu.

4 I'm here talking about -- I'm here to talk  
5 about airline security. Basically -- do you want to  
6 give me three minutes or should I start with that?

7 MR. WALL: Go ahead.

8 MR. SHRIVER: Thank you. Recent events have  
9 occurred on United Airlines this last weekend where a  
10 gentleman went past screeners and brought in, I believe  
11 it was a can of mace, a stun gun and several knives.  
12 There was a red team for the FAA that not too long ago  
13 did some test on how effective the screening was. And  
14 one of the security screening companies won a lawsuit  
15 because the red team put through weapons that weren't  
16 considered classic identifiable weapons, but they were  
17 perfectly acceptable weapons that would be used against  
18 them.

19 We have to rethink how we're approaching the  
20 security thing. If people can get through with weapons,  
21 we have to train the flight crew in a close-range self  
22 defense. Atemi-Ryu JuJitsu has been demonstrated here  
23 on two occasions. Vince Cecere and James Karin are here  
24 with me tonight. We want to do one more demonstration  
25 for those who that haven't seen how effective it is.

1 It's a martial art that uses pressure points, weak spots  
2 in the body and joint locks. We have people we pulled  
3 from the audience that have been given three minutes'  
4 worth of introduction and find their skills are very  
5 effective and appropriate. We ask that you guys  
6 consider doing a test where we take a flight crew, any  
7 flight crew, and we train them in the skills that you  
8 can see how effective it is.

9           There are kickboxing -- cardiovascular  
10 kickboxing schools that are training flight attendants.  
11 There are people that are trying to teach you how to use  
12 an ice hammer and a fire extinguisher, a tray, whatever,  
13 but these aren't effective. And they are not really  
14 going to solve the problem. Once you see our effective  
15 close-range self defense that's being taught to Girl  
16 Scouts, being taught to elderly, being taught to all  
17 kinds of people, it's effective and needs to be  
18 considered and considered thoroughly.

19           The fact is that airline screeners, our  
20 federal employees, won't really affect how safe the  
21 flight is. Right now the FAA is saying something like  
22 80 percent accuracy rates -- I don't know if it's FAA,  
23 but 80 percent accuracy rates of the screening machines.  
24 It was on public radio the other day talking about the  
25 success rate is 20 percent and the failure rate is 80

1 percent. There's an illusion of security that's out  
2 there. And we need to address it before something else  
3 terrible happens. Thank you. Shall we do the  
4 demonstration now?

5 MR. CECERE: May I --

6 MR. WALL: Our next speaker will be Mr. Vince  
7 Cecere.

8 MR. CECERE: My name is Sensei Vince Cecere, third  
9 degree chief instructor of combat systems, second degree  
10 black belt chief instructor and founder of the Atemi-Ryu  
11 combat systems of Los Angeles.

12 We are hearing a lot of people talking about  
13 security, talking about expansion. We're talking about  
14 money. We're talking about whose communities are going  
15 to be sheared up by this income of money. I assure you  
16 that we're putting the cart before the horse. Until we  
17 get the flying public's confidence back that they can  
18 actually get on the plane without having anxiety and not  
19 being afraid of some lunatic who didn't take his  
20 medication or some guy with bad intentions or some group  
21 decides that they want to hinder our way of life, I  
22 assure you, those of you who have seen our combat  
23 techniques in the other demonstrations as well as those  
24 who will see it now, you'll see that we are offering a  
25 solution to a major problem.

1           We have the infrastructure to get the people  
2 trained. I have a plan through Ballys which has over  
3 300 clubs, which I have already talked to them, which  
4 they will assist us in training as many airline  
5 personnel as we need. So we have the people. We have  
6 the clubs. We have the places to train them, and we  
7 definitely have a need.

8           People will say, "Why are you doing this? Why  
9 are you doing this? Why don't you just keep training  
10 the military? Why don't you just keep training the  
11 police? Why don't you just keep training the different  
12 places?" I didn't get a chance to serve my country in  
13 any other facet, really, and I see something that I know  
14 that most people don't. Shame on me if I sit on my  
15 hands and do nothing while a lot of innocent people,  
16 a lot of innocent lives were taken.

17           Secondly, I'm a New Yorker. I take it  
18 personally. And if it would be okay, we would like to  
19 demonstrate.

20           MR. WALL: Sure.

21           (Demonstration took place.)

22           MR. WALL: Thank you, Sensei. Could we have a round  
23 of applause for the assistant. We'll take a ten-minute  
24 break before your next demonstration. Thank you, sir.  
25 I appreciate that. Any other speakers that would like

1 to fill out cards now? Anyone else who would like to  
2 say something this evening? We are going to remain  
3 open. We'll take a short break and recess until we  
4 receive some more cards. We will be here until  
5 9:00 o'clock tonight. So we encourage you, if you have  
6 not had a chance to make a comment or did not prepare  
7 one, we would love to hear your thoughts tonight. So  
8 we'll recess until we receive some more input that  
9 others are awaiting. Thank you.

10 (Recess was taken.)

11 MR. WALL: Ladies and gentlemen, we are going to  
12 reconvene the public hearing. Our next speaker will be  
13 Mayor Mike Gordon from the City of El Segundo. Mayor  
14 Gordon.

15 MR. GORDON: Good evening. Thank you for the  
16 opportunity to be here this evening. My name is Mike  
17 Gordon. I'm the Mayor of the City of El Segundo. I  
18 just want begin by letting you know that the City of  
19 El Segundo is very pleased that Mayor Hahn has agreed to  
20 set aside Mayor Riordan's Master plan for the expansion  
21 of LAX and is now committed to developing a new plan for  
22 LAX that limits growth at LAX to 78 million annual  
23 passengers.

24 For the first time since LAWA embarked on this  
25 Master Plan odyssey, the mayor of Los Angeles has now

1 committed to being a full partner with the region in  
2 developing a truly regional airport plan that serves the  
3 aviation needs of all of Southern California. The  
4 Inland Empire airports needs to be the first priority of  
5 development of a regional system. The Ontario  
6 International Airport is itself the most important  
7 component of the regional airport plan.

8 We are pleased that Mayor Hahn recognized and  
9 embraces the role Ontario must play in the regional  
10 airport system. We applaud Mayor Hahn's successful  
11 negotiation with Aeromexico to bring more flights to  
12 Ontario. Ontario is ready today to play an enhanced  
13 role in our regional aviation system, and it has  
14 significant unused capacity that could be put into play  
15 tomorrow.

16 Developing a truly regional airport system  
17 reduces vulnerability of LAX and reduces the  
18 vulnerability of our regional economy. It will reduce  
19 vulnerability of our airport system by adding regional  
20 airports in Southern California that could handle  
21 significant passengers and cargo and create flexibility  
22 and redundancy in the region's aviation system. But a  
23 truly regional plan will help to ensure that security  
24 will not take a back seat to passenger throughput. It  
25 will help to ensure that LAX receives only as much air

1 traffic as it can safely handle. We are grateful to  
2 Mayor Hahn for setting aside the previous Master Plan  
3 alternatives for LAX expansion. We are pleased to offer  
4 this preliminary public input for the mayor's new plan.

5 Now, discussing the well funded, comprehensive  
6 campaign designed specifically to market Ontario Airport  
7 locally as well as nationally and internationally as a  
8 convenient alternative to LAX, but Ontario isn't the  
9 only regional airport opportunity in Inland Empire.

10 Former military bases at March, Norton and  
11 George are now available for commercial aviation. Now  
12 called San Bernardino International, Southern California  
13 logistics and March Inland Port, these airports are  
14 planning their entry to the Southern California  
15 marketplace. Southern California logistics is already  
16 operating commercially. All these airports have strong  
17 community support for further development. As specialty  
18 cargo airports, these airports can relieve much of the  
19 cargo burden at LAX. Perhaps more importantly, the  
20 Inland Empire airports and others in the region are  
21 poised to play an increasingly critical role in post  
22 September 11th security efforts.

23 You will recall the Secretary of  
24 Transportation temporarily banned the carriage of mail  
25 and cargo on passenger planes following the events of

1 September 11th. And for that we believe the airport  
2 system is what is truly necessary here in Southern  
3 California. We are grateful to Mayor Hahn for joining  
4 us and calling for a regional solution. We look forward  
5 to working with the communities in the Inland Empire in  
6 bringing that about. We are happy to respond to  
7 questions. Thank you.

8 (The statement submitted for the  
9 record was marked as Statement 3.)

10 MR. WALL: Thank you, Mayor Gordon. Our next  
11 speaker will be Ms. Carole Hossan. That's H-o-s-s-a-n.

12 MS. HOSSAN: You said it right, too. You're  
13 probably tired of seeing me. But I keep hearing that  
14 the LAX Master Plan expansion is dead, but it's here in  
15 the other room being commented upon.

16 During past expansions of LAX, Westchester has  
17 lost over 3,000 homes and thousands of residents. I  
18 would like to see LAX constrained to its current  
19 footprint and not have the northern runway extension  
20 occur that would take out one-third of our central  
21 business district and also some homes. I also object to  
22 the potential LAX Expressway which would either degrade  
23 the historic centinella adobe or take out homes in  
24 Inglewood. Rather than pour everything into LAX, I  
25 would like to see the City of Los Angeles and

1 Los Angeles World Airports put muscle and not just lip  
2 service into the regional approach to increase air  
3 traffic espoused by them, Southern California  
4 Association of Governments, also known as SCAG.

5 Los Angeles and LAWA should help Ontario and  
6 Palmdale in concrete ways, not just with encouraging  
7 words. LAX adjacent communities will be watching what  
8 the City and LAWA does, not just what they say they will  
9 do, to help Palmdale and Ontario become the airport  
10 their citizens want them to be. Thank you for your  
11 time.

12 MR. WALL: Thank you, ma'am. Our next speaker will  
13 be Mr. Cecil Carpio -- I'm sorry. Is this Cecil?

14 MS. CARPIO: Cecil Carpio.

15 MR. WALL: That's C-a-r-p-i-o?

16 MS. CARPIO: Yes, it is. My name is Cecil Carpio.  
17 I'm from the City of Inglewood, and a couple of books I  
18 would like to cite. One is the "Executive Summary for  
19 the EIR/EIS LAX Proposed Master Plan Improvement."

20 On page ES-7 under development of alternatives  
21 it reads, "Alternatives to increasing capacity at LAX.  
22 Two broad categories of options were analyzed in the  
23 search for alternatives to increase capacity at LAX.  
24 First, alternative airports and alternative modes of  
25 transportation were evaluated. Second, various aviation

1 activity management or demand management scenario for  
2 study, in all cases the analyses revealed that the  
3 alternatives in these two categories could not  
4 reasonably be expected to meet the purpose and needs of  
5 the Master Plan and would not eliminate the need for  
6 improvements at LAX. This range of alternatives was  
7 rejected from further consideration."

8           And so my comment is, the Regional Airport  
9 Plan needs to be further considered. And second is the  
10 economic study. It's called the "Industrial Economic  
11 and Administrative Studies Pathway to Becoming World  
12 Class and Cutting Edge." It's done by KH Consulting  
13 Group, and it was the final report, November 1999. And  
14 on page XIII-69 under "Marketing," it says "Given the  
15 current controversy surrounding LAX Master Plan, it may  
16 be many years before new facilities can be added. So  
17 the role of Ontario as a reliever will be doubly  
18 important. Ontario should establish a marketing program  
19 to work with the airlines to investigate the feasibility  
20 of increasing operations. This program should be  
21 coordinated with LAX to ensure that the message to the  
22 airlines is unified and clear. Ontario should gather  
23 detailed historical information about airline load  
24 factors by route, route profitability and passenger  
25 travel patterns to construct an effective marketing

1 plan. This marketing plan should be incorporated in the  
2 overall Master Planning efforts for Ontario."

3 And my comment to this is, this marketing plan  
4 should be incorporated into comments, or I should say, a  
5 new Master Plan when we're discussing a regional  
6 solution. Thank you.

7 MR. WALL: Thank you, ma'am. Are there any others  
8 in the audience who would like to submit a comment card?  
9 Gentlemen, I have no other cards at this time. We will  
10 take another short recess.

11 (Recess was taken.)

12 MR. WALL: We have one speaker ready to provide  
13 comments. Ladies, we will now reconvene the public  
14 hearing. Our next speaker will be John Perrone  
15 representing American Airlines. John, right there.  
16 I'll start the timer when you're ready to speak.

17 MR. PERRONE: Thank you. Good evening. I've been  
18 flying with American Airlines for almost ten years. I'm  
19 a flight attendant. I live in Riverside. I'm very pro  
20 the development of Ontario as a viable alternative to  
21 Los Angeles.

22 Before September 11th, I was one of a few of  
23 us who would be flying in and out of Ontario, when I was  
24 done with the services, the beverages and the meals.  
25 I'm willing to sit down and talk to passengers and thank

1 them for choosing Ontario. Oftentimes I ask them where  
2 they live. A lot of times I'll get the Inland Empire  
3 cities. Sometimes I'll get the Pasadenas and some  
4 people in the valley and Orange County, south of Orange  
5 County. But most are obviously from this area. When I  
6 do speak with people that are closer to Los Angeles or  
7 South Orange County, I ask them, "Why do you think more  
8 people choose Ontario?" And most of them think it's  
9 just an image thing, because traffic normally on the 15  
10 northbound and southbound is a lot easier, and sometimes  
11 they'll be going opposite the heavy traffic anyway, and  
12 they think it's an image thing.

13 I know when I was younger -- I should say, I  
14 think when I was younger the fares out of Ontario when  
15 American was the premier carrier of Ontario they offered  
16 cheaper fares than LAX. Now, again, I speak as an  
17 employee. So I don't call reservations too often. I  
18 think for the most part American encourages and other  
19 airlines encourage their passengers to choose  
20 Los Angeles by offering lower fares. I don't think  
21 Ontario is promoted that way with lower fares at all.

22 Now we have only six flights a day which  
23 allows American to not utilize their union labor at  
24 Ontario or Long Beach. You need to have seven flights a  
25 day for running six months or however longer to require

1 the union. The only unions right now representing at  
2 Ontario are the pilots and flight attendants. Until '94  
3 where they cut off the flights to Chicago, right now  
4 only American serves Dallas, Fort Worth.

5 So I guess I'm just here to ask Los Angeles  
6 World Airports to do your best to promote this Inland  
7 Region to Los Angeles and Orange County residents in the  
8 best manner you see fit. Thank you very much.

9 MR. WALL: Thank you, John. Do we have any other  
10 individuals who would like to speak?

11 MS. HOSSAN: I'll speak again.

12 MR. WALL: Thank you. Our next speaker will be  
13 Carole Hossan.

14 MS. HOSSAN: Okay. This is off-the-cuff, but just  
15 some things. I didn't go to the last Board of Airport  
16 Commissioner Meetings, but I know at previous meetings I  
17 believe the advertising budget for Ontario was put on  
18 hold, I believe, because of budget concerns after the  
19 September 11th tragedy.

20 And a suggestion that I don't know if it was  
21 made at a public forum, but maybe the name Ontario to  
22 people that aren't familiar with the area, they might  
23 not even realize that it's near  
24 Los Angeles. Maybe it should be LAX -- or Los Angeles  
25 Ontario, or something so people realize where it is, you

1 know, that it's a travelable distance from Los Angeles.  
2 And I know, you know, we went out to Palmdale the other  
3 night. There's an airport with no airplanes. I don't  
4 know the history of Palmdale. I don't know if they need  
5 advertising. I don't think I would know about it if it  
6 weren't for being involved in this situation. I know  
7 they want flights that go to destinations, not just  
8 flights that go to Los Angeles to go to somewhere else.  
9 I'm sure that will -- you know, ticket prices and  
10 landing fees, et cetera. Again, I'm not sure about the  
11 latest situation on this, but Ontario's landing fees,  
12 you know, fairly recently were raised 59 percent. I  
13 don't know if they've been lowered or not, but there are  
14 specific things that can be done to enhance and promote  
15 these airports. Especially the time that Los Angeles  
16 has had these airports, I think more progress should  
17 certainly have been made in this direction.

18 So I really hope that, you know, people get  
19 together and pull together for the economic health of  
20 the whole region.

21 MR. WALL: Thank you, again, Carole for your  
22 comments. Is there anyone else in the audience who  
23 would like to speak? Seeing no one, we'll take another  
24 recess.

25 (Recess was taken.)

1 MR. KESSLER: We will now reconvene the public  
2 hearing. Is there anyone out there that has not had an  
3 opportunity to speak on the Draft EIS/IER? Not seeing  
4 anyone else, I will remind everyone that if you feel you  
5 are unable to provide us with verbal comments today, we  
6 will accept written comments until Friday, November 9,  
7 2001. You can mail your comments either to me at the  
8 FAA or to Jim Ritchie with the City of Los Angeles. The  
9 mailing addresses are listed on the cover of the  
10 EIS/EIR.

11 I want to thank everyone for your comments  
12 today. This public hearing for the Draft EIS/EIR for  
13 the Los Angeles International Airport is now closed.

14 (Whereupon the proceeding adjourned  
15 at 9:00 o'clock p.m.)

**U.S. DEPARTMENT OF TRANSPORTATION  
Federal Aviation Administration**

**Los Angeles International Airport  
Los Angeles, California**

**Draft Environmental Impact Statement/Environmental Impact Report  
Public Hearing Remarks**

**Wednesday, November 7, 2001**

**Ontario Airport Marriott Hotel  
Ontario, California**

**David B. Kessler, AICP  
Environmental Protection Specialist**

Good evening ladies and gentlemen, my name is David Kessler; I'm an Airport Planner from the Federal Aviation Administration, Western-Pacific Region. I would like to welcome you to the 8<sup>th</sup> of a total of nine Public Hearings the FAA and the city of Los Angeles are conducting for the Draft Environmental Impact Statement/Environmental Impact Report or EIS/EIR for the proposed master plan at Los Angeles International Airport. The first three public hearings on this topic were held on Saturday, June 9<sup>th</sup> in Inglewood, Manhattan Beach, and Westchester. During the past two weeks, Public Hearings on the Draft EIS/EIR were held in Monterey Park, San Pedro, the Mid-Wilshire District of the city of Los Angeles and in Palmdale. Today's hearing is the fifth of six additional hearings that will be completed this week. These hearings were originally scheduled for early September; however, they were postponed due to the terrorist attacks in New York and Washington, D.C. The next hearing will be held tomorrow, Thursday, November 8th at the Airtel Plaza Hotel, next to the Van Nuys Airport. The address of the Airtel Plaza Hotel is 7277 Valjean Avenue, in Van Nuys.

The purpose of these hearings is to collect comments from the general public concerning the adequacy of the information disclosed in the Draft EIS/EIR. The FAA and the City of Los Angeles along with the Federal Highway Administration as a cooperating agency have prepared the Draft EIS/EIR.

I would like to take this opportunity to make sure that everyone understands that **NO** decisions will be made today regarding the proposed project. Today's hearing is **not** a question and answer type of forum. Our job is to listen to what you have to say about the adequacy of the information in the Draft EIS/EIR. In other words, it's your turn to talk to us. Since we are here to listen, we are not going to respond to questions about the pros and cons of the proposed project. Since 5 o'clock this afternoon, the city has held a public workshop just outside of this room for anyone to ask questions about the master plan, the environmental process and the various proposed projects.

Following publication of the Draft EIS/EIR for comment, the next step in the joint federal and state environmental disclosure process is holding this and the other public hearings during this week and next week. The environmental disclosure process for this project began in 1997 with the publication of a Notice of Intent to prepare the joint EIS/EIR in the *Federal Register*. In July of 1997, we held a series of meetings with members of the public and governmental agencies to receive comments on the scope of the Draft EIS/EIR. Following those meetings, the Draft EIS/EIR was prepared considering the comments received during the scoping meetings and those submitted in response to the Notice of Intent. The document has also been prepared pursuant to the National Environmental Policy Act of 1969 or "NEPA", the Council on Environmental Quality Regulations, which are the implementing regulations for NEPA, the California Environmental Quality Act of 1970 or "CEQA", and the Airport and Airway Improvement Act of 1982, as amended.

Following today's hearings and the close of the comment period, we will then correct, and revise the EIS/EIR as necessary based on the comments received. We will also prepare responses to the comments we receive and include those responses in the **Final EIS/EIR**.

Before we begin receiving verbal comments, we would like to let you know the ground rules of this hearing. First, as I said earlier, we are not here to respond to questions about this project. We are only here to listen to your comments and take notes. We also have a court reporter present to ensure that we have an accurate transcript of this hearing.

For anyone who would like to speak, we ask you to fill out a speaker card, **like this one** and give it to the person at the sign in desk. That person will bring the speaker cards up to our facilitator who will call the names of each speaker so we can proceed in an orderly fashion. So that everyone gets an opportunity to provide verbal comments, everyone will get three minutes to speak. To be fair to everyone, we are not going to allow people to transfer their allotted time to someone else. I ask that when you speak, you give us your name and address for the record. We also have a Spanish language translator for anyone wishing to provide comments in Spanish.

If there is anyone who uncomfortable speaking in front of a group or if you need more than three minutes to provide your comments, we ask that you provide your comments in writing. We have comment sheets, **like this one**, available for your use at the sign-in desk. You can leave your comments at the sign in desk, or you can mail your written comments using the comment sheet or a letter to either address listed on the cover of the EIS/EIR. The city's address is listed at the top of the comment sheet. I would like you to understand that a verbal comment is just as important as a written comment. So please feel free to provide any comments on the document you may have to us either verbally today, or in writing. Comments are due by **5:00 p.m., Pacific Standard Time, on Friday, November 9, 2001.**

Lastly I would like everyone to know that even though we have this hearing scheduled until 9 o'clock this evening, we will stay here as long as necessary for everyone to get a chance to provide verbal comments on the Draft EIS/EIR. As I said earlier, our job here today is to listen to your comments.

Now, I will return the Hearing back to our facilitator, **Tom Wall**, to introduce Mr. Ritchie who will provide some introductory comments from the city of Los Angeles. Following Mr. Ritchie's comments, we will collect the speaker cards and call the name of the first speaker.

Thank you.

Is there any one else who has not had an opportunity to speak concerning the information in the Draft EIR/EIS? **[wait for anyone to speak up]** Not seeing anyone else, I will remind everyone that if you feel that you are unable to provide us with verbal comments, today, we will be accepting written comments until **5:00 p.m. Pacific Standard Time, Friday, November 9, 2001**. You can mail your comments either to me at the FAA or to Jim Ritchie with the City of Los Angeles. The mailing addresses are listed on the cover of the EIS/EIR. I want to thank everyone for your comments today, this public hearing for the Draft EIR/EIS at Los Angeles International Airport is now closed.

**END OF COMMENTS**

## Statement of Ontario City Council Airport Liaison Paul Leon

### LAWA Public Hearing

Wednesday, November 7, 2001

Good evening. I'm Paul Leon an Ontario City Councilmember and the Airport Liaison for the Ontario City Council. I am here this evening to speak in support of Los Angeles Mayor James Hahn's recently articulated plan to upgrade security at LAX and to express appreciation for his statements and actions in support of a regional approach to the air passenger and cargo needs of Southern California. We are especially appreciative of his efforts to expand service at Ontario International Airport and his recent marketing trip to Mexico which resulted in daily Aeromexico flights between Ontario and Hermosillo beginning in January 2002. The City of Ontario values our partnership with the City of Los Angeles and LAWA and stand ready to work with the entire region to accommodate our share of Southern California air traffic at Ontario International Airport.

###

Mike Gordon  
LAX Public Hearing  
Ontario, CA  
November 7, 2001

- Good evening. I'm Mike Gordon, Mayor of the City of El Segundo
- The City of El Segundo is pleased that Mayor Hahn has agreed to set aside the Riordan Master Plan for the expansion of LAX
- And is now committed to developing a new plan for LAX that limits growth at LAX to 78 million annual passengers
- For the first time since LAWA embarked on this Master Plan odyssey, the mayor of Los Angeles has committed to being a full partner with the region in developing a truly regional airport plan that serves the aviation needs of all of Southern California.
- Inland Empire airports need to be the first priority in the development of our regional system.
- Ontario International Airport is itself the most important component of the regional airport plan.
- We are pleased that Mayor Hahn recognized and embraces the role Ontario must play in the regional airport system and
- We applaud Mayor Hahn's successful negotiation with Aeromexico to bring more flights into Ontario.
- Ontario is ready today to play an enhanced role in our regional aviation system. — it has significant unused capacity
- ~~It is situated in one of the fastest growing areas of the region.~~
- ~~It has significant unused capacity that can be used today and the ability to expand in the future.~~
- ~~Ontario Airport is positioned to be the launch point for the regional plan that will develop over the next 20 years.~~

- Now the City of Los Angeles must make sure that this airport fulfills its role in the region.
- We are particularly encouraged that Mayor Hahn has recognized the pivotal role of Ontario Airport
- ~~And has negotiated with Aeromexico for additional flights to Ontario~~
- ~~But more flights to more destinations at competitive prices are needed~~
- ~~Along with~~ a well funded, comprehensive campaign<sup>15</sup> designed specifically to market Ontario Airport, locally as well as nationally and internationally, as a convenient alternative to LAX.
- But Ontario isn't the only regional airport opportunity in the Inland Empire.
- Former military bases at March, Norton and George are now available for commercial aviation
- Now called San Bernardino International, Southern California Logistics and March Inland Port ~~in place~~, these airports are planning their entry into the Southern California marketplace.
- Southern California Logistics is already operating commercially.
- All these airports have strong community support for further development.
- As specialty cargo airports, these airports can relieve much of the cargo burden at LAX.
- Perhaps more importantly, Inland Empire airports and others in the region are poised to play an increasingly critical role in post 9/11 security efforts
- You will recall, the Secretary of Transportation temporarily banned the carriage of mail and cargo on passenger planes following the events of 9/11

- Anthrax-tainted mail and cargo continue to be a weak links in aviation security
- As specialty cargo airports, San Bernardino International, Southern California Logistics or March Inland Port can easily facilitate the separation of mail and cargo from passengers should it be necessary to ensure the safety and security of the aviation system
- Developing a truly regional airport system reduces vulnerability at LAX and reduces the vulnerability of our regional economy.
- It will reduce vulnerability in our airports system by adding regional airports in Southern California that can handle significant passengers and cargo - and ~~thereby~~ create flexibility and redundancy in the region's aviation system.
- A truly regional plan will help to ensure that security will not take a back seat to passenger throughput.
- It will help to ensure that LAX receives only as much air traffic as it can safely handle.
- We are grateful to Mayor Hahn for setting aside the previous ~~four~~<sup>RIDROAD</sup> Master Plan alternatives for LAX expansion.
- We are pleased to offer this preliminary public input for the Mayor's new plan.
- But the public expects and deserves the opportunity to review the details of the new plan once completed,
- and the opportunity to comment on an entirely new environmental impact review that must be undertaken for this entirely new plan.
- We look forward to participating in future public hearings once the details of the new plan are drafted and LAWA completes the new EIR that must be undertaken.

**Official Hearing Transcript  
Airtel Plaza Hotel  
Van Nuys, California  
Thursday, November 8, 2001**

Following this page is the transcript of the oral testimony taken at the above hearing. Each speaker at the hearing has been assigned a unique identification number. The numbers assigned to each speaker for this hearing are:

<b>Number</b>	<b>Speaker</b>	<b>Affiliation</b>
PHA00001	Veronica Johnson	Councilmember Ruth Galanter's Office
PHA00002	Robert Rodine	Valley Industry and Commerce Association
PHA00003	Diane Sambrano	None Provided
PHA00004	Bruce Ackerman	Economic Alliance of the San Fernando Valley
PHA00005	Carol Flink	None Provided
PHA00006	Charles Brink	None Provided
PHA00007	Daniel Shriver	None Provided
PHA00008	Sensei Vince Cecere	None Provided
PHA00009	James Karin	None Provided
PHA00010	Cecil Carpio	None Provided
PHA00011	Bobby Blanks	Congressmember Maxine Waters' Office
PHA00012	Gerald Silver	Homeowners of Encino

Any exhibits attached to this hearing transcript have been previously reproduced in this Final EIS/EIR as individual public comment letters.

3 ---oOo---

4  
5 MR. WALL: Ladies and gentlemen, on behalf of the  
6 Federal Aviation Administration and Los Angeles World  
7 Airports, I want to welcome you to an open house to hear  
8 your written and verbal comments concerning the  
9 Los Angeles Airport Master Plan Environmental Impact  
10 Report and Environmental Impact Statement. We have two  
11 gentlemen who will receive your testimony this evening.  
12 I'll introduce the first, Mr. Mickeal Agaibi who is the  
13 Supervisor of Planners the Federal Administration Local  
14 Office. Mr. Agaibi.

15 MR. AGAIBI: Thank you. Good evening, ladies and  
16 gentlemen. My name is Michael Agaibi. I'm the Airport  
17 Planner from the Federal Aviation Administration  
18 Western-Pacific Region. I would like to welcome you all  
19 to the 9th public hearing for the FAA and the City of  
20 Los Angeles are conducting for the Draft Environmental  
21 Impact Statement, Draft Environmental Report or the  
22 EIS/EIR for the proposed Master Plan at Los Angeles  
23 International Airport. The first three public hearings  
24 on this topic were held on Saturday June 9th in  
25 Inglewood, Manhattan Beach and Westchester. During the

1 past two weeks public hearings on the Draft EIS/EIR were  
2 held in Monterey Park, San Pedro and the Mid-Wilshire  
3 District of the City of Los Angeles as well as Palmdale  
4 and Ontario. Today's hearing is the last of six  
5 additional hearings being held for the Draft EIS/EIR.  
6 These hearings were originally scheduled for early  
7 September, however, they were postponed due to the  
8 terrorist attack on New York and Washington D.C.

9 The purpose of these hearings is to collect  
10 comments from the general public concerning the adequacy  
11 of the information disclosed in the Draft EIS/EIR. The  
12 FAA and the City of Los Angeles along with the Federal  
13 Highway Administration as a cooperating agency have  
14 prepared the Draft EIS/EIR.

15 I would like to take this opportunity to make  
16 sure that everyone understands that no decisions will be  
17 made today regarding the proposed projects. Today's  
18 hearing is not a question-and-answer type of forum. Our  
19 job is to listen to what you have to say about the  
20 adequacy of the information in the Draft EIS/EIR. In  
21 other words, it is your turn to talk to us. Since we  
22 are here to listen, we are not going to respond to  
23 questions about the pros and cons of the proposed  
24 project. Since 5:00 this afternoon the City has held  
25 public workshop just outside of this room for anyone to

1 ask questions about the Master Plan, the environmental  
2 process and the various proposed project.

3 Following the publication of the Draft EIS/EIR  
4 for comment, the next step in the joint federal and  
5 state environmental disclosure process is holding this  
6 and other public hearings during the past two weeks.

7 The environmental disclosure process for this project  
8 began in 1997 with the publication of a Notice of Intent  
9 to prepare the joint EIS/EIR in the Federal Register.

10 In July of 1997 we held a series of meetings with the  
11 members of the public and environmental agencies to  
12 receive comment on the scope of the Draft EIS/EIR.

13 Following those meetings, the Draft EIS/EIR was prepared  
14 considering the comments received and those submitted in  
15 response to the Notice of Intent. The document has also  
16 been prepared pursuant to the National Environmental  
17 Policy Act of 1969, NEPA, the Council Environmental  
18 Quality Regulations, which are the implementing  
19 regulations for NEPA, and the California Environmental  
20 Quality Act of 1970 or CEQA, and the Airport and Airway  
21 Improvement Act of 1982, as amended.

22 Following today's hearing and the close of the  
23 comment period, we will then correct and revise the  
24 EIS/EIR, as necessary, based on the comments received.  
25 We will also prepare responses to the comments we

1 receive and include those responses in the Final  
2 EIS/EIR.

3 Before we begin receiving verbal comments, we  
4 would like to let you know the ground rules of this  
5 hearing. First, as I said earlier, we are not here to  
6 respond to questions about this project. We are only  
7 here to listen to your comments and to take notes. We  
8 also have court reporters present to ensure that we have  
9 an accurate transcript of this hearing. For anyone who  
10 would like to speak, we ask you to fill out a speaker  
11 card. I don't have a copy of it here. Do you have a  
12 copy of it?

13 MR. WALL: I have one here, Mike.

14 MR. AGAIBI: Of this card and give it to the person  
15 at the sign-in desk. The person will bring the speaker  
16 cards up to our facilitator who will call the name of  
17 each speaker so we can proceed in an orderly fashion.  
18 So that everyone gets an opportunity to provide verbal  
19 comments, everyone will get three minutes to speak. To  
20 be fair to everyone, we are not going to allow people to  
21 transfer their allotted time to someone else. I ask  
22 that when we speak -- or when you speak, you give us  
23 your name and address for the record. We also have a  
24 Spanish language translator for anyone wishing to  
25 provide comments in Spanish.

1           If there is anyone uncomfortable speaking in  
2 front of a group or if you need more than three minutes  
3 to provide your comments, we ask that you provide your  
4 comments in writing. We have comment sheets --

5           MR. WALL: Like the ones that are there at the front  
6 desk.

7           MR. AGAIBI: -- available for you at the sign-in  
8 desk. You can leave your comments at the sign-in desk  
9 or you can mail your written comments using the comment  
10 sheet or a letter to either address listed on the cover  
11 of the EIS/EIR. The City's address is listed on the top  
12 of the comment sheet. I would like you to understand  
13 that the verbal comment is just as important as a  
14 written comment. So please feel free to provide any  
15 comment on the document you may have to us either  
16 verbally today or in writing. Comments are due by 5:00  
17 p.m. Pacific Standard Time on Friday, November 9th,  
18 2001.

19           Lastly, I would like everyone to know that  
20 even though we have this hearing scheduled until 9:00  
21 o'clock this evening, we will stay here as long as  
22 necessary for everyone to get a chance to provide verbal  
23 comments on the Draft EIS/EIR. As I said earlier, our  
24 job here today is to listen to your comments.

25           Now I will turn the hearing back to our

1 facilitator, Tom Wall, to introduce Mr. Ritchie who will  
2 provide some introductory comments from the City of  
3 Los Angeles. Following Mr. Ritchie's comments, we will  
4 collect the speaker cards and call the name of the  
5 first speaker.

6 (The statement submitted for the  
7 record was marked as Statement 1.)

8 MR. WALL: Thank you, Mr. Agaibi. Representing  
9 Los Angeles World Airports is Mr. Jim Ritchie, the  
10 Deputy Executive Director for Los Angeles World  
11 Airports. Mr. Ritchie.

12 MR. RITCHIE: Thank you, Tom. Excuse my voice. On  
13 behalf of the City of Los Angeles and L.A. World  
14 Airports we welcome you tonight. And thank you Cecil  
15 Carpio who saved my voice since I'm the victim of six  
16 public hearings. I'm glad to see friends in the  
17 audience. I want to introduce Mahalia Walters our  
18 commissioner. If you'll raise your hand. This  
19 wonderful lady has been with us at all our public  
20 hearings. If there's anything going on in this forum  
21 that you like or don't like or would like, convey it to  
22 her and she'll take it to the Board of Commissioners.

23 With that, we have received guidance from  
24 Mayor Hahn to expand the opportunities for public input  
25 to the LAX Master Plan process. Tonight we will receive

1 your comments. More recently Mayor Hahn identified a  
2 number of objectives to be incorporated into another  
3 alternative for the future planning of LAX. On November  
4 9th, tomorrow, the public comment period will close.  
5 After the close of the public comment period, we will  
6 incorporate the mayor's guidance along with other  
7 comments received into the development of a new  
8 alternative. This alternative will undergo another  
9 rigorous environmental analysis, as did the  
10 environmental alternatives that you've seen in the other  
11 room. As a result of that, a supplemental environmental  
12 document will be distributed for public review and  
13 comment probably early in the summer of next year. Very  
14 likely the development of this new alternative will  
15 necessitate another public hearing similar to this for  
16 you to comment on this new alternative. With that, I  
17 appreciate your interest. And the evening is yours,  
18 Tom.

19 MR. WALL: Thank you, Jim. I have a series of cards  
20 for people who indicated a willingness to provide their  
21 input. I'll call the cards one at a time. I would like  
22 you to go to the lectern. Your conversation will be  
23 recorded by our two court reporters, Kim and Lisa. I'll  
24 remind you, if you speak slowly and clearly, they'll be  
25 able to provide an accurate transcript of your

1 testimony. If your comments are longer than three  
2 minutes, we ask that you submit them in writing. They  
3 will be included in the record.

4 I have a large clock in front of me. As soon  
5 as you're comfortable at the lectern, I'll start the  
6 clock. Don't be alarmed when it gets to the end of the  
7 three-minute period. An alarm goes off and it starts  
8 blinking. Please do not panic. I would ask at that  
9 point you wrap up your comments, and I'll call the next  
10 speaker. Let's begin with Veronica Johnson who is from  
11 the office of Councilmember Ruth Galanter. Welcome  
12 Ms. Johnson.

13 MS. JOHNSON: I'm here for Councilmember Ruth  
14 Galanter who represents the District of the City of L.A.  
15 She's sorry she couldn't be here tonight. Thank you all  
16 for being here tonight.

17 In light of the events of September 11th, the  
18 entire Master Plan is most likely obsolete. The  
19 assaults on the World Trade Center and the Pentagon have  
20 demonstrated that airports must operate differently if  
21 they are to be able to operate at all. Even before  
22 September 11th trends within the airline industry have  
23 been unclear. While the LAWA proposed Master Plan  
24 before us tonight includes in all of its alternatives  
25 runways to accommodate planes carrying 600 passengers or

1 more, airlines have, in fact, been flying and buying  
2 more of the smaller planes. While the overall loss of  
3 life on September 11th was beyond horror, it is a sign  
4 of some drastic changes in demand that already occurred,  
5 that the four already hijacked planes carried fewer  
6 than 400 total passengers and crew. Since then demand  
7 has plummeted and demand forecasts on which the entire  
8 Master Plan is based are no longer relevant or useful.  
9 In fact, the base line data for the EIR are so flawed in  
10 their conception and current relevance that the  
11 Environmental assessment is inherently flawed as well.

12 I'm concerned we are not being asked to  
13 comment on the possibility of a Fifth Alternative that  
14 is conceptual, at best, with no opportunity to inspect  
15 any analysis on its impacts on the surrounding  
16 communities, businesses and residents. I am concerned  
17 as long as the current Master Plan process is on the  
18 table, the door is still open for incremental expansion  
19 later in this decade. I'm concerned that nowhere in the  
20 existing Master Plan document or in the proposed Fifth  
21 Alternative is there an overarching plan to address  
22 projected aviation demand in the overall Southern  
23 California region using LAWA's other airports, Ontario  
24 and Palmdale. I urge you to reject this Master Plan in  
25 the current planning process, to abandon it and begin

1 anew with a true regional plan assessed with a new  
2 environmental set of data that adequately addresses  
3 impact on a regional basis. Thank you.

4 (The statement submitted for the  
5 record was marked as Statement 2.)

6 MR. WALL: Thank you, Ms. Johnson. Our next speaker  
7 will be Mr. Robert Rodine.

8 MR. RODINE: Thank you. I'm Robert Rodine. I'm a  
9 resident of Sherman Oaks. I'm speaking before you  
10 tonight as the Chairman of the Aviation Committee of the  
11 Valley, the Industry and Commerce Association.

12 I'd like to continue on the theme that I began  
13 in Monterey Park at which time I addressed the folly of  
14 the Regional Plan. Attached to my comments at that time  
15 was a schedule that showed the loss to this community.  
16 When I speak of this community, I mean the entire region  
17 of some 42 million annual passengers as a result of the  
18 Regional Plan absent some very, very dynamic and  
19 effective leadership on the part of our politicians to  
20 demand certain airports open up their curfews, their  
21 limits and constraints.

22 Speaking primarily of airports, Burbank, Long  
23 Beach, Ontario and John Wayne, all of those airports are  
24 capped. John Wayne is capped by an environmental issue.  
25 The others are capped by political will. By virtue of

1 those caps and by virtue of the fact that the people of  
2 Orange County don't prepare to be moved want to have El  
3 Toro built. The assumption that the Regional Plan will  
4 work is absolutely ludicrous. If those airports other  
5 than LAX can't assume the passenger load by virtue of  
6 limitations, then I think that in the interest of  
7 protecting the air commerce infrastructure of the  
8 region, LAX has to go forward with a Master Plan of at  
9 least 92 million annual passengers. 78 million annual  
10 passengers will cost this region too much, and we cannot  
11 afford the loss of the direct economy from the  
12 employment associated with it or the economy of those  
13 passengers which are diverted to other regions such as  
14 Phoenix, Salt Lake City, San Francisco, Las Vegas and  
15 wherever else they might go because LAX will not be able  
16 to accommodate them. Thank you very much.

17 MR. WALL: Thank you, Mr. Rodine. Next will be  
18 Ms. Diane Sambrano. That's S-a-m-b-r-a-n-o.

19 MS. SAMBRANO: Good evening. Thank you for being  
20 here tonight to hear our comments. As one of the  
21 persons who is greatly affected by LAX on a regular  
22 basis, 15 minutes all night long every night, 2:47,  
23 3:01, 3:15 and 3:46 last night is the last time I called  
24 in. For someone to say LAX needs more of the burden, I  
25 would say, come move in with me for a week and see if

1 you agree. Ladies and gentlemen, it is time for the  
2 rest of this region to accept some of the burden if they  
3 want any of the benefits. I'm tired of the burden for  
4 someone else's benefits. We are subjected to noise,  
5 pollution, not being able to sleep all night, not to  
6 mention congestion and the assorted other dreadful,  
7 horrible, rotten assortment of activities I can think of  
8 that go with somebody else make some bucks.

9 As you see here tonight, there is not a great  
10 response. And probably part of that is because many of  
11 the people in this region don't understand what the  
12 burden is. It's nice for someone else to make money,  
13 but somebody else's profit shouldn't be to my detriment.  
14 We stand to lose schools, air quality, not to mention  
15 quality of life.

16 Among the comments in this very nice and  
17 pretty glossy document it says that perhaps we'll lose  
18 \$50,000 -- or 50,000 jobs if the airport does not  
19 expand. How could you lose something you don't already  
20 have? Projected is not reality. It is someone's whim.  
21 Somebody's dream. Someone's goal. To those of us who  
22 live near the airport, it's not a dream. It's a  
23 nightmare. It's as if LAX acts as though it is a child  
24 who wakes up every 15 minutes and screams it's bloody  
25 head off. I think anyone who has had a child is very

1 glad that child grew up and probably doesn't wake up  
2 every 15 minutes all night long.

3 For those who are so insistent that saying  
4 money is everything, well, all you have to do is go back  
5 in history. Was Howard Hughes happy? How about King  
6 Solomon? All the wealthy investors of the world that  
7 became known for their cash flow didn't live near an  
8 airport, did they? You know why? They didn't have to  
9 get up at a certain hour and go to work at some of these  
10 minimum wage jobs. To have a job should not be the goal  
11 of life. To enjoy life should be one of the benefits  
12 that one has in living in a supposed first-rate country.  
13 Our children cannot study because of the noise. And we  
14 cannot sleep because of the noise. Thank you.

15 MR. AGAIBI: Thank you.

16 MR. WALL: Thank you, ma'am. Our next speaker will  
17 be Mr. Bruce Ackerman.

18 MR. ACKERMAN: Good evening. Again, thank you for  
19 having this hearing. My name is Bruce Ackerman. I'm  
20 the President Chief Executive Officer of the Economic  
21 Alliance of the San Fernando Valley. I'm also a  
22 resident of the valley living in West Hills and also  
23 President of the Friends of Burbank Airport.

24 The Economic Alliance has had a long-standing  
25 commitment to and support of the LAX Master Plan. That

1 support has always been a limited build out and limited  
2 build up at LAX. No small part of that support has been  
3 the Van Nuys flyaway. We are very concerned about the  
4 discussion for curtailment of that build out or change  
5 in that build out for what had been proposed. We are  
6 very supportive of an immediate expansion of the flyaway  
7 as a satellite terminal. If we could accomplish that in  
8 a short time, we would see three major benefits happen  
9 in the San Fernando Valley as well as LAX. Number one,  
10 economic impact of the increased jobs would be  
11 immediate. Number two, the reduction in traffic at LAX  
12 would be felt immediately. And number three, the  
13 security factor of having a remote satellite terminal  
14 would be felt immediately.

15 Thank you for the opportunity to provide that  
16 testimony. Good luck in your decisions. Thank you.

17 MR. WALL: Thank you, Mr. Ackerman. Ms. Carol  
18 Flink.

19 MS. FLINK: Good evening. Hi. I don't have a  
20 prepared speech. I'm here with --

21 MR. WALL: Ma'am, can you speak closer to the  
22 microphone so we can all hear you.

23 MS. FINK: I'm here because three weeks ago I  
24 started taking lessons in JuJitsu from the attending  
25 Master over here, Sensei Cecere. I work in medicine. I

1 run a radiology department. After September 11th I  
2 felt insecure. I felt unhappy about what happened to  
3 us. I wanted to do something that gave me some  
4 self-esteem and encouragement to build up my ego to feel  
5 safe within myself. I don't fly a lot, but after taking  
6 only three lessons and I have about three or four five  
7 months to go, I learned self-defense that I feel I could  
8 apply if someone approached me from the front, from  
9 behind, from the side. And I could put a person down.  
10 I put my husband down on the ground. I feel this is a  
11 method that could possibly apply to our air marshals,  
12 our stewards, anyone in everyday society that needs to  
13 protect themselves.

14 I didn't even know about this meeting until  
15 about three hours ago. I kind of ran over from my  
16 office. I don't think I'm even talking in term about  
17 what you're talking about airport expansion at the  
18 moment. I believe there is going to be a demonstration  
19 later. I've got months of training, but in three weeks  
20 I could protect myself. I could do it in closed  
21 quarters. I feel better. I don't feel like a  
22 defenseless person against the terrorism that  
23 unfortunately, you know, we're all involved in now.  
24 It's very emotional for me. I know friends in New York  
25 that were affected by this. I want to say, if I could

1 learn how to do this, I think anyone can. I think later  
2 on he's going to do a demonstration. You are going to  
3 be amazed by what you're going to see. I was after only  
4 one hour. That's all I have to say. Thank you.

5 MR. WALL: Thank you. On behalf of the husbands in  
6 the audience, I'm starting to get nervous. Our next  
7 speaker will be Mr. Charles Brink.

8 MR. BRINK: I'm Charles Brink in Van Nuys. I'm, of  
9 course, totally opposed to any more expansion of LAX to  
10 be a regional facility except for bringing public  
11 transportation into there, the expansion of the  
12 flyaways, secure baggage check-in facility and the  
13 expansion of more facilities like flyaway in remote  
14 locations would help the problem. Because with the  
15 event of larger aircraft, we could get more people into  
16 the aircraft, but we don't have the facilities to park  
17 them or handle them there. Plus, we're used to traffic  
18 on the 405.

19 The decision of not continuing the Rapid  
20 Transit Line to the airport is one of the dumbest things  
21 the City has ever done, but there are a number of dumb  
22 things. That happens to be one of them. I asked the  
23 reason, someone said, "Well, we're afraid an airplane  
24 may crash into a Rapid Transit vehicle causing damage."  
25 What about all the people?

1           So I'm suggesting you restrict expansion to be  
2     expanding the methods of getting the public physically  
3     to the airport and lessening the impact of the  
4     mitigation in the area. Of course, for noise  
5     mitigation, quieter aircraft stage four type aircraft  
6     should become available that would work. But most of  
7     all, you need to expand the other airports. Palmdale  
8     Airport needs to be expanded. There's a gorgeous  
9     opportunity to take trains from Metrorail and bring it  
10    directly to the airport to provide transportation and  
11    park and ride facilities, various ideas that would  
12    improve public transportation in the area. But the idea  
13    of simply expanding LAX more and more and more would  
14    have come to an end without September 11th. It came to  
15    an end at the 11th. But use your time. Use your money,  
16    and don't waste any more 110 million dollars in symbols,  
17    big LAX signs. Put your money on the road and make it  
18    worthwhile.

19           MR. WALL: Thank you, sir. Do we have any other  
20    speakers in the audience that are interested in  
21    discussing the Master Plan EIS/EIR? I'm going to  
22    continue now with the three speaker cards that I have.  
23    First is Daniel Shriver.

24           MR. SHRIVER: Hello. My name is Daniel Shriver,  
25    S-h-r-i-v-e-r; 4741 Ben Avenue, Valley Village,

1 California 91607. I'm here to speak about AteMi-Ryu  
2 JuJitsu.

3 Back at the Luminarias I first spoke to this  
4 Board to talk about AteMi-Ryu JuJitsu and about how  
5 close-range martial arts would be very effective for the  
6 airline industry. We've done demonstrations. Sensei  
7 Vince Cecere, Brian -- I'm forgetting his name right  
8 now, Brian Clark and James Karin have come to our aid to  
9 show you just how effective and appropriate this is. I  
10 appreciate their efforts. We're here because it's the  
11 right thing to do. We're here because it's appropriate  
12 and everyone that sees it knows it's effective.

13 Martial arts came about because of bullies,  
14 because of people like terrorists who -- we all know it.  
15 We all went to high school. We all went to elementary  
16 school. We all know there are people that want to take  
17 things from you and have you live in fear. Martial arts  
18 has always been an answer to this. I lost a friend on  
19 September 11th. And I couldn't help but think that if  
20 the flight attendant that had the first box cutter to  
21 her throat had simple self-defense, we would be living  
22 in a different world. We wouldn't be having these  
23 meetings. We would be expanding LAX. The United  
24 Airlines wouldn't be losing 15 million a day as was  
25 reported in the news today. American West would not be

1 losing a million dollars a day.

2 This is not an aviation problem. This is an  
3 industry problem. Ben Affleck and Matt Damon were doing  
4 a TV show called "The Runner." It's gone away. I have  
5 friends that were going to open a restaurant. It's gone  
6 away. No investments. This is something that affects  
7 everyone, everyone. Please, this is an easy-to-do,  
8 simply applied, effective and appropriate answer to what  
9 we're all facing. And I hope and pray that people that  
10 read this report, people that hear this talk about it  
11 and let's bring it to the discussion of everyone because  
12 everyone will benefit. They say, why are we doing this?  
13 Why am I here? Because it's the right thing to do. It  
14 couldn't be simpler. Thank you for your time.

15 MR. WALL: Next speaker is Mr. Vince Cecere.

16 MR. CECERE: Hello. Good evening. Real good. For  
17 those of you who don't know me, Sensei Vince Cecere.  
18 For those who haven't been in other meetings, I'm a  
19 third-degree back belt in combat JuJitsu and head  
20 representative of Grand Moses Powell as well as the  
21 chief founder and chief instructor of the Atemi-Ryu  
22 JuJitsu of Los Angeles.

23 I know that we're at an expansion meeting that  
24 we're talking about money, this, that and the other  
25 thing. Nobody in today's world is going to doubt we

1 have a security problem on multiple levels. If you  
2 watch the news every day, you see the countries tearing  
3 themselves apart. You see these maniacs putting powders  
4 in envelopes. You see New York's bravest fighting .  
5 Somebody has got to put the brakes on. Somebody's got  
6 to say, "Hey, people, take a breath. Look what's going  
7 on. You're letting the people run us into the ground."  
8 Everyone is running scared. You don't have to be  
9 scared. A lot of problems we can't do anything about.  
10 Some of the security problems we can. One of them which  
11 we can is to make sure another airliner doesn't have to  
12 be a weapon of mass destruction.

13 Every fighter will tell you that if you take  
14 three hooks to the head, you'll start covering up. We  
15 haven't even begun to raise our hands. What are we  
16 going to say when the next building gets hit? If you  
17 don't believe that everything that the media is showing  
18 about our security on the news, if you don't believe  
19 that these lunatics walking around screaming Islamic  
20 aren't looking at another airplane to grab, you should  
21 look yourself in the mirror, look yourself in the eye  
22 and see if you can sit here and say you are truly safe.  
23 You can ask any person in this room or any person across  
24 the country that knows anything about security and they  
25 are going to tell you, these guys are waiting to hit you

1 and grab something else. It doesn't have to be. I'm  
2 not saying this is an easy thing to do. I'm saying,  
3 it's a tremendous undertaking. To take any great  
4 journey, you have to do it one.

5 Step at a time. Somebody has to be brave  
6 enough to step up and take that journey. That's why  
7 we're here. Hopefully tonight we'll get another chance  
8 to do another demonstration. For the people that  
9 haven't been mesmerized yet, maybe we'll get the other  
10 half. Thank you.

11 MR. WALL: Thank you, Vince. Our next speaker is  
12 James Karin.

13 MR. KARIN: Hello. I'm James Karin. My address is  
14 12433 Moorpark, Studio City. I've been around the  
15 traveling business all my life. My mother is a travel  
16 agent. Because of that, I was very fortunate to be able  
17 to travel around the world. One thing I've always  
18 enjoyed doing is talking with people about trips they  
19 they've taken or planning on taking. But since  
20 September 11th all that has changed. People are scared  
21 to fly. My mother says all the time people are  
22 cancelling trips they have planned for months because  
23 they are scared to fly. We can't have this. There is a  
24 time when people need to stand up and protect  
25 themselves. That is now.

1 I've been in martial arts most of my life,  
2 studied many, many different styles. When I saw  
3 Ateimi-Ryu JuJitsu for the first time, I was blown away.  
4 I couldn't believe it. The amount of control you can  
5 have with minimum movement no matter what your size or  
6 shape is is astonishing. I think everybody needs it,  
7 not just flight attendants or flight crews or people in  
8 security positions. Anybody in any situation. The only  
9 person you can count on is yourself. So I think  
10 everyone should have the tools and knowledge to help  
11 protect them. Thank you.

12 MR. WALL: Thank you. We're going to have a  
13 demonstration, but we have an additional speaker. Our  
14 next speaker will be Cecil Carpio.

15 MS. CARPIO: My name is Cecil Carpio from the city  
16 of Inglewood. Basically, what I would like to do right  
17 now is just read a document or two into the record.

18 "For immediate media release October 8, 2001  
19 contact Julie Wong 213-978-0741. Mayor Jim Hahn calls  
20 for LAX Master Plan alternative based on safety and  
21 security." And page two of this letter Mayor Hahn asked  
22 that the new alternative plan to accommodate no more  
23 than 78 million annual passengers. In addition, Mayor  
24 Hahn requested that the proposed alternative simply  
25 reduce or eliminate airport incursions, which are a

1 significant safety issue given the present LAX airfield  
2 configuration. The alternative could make a better  
3 design to handle the next generation quieter and more  
4 environmentally friendly jets, and redesigning ticket  
5 and baggage handling areas.

6 Also I would like to read from Immediate  
7 Release August 27, 2000; contact Hilda Delgado  
8 213-978-0741. Mayor Jim Hahn urges airport  
9 commissioners to make Ontario International Airport more  
10 business friendly, outlines proposal to support regional  
11 air traffic growth. Mayor Hahn's recommendations for  
12 Ontario International Airport are, lower landing fees,  
13 lower parking rates, create a flyaway bus shuttle  
14 service from the San Fernando and San Gabriel Valley to  
15 Ontario International Airport. Nationally market  
16 Ontario International Airport. Immediately proceed with  
17 the Master Plan initiative for Ontario International  
18 Airport, provide ticket pricing parity. Then there is a  
19 copy of a letter attached that addresses the  
20 commissioners. The reason I read those two documents is  
21 because I want to emphasize the fact that now more than  
22 ever we really need to focus when we go to a new plan on  
23 the regional solution. Thank you.

24 (The statement submitted for the  
25 record was marked as Statement 3.)

1 MR. WALL: Thank you. Thank you, Ms. Carpio. Are  
2 there any other speakers in the audience that want to  
3 address the LAX Master Plan at this time? If not, we'll  
4 invite Vince, James and Daniel forward to provide a  
5 demonstration. I've been watching Susan Philmore in the  
6 back of the room grab people by the throat. So many of  
7 those techniques which you demonstrated in previous  
8 forums is catching on.

9 (Demonstration took place.)

10 MR. WALL: Ladies and gentlemen, do we have any  
11 other speakers in the audience that wish to address the  
12 issue of the Master Plan on the Environmental Impact  
13 Statement or the Environmental Impact Report? Any other  
14 demonstrations you would like to put on? Bruce and I  
15 could sing for you. I think that would have just a  
16 detrimental effect on the highjackers. We'll reconvene  
17 when we get some additional speakers. Thank you very  
18 much.

19 (Recess was taken).

20 MR. WALL: Ladies and gentlemen, we will reconvene  
21 the public hearing. Ladies, are you ready? Our next  
22 speaker will be Mr. Bobby Blanks representing the office  
23 of Congressman Maxine Waters. Sir, if you could come  
24 up to the lectern here in the center. I'll start your  
25 three minutes' time whenever you're ready to begin.

1 MR. BLANKS: My name is Bobby Blanks. I'm Field  
2 Representative to Congressman Maxine Waters. The  
3 address 10124 South Main Street, Los Angeles, California  
4 90003. I would like to read a statement on behalf of  
5 Congressman Maxine Waters.

6 "Thank you for the opportunity to speak and to  
7 submit a statement regarding the proposed Los Angeles  
8 Airport Master Plan and the Draft Environmental Impact  
9 Statement Environmental Impact Report. As a  
10 Congressman of the 35th Congressional District, I  
11 represent over 600,000 constituents including residents,  
12 business owners and schools, and many more located in  
13 cities such as South Los Angeles, Inglewood, Gardena,  
14 Hawthorne, Lennox and portions of Westchester. With the  
15 numerous phone calls and letters and people whom I have  
16 spoken with directly, we are in agreement that there  
17 should not be any expansion of the Los Angeles  
18 International Airport.

19 While there has been over 60 million wasted in  
20 preparing the Draft EIS/EIR, the document is deeply  
21 flawed and contains numerous omissions and ambiguous or  
22 misleading information and a number of faulty  
23 assumptions.

24 Specifically, our objections to the plan  
25 proposed expansion hinges on the following: One, the

1 Draft EIS/EIR states that the environmental, noise and  
2 health burdens of the airport's operations and expansion  
3 are and will be borne by low-income and minority  
4 populations, yet it offers low commitments to recognize  
5 and address this imbalance. Two, the air quality is  
6 already horrible. The current operations at LAX already  
7 constitute the largest single source of air pollution in  
8 the nation's worst air quality region. Any proposed  
9 expansion will decrease the air quality in surrounding  
10 communities and L.A. basin.

11 In regard to traffic, LAX constitutes one of  
12 the largest single destinations for vehicular traffic in  
13 the Los Angeles region. The Draft EIS/EIR construction  
14 activities from any of the proposed alternatives will  
15 result in increased traffic congestion, potentially  
16 affecting the communities during the next 15 years and  
17 beyond. It further states that these traffic impacts to  
18 citizens living and working in the communities  
19 surrounding the airport will be "significant and  
20 unavoidable." Calculations show the increase of cargo  
21 volume alone will require over six semi trucks per hour  
22 or one every ten minutes to support increase. This is  
23 not acceptable.

24 Given the events that took place on September  
25 11th, there should be more focus on safety and security

1 rather than expansion. However, we will not be fooled  
2 into expansion under the guise of safety and security.

3 I strongly support a regional approach to air  
4 travel so other airports such as Ontario and Palmdale  
5 begin to accept their fair share of air traffic. Thank  
6 you.

7 (The statement submitted for the  
8 record was marked as Statement 4.)

9 MR. WALL: Thank you, Mr. Blanks. Thank you,  
10 Robert. Our next speak will be Mr. Gerald Silver.

11 MR. SILVER: Good evening. I'm Gerald Silver,  
12 president of Homeowners of Encino. I'm speaking on  
13 behalf of 49 homeowners associations. I won't take the  
14 time to mention them now. The Sierra Club National  
15 Chapter we are very much interested in noise issues,  
16 principally at Van Nuys Airport.

17 I want to address, basically, the situation  
18 out at LAX. Number one -- and by the way, I may run  
19 over a moment or two. If you have more speakers lined  
20 up, I'll be glad to relinquish.

21 MR. WALL: Sir, we're providing three minutes for  
22 each speaker. If you have written comments you'd like  
23 to submit.

24 MR. SILVER: Let me then withdraw the comments on  
25 the subject and talk about your -- three minutes and you

1 have plenty of time is inadequate for a thoughtful  
2 discussion of these issues. You're not really seeking  
3 input, then. What you're really saying is you'll give  
4 people three minutes so you can stand around and have  
5 coffee. That's inappropriate. I'm hoping you'll  
6 reconsider. As I said, I represent a number of  
7 homeowner associations.

8 Let me begin, clearly the Riordan plan was an  
9 unacceptable approach. It was build, build and more  
10 build. It was designed to support, principally, the  
11 moneyed interest along Century Boulevard. It was done  
12 because the airlines wanted to take the least line of  
13 resistance. And clearly we need not only a regional  
14 approach on paper, but in practice as well.

15 You heard this over and over and you'll hear  
16 it again. Clearly Palmdale for 20 -- I guess 30 years  
17 now we've been asking Palmdale Airport be a major mode  
18 of transportation. Now, how is that going to be done?  
19 How do you propose to do that as well as Ontario? Well,  
20 it's going to obviously require a terrorist approach  
21 with respect to LAX when new projects are proposed.  
22 What needs to be said, yes, we're glad to do that.  
23 We're bound to provide this facility, but we have a  
24 thoughtful and analytical process when improvements are  
25 made at LAX.

1 I have 47 seconds and another three minutes of  
2 comments. I hope you won't cut me off. So what you'll  
3 tell the airlines is you can make your improvements at  
4 LAX, but this is going to be a two-year program that we  
5 have to look at analytically with a number of advisory  
6 committees. But on the other hand, if you want to make  
7 your improvements at Palmdale, we have a fast-track  
8 approach. That fast track will allow you to go in and  
9 get expedited treatment over people waiting to go to  
10 LAX. We also have a few carrots we're going to offer,  
11 the kind of marking provisions some of the build  
12 procedures that would allow them to build their terminal  
13 facilities with relative ease and with some of the money  
14 being footed by LAX. Now, may I go on?

15 MR. WALL: Just a minute, sir. I'll refer to our  
16 LAWA and FAA representatives.

17 MR. RITCHIE: Let him.

18 MR. SILVER: I appreciate that courtesy.

19 So with that kind of carrot-and-stick, what it  
20 does encourage not by force, but by the economics by the  
21 time frame for them to take that kind of action. We do  
22 this all the time anyway, you know, City agencies do  
23 that. Now, let me also comment about the physical  
24 layout and design.

25 The idea of putting additional runways in to

1 increase capacity is really an impractical solution to  
2 this problem. And I very much like -- we very much like  
3 the proposal that Mr. Hahn has put forward. Many of the  
4 other airports around the country do this. Rather than  
5 try to funnel everybody through this horseshoe, what is  
6 needed is satellite intake terminals and the kind of  
7 brilliant intelligent terminals needed, not the  
8 haphazard operation and ill-planned such as we have, for  
9 instance, on Lot 2. I won't take the time to go into  
10 the experience I had in the last few weeks going into  
11 Lot 2. The way that was handled as a satellite terminal  
12 I will not fly out of LAX until that matter is  
13 straightened out. You can see air transit is going down  
14 the drain until that matter is cleared up.

15           The satellite terminal notion of having  
16 monorail or some other kind of mechanisms of people  
17 movers to bring people from these remote lots, the  
18 remote lots have to be properly structured. They have  
19 to have signage, adequate notices put out to the public  
20 so they can properly use those. It has to be a  
21 responsible flow of public going in and out of these  
22 various lots. You don't have that. You have covered  
23 area so in hot and rainy weather people are encouraged  
24 to fly through load factor is another thing that needs  
25 to be addressed. Obviously, more people can go on

1 flights. You don't have -- I realize the airlines to  
2 some extent have a lot of control in load factors, but,  
3 you know, they are the bully puppet element here.  
4 That's really what's needed on the part of the LAX  
5 Administration.

6 Now, let me also talk about the FAA because  
7 there are very important --

8 MR. WALL: I would ask you to wrap up now, sir.  
9 Sir, if you have additional comments, I ask that you put  
10 them in writing. Thank you very much.

11 MR. SILVER: May I ask, respectfully, I have another  
12 point or two. If I could close? I don't want to take  
13 their time. I don't want to have dead air and waste  
14 your time and the City resources here.

15 FAA, that was my last point before you  
16 interrupted. The FAA has their hands full right now.  
17 They are dealing with security matters. This is all new  
18 to the FAA. So they are not about to take on a lot of  
19 these smaller issues. I think the DOAC in looking at  
20 these programs need to take some very strident  
21 positions. Yes, it may be necessary to change or to  
22 challenge what the FAA rules and regulations are. But  
23 you have friends that are out there. You have residents  
24 who are willing to go to their congressmen. Remember,  
25 congress has overwriting authority on the FAA on this.

1 We will help. We'll go to the various congressmen and  
2 support the measures that need to be taken. So I don't  
3 see that these FAA rules that say you can't do this or  
4 can't do this are ironbound. That's a very important  
5 thing.

6 Bottom line, no more physical expansion at  
7 LAX. We must use every tool and technique to go out to  
8 Palmdale, to Ontario. I thank you very much for  
9 allowing me to go on. I realize you have a lengthy line  
10 of speakers that want to speak after me.

11 MR. WALL: Thank you, sir. We ask that you put your  
12 comments in writing if you haven't done so. Thank you.  
13 Are there other speakers in the audience that wish to  
14 address the Master Plan Environmental Report or  
15 Environmental Statement? Seeing none at this point,  
16 we'll recess.

17 (Recess was taken.)

18 MR. WALL: Since no more comment from the audience,  
19 I'll turn it back over to the Federal Aviation  
20 representative.

21 MR. AGAIBI: Just to remind everyone, we will be  
22 receiving any comments tomorrow, November 9th, by  
23 5:00 o'clock in the afternoon. The deadline for  
24 receiving any comments will be tomorrow at 5:00 o'clock  
25 in the afternoon. It can be sent either to Jim Ritchie

1 or Dave Kessler at the FAA. You have the address  
2 written at the front table on one of the Master Plan  
3 documents.

4 Thank you all for coming and providing any  
5 comment today. I will look forward to working with you  
6 in the future. Thank you.

7 MR. WALL: Thank you, sir. The public comment this  
8 evening is now closed.

9 (Whereupon the proceeding adjourned  
10 at 9:00 o'clock p.m.)

U.S. DEPARTMENT OF TRANSPORTATION  
Federal Aviation Administration

Los Angeles International Airport  
Los Angeles, California

Draft Environmental Impact Statement/Environmental Impact Report  
Public Hearing Remarks

Thursday, November 8, 2001

Airtel Plaza Hotel  
Van Nuys, California

Mickeal R. Agaibi, P.E.  
Supervisor, Planning Section

Good evening ladies and gentlemen, my name is Mickeal Agaibi; I'm an Airport Planner from the Federal Aviation Administration, Western-Pacific Region. I would like to welcome you to the 9<sup>th</sup> Public Hearing the FAA and the city of Los Angeles are conducting for the Draft Environmental Impact Statement/Environmental Impact Report or EIS/EIR for the proposed master plan at Los Angeles International Airport. The first three public hearings on this topic were held on Saturday, June 9<sup>th</sup> in Inglewood, Manhattan Beach, and Westchester. During the past two weeks, Public Hearings on the Draft EIS/EIR were held in Monterey Park, San Pedro, the Mid-Wilshire District of the city of Los Angeles, Palmdale and Ontario. Today's hearing is the last of six additional hearings being held for the Draft EIS/EIR. These hearings were originally scheduled for early September; however, they were postponed due to the terrorist attacks in New York and Washington, D.C.

The purpose of these hearings is to collect comments from the general public concerning the adequacy of the information disclosed in the Draft EIS/EIR. The FAA and the City of Los Angeles along with the Federal Highway Administration as a cooperating agency have prepared the Draft EIS/EIR.

I would like to take this opportunity to make sure that everyone understands that **NO** decisions will be made today regarding the proposed project. Today's hearing is **not** a question and answer type of forum. Our job is to listen to what you have to say about the adequacy of the information in the Draft EIS/EIR.

In other words, it's your turn to talk to us. Since we are here to listen, we are not going to respond to questions about the pros and cons of the proposed project. Since 5-o'clock this afternoon, the city has held a public workshop just outside of this room for anyone to ask questions about the master plan, the environmental process and the various proposed projects.

Following publication of the Draft EIS/EIR for comment, the next step in the joint federal and state environmental disclosure process is holding this and the other public hearings during the past two weeks. The environmental disclosure process for this project began in 1997 with the publication of a Notice of Intent to prepare the joint EIS/EIR in the *Federal Register*. In July of 1997, we held a series of meetings with members of the public and governmental agencies to receive comments on the scope of the Draft EIS/EIR. Following those meetings, the Draft EIS/EIR was prepared considering the comments received during the scoping meetings and those submitted in response to the Notice of Intent. The document has also been prepared pursuant to the National Environmental Policy Act of 1969 or "NEPA", the Council on Environmental Quality Regulations, which are the implementing regulations for NEPA, the California Environmental Quality Act of 1970 or "CEQA", and the Airport and Airway Improvement Act of 1982, as amended.

Following today's hearings and the close of the comment period, we will then correct, and revise the EIS/EIR as necessary based on the comments received. We will also prepare responses to the comments we receive and include those responses in the **Final EIS/EIR**.

Before we begin receiving verbal comments, we would like to let you know the ground rules of this hearing. First, as I said earlier, we are not here to respond to questions about this project. We are only here to listen to your comments and take notes. We also have a court reporter present to ensure that we have an accurate transcript of this hearing.

For anyone who would like to speak, we ask you to fill out a speaker card, **like this one** and give it to the person at the sign in desk. That person will bring the speaker cards up to our facilitator who will call the names of each speaker so we can proceed in an orderly fashion. So that everyone gets an opportunity to provide verbal comments, everyone will get three minutes to speak. To be fair to everyone, we are not going to allow people to transfer their allotted time to someone else. I ask that when you speak, you give us your name and address for the record. We also have a Spanish language translator for anyone wishing to provide comments in Spanish.

If there is anyone who uncomfortable speaking in front of a group or if you need more than three minutes to provide your comments, we ask that you provide your comments in writing. We have comment sheets, **like this one**, available for your use at the sign-in desk. You can leave your comments at the sign in desk, or you can mail your written comments using the comment sheet or a letter to either address listed on the cover of the EIS/EIR. The city's address is listed at the top of the comment sheet. I would like you to understand that a verbal comment is just as important as a written comment. So please feel free to provide any comments on the document you may have to us either verbally today, or in writing. Comments are due by **5:00 p.m., Pacific Standard Time, on Friday, November 9, 2001.**

Lastly, I would like everyone to know that even though we have this hearing scheduled until 9 o'clock this evening, we will stay here as long as necessary for everyone to get a chance to provide verbal comments on the Draft EIS/EIR. As I said earlier, our job here today is to listen to your comments.

Now, I will return the Hearing back to our facilitator, **Tom Wall**, to introduce Mr. Ritchie who will provide some introductory comments from the city of Los Angeles. Following Mr. Ritchie's comments, we will collect the speaker cards and call the name of the first speaker.

Thank you.

Is there any one else who has not had an opportunity to speak concerning the information in the Draft EIR/EIS? **[wait for anyone to speak up]** Not seeing anyone else, I will remind everyone that if you feel that you are unable to provide us with verbal comments, today, we will be accepting written comments until **5:00 p.m. Pacific Standard Time, Friday, November 9, 2001**. You can mail your comments either to David Kessler at the FAA or to Jim Ritchie with the City of Los Angeles. The mailing addresses are listed on the cover of the EIS/EIR. I want to thank everyone for your comments today, this public hearing for the Draft EIR/EIS at Los Angeles International Airport is now closed.

**END OF COMMENTS**

STATEMENT BY COUNCILMEMBER RUTH GALANTER FOR LAX  
MASTERPLAN EIR PUBLIC MEETINGS

Thank you very much for being here tonight. In light of the events of September 11<sup>th</sup>, the entire master plan is most likely obsolete. The assaults on the World Trade Center and the Pentagon have demonstrated that airports must operate differently or they may not be able to operate at all.

Even before September 11<sup>th</sup>, trends within the airline industry have been unclear. While the LAWA proposed master plan includes in all its alternatives runways to accommodate planes carrying 600 passengers or more, airlines have in fact been flying (and buying) more 757's and 767's. While the overall loss of life on September 11<sup>th</sup> was beyond horror, it is a sign of some drastic changes in demand that the four hijacked planes carried fewer than 400 total passengers and crew. Certainly since then, demand has fallen off the charts and the demand forecasts that the entire master plan is based on are no longer useful. In fact, the EIR is so flawed in its conception and current relevance, that the environmental assessment is inherently flawed as well.

I am concerned that we are now being asked to comment on a fifth alternative that is conceptual at best, with no opportunities to inspect any analysis on its impacts on the surrounding communities, businesses and residents.

I am concerned that as long as this EIR process is on the table, the door is still open for incremental expansion later in this decade.

And I am concerned that nowhere in the existing master plan document or in the proposed fifth alternative is there an overarching plan to address projected aviation demand in the Southern California region using LAWA's other airports -Ontario and Palmdale.

I urge you to reject this planning process and begin anew with a true regional plan assessed with a new environmental document that adequately addresses impacts on a regional basis.

CITY HALL  
LOS ANGELES, CALIFORNIA 90012  
JAMES K. HAHN  
MAYOR

**FOR IMMEDIATE RELEASE**  
October 8, 2001

**CONTACT:** Julie Wong  
213/978-0741

## **MAYOR JIM HAHN CALLS FOR LAX MASTER PLAN ALTERNATIVE BASED ON SAFETY AND SECURITY**

LOS ANGELES — Mayor Jim Hahn today requested the Board of Airport Commissioners develop an alternative to the LAX Master Plan focused on safety and security at the airport.

In the wake of the September 11 terrorist attacks, the alternative would consider the impact on the airport, prior public comments, and the testimony and written comments presented during the remaining six public hearings to be held in the coming weeks. This fifth alternative would be added to the four currently proposed in the LAX Master Plan in an effort to make LAX the standard of safety and security for the Nation.

"Since day one I have said public safety is the first priority of government. Together, we can make LAX the safest and most secure airport in the nation," said Mayor Hahn.

"With the development of this safety and security alternative, we will set new standards of excellence in airport design and security, create a community-friendly and consumer-friendly airport, and give a much needed boost to our regional economy."

(more)

**Page 2****LAX Master Plan Alternative**

Mayor Hahn asked that the new alternative plan to accommodate no more than 78 million annual passengers (MAP). In addition, Mayor Hahn requested that the proposed alternative significantly reduce or eliminate airport incursions, which are a significant safety issue given the present LAX airfield configuration. The alternative could include a design to better handle the next generation of quieter and more environmentally friendly jets, alternatives to the central parking area, and redesigning ticketing and baggage handling areas.

As the U.S. Conference of Mayors Airport Security Task Force chair, Mayor Hahn is leading the national coordinated effort of municipal governments to improve airport and aircraft security. In its first meeting, the 25 mayors who comprise the task force adopted the Mayor's Principles on Airport/Aircraft Security, which were submitted to Congress and President Bush.

**"Mayor Hahn is clearly on the right track,"** said U.S. Congresswoman Maxine Waters, who will represent the LAX area in the U.S. House of Representatives after re-apportionment is completed. **"This fifth alternative ends any expansion at LAX in excess of 78 MAP, but ensures the safety and security of the airport and its passengers. I look forward to working with Mayor Hahn to accomplish his goals."**

Mayor Hahn said these new measures would help to restore consumer confidence in air travel as a safe and secure mode of transportation. Prior to the September 11 terrorist attacks, LAX was responsible for contributing \$60 billion annually and 400,000 jobs to the regional economy.

**"LAX can be both safe, consumer and community friendly, and a key component of our regional economy,"** Mayor Hahn said.

**MAYOR JIM HAHN URGES AIRPORT COMMISSIONERS TO MAKE ONTARIO  
INTERNATIONAL AIRPORT MORE BUSINESS FRIENDLY**  
*Outlines proposal to support regional air traffic growth*

Mayor Jim Hahn urged the Board of Airport Commissioners today to immediately take a number of steps to attract and retain more air service at Ontario International Airport to alleviate some of LAX's air traffic burden. Ontario International Airport is owned and operated by Los Angeles World Airports (LAWA).

"I am strongly committed to finding a regional approach to address our air transportation problem," Mayor Hahn wrote in a letter to the Commission members. "Expanding services at Ontario International Airport will be a key step in these efforts. To that end, I would like you, as a commission, to take immediate steps to make Ontario International Airport a more business friendly airport."

Mayor Hahn's recommendations for Ontario International Airport are:

- ?? Lower landing fees
- ?? Lower parking rates
- ?? Create a FlyAway bus shuttle service from the San Fernando and San Gabriel Valleys to Ontario International Airport
- ?? Nationally market Ontario International Airport
- ?? Immediately proceed with the Master Plan initiative for Ontario International Airport
- ?? Provide ticket pricing parity

A copy of Mayor Hahn's letter is attached. The Commission is expected to begin work on Mayor Hahn's proposals at its first meeting tomorrow.

**Public Hearing held by Los Angeles World Airports and  
the Federal Aviation Administration**

**Airtel Plaza Hotel, Van Nuys, CA**

Thank you for the opportunity to speak and submit a statement regarding the proposed Los Angeles International Airport Master Plan and the Draft Environmental Impact Statement/Environmental Impact Report.

As Congressman of the 35<sup>th</sup> Congressional District, I represent over 600,000 constituents including residents, business owners, schools, and many more, located in cities such as South Los Angeles, Inglewood, Gardena, Hawthorne, Lennox, and portions of Westchester.

PHA

With the numerous phone calls, letters, and people whom I have spoken with directly, we are in agreement that there should not be any expansion of the Los Angeles International Airport.

While there has been over \$60 million wasted in preparing the draft EIS/EIR, the document is deeply flawed and contains numerous omissions, ambiguous or misleading information and a number of faulty assumptions.

Specifically, our objections to the plan proposed expansion hinges on the following: 1) The draft EIS/EIR states that the environmental, noise and health burdens of the airport's operations and expansion are, and will be, borne by low income and minority populations, yet it offers no commitments to recognize and address this imbalance; 2) Air quality is already horrible. The current operations at LAX already constitute the largest single source of air pollution in the nation's worst air quality region. Any proposed expansion will further decrease the air quality in the surrounding communities and the LA Basin; 3) In regard to traffic, LAX constitutes one of the largest single destinations for vehicular traffic in the Los Angeles region. The draft EIS/EIR concludes that construction activities from any of the proposed

alternatives will result in increased traffic congestion, potentially affecting the local communities during the next fifteen years and beyond. It further states that these traffic impacts to citizens living and working in the communities surrounding the airport will be "significant and avoidable". Calculations show that with the increase in cargo volume alone will require over six semi trucks per hour, or one every ten minutes, to support this increase. This is not acceptable.

Given the events that took place on September 11<sup>th</sup>, there should be more of a focus on safety and security rather than expansion. However, we will not be fooled into expansion under the guise of "safety and security".

I strongly support a regional approach to air travel so that other airports such as Ontario and Palmdale begin to accept their fair share of air traffic.

Subject: Supplement to Draft Environmental Impact Statement/Environmental Impact Report  
Los Angeles International Airport, Proposed Master Plan Improvements

Dear Mr. Kessler:

Thank you for providing a copy of the subject document to the Federal Emergency Management Agency (FEMA) for review and comment. We have reviewed the document and determined that FEMA's concerns are limited to the effects of the proposed alternatives on flood hazards.

As you may be aware, the City of Los Angeles participates in the National Flood Insurance Program (NFIP). Under this program, the Federal government makes affordable flood insurance available within participating communities. In exchange, the communities adopt certain floodplain management regulations to reduce the risk of flood damage. In support of the NFIP, FEMA has identified Special Flood Hazard Areas (SFHAs) in floodprone communities. An SFHA is an area that is subject to inundation during a flood having a 1 percent chance of occurrence in a given year (also known as the base flood or 100-year flood). Flood insurance is required for structures within SFHAs in order to protect Federal financial investments and to reduce the cost of disaster assistance. Further, the floodplain management regulations adopted by participating communities affect the construction and improvement of structures located in SFHAs. Accordingly, FEMA is concerned with the location of potential construction activities relative to any identified SFHAs.

FEMA has prepared Flood Insurance Rate Maps (FIRMs) to show SFHAs in communities throughout the United States. The area of Los Angeles International Airport is shown on the FIRM for the City of Los Angeles. Almost all of the airport lies in an area that has been designated Zone C on the FIRM. Zone C is defined as an area that has little or no risk of flooding. The floodplain management requirements of the NFIP do not apply in Zone C. The only SFHA on the airport site is a thirteen-acre area in an undeveloped part of the site just north

00016

SAF00001

of Imperial Highway. This area, which is shown on panel 89 of the FIRM, has been designated Zone A, an SFHA that has been studied by approximate methods. However, in a September 6, 2002, letter to City of Los Angeles, FEMA stated that the area in question has been filled and is no longer subject to significant flood hazards. This letter, which is included in Appendix S-A of the subject document, constitutes a revision to the FIRM, and the area in question is now considered Zone C. Consequently, the requirements of the NFIP no longer apply to this area.

We also evaluated the document to determine if the proposed alternatives would have an effect on off-site flood hazards. Section 4.7 of the document indicates that increases in impervious area could potentially increase stormwater runoff and cause flooding in the Dominguez Channel, which lies southeast of the airport. To mitigate possible flooding effects, the document indicates that Los Angeles World Airports would prepare detailed drainage plan and identify measures to reduce runoff and increase drainage capacity. The NFIP does not have specific regulations regarding basin changes that result in increased flood discharges. However, we urge the City of Los Angeles to monitor the effects of the project and, following the completion of the drainage plan, to evaluate whether the resulting basin conditions would require a restudy of flood hazards. Such a restudy would be necessary to revise the FIRMs for Los Angeles and neighboring jurisdictions to ensure that flood hazards are accurately depicted on the maps.

Again, thank you for the opportunity to comment on this document. If you have questions, or if I can be of further assistance, please contact me at (510) 627-7284.

Sincerely,

Sandro Amaglio  
Environmental Officer

AUG - 6 2003 '03

Dear Mr. Ritchie:

This is in response to your Supplement to the Draft Environmental Impact Statement/ Environmental Impact Report for the proposed Master Plan development of the Los Angeles International Airport (LAX).

Please review the current effective Flood Insurance Rate Maps (FIRMs) for the site of construction. Please note that the Federal Government and the City of Los Angeles, California are participants in the National Flood Insurance Program (NFIP). The NFIP floodplain management building requirements are described in the Code of Federal Regulations 44, Sections 59 through 65.

The basic NFIP floodplain management building requirements are as follows:

- All buildings constructed within a riverine floodplain, (i.e., any of the "A" Flood Zones designations as delineated on the FIRM), must be elevated so that the lowest floor is at or above the Base Flood Elevation level.
- If the area of construction is located within a Regulatory Floodway as delineated on the FIRM, all "development", (the term "development" in this context includes not only the construction of buildings, but all types of developments), must not increase base flood elevation levels. A hydrologic and hydraulic analysis must be performed prior to the start of the development. This analysis must demonstrate that the development would not cause any rise in base flood levels.
- All buildings constructed within a coastal high hazard area, (any of the "V" Flood Zones designations as delineated on the FIRM), must be elevated on pilings and columns, so that the lowest horizontal structural member, (excluding the pilings and columns), is elevated to or above the base flood elevation level. In addition, the posts and pilings foundation and the structure attached thereto, is anchored to resist flotation, collapse and lateral movement due to the effects of wind and water loads acting simultaneously on all building components.

SAF00002

- Upon completion of any development that changes existing Special Flood Hazard Areas, the NFIP directs all participating communities to submit the appropriate hydrologic and hydraulic data to FEMA for a FIRM revision. In accordance with CFR44, Section 65.3, as soon as practicable, but not later than six months after such data becomes available, a community shall notify FEMA of the changes by submitting technical for a flood map revision. To obtain copies of FEMA's Flood Map Revision Application Packages, please refer to the FEMA website at [http://www.fema.gov/mit/tsd/dl\\_mt-2.htm](http://www.fema.gov/mit/tsd/dl_mt-2.htm)

***Please Note:***

Many NFIP participating communities have adopted floodplain management building requirements, which are more restrictive than the minimum federal standards described in CFR44. Please contact the local community's floodplain manager for more information on local building requirements.

If you have any questions or concerns, please don't hesitate to call Mr. Michael Shore of my staff at 510-627-7180.

Sincerely,

John W. Eldridge, Jr.  
Branch Chief  
National Flood Insurance Program

Mr. David B. Kessler  
U.S. Department of Transportation  
Federal Aviation Administration  
P.O. Box 92007  
Los Angeles, CA 90009-2007

Dear Mr. Kessler:

Thank you for granting a comment period extension to the Fish and Wildlife Service (Service) for the Supplemental Draft Environmental Impact Statement (SDEIS) for the Los Angeles International Airport (LAX) Proposed Master Plan Improvements (Plan).

We understand this extension to October 31, 2003, was discussed and agreed upon in a telephone conversation between you and Ken Corey in the Service's Carlsbad office, on August 13, 2003. We also understand this extension coincides with an extension to November 7, 2003, granted to the City of Los Angeles.

Our need for this extension is because our Carlsbad Fish and Wildlife Service office, responsible for this review, is currently working on a high priority Biological Opinion (BO) for the Western Riverside County Multiple Species Habitat Conservation Plan. This exceptionally large and complex BO will address the potential effects of economic and urban development on 146 species and their habitats within a 1.26 million-acre planning area.

As you are probably aware, this project is the focus of intense public and political attention. Service efforts to produce this Biological Opinion began in July, and we committed to Riverside County officials to issue a draft in September 2003. This has impacted the Service's ability in the short-term to devote attention to other issues, including the LAX Plan.

We recognize this commitment as a very ambitious goal, and we recognize the short-term consequences for other project reviews, but we believe there will be long-term fish and wildlife benefits as the result.

The LAX Plan is designated a priority project under Presidential Executive Order 13274, Environmental Stewardship and Transportation Infrastructure Project Reviews. The Service has expressed interest in reviewing this SDEIS because we submitted substantial comments on the

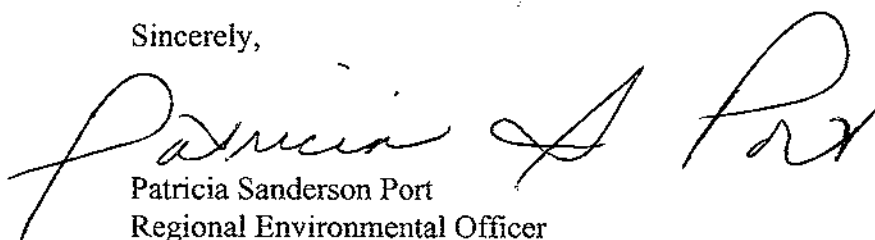

SAF00004

Draft Environmental Impact Statement in 2001 and the project will require consultation under Section 7 of the Endangered Species Act (ESA).

The Service has also indicated they are committed to doing their part to ensure appropriate environmental stewardship while streamlining the LAX environmental review process. With this in mind, we believe that allowing this extension contributes to the Executive Order's streamlining and stewardship goals by reducing potential for last minute conflict that could occur during ESA consultation. Finally, we wish to acknowledge the positive coordination demonstrated by the Federal Aviation Administration in this effort.

You may direct comments to Andy Yuen, Deputy Field Supervisor of our Carlsbad Fish and Wildlife Office, at (760)431-9440.

Sincerely,

A handwritten signature in cursive script, appearing to read "Patricia A. Port".

William C. Withycombe, Regional Administrator  
 FAA Western-Pacific Region  
 Federal Aviation Administration  
 P.O. Box 92007 - Worldway Postal Center  
 Los Angeles, CA 90009

Subject: Los Angeles International Airport (LAX), Proposed Master Plan Improvements,  
 Los Angeles County, California (CEQ #030309)

Dear Mr. Withycombe:

The U.S. Environmental Protection Agency (EPA) has reviewed the Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (SDEIS/R) for the above-referenced project. This is a priority project for accelerated environmental review pursuant to Executive Order 13274 (Environmental Stewardship and Transportation Infrastructure Project Reviews; February 27, 2003). Our comments are provided under the National Environmental Policy Act (NEPA), the Council on Environmental Quality's NEPA Implementing Regulations (40 CFR Parts 1500-1508), and Section 309 of the Clean Air Act. EPA provided comments on the Notice of Intent to prepare a Draft Environmental Impact Statement (July 31, 1997); the DEIS (September 24, 2001); and a preliminary draft of the SDEIS/R (May 1, 2003). EPA is pleased that many of the comments we made previously have been addressed.

The SDEIS/R presents a new Safety and Security Alternative (Alternative D), which seeks to accommodate projected growth in air traffic, without providing additional capacity. We note that Alternative D is the preferred alternative of the City of Los Angeles, and that the preferred alternative of the Federal Aviation Administration (FAA) will be identified in the Final Environmental Impact Statement (FEIS). Based on our review of the SDEIS/R, EPA is rating Alternative D as Environmental Concerns - Insufficient Information (EC-2). We continue to rate Alternatives A, B, C, and No Action as Environmental Objections - Insufficient Information (EO-2) due to the projected violations of the National Ambient Air Quality Standards (NAAQS). Please refer to the attached "Summary of EPA Rating Definitions."

EPA appreciates the efforts of FAA and the City of Los Angeles to more effectively control and reduce emissions from the project (especially construction emissions) which can contribute to reducing air pollution levels in the South Coast Air Basin, an "extreme" ozone nonattainment area. Alternative D results in less emissions than Alternatives A, B, and C, and No Action.

EPA remains concerned about auxiliary power unit (APU) emissions at LAX, and believes that further reductions of APU emissions can be achieved. We recommend that the FEIS quantify APU emissions at LAX for each pollutant; the degree to which APU emissions can be controlled or reduced by FAA or the City of Los Angeles; and, for each pollutant, the degree of emissions reductions that could be achieved by a comprehensive APU-reductions strategy. The importance of applying all feasible controls to reduce emissions is highlighted by attainment assessments in the new South Coast Air Quality Management Plan, and by a sharp rise in the number of violations of the Federal ozone standard in the air basin during the summer of 2003.

The SDEIS/R does not address whether any fully evaluated alternative would have a disproportionately high, adverse effect on low-income or minority populations due to the project's air quality impacts. EPA is also concerned with the accuracy of the projected level of acrolein emissions, a hazardous air pollutant. We acknowledge the SDEIS/R's improved discussion of the uncertainties involved in accurately predicting air toxic emissions. However, the projected hazard indices from exposure to acrolein are a source of concern.

We appreciate the opportunity to comment on the SDEIS/R and believe our comments can be addressed in the FEIS. Please send one paper copy of the FEIS and four CD-rom copies when it is released for public review. EPA intends to work with FAA and the City of Los Angeles to address our comments and is available to review a preliminary draft of the FEIS. If you have questions, please contact my staff reviewer, David Tomsovic, at 415-972-3858 or [tomsovic.david@epa.gov](mailto:tomsovic.david@epa.gov).

Sincerely,

Enrique Manzanilla, Director  
Cross Media Division

Diamond Bar, CA

SAF00005

## SUMMARY OF EPA RATING DEFINITIONS

This rating system was developed as a means to summarize EPA's level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the EIS.

### ENVIRONMENTAL IMPACT OF THE ACTION

#### *"LO" (Lack of Objections)*

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

#### *"EC" (Environmental Concerns)*

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

#### *"EO" (Environmental Objections)*

The EPA review has identified significant environmental impacts that must be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

#### *"EU" (Environmentally Unsatisfactory)*

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the CEQ.

### ADEQUACY OF THE IMPACT STATEMENT

#### *Category 1" (Adequate)*

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

#### *"Category 2" (Insufficient Information)*

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analysed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

#### *"Category 3" (Inadequate)*

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analysed in the draft EIS, which should be analysed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

\*From EPA Manual 1640, "Policy and Procedures for the Review of Federal Actions Impacting the Environment."

U.S. EPA - Detailed Comments - Supplement to Draft Environmental Impact Statement/Environmental Impact Report (SDEIS/R) - Los Angeles International Airport (LAX) Master Plan Improvements - November 5, 2003

## **Air Quality**

The South Coast Air Basin is classified as "extreme" nonattainment for the Federal National Ambient Air Quality Standard for ozone. LAX is the largest single source of emissions of volatile organic compounds (VOC) and oxides of nitrogen (NO<sub>x</sub>)—ozone precursors—in the air basin (see 2003 AQMP [Air Quality Management Plan], Attachment D to Appendix III, *Top 300 SCAB VOC and NO<sub>x</sub> Producers in 1997*, South Coast Air Quality Management District).

### Auxiliary Power Units (APUs).

Emission estimates in the SDEIS/R from APUs, combined with ground service equipment (GSE), are higher than corresponding estimates in the 2001 DEIS/R for carbon monoxide (CO), volatile organic compounds (VOC), nitrogen oxides (NO<sub>x</sub>), and particulate matter less than 10 microns in diameter (PM-10). Although EPA understands that these increases are the result of an updated version of the Emissions Dispersion Modeling System (EDMS) model, we note that the increases constitute a large proportion of on-airport emissions (SDEIS/R at p. 4-367).

The SDEIS/R does not present the assumptions used to estimate APU emissions, nor disaggregate LAX's APU emissions as a line-item separate from GSE emissions. APU/GSE are the largest on-airport source of VOC at LAX. APU emissions are projected to increase in future years (even though many passenger gates for commercial aircraft at LAX are already equipped with fixed electrical and preconditioned air systems). It would be helpful, especially in refining the air quality impact assessment and LAX's air mitigation program, to quantify: (i) APU emissions during "taxi-in" and "taxi-out" operations; (ii) APU emissions when commercial aircraft are at the gates; and (iii) the extent to which commercial jets use the existing preconditioned air and power available at the gates.

APU emission reductions could be achieved through reduced APU operating time, centralized power, or pre-conditioned air systems at terminal gates. EPA recognizes that mitigating emissions during "taxi-in" and "taxi-out" operations is constrained by safety and operational requirements. We are also aware that FAA is drafting national guidance to reduce emissions from APU operations associated with gate turnaround of commercial aircraft. However, the SDEIS/R does not provide a clear commitment by FAA or the City of Los Angeles to mitigate at-gate APU emissions at LAX as a component of the proposed action (see S-E, Supplemental Air Quality Impact Analysis, p. 36).

The SDEIS/R presents a commitment to mitigate emissions from GSE through incentives, tenant lease requirements, and by providing sufficient fueling infrastructure (S-E, Supplemental Air Quality Impact Analysis, p. 40). A similar approach for reducing APU emissions at LAX should be considered. Reductions in APU emissions at LAX from a

strengthened mitigation commitment may also be applicable to FAA's Clean Air Act General Conformity analysis.

**Recommendation:** EPA recommends that the FEIS include measures to reduce APU emissions at LAX, based upon appropriate operational and aircraft safety considerations, and address the extent to which such mitigation could be implemented by FAA or the City of Los Angeles, including under tenant lease arrangements. We also recommend that APU emissions be quantified to reflect specific activities and uses during aircraft operations for each alternative.

### Emissions Data

EPA continues to be concerned with the quantification of air quality impacts and the accuracy of the data reported in the SDFIS/R. The SDEIS/R provides emissions estimates by source category at LAX in 1996 and 2000, and for the impact analysis years under Alternative D (section 4.6 in Volume 1; Appendix S-E; Technical Report S-4). The SDEIS/R adjusts the emissions estimates for No Action and Alternatives A, B, and C presented in the 2001 DEIS/R, based on the latest version of the EDMS model (version 4.11). However, the SDEIS/R does not provide an inventory of these revised emissions estimates for each analysis year and source category.

A comparison of on-airport motor vehicle emissions estimates in Tables S4.6-6 and S4.6-7 shows an unexplained increase in emissions of NO<sub>x</sub> and SO<sub>x</sub> from 1996 to 2000, i.e., 431 tons per day of NO<sub>x</sub> in 1996 to 1,841 tons per day in 2000 (an increase of more than 400 percent); and 2 tons per day of SO<sub>x</sub> in 1996 to 13 tons per day in 2000 (a 650 percent increase).

EPA's review finds unexplained values in Table S.4.6-9 for NO<sub>x</sub> emissions under Alternative C in 2005, and SO<sub>x</sub> emissions under No Action in 2015. Our review indicates that the NO<sub>x</sub> emissions under Alternative C in 2005 should be approximately 6,100 tons per year (tpy), not 5,800 tpy; while the SO<sub>x</sub> emissions under No Action in 2015 should be approximately 530 tpy, not 770 tpy.

**Recommendation:** The FEIS should provide emissions estimates for all individual source categories (unmitigated and mitigated cases) under all alternatives in all impact years. Changes in airport-related emissions estimates, relative to the 2001 DEIS/R, should be explained in the FEIS.

### Mitigation of Construction Emissions

We are pleased that the SDEIS/R incorporates EPA's recommendations to reduce emissions from construction equipment (Table S4.6-18), which serves to reduce emissions of diesel particulate matter (DPM), an air toxic.

**Recommendation:** EPA requests that the proposed air quality mitigation in the SDEIS/R be referenced in the FEIS and Record of Decision as part of a comprehensive "Construction Emissions Mitigation Plan." We recommend that a combination of fuels and controls (such as diesel particulate filters) be required on all construction equipment for this project, unless technically infeasible.

#### Air Quality and Source Apportionment Study

EPA commends Los Angeles World Airports (LAWA) for its efforts in developing an "Air Quality and Source Apportionment Study of the Area Surrounding Los Angeles International Airport," although we recognize that this study is not part of the SDEIS/R. The Air Quality and Source Apportionment Study is intended to supplement gaps in current information on the effects of LAX on air pollution, thus allowing FAA and the City of Los Angeles to better understand the airport's contribution to local and regional air pollutant loading. Data and analysis developed by LAWA's study could facilitate a more effective disclosure of impacts, identify appropriate mitigation, and improve the decision-making process for this project. The study's findings and recommendations could complement the Human Health Risk Assessment (HRRA). Because the SDEIS/R does not specifically determine if any fully evaluated alternative would have a disproportionately high, adverse effect on low-income or minority populations based on air quality impacts, the Air Quality and Source Apportionment Study remains of keen interest to EPA.

**Recommendation:** We encourage LAWA to proceed with the Air Quality and Source Apportionment Study in a timely manner since it would provide important data on LAX's air quality impacts, thus enabling FAA and the City of Los Angeles to make the most informed decision for the proposed Master Plan Improvements, including appropriate air quality mitigation. FAA and the City of Los Angeles should integrate the information from the Air Quality and Source Apportionment Study in the decision-making for this project as such information becomes available.

#### **Environmental Justice Impacts**

The SDEIS/R suggests that Alternative D, even without Federal air quality violations, would have adverse air quality effects on adjacent communities, many of which are predominately low-income or minority (pp. 4-329 and 4-330). Furthermore, according to the SDEIS/R, Alternative D "could contribute to higher ozone levels due to increased NO<sub>x</sub> emissions associated with airport traffic," and low-income or minority communities "may be more severely affected because they may be more susceptible to asthma and other chronic respiratory illnesses" (p. 4-330, Volume 1). Emissions of hazardous air pollutants from this project (e.g., acrolein and 1,3-butadiene) present a potential health or environmental risk to low-income or minority populations (although FAA may have over-estimated the potential health effects of acrolein).

The SDEIS/R remains inconclusive about whether any fully evaluated alternative would have a disproportionately high, adverse effect on low-income or minority populations based on air quality impacts, including emissions of hazardous air pollutants. Our May 1, 2003 comment letter on the preliminary draft asked that the SDEIS/R specifically address this issue or whether the information needed to make such a determination is "incomplete or unavailable" (40 CFR 1502.22). DOT's Final Order on Environmental Justice identifies steps to be taken when a disproportionately high, adverse human health or environmental effect on low-income or minority populations is identified. According to DOT's Final Order, a proposed activity having such an effect should be undertaken only if further mitigation or alternatives avoiding or reducing such effects are not practicable (Federal Register, April 15, 1997, pp. 18377-18381). There are several tools, presented below, that could prove useful in enabling FAA to make this determination in the FEIS.

Cumulative risk, defined by EPA as "the combined risks from aggregate exposures to multiple agents or stressors," is an emerging discipline that EPA is addressing, in part, through a Framework for Cumulative Risk Assessment, EPA, 2003 (see <<http://cfpub.epa.gov/ncea/cfm/recordisplay.cfm?deid=54944>>). This framework identifies the elements of a cumulative risk assessment process and offers a structure to conduct a cumulative risk assessment (May 27, 2003 Federal Register at p. 28825). Maps showing potential cumulative risks in the air basin are at <http://www.aqmd.gov/rules/CIWGmeet.htm#maps>.

Draft guidance issued by EPA regarding Title VI of the Civil Rights Act may be a useful reference, including the development of a methodology to make a determination on disproportionately high, adverse effects on low-income or minority populations (see Federal Register, June 27, 2000, pp. 39650-39701, "Draft Title VI Guidance for EPA Assistance Recipients Administering Environmental Permitting Programs and Draft Revised Guidance for Investigating Title VI Administrative Complaints Challenging Permits"). EPA is available to assist FAA in developing the analysis necessary to complete this determination for Alternative D, the City's preferred alternative.

**Recommendation:** Because of high hazard indices for acrolein, it is appropriate to validate the estimated (modeled) concentrations of hazardous air pollutants with current monitoring data, especially for two pollutants, acrolein and 1,3-butadiene. Estimated concentrations of hazardous air pollutants, especially acrolein and 1,3-butadiene, could potentially be validated by monitoring over a representative number of days over several months in different seasons. We recommend that FAA consult the air district to more comprehensively identify emissions of hazardous air pollutants at LAX, and to provide potentially-affected populations with the best available data on exposure and health risks.

Although EPA recognizes that uncertainties regarding potential air quality and health effects remain, the FEIS should clearly address if this project, especially the City's preferred alternative (Alternative D), would have a disproportionately high, adverse effect on low-income or minority populations based on air quality impacts. The tools referenced above (EPA's cumulative risk assessment document; the air district's cumulative risk

maps; and EPA's draft Title VI guidance) are potential components allowing FAA to make this determination in the FEIS, based upon the best available data, information and references.

If additional mitigation for reducing impacts from air pollutants is feasible, it should be implemented by FAA and the City of Los Angeles to the fullest extent. The SDEIS/R presents an excellent program to reduce construction emissions, and opportunities to substantially reduce certain operational emissions (e.g., GSE emissions). Reducing APU emissions to the fullest extent practicable, consistent with safety and operational requirements, would be a significant accomplishment in approving this project at the Federal level. The FEIS should also explore practicable mitigation opportunities within the impacted areas that could provide additional air quality benefits. We are available to FAA and the City of Los Angeles in this regard.

### **Jet Aircraft Noise Impacts and Mitigation**

While the SDEIS/R assesses jet aircraft noise impacts for Alternative D, it also provides additional single event noise disclosure information (thresholds of significance) for previously-evaluated Alternatives A, B and C as well as Alternative D. This supplemental information was added for California Environmental Quality Act (CEQA) purposes and in response to a State appeals court ruling ("Berkeley Jets"). This analysis of single event noise addresses awakenings and classroom disruption.

In general, noise exposures due to jet aircraft under Alternative D are expected to be less than exposures under Alternatives A, B, C, and No Action. When compared to No Action in 2015, Alternative D in 2015 is projected to result in less residents exposed to noise levels that are equal to, or greater, than 65 decibels Community Noise Equivalent Level (CNEL). Due to a shift in the noise contours of Alternative D in 2015, approximately 2,000 new residents will be exposed to noise equal to or greater than 65 CNEL, and approximately 250 new residents to a 1.5 CNEL increase. The SDEIS/R states that the thresholds of significance for single event aircraft noise effects are only used to consider noise impacts under CEQA, and are not meant to apply to Federal analyses under the National Environmental Policy Act (NEPA).

**Recommendation:** The FEIS should clarify that the CEQA awakenings threshold is based on a 1997 Federal Interagency Committee on Aviation Noise sleep disturbance curve, and determine whether the projected impacts from aircraft noise require mitigation by FAA.

In Alternative D, residents that are newly exposed to noise equal to or greater than 65 CNEL, or exposed to a 1.5 CNEL increase, would be mitigated by Mitigation Measure MM-LU-1. While we support studying the relationship between aircraft noise levels and the ability of children to learn (and implementing possible future mitigation in response to this study), it is important to ensure that all schools exposed to levels equal to or greater than 65 CNEL are mitigated before 2015.

**Recommendation:** If Alternative D is selected as FAA's final preferred alternative, the FEIS and Record of Decision should provide a commitment to provide appropriate mitigation for newly-exposed residents and sensitive sites (e.g., schools and health care facilities) before 2015.

Subject: The Supplemental Draft Environmental Impact Statement/Environmental Report (SDEIS), for the Los Angeles International Airport (LAX) Proposed Master Plan Improvements, Los Angeles County, California.

Dear Mr. Kessler:

The Department of Interior (Department) has reviewed the Supplemental Draft Environmental Impact Statement / Environmental Impact Report (SDEIS), for the Los Angeles International Airport (LAX) Proposed Master Plan Improvements, Los Angeles County, California. Our comments are based on biological resources information presented in the SDEIS as well as the original DEIS, supporting technical appendices, and our knowledge of biological resources in western Los Angeles. Our comments on the DEIS are still relevant and are hereby incorporated by reference.

## **GENERAL COMMENTS**

The proposed project will impact non-native grasslands, disturbed areas, valley needlegrass grasslands, southern foredune, southern dune scrub and ephemeral wetlands. Federally threatened and endangered species that will be impacted, or have potential to be impacted, include the endangered El Segundo blue butterfly and Riverside fairy shrimp. The project will additionally impact several non-listed sensitive species with limited distribution in the Los Angeles Basin including, but not limited to, the loggerhead shrike, burrowing owl, western spadefoot toad, and San Diego black-tailed jackrabbit. The SDEIS analyzes an additional action alternative, Alternative D, as compared to the DEIS.

## **SPECIFIC COMMENTS**

**Volume II. Section 4.10 Biotic Communities. Pages 4-449 - 4-479**

Habitat Modeling: We remain concerned that the habitat model does not accurately describe or quantify habitat values for sensitive species' habitats affected by this project. As a result, we are concerned that existing habitat values are underestimated and restored habitat values are

SAF00006

overestimated. The original DEIS used a habitat model referred to as a “modified Habitat Evaluation Procedure” to evaluate the effect of each alternative on biotic communities and sensitive flora and fauna within the study area.

The study area encompasses developed land that LAX currently occupies, undeveloped areas around the airport, and sensitive dune habitat west of the airport. Nine ephemeral wetted areas occur in the study area that contain Riverside fairy shrimp cysts.

The habitat model has been renamed in the SDEIS, and is now called the “Mitigation Land Evaluation Procedure (MLEP).” Changing the name of the analysis does clarify confusion about use of the habitat model in the SDEIS, as compared to how a traditional Habitat Evaluation Procedure would be used. The bulk of our concerns, however, are not addressed in the SDEIS.

We expressed concerns with this methodology in our previous comment letter, and remain concerned that, in addition to inaccurately described and quantified habitat values, previous scientific documentation of this model was not included, causing us to question some conclusions it generated. Specifically, we have the following concerns with the MLEP:

- a. The MLEP is based on idealized vernal pool/native grassland habitat characteristics. All habitat types within the study area are then assigned habitat values based on this idealized habitat. As one would expect, southern foredune and southern dune scrub score lower habitat values than valley needlegrass grassland when compared to an idealized grassland habitat. These diverse habitat types should be scored against similar habitat types rather than a single habitat type. This method also does not score habitat based on the value the habitat provides to individual species. Thus, we do not believe MLEP habitat values can be used to accurately reflect impacts of this proposed project to each habitat type.
- b. Once habitat units are calculated using the habitat values, the total number of habitat units impacted are calculated in an aggregate manner for each project alternative. As such, MLEP “habitat units” do not translate into the actual amount of impact to each habitat type. Thus, tracking losses of individual habitat types would not be possible. It is important to calculate losses for each habitat type individually so that they can be mitigated with the same type of habitat where feasible. The basis for an accurate appraisal of impacts of this project is given in table S4.10-4 (p. 4-459), before the MLEP is applied.
- c. The MLEP methodology results in an overvaluing of habitat to be restored for mitigation. As explained in the SDEIS, habitats are evaluated against an idealized native grassland/vernal pool habitat. Habitats can score from zero to one; zero represents a habitat that does not share any characteristics with the ideal habitat and a score of one represents a habitat that is identical to the ideal habitat. In the case of analysis of the SDEIS, valley needlegrass grassland scored a habitat value of 0.65 habitat units, per unit area, indicating that it shared 65 percent of the characteristics with the ideal habitat. The

evaluation then used habitat value of 0.8 for restored habitat; a habitat value higher than any of the naturally occurring habitats' values. This represents a projected overvaluation of habitat to be restored as part of the project's mitigation measures.

For example, assume that the project impacts 10 acres of valley needlegrass grassland, valued at 0.65 habitat units per unit area. The loss in terms of habitat units is 10 acres multiplied by 0.65 habitat units per acre or 6.5 habitat units. According to the plan these units are then mitigated at a 1:1 ratio, so 6.5 habitat units would need to be replaced. Restored habitat has a habitat value of 0.8, so to mitigate for 6.5 habitat units of impact, 6.5 units or 8.1 acres (8.1 acres x 0.8 habitat units per acre = 6.5 habitat units) of restored habitat would be created. This illustrates that the loss of 10 acres of valley needlegrass grassland would be mitigated at less than a 1:1 ratio, in terms of actual acres, by restoring 8 acres rather than 10 acres.

Our original comments pertaining to the model were intended to encourage an accurate accounting for each type of habitat lost and an accurate discussion of plans for mitigating losses of valuable and diverse habitat. The MLEP does not achieve this goal.

We recommend revising use of the MLEP and integrating it with an analysis of acres impacted for each habitat type. This will facilitate accurate accounting for the loss of each type of habitat, and corresponding mitigation.

#### **Volume II. Section 4.11. Pages 4-481 - 4-494**

Riverside Fairy Shrimp: The SDEIS indicates all alternatives, including the No Action alternative, would result in adverse impacts to the Riverside fairy shrimp. The Riverside fairy shrimp occurs in only a few geographic areas in Southern California. The Riverside fairy shrimp cysts found on LAX are a likely remnant of a once much larger vernal pool complex. These cysts are now isolated from other vernal pools supporting the Riverside fairy shrimp, but as is acknowledged on page 4-489, the "destruction of the individual cysts could contribute to the cumulative impacts to the continued existence of the species if other populations are extirpated."

In addition, the existence of the last remaining population of Riverside fairy shrimp on the Los Angeles coast could be genetically significant, and provide important information about the evolution of the Riverside fairy shrimp. For these reasons it is paramount to preserve these cysts *in situ* at LAX, or to relocate the cysts to suitable habitat at a nearby location that will be managed and monitored for the long-term conservation of the Riverside fairy shrimp.

While no decision has yet been made regarding on-site or off-site conservation, an evaluation of alternate sites to relocate and restore, or recreate vernal pool habitat for the Riverside fairy shrimp has been conducted by LAX. We will be continuing our coordination with LAX to resolve this question.

Our previous comment letter discussed replacement estimates for vernal pools and their associated watersheds. It is important that the vernal pools have sufficient watersheds to create the conditions that will allow for the long-term survival of the Riverside fairy shrimp.

El Segundo Blue Butterfly: Alternative D would potentially impact 10,597 square feet (0.24 acres) of occupied El Segundo blue butterfly habitat due to installation of navigational aids and associated service roads. The SDEIS does not discuss the potential impacts, if any, from future maintenance and operation of navigational aids and associated service roads. We recommend the Final EIS (FEIS) clarify whether vegetation adjacent to navigational aids and service roads will be sprayed with herbicide as part of routine maintenance. Moreover, the indirect effect of fragmenting occupied El Segundo blue butterfly habitat is not analyzed in the SDEIS, or considered in offsetting measures for this species.

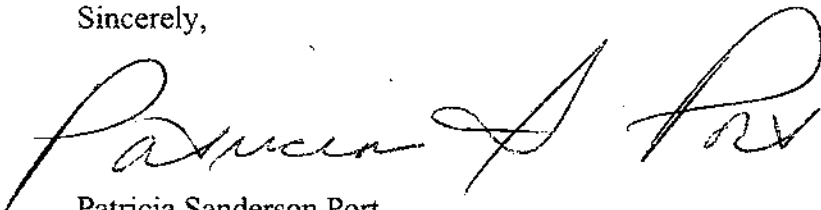

We recommend the FEIS include more information about the configuration of installation, operation and maintenance of these roads, and resulting impacts to the butterfly. Our concern is that there may be indirect effects to this species, which have not been considered in this SDEIS.

## CONCLUSION

Issues raised in our comments on the DEIS remain unresolved. We recommend the FEIS include a more thorough discussion of habitat impacts and how impacts will be mitigated. We also recommend the FEIS contain detailed information on how restoration, management, and monitoring will be conducted to ensure long-term conservation of both the El Segundo blue butterfly and the Riverside fairy shrimp.

The Department appreciates this comment opportunity, and we look forward to working with you to further address our concerns. You may direct questions regarding these comments to Andy Yuen at the U.S. Fish and Wildlife Service Field Office, in Carlsbad, California, at (760)431-9440.

Sincerely,

Patricia Sanderson Port  
Regional Environmental Officer

Subject: Supplement to the Draft EIS/EIR, Los Angeles International Airport Proposed Master Plan Improvements. SCH# 1997061047.

Dear Mr. Kessler and Mr. Ritchie,

Thank you for the chance to comment on your updated EIS/EIR. We would like to draw your attention to our letter of September 24, 2001, in which we discussed our concerns with impacts in the Coastal Zone. The Airport Dunes are entirely within the Coastal Zone; most of the proposed development is not in the Coastal Zone. There is extensive documentation identifying most of the Airport Dunes as an Environmentally Sensitive Habitat Area (ESHA). The section of the Coastal Act most applicable to projects in and adjacent to Environmentally Sensitive Habitat Areas is Section 30240, which states:

**Section 30240 Environmentally sensitive habitat areas; adjacent developments**

(a) Environmentally sensitive habitat areas shall be protected against any significant disruption of habitat values, and only uses dependent on those resources shall be allowed within those areas.

(b) Development in areas adjacent to environmentally sensitive habitat areas and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade those areas, and shall be compatible with the continuance of those habitat and recreation areas.

Recently, the Commission and the courts have interpreted this section vary narrowly – the replacement of existing sensitive habitat with a different kind of habitat, or with plants from a different habitat type with different ecological requirements could be interpreted as a significant disruption of habitat values. An example of a questionable activity would be an attempt to install vernal pool habitat on the dunes.

Rec'd  
11/05/03  
SAS00001

As we discussed in our prior letter, any development in the Coastal Zone requires a coastal development permit, unless the development is owned by a federal agency, or involved in other significant ways described in the Coastal Zone Management Act, in which case a consistency determination under the Coastal Zone Management Act will be required. Even development that is a mitigation measure required for impacts elsewhere will require a coastal development permit if the mitigation measure is located in the Coastal Zone. Please note that grading or the installation or removal of vegetation on the Airport Dunes will require a coastal development permit and will be evaluated for its consistency with the Coastal Act. The standard of review will be Chapter 3 of the Coastal Act and whether or not the activity or development will prejudice the ability of the City of Los Angeles to adopt an LCP that is consistent with the Coastal Act. If you would like to discuss the procedures and informational requirements for a coastal development permit in this area, please contact me or Pam Emerson at 562 590-5071.

We look forward to working with you on these issues.

Sincerely,

Teresa Henry  
District Manager

**SUBJECT:** Draft EIS/EIR, Los Angeles International Airport Proposed Master Plan  
Improvements. SCH# 1997061047.

Thank you for including the California Coastal Commission in the environmental review process for the above-mentioned document. The following comments represent the opinions of the staff only and do not represent the comments of the Commission itself.

The California Coastal Commission has direct permitting responsibility and regulatory authority over all federally permitted or funded projects occurring within or affecting the California coastal zone. The Commission's authority, called "federal consistency review," comes from the coastal zone Management Act enacted by Congress in 1972 and periodically re-authorized since then. All federal activities affecting coastal zone resources have been subject to the Commission's regulatory jurisdiction since the National Oceanic and Atmospheric Administration of the U.S. Department of Commerce approved California's Coastal Management Program (CCMP). Activities authorized, funded, or carried out by federal agencies that affect coastal zone resources must be reviewed by the Commission for consistency with the federally approved California Coastal Management Program (CCMP), including the California Coastal Act.

Any development within the coastal zone requires a Coastal Development Permit (CDP) unless the developer of the project is a federal agency, in which case a federal consistency review, as described above, may be required. In reference to LAX, the inland boundary of the coastal zone is the inland extent of the dedicated right-of-way of Pershing Drive. Coastal Commission approval would be required for the proposed relocation of FAA's navigational aids within the Los Angeles/El Segundo Dunes located in the coastal zone. Any potential impacts to sensitive biotic communities, sensitive flora and fauna species, and wetlands within the coastal zone would be analyzed and mitigation would be required for those impacts within the coastal zone. It is possible that certain improvements proposed in sensitive areas that could be constructed elsewhere would be required to be relocated to less sensitive areas. Any development within the coastal zone including some not anticipated in this letter would require a CDP. Street Improvements located within the coastal zone, including many of the proposed improvements to Main Street, California Street, Pershing Drive, Imperial Highway and other streets, would require a CDP. Any changes to bike paths or footpaths within the coastal zone would require a CDP. Any changes of land use,

SAS00001

drainage systems, or fuel pumps, as well as relocation of residences or businesses, within the coastal zone would require a CDP. Construction setup, staging or storage areas within the coastal zone would require a CDP. These items are examples and not a comprehensive list of all possible impacts that may require a CDP. Any additional development or change in intensity of use within the coastal zone will require a CDP.

**Project Description.** In our early meetings with the airport staff, the Coastal Commission staff understood that the development envisioned in the master plan was entirely located outside of the coastal zone—that no development was proposed seaward of Pershing drive. Some language in the EIR indicates that the Airport may be considering development of a golf course or vernal pools on the dunes, which are located in the Coastal Zone. Specifically, in the appendix that addresses natural resources, tables 8, 11 and 14, the map code for open space is also used for golf course. The map seems to show a 100-acre golf course on the dunes in the coastal zone. On another illustration there seems to be a hotel resort. There are three depictions of a golf course on the dunes. For this reason the staff has also commented on issues involving the dunes. In analyzing this MASTER PLAN EIS/EIR and the measures used to mitigate the various alternative's impacts, Coastal Commission staff will be concerned with:

1. Sensitive biological resources found in the Los Angeles/EI Segundo Dunes area, which are located within the coastal zone;
2. Effects on federally and state listed threatened and endangered species including those requiring an incidental take permit from the U.S. Fish and Wildlife Service;
3. Effects of water quality runoff on coastal waters or watercourses;
4. Effects to coastal access and recreation and traffic impacts;

This list is not comprehensive and in no way limits the Commission's jurisdiction over matters not listed.

### **Sensitive Biological Resources.**

There are vernal pools and some coastal prairie and some degraded Coastal Sage Scrub on the West End of the airport outside the coastal zone. We are concerned that when the Airport considers mitigation measures for impacts on these resources that there is an understanding that an improvement or mitigation located west of Pershing Drive will be located inside the coastal zone. The Commission will review any development inside the coastal zone for consistency with the view, habitat and public access and recreation policies of the Coastal Act.

The Coastal Act policies addressing environmentally sensitive habitat areas, such as are found on the dunes are very strict. The policies would not allow relocation of habitat

from the dunes to another part of the dunes or consolidation of habitat areas. Similarly the policies would not allow development of a different kind of habitat on the dunes, such as vernal pools if that habitat was not now found there. Such development would require a coastal development permit to be issued by both the City of Los Angeles, and by the Commission. The policies that the Commission staff would use in preparing its analysis includes the following:

**Section 30240**

(a) Environmentally sensitive habitat areas shall be protected against any significant disruption of habitat values, and only uses dependent on those resources shall be allowed within those areas.

(b) Development in areas adjacent to environmentally sensitive habitat areas and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade those areas, and shall be compatible with the continuance of those habitat and recreation areas.

The Commission's review of any development proposed in the dunes would require protecting the long-term viability of the dune habitat and the endangered species that depend on the dunes before approving any proposal. A hotel or golf course on the dunes would not be a use that is dependent on the resource. Therefore construction of a hotel or a golf course on the dunes would raise serious issues of conformity with Section 30240 of the Coastal Act.

**Water Quality.** The Los Angeles World Airport now drains its storm water directly into the ocean, seaward of Dockweiler State Beach, a heavily used public beach. Los Angeles World Airports (LAWA) is committed to developing a detailed drainage plan (HWQ-1) upon the selection of a final build alternative. Most of the initial treatment of drainage proposed however, will occur outside the coastal zone. The Draft EIS/EIR states that with the implementation of HWQ-1, any hydrology and water quality associated impacts would be less than significant. It is, however, very difficult to assess the future success of such a plan without having the opportunity to examine it first. The Commission staff believes that the drainage plan should be incorporated into the Final EIS/EIR to allow for public review.

LAWA fails to propose specific potential management measures and practices to be implemented for each of the build alternatives. At a minimum, a conceptual design with minimum mitigation measures should be developed for each build alternative at this time. This is made feasible by the fact that the three build alternatives are really very similar in nature. Commission staff believes that the potential hydrology and water quality impacts associated with the build alternatives and the proposed mitigation measures should be an integral part of the build alternative selection process.

Besides the narrative stormwater BMP design standards customary in NPDES permits, the Commission staff believes that here exists a perfect opportunity for LAWA to take more meaningful and quantifiable measures to address the runoff issues and their associated impacts. The LA Regional Water Quality Control Board has recently taken steps to require numerical BMP design standards in its Standard Urban Storm Water Mitigation Plan (SUSMP). However, these standards only apply to a few categories of new and re-developments, of which airport is not one. Nevertheless, due to the scale of the proposed development and the significant impacts associated with the runoff as a result of the intensified uses, establishing specific design criteria such as the 85<sup>th</sup> percentile, 24-hour design storm standard is reasonable. Specifically, for design purposes, post-construction structural BMPs (or suites of BMPs) should be designed to treat, infiltrate or filter stormwater runoff from each storm event, up to and including the 85th percentile, 24-hour storm event for volume-based BMPs, and/or the 85th percentile, 1-hour storm event, with an appropriate safety factor, for flow-based BMPs. For LAX, this means treating runoff associated with up to and including 0.75 inch of rainfall in 24 hours or 0.2 inch per hour.

While it is commendable that LAWA has aimed for "reducing impacts to water quality to the maximum extent practicable and achieving no net gain in pollutant loads discharged to receiving water bodies," there exist no practical and feasible guiding principles for designing management practices. Furthermore, the goal of "no net gain" is merely to hold steady the current level of pollutant contributions by LAX to the Santa Monica Bay and Dominguez Channel. It then begs the question of whether or not the current level is good enough for safeguarding the quality of the receiving waters. Judging from the information provided, LAX's current stormwater measures seem inadequate to satisfactorily treat the runoff generated onsite.

Since both of the receiving water bodies are on the CWA Section 303(d) list for impairment by several pollutants of concern of which LAX is a contributor (e.g., Cu, Pb, and Zn), it is conceivable that the future Total Maximum Daily Loads (TMDLs) developed for these pollutants would require LAX to share in the necessary load reductions. It simply is sensible to anticipate those future needs by incorporating the necessary stormwater designs during the current phase of development when opportunities abound. It may be worth pointing out that LAWA already acknowledges "[d]ue to the relatively large area that would be redeveloped, substantial opportunities would exist to replace existing facilities with ones that incorporate water quality control BMPs into their design, construction and operations thereby reducing total LAX-related pollutant loads."

It is not clear whether or not baseline information for the various pollutant loadings has been established. Pollutant loads used in the analysis were calculated by multiplying the pollutants' Event Mean Concentrations (EMCs) and average annual runoff. And, these EMCs were obtained from various sources not necessarily specific to the region (e.g., Federal Highway Administration) or most up-to-date. Pollutant loads could have

been underestimated as a result. In addition, without locally relevant data for determining baseline levels, it will be impossible in the future to determine whether the goal of "no net gain" is being attained.

Lastly, using LAWA's method where EMCs remain constant, the only variable in the formula for calculating pollutant loads before and after development would be land use (i.e., the change in impervious area coverage). This will most likely result in underestimates of pollutant loads because it ignores the potential increase in pollutant contributions due to the intensification of various activities at LAX. Stormwater BMPs designed using these projections may then fall short of intended treatment efficacy.

Only nine pollutants are considered in the DEIR. Several pollutants, including cadmium, mercury, nickel, silver, chromium, PAHs, and PCBs, scheduled for TMDL development for the Santa Monica Bay and Dominguez Channel have been prematurely eliminated from the study. The DEIR provides no valid reasons for their exclusion. The Commission staff strongly urges baseline information on the omitted pollutants be established and a rigorous monitoring program be implemented to determine the exact LAX contribution of these pollutants to the downstream water bodies.

The planned parking capacity for each of the build alternatives would exceed demand for both 2005 and 2015 by about 6,800 stalls and 3,800 stalls, respectively. This is meant to reduce the number of double trips by people recirculating on the terminal service loop due to Central Terminal Area congestion or by not being able to find parking spaces. While this sounds like a good idea, the concern with these additional spaces are the potential increase in impervious areas. Are these additional stalls located in (existing) vertical structures or are they horizontal ground spaces built on formerly pervious areas? One of the most effective practices to reducing runoff and its associated pollutants is minimizing the creation of impervious areas in the first place. There needs to be a balanced analysis between traffic relief and water quality impacts. If these extra stalls are critical to ensuring traffic relief, active measures should be undertaken to minimize any negative runoff impacts associated with the increase in impervious areas. Examples of these measures include, but are not limited to, retention and/or detention basins, catch basin filters and underground sand filters.

Commission staff strongly encourages LAWA to, wherever appropriate, design water quality components into LAX's flood control measures. While it is important to ensure that drainage facilities can adequately convey stormwater runoff and prevent flooding, increasing the structure's capacity is often less effective than reducing peak flow rates. As mentioned in the DEIR, reducing peak flow rates could be achieved, for example, by reducing the directly connected impervious areas. Taking this one step further, peak flow rates could be reduced by minimizing overall impervious areas, period, or by creating pervious areas such as filtering strips and/or grassy swales to intercept flows.

While the pollutant loads associated with wet weather flows were estimated quantitatively, those associated with the dry weather flows were only addressed qualitatively. The reason given was that "[s]ince, the types of pollutants in dry weather flows are governed by the source of the flow and, therefore, are extremely variable and cannot be quantified, the analysis of dry weather flows is limited to the identification of factors that are likely to increase or decrease their occurrence." Were there no past sampling results or chemical use records to assist in the quantification? There needs to be a better effort in quantifying pollutant loading as a result of dry weather flows.

LAWA acknowledges that there will be an overall intensification of use at LAX under all three build alternatives. In addition, the DEIR states, "the Imperial retention basin would be removed and dry weather flows entering the storm drain system would have the potential to discharge untreated to the Santa Monica Bay or Dominguez Channel water bodies." The only mitigation measures proposed are compliance with existing regulations and airport procedures, particularly the LAX SWPPP, and incorporation of some unspecified source control, structural and treatment BMPs under HWQ-1. Unfortunately, these may not be adequate. The SWPPP developed pursuant to the Industrial Activities Storm Water General Permit (Industrial NPDES Permit) is often only required to be available onsite and ready for inspection by the appropriate authorities when requested, but not required as a part of the permit application process. In other words, the SWPPP is often not evaluated for adequacy. LAWA is strongly urged to propose clear measures to prevent and control dry weather runoff. This could be accomplished by incorporating the SWPPP into the final EIS/EIR to allow for public review. In light of their smaller quantities, diversion of dry weather runoffs for treatment (or treatment onsite) should be considered.

The DEIR fails to analyze a more comprehensive list of BMPs that could be implemented during the construction phase. It simply states that by following the procedures outlined in the SWPPP, prepared pursuant to the construction NPDES permit, and employing the eight BMPs listed in the DEIR, impacts to water quality associated with construction activities would be less than significant. For the same reason stated above for industrial NPDES permit, SWPPP developed according to the requirements of a construction permit is often not subject to agency/public review and cannot guarantee water quality protection. In addition, the eight BMPs listed in the DEIR fail to address, among others, the staging and times of year planned for land disturbance and the methods proposed for chemical use and storage. Such details should be incorporated into the final EIS/EIR.

There is very little mention of BMP inspection, monitoring, and maintenance. Besides inappropriate and inadequate designs, BMPs often fail because they are not being properly maintained. A rigorous program needs to be in place to ensure that the BMPs continue to operate at their design capacities in preventing and controlling polluted runoff. It is also imperative to identify BMP inadequacies in terms of type, size, location, and number. Structural BMPs should be inspected prior to the start of the rainy season

(no later than October 15<sup>th</sup>), after the first storm of the rainy season, and monthly thereafter until April 30<sup>th</sup>. Major observations to be made during inspections include:

- Locations of discharges of pollutants from the site;
- BMPs that are in need of maintenance;
- BMPs that are not performing, failing to operate, or inadequate; and
- Locations where additional BMPs are needed.

While it is important to have structural and/or treatment stormwater BMPs, the Coastal Commission staff strongly encourages the implementation of nonstructural BMPs for source control as well. These include, among others, personnel training for good housekeeping measures.

**Impacts on Beach Access.** The proposed master plan improvement may impact major beach access routes—Highways 1, 42, 105, and 405, as well as Pershing Drive, West Imperial Highway, Westchester Parkway, Vista Del Mar, Main Street, and Culver Boulevard. As we have discussed, directly blocking access along Imperial Highway to the beach would raise major issues of consistency with Sections 30210 and 30211 of the Coastal Act. Increased congestion on any of these east-west corridors could impact beach access particularly in the summer months. The information that you provided does not show the extent of traffic impacts on these routes during peak beach use times. In analyzing projects for the Commission, the staff will need to know the project's impacts on beach access routes. We note that certain key intersections will function at level F after mitigation. Staff will need to know whether these routes will flow at high levels of congestion—at or above level F-- on peak beach use times, including holidays and summer weekends.

**Traffic Impacts.** One of the mitigation measures proposes funding for a Los Angeles County plan to "extend the Marina Freeway (Route 90)". There is no indication or proof that Caltrans or the County would be willing or able to use these funds. There is also no indication of alternate mitigation if these funds are not allocated to that proposed project. The portion of the Marina Freeway that would be extended is located within the coastal zone. There is an unnamed drainage in the median strip of the existing Marina Freeway (Route 90) that supports freshwater wetland plants. The standard of review of any development within the coastal zone is whether or not it is consistent with the Coastal Act. The status of a project as a required mitigation measure for development outside the coastal zone does not change this standard of review or assure approval. Therefore, before any of the mitigation measures in the coastal zone such as this road are constructed Caltrans, the City of Los Angeles, or the County of Los Angeles must obtain a coastal development permit. It may not be possible to obtain a coastal development permit if the road or other improvement requires wetland fill or has other impacts on coastal resources. Provisions for alternative mitigation consistent with the Coastal Act should be provided.

**Transit Alternatives.** The 1984 Marina del Rey Ballona LUP provides for light rail along Lincoln Boulevard connecting to the airport, and/or a 'people mover' along Lincoln Boulevard connecting to Santa Monica. Two 1987 revisions to that plan by both Los Angeles County (the Marina del Rey LUP) and the City of Los Angeles (the Playa Vista LUP) provide for light rail along Lincoln Boulevard connecting to the airport, and or a "people mover" along Lincoln Boulevard connecting to Santa Monica "if found feasible by local, regional, or state agencies responsible for their development." The 1987 Playa Vista LUP in addition requires that the part of any system operating in the City shall be linked to those portions located in County areas to assure an integrated system.

It may be more likely now than it was in 1987 that a transit alternative is feasible and might significantly reduce trips. Since 1987, there have been two successful light rail lines constructed in Los Angeles County. The Airport is now proposing to extend one of these lines, the "Green Line", across Lincoln Boulevard into the Airport. Although it is possible that an improvement that has high initial costs may still not be feasible, the Commission staff will most likely want a careful analysis of transit alternatives. We note that one of the difficulties of extending a light rail line or "people mover" along Lincoln has been lack of sufficient right-of-way. The mitigation measures for this project already include proposals to acquire right-of-way in several areas, including along some of the Lincoln Corridor. The presently proposed traffic mitigation measures would use former rail right-of-way located within Culver Boulevard for road improvements.

**Wetland Issues that may be raised by some road improvements.** Section 30233 allows fill of wetlands for incidental public service purposes. In the Bolsa Chica decision, the courts found that it was not allowable to fill wetlands except as provided for in section 30233. In fact, the court said that "incidental public services are limited to temporary disruptions and do not usually include permanent roadway expansions" at all. Bolsa Chica Land Trust v. Superior Ct. (1999) 71 Cal. App. 4<sup>th</sup> 493,517. However, it did allow for roadway expansions when "no other alternative exists and the expansion is necessary to maintain existing traffic capacity." Id. This decision will put severe limitations of on roadway expansions that require wetland fill. If any of the road expansions proposed as mitigation for traffic generated by airport expansion are located in the coastal zone and require wetland fill, it may not be possible for the Commission to approve the widened roadway because of the limitations of Section 30233.

Many parts of the road improvement involve no wetland fill. In other areas, such as along Lincoln Boulevard in Area B and the extension of Admiralty to Culver Boulevard in Area A, there may be wetland fill issues. The Commission will need to know precisely what the impacts of the proposed widening will be on wetland areas. Additional surveys concerning the extent of the wetlands will need to be completed in advance of the Commission's consideration of the proposed road improvements.

**Mitigation Measures.**

The proposed traffic mitigation measures concentrate on adding lanes to major streets, and some intersections such as Lincoln at Washington. According to the report, these measures will alleviate, but not entirely mitigate increased traffic. Mass transit mitigation includes "smart" signals along north/south bus routes, but does not include enhancements to east/west bus routes, which are the public transportation routes for beach visitors who now arrive on mass transit. Proposed mitigation measures that involve development within the coastal zone would be reviewed for consistency with the coastal act policies. Concerns would include impacts on beach visitor access, on wetland or habitat areas, or on community character.

Under the Coastal Act mitigation measures must be considered to reduce or avoid impacts. The Commission staff will rely on Coastal Act Sections 30253 and 30254 to analyze alternatives, and to consider the effects of the intensity of development. Under the Coastal Act, where traffic corridors are constrained by natural habitats or wetlands, or when public access would be adversely impacted the Commission staff will consider recommending that the size of the road be reduced.

**Consistency with Certified LUP's/LCP's.** The standard of review of all development within the coastal zone is the policies of the Coastal Act. However, in communities where there is a certified local coastal program, that LCP will be the standard of review for development. The City of Manhattan Beach and Marina del Rey all have certified Local Coastal Programs. Any road improvements within these areas would require a coastal development permit issued by the local government having jurisdiction over the area. In areas such as Venice, Redondo Beach, Hermosa Beach, Playa Vista the standard of review would be consistency with the Land Use Plan. Where there is a certified Land Use Plan, the Commission staff will look consider the policies of the Land Use Plan, but the standard of review will remain the Coastal Act policies. This is relevant in the case of the Airport because it applies to mitigation measure such as road widening projects that may be located in those communities.

The Commission staff looks forward to receiving the final EIS/EIR and to working with the LAWA staff in processing the coastal development permits and Federal consistency reports that may be necessary. For more information on our comments on water quality, please contact Derek Lee at (415) 904-5200; for Federal Consistency issues, please contact James Raives at (415) 904-5200. For other matters please contact Pam Emerson, Los Angeles Area Supervisor at (562) 590-5071. Thank you again for your attention.

Dear Mr. Ritchie:

Re: *Los Angeles International Airport Master Plan, Alternative D  
 Supplement to the Draft Environmental Impact Statement / Environmental Impact Report  
 SCH# 1997061047*

Thank you for including the California Department of Transportation (Department), Division of Aeronautics in the environmental review process for the above-referenced project. We have reviewed the proposed Master Plan and its Draft Supplemental Environmental Impact Statement / Environmental Impact Report (EIS / EIR) pursuant to the California Environmental Quality Act (CEQA). For your consideration, we offer the following comments relative to aviation system planning, environmental planning for the proposed projects through the Master Plan, and airport land use compatibility. The following comments include our perspectives on both the proposed Airport Master Plan and its Draft Supplemental EIS / EIR.

1. The project is the integration of Alternative D, the Enhanced Safety and Security Plan, into the existing environmental review process for the Los Angeles International Airport (LAX) Master Plan. The EIS / EIR also serves to present certain supplemental information and environmental analyses that apply to all of the five alternatives to the project. The alternatives evaluated in the original EIS / EIR and this supplemental EIS / EIR are the results of eight years of master planning process, ongoing scientific study, several hundred information community meetings, and an extensive formal public comment period for the identification of project issues for environmental analysis. In addition to the No Action / No Project Alternative, the original EIS / EIR and this supplemental environmental document analyze four build alternatives. However, this supplemental EIS / EIR is focused on the new Alternative D, which is also the CEQA Preferred Alternative.
2. The California Department of Transportation, Division of Aeronautics' stated mission is to foster and promote the development of a safe, efficient, dependable, and environmentally compatible air transportation system." The Division is a permitting agency for public-use airports, and therefore a Responsible Agency under CEQA.

*"Caltrans improves mobility across California"*

SAS00002

Mr. Jim Ritchie  
November 7, 2003  
Page 2

3. We have attended various project development meetings, technical advisory consultations facilitated by the California Office of Planning and Research, a simulation for air traffic control and airfield operations at the National Aeronautical and Space Administration's Ames Research Center. We appreciate the intergovernmental coordination and public participation efforts undertaken by the City of Los Angeles and the Federal Aviation Administration.
4. In the technical advisory consultations and the simulation at the Ames Research Center, we have observed that the proposed physical changes to the airport taxiways, runways, and the construction planned for aircraft parking and terminal facilities have undergone extensive scrutiny and systematic testing in the operational and environmental analyses for Alternative D. The operational testing was observed and participants were interviewed by the Department in conjunction with our analyses of the various project components. In our opinion, the new large aircraft requirements, for the Airbus Industries A-380 and Boeing 777 type aircraft, necessitate most of the proposed changes, as well as the physical constraints of the existing facilities. The high-speed taxiway exits from the outer Runways 25L on the south complex, and 24R on the north complex of the airport have generated most of the surface incidents and runway incursions at the airport. The operational changes for the air traffic control procedures, user awareness programs, and pilot training have apparently reduced the number of incidents and their frequency since their implementation. Therefore, we think that alternatives to eliminate the high-speed exits by physical removal, such as their conversion to slower-speed exits are not extensively evaluated or presented in the environmental document. The center taxiways between both north and south parallel runways are a key feature to alleviate the problems due to the operations of the high-speed exits. However, we would like to review your operational research to establish the nexus between the operation of the center taxiways and runway incursions. The Master Plan and its environmental document do not conclusively explain this relationship or refer to a technical study regarding this issue. The Department does not object to the center taxiway conceptual design as long as it is operationally and financially justified. Airport delay related to the new flow patterns were also not evaluated in the analyses.
5. Where feasible, the Department encourages airports to meet or exceed minimum design safety standards outlined in the FAA Advisory Circular 150/5300-13 Change 7, the Airport Design Guide (ADG), when making design changes. In many instances, runway and taxiway dimensional criteria are difficult or impossible to achieve within the given space available for LAX today. Nevertheless, any substandard runway and taxiway separation specifications in airport design will require approved design exceptions from the FAA. The Department has incorporated excerpts the ADG as State airport design standards for runways and taxiways in accordance with the California Code of Regulations Title 21, Section 3526(c). We recommend an FAA-approved Airport Layout Plan depicting the proposed changes become effective in conjunction with the adoption of the Master Plan.
6. Higher weight bearing runways and taxiways are strongly recommended in advance of any consideration to accommodate the new large aircraft. This design should meet or exceed FAA's current design specifications. To this end, Caltrans District 7 has also proposed structural improvements for the tunnel on State Route 1 (Sepulveda Boulevard), which goes under LAX. These structural improvements will include the placement of a new deck on the top of the original structure, capable of supporting the proposed aircraft design load. These structures are owned and maintained by the Los Angeles Department of Public Works. However, the Department's oversight involvement

Mr. Jim Ritchie  
November 7, 2003  
Page 3

with Mr. Jim Ritchie this project is necessary given that the proposed improvements are within the Caltrans right-of-way. Through the Project Study Report / Project Report process, the Department will also propose a Traffic Management Plan in case of an emergency situation which could require the full closure of the Sepulveda Subway. The construction of Sepulveda Subway project is expected to start by June 2004 and be completed by June 2005. Runway closures and potentially significant airport capacity impacts should be anticipated during construction.

7. Terminal gate facilities designed for older aircraft prohibit new large aircraft and large aircraft such as the Boeing 747 from typical self-ingress and egress from terminal rows in many locations. Frequently, aircraft must shut down and stop in a taxi lane or taxiway traffic area(s), and be towed into tightly engineered gate spaces. Departing fully-loaded aircraft are typically towed out from these constrained locations and block the active movement areas until started and ready for taxi. Therefore, terminal and existing gate facilities must be expanded to accommodate the typical fleet of aircraft using the airport today and those new large aircraft planned to arrive in the coming years.
8. The Alternatives A, B, and C all propose the relocation and the reconfiguration of the LAX Fuel Storage Facility. As technical studies, the Chevron Fuel Farm Relocation Feasibility Study and the Scattergood Fuel Farm Relocation Feasibility Study were included in the original environmental study, whose scope did not include Alternative D. On the other hand, Alternative D calls for a reconfiguration of the fuel farm during the last phase (Phase III) of the proposed activities, but does not propose relocation. From a physical security standpoint, we recommend that the EIS / EIR clearly assess and disclose the risks and opportunity costs of the decision to have the fuel farm remain in its place. We recommend your interagency coordination with the Transportation Security Agency, the California Highway Patrol, and local law enforcement agencies to technically assess the physical security problems associated with the LAX Fuel Storage Facility.
9. From an airport land use compatibility planning standpoint and in accordance with the California Environmental Quality Act, Public Resources Code Section 21096, the Department's California Airport Land Use Compatibility Handbook (Handbook) must be utilized as a resource for projects at the airport and for projects within the boundaries of an airport land use compatibility plan, or if such a plan has not been adopted, within two nautical miles of the airport. For your reference, the Handbook is published on-line at <http://www.dot.ca.gov/hq/planning/aeronaut/htmlfile/landuse.html>. In specific, the Public Utilities Code Sections 21676(c), 21664.5, and 21661.5 require that proposed airport master plans, expansion of an existing airport, and plans for construction of a new airport must be submitted to the Airport Land Use Commission for review. We also recommend that the growth-inducing impacts of the decision to restrict the growth of LAX be considered from a region-wide perspective. The Department's California Aviation System Plan and its policies can also be used as a resource in these analyses. In this context, we recommend that a preferred plan for the regional distribution of commercial air service and its associated benefits and adverse impacts be included in the environmental analyses. These analyses should be supported by impacted communities and stakeholders, namely regional airports, commercial airlines, and general aviation. Lacking sufficient support, we are concerned that the desired regional aviation system left to evolve on its own will not materialize as described in the LAX Master Plan, Alternative D.

Mr. Jim Ritchie  
November 7, 2003  
Page 4

10. On page 11 of "S-1. Supplemental Land Use Technical Report," line 4 states that " This suspension of aviation easement requirements has been granted by Caltrans." This is not the case. The Department of Transportation has not suspended any of the requirements of the Noise Standards found in the California Code of Regulations, Title 21, Section 5000 *et seq.*

This bullet further implies that notifying homeowners "regarding the existence and significance of such noise impacts" is sufficient to meet the requirements of the Noise Standards. Such notification is not sufficient. For a residence within LAX's 65dB CNEL aircraft noise contour to be excluded from calculations to determine the size of the airport's noise impact area, the residence must meet one of the descriptions in Section 5014(a) of the Noise Standards.

11. This Supplemental EIS / EIR is for an Airport Master Plan. Future project-specific environmental studies can be tiered from this environmental study during the subsequent phases of the proposed development, and the Department encourages tiering as an environmental streamlining technique. However, tiering should be subject to the time and scope limitations mentioned in the CEQA Guidelines Sections 15152 and 15153, and the instructions in the Airport Environmental Handbook (FAA Order 5050.4A), Chapter 10.
12. The projects proposed through this Master Plan will require multiple amendments to the State Airport Permit for LAX. Please coordinate with our Aviation Safety Officer Mr. Kurt Haukohl for the processing of these requests at (916) 654-5284.

These comments reflect the areas of concern to the Department's Division of Aeronautics. We advise you to contact Caltrans District 07 office regarding surface transportation issues.

The need for environmentally compatible airport operations is a local, regional, statewide, and federal issue. We strongly feel the both the protection of aviation facilities from the encroachment of incompatible land uses and the calculation of all environmental costs and benefits in the development of airport projects will contribute significantly to the safety of airport operations, to the well-being of the communities surrounding aviation facilities, and to California's economic future.

We appreciate the opportunity to review and comment on this project. If you have any questions, please call me at (916) 654-5253.

Sincerely,

DAVID COHEN  
Associate Environmental Planner

 Vic. LA-105-0.0, LA-1-(25.92-29.08)  
 LA-405-(21.25-25.94)  
 SCH # 1997061047

Dear Mr. Ritchie:

Thank you for including the California Department of Transportation (Department) in the environmental review process for the above-mentioned document. This letter supplements our letter of July 20, 2001 and pertains to the new alternative, "Alternative D".

In summary, the Supplement to the Draft EIR/EIS for the proposed LAX 2015 Master plan will need to provide sufficient project detail for transportation improvements within the State right-of-way and adequately identify the funding sources or short fall of resources associated with implementing these projects. Additional environmental determinations will be needed for individual transportation projects that are proposed within the State right-of-way.

Any work within State highway right-of-way, typically needs a Project Study Report (PSR) and/or an encroachment permit from Caltrans. The PSRs and permit applications will need to include all pertinent analysis, reports, and plans to allow for a comprehensive review of the work proposed and its impact to the State highway right-of-way.

Following are our comments on the Supplemental to the EIS/EIR document prepared for LAX 2015 Master Plan:

## I. General Draft EIR/EIS Comments

The Draft EIR/EIS has not provided sufficient geometric detail for the proposed ground transportation improvements. Therefore, it should be noted that the document does not constitute geometric approval or environmental approval for any specific work to be done on the State Highway System.

Please provide a discussion of the proposed series of airfield improvements, which in general terms consist of the construction of a new parallel taxiway between runways and the centerline realignment of a runway. What affect will the improvements have on the Sepulveda Boulevard tunnel? Will loads be increased over the tunnel?

## II. Draft EIR/EIS Section Comments

### Section 4.3.2

The significant ground transportation projects need to be included in the Regional Transportation Plan (RTP), Regional Transportation Improvement Program (RTIP) and State Implementation Plan (SIP) so as to ensure FHWA air quality standards are met.

### Section 4.3.2.8

Mitigation measures provided in this section need to be applicable irrespective of the extent to which airport revenue is permissible under federal law and policies to fund these measures. To the extent that airport revenue is not permissible, other sources of revenue need to be identified.

Additionally, we recommend reviewing and evaluating for mitigation measures, some of the proposed improvements identified in the I-405 Arterial Improvement Planning Studies, Final Report (June, 2003), prepared by KAKU Associates.

### Section 4.3.2.8

Right-of-way lines should be considered for display in final document.

SCAG's 2001 RTP, Regional Aviation Element specifies a 78 Million Annual Passengers (MAP) in 2025. Please state why LAWA proposes to achieve the 78 MAP by 2015.

#### Section 4.3.2.8 and Technical Report 2b

Intuitively, we have concerns when the MAP would increase to 78 million by 2015 and traffic projections indicate that traffic would remain about the same as 2001. SCAG conducted a survey analysis for the 2001 RTP using the Regional Airport Demand Allocation Model (RADAM) for travel forecasting. RADAM was developed for SCAG and it breaks the SCAG region into 100 large zones. Then SCAG distributed the trips into their Travel Analysis Zones. SCAG used the same methodology for the 2004 RTP. Please provide a discussion on the parity of the future passenger travel numbers used for this document comparing SCAG's methodology and travel numbers with LAWA's methodology and travel numbers.

#### Section 4.3.2.9

It appears that impacts associated with the Lennox Boulevard new interchange off of I-405 will include required relocation of as many as 12 residential homeowners, 7 businesses, and 1 community center. However, the DEIR/DEIS states that compliance with the Uniform Relocation Act (mitigation) would ensure a less than significant impact. Furthermore, after the implementation of mitigation, the DEIR/DEIS anticipates less than significant visual, noise, and historical impacts. All these very preliminary conclusions need to be reassessed for this project and the proposed fly-over access off of I-105/Imperial Highway and substantiated in a Preliminary Environmental Assessment Report and environmental documents, as well as full and comprehensive discussions about biological, archaeological, and other resources. All technical studies need to be prepared by qualified personnel.

#### Section 4.3.2.9.2

The development of several new Fly-Away remote terminals is proposed to reduce the amount of vehicle traffic associated with travel to and from LAX. For the FEIR, please report on the progress of adding Fly-Away terminals at Los Angeles Union Station, Long Beach, Inglewood, Norwalk/Santa Fe Springs Transportation Center and San Fernando Valley II. A traffic analysis may be needed for these new Fly-Away locations.

#### Section 4.3.1.3

The State relinquishment of Sepulveda Boulevard between Lincoln Boulevard and Imperial Highway appears on the City of Los Angeles State Highway Projects List, 9/23/02, but does not have a number of priority order assigned to it. Please seek to have a priority number assigned and report on the priority status in the FEIR.

#### Section 4.3.8.4

Please be mindful that CMP mitigation analysis is a 10-year old methodology for analyzing traffic impacts. Under the California Environmental Quality Act (CEQA), responsible and commenting agencies need to ensure that LOS for roadway facilities is not made worse by new land-use proposals. If proposals worsen Level of Service conditions, responsible and commenting agencies need to ensure that the agency proposing the land-use put the roadway back the way it was. The CMP in

acknowledging the Department's role, stipulates that Caltrans needs to be consulted to identify specific locations to be analyzed on the State Highway System.

Section 4.6

On page 4-355 paragraph 3, we recommend that the first sentence of this paragraph include the amount of emissions released by ALL sources at or near LAX. (*The sources should be inclusive as is indicated, they can be either positive or negative.*)

It is important to clarify for each alternative, the specific year that the interim year is applicable to, e.g. 2005, 2015 or 2013 as indicated in Section 4.6.2.1 – Interim Year Analysis

Does the use of AERMOD limit the number of receptors that can be used? If so, can the model override its defaults to allow for the inclusion of additional receptors?

Is any "real" weather data used? Has the a.m. weather gathering concerns been resolved with AERMOD?

Bullet 1 should indicate the date of the CO attainment demonstration, i.e. the revision/update is incorporated within the 2003 revision to the CO Plan.

Section should indicate SCAQMD has issued the Final 2003 AQMP.  
Data should be updated to indicate the 2003 Final Air Quality Management Plan, August 2003.

Identify "WTA" in the list of acronyms on page 4-392. Conformity Applicability: Since the LAX Master Plan is being proposed in a federally designated non-attainment area for various pollutants, the Plan must consider consistency with the latest RTP and AQMP/applicable State Implementation Plan (SIP). Projects associated with the proposed plan are subject to conformity.

Please update smog alert episode to reflect that in the early summer, 2003, the basin experienced a Stage 1 smog alert episode. Information that there has been no State 1 smog alerts since 1999 is erroneous.

If you have any questions regarding our comments, please do not hesitate to contact me at (213) 897-4429.

Sincerely,

STEPHEN BUSWELL  
IGR/CEQA Program Manager  
Office of Regional Planning

Los Angeles, California 90009-2216

**Los Angeles International Airport (LAX) Draft Master Plan Supplement to the Draft  
Environmental Impact Statement/Environmental Impact Report  
State Clearinghouse Number 1997061047**

Dear Mr. Ritchie:

The Department of Fish and Game (Department) has reviewed the above-referenced Supplement to the Environmental Impact Statement/Environmental Impact Report (SEIS/EIR). The following statements and comments have been prepared pursuant to the Department's authority as Trustee Agency with jurisdiction over natural resources affected by the project (CEQA Section 15386).

The Department has provided comments for the previous SEIS/EIR which considered Alternatives A, B, and C. Our letter, dated September 21, 2001, is attached.

Under Alternative D (Enhanced Safety and Security Plan), the number of runways would stay the same at four. Two existing runways would be moved, two runways would be lengthened, and all runways further separated from one another to improve operational efficiency and safety. Alternative D would encourage a long-term regional approach to serving air traffic demand in the Los Angeles basin by designing facilities at LAX to accommodate passenger and cargo activity levels equivalent to the No Action/No Project Alternative activity level, but would be designed to allow air carriers to emphasize international routes at LAX. Alternative D would enhance security by limiting access by private vehicles to the main airport infrastructure to reduce the risk to airport users. The public parking structures in the CTA would be relocated and would be replaced by new centralized passenger terminals. The existing Terminals 1 through 7 would be

reconfigured. The Tom Bradley International Terminal (TBIT) would be reconfigured with the addition of a new North/South Linear Concourse. A West Satellite Concourse would be built west of the TBIT.

A new Ground Transportation Center (GTC) and an Intermodal Transportation Center (ITC) would be constructed east of Aviation Boulevard and would be the primary access points for all passenger drop-off and pick-up and vehicle parking. Passengers and employees would access the CTA via an Automated People Mover (APM) system from new GTC, ITC and consolidated Rental Car (RAC) facilities. Intersection improvements would be made to the off-airport transportation network to accommodate the shift in traffic patterns from the CTA to the GTC and ITC areas. Some cargo facilities would be modified under Alternative D, with the overall square footage being equivalent to the No Action/No Project Alternative.

Alternative D would require the acquisition of approximately 77 acres of property, the least amount of land acquisition of all the proposed build alternatives. The 340-acre, LAX Northside project described in the No Action/No Project Alternative that is currently recognized within the City's current General Plan and Zoning for 4.5 million square feet of development, would be developed for Alternative D; however, under Alternative D, the existing trip cap that exists for LAX Northside would be reduced to limit vehicle trips to a level comparable to that associated with the 2.6-million-square-foot Westchester Southside development proposed under Alternatives A, B, and C.

The Department offers the following comments and recommendations:

The precipitous decline of species associated with open grasslands within the Los Angeles Basin is well documented, with LAX likely supporting the largest population of loggerhead shrike (*Lanius ludovicianus*) in the Los Angeles Basin based on an estimate of five to eight sites remaining in the Basin and San Gabriel/San Fernando Valleys<sup>1</sup>. The project site supports one of only three known occurrences of San Diego black tailed jackrabbit (*Lepus californicus bennettii*) within the Los Angeles Basin. Similarly, western spadefoot toad (*Scaphiopus hammondi*) is known from no more than five occurrences within the Los Angeles Basin. Federally threatened and endangered species that would be impacted by the project include the endangered El Segundo blue butterfly (*Euphilotes battoides allyni*) and Riverside fairy shrimp (*Streptocephalus woottoni*).

Although the impacts associated with Alternative D differ from other alternatives discussed in the previous EIS/EIR, the basic points of our letter addressing the inadequacies of the previous EIS/EIR apply in this case as well. Our most serious concerns remain the inadequate and inappropriate methodologies used for biologic baseline documentation, impact assessment, and mitigation calculations. For this reason we request an opportunity to meet with the applicant,

---

<sup>1</sup> Kimball Garrett, Ornithology Collections Manager, Natural History Museum of Los Angeles County; personal communication via electronic mail, November 5, 2003.

**Mr. Jim Richie**

November 6, 2003

Page 3

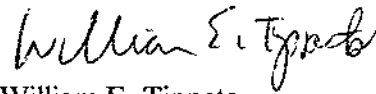

the Federal Aviation Administration (FAA), and the City of Los Angeles to address our concerns prior to final certification action. The U.S. Fish and Wildlife Service should also be invited to participate.

At issue is the use of a "modified Habitat Evaluation Procedure" (re-named "Mitigation Land Evaluation Procedure - MLEP" for the SEIS/EIR). As stated in our previous letter this procedure does not accurately represent the current biologic conditions or the impacts of the project alternatives, nor does it provide for mitigation that is proportional to the impacts. The current application of the MLEP is therefore inadequate to meet the basic requirements of CEQA. In our extensive experience with land use planning and CEQA in southern California, this radical departure from accepted impact analysis methods has no precedence or justification.

The Department has determined that all of the four alternatives as currently proposed would have significant, unmitigated impacts on sensitive biological resources. Specifically, the actions will substantially reduce the habitat of sensitive wildlife species, reduce the numbers of endangered, threatened or rare species, and result in significant impacts in light of past habitat losses and the small amount of remaining habitat to support sensitive species in western Los Angeles County. Suggested mitigation measures are provided in our previous comment letter.

Questions regarding this letter and further coordination on these issues should be directed to Brad Henderson at (310) 214-9950.

Sincerely,

William E. Tippetts  
Environmental Program Manager

**Draft Environmental Impact Statement / Environmental Impact Report for the Los Angeles International Airport Proposed Master Plan Improvements, Los Angeles, Los Angeles County, California  
(SCH 1997061047)**

Dear Mr. Ritchie:

The Department of Fish and Game (Department) has reviewed the Draft Environmental Impact Statement/ Environmental Impact Report (DEIS/EIR) dated January 2001, for the Los Angeles International Airport (LAX) Proposed Master Plan Improvements, Los Angeles, Los Angeles County, California. The Department is identified as a Trustee Agency pursuant to California Environmental Quality Act (CEQA) Section 15386 and is responsible for the conservation, protection and management of the state's biological resources.

The proposed project consists of three alternative expansion scenarios for LAX as well as a "no project" alternative. Under Alternative A, a new runway would be added to the north airfield complex, and two existing runways would be lengthened; all runways would be further separated from one another. This alternative differs from the other build options because it would not develop the Manchester Square property acquired as part of the LAX noise mitigation program. This alternative would fully meet the projected demand for aviation services at LAX by accommodating 97.9 million passengers and 4.2 million tons of cargo in 2015. As with each of the three build alternatives (A, B and C), a new passenger terminal complex would be constructed at the west end of the airport on Pershing Drive connected to the I-105 and I-405 freeways by a ring road encircling the airport. An LAX Expressway would be built along side the I-405 and would provide direct freeway access to the airport via a connection to the ring road. New midfield concourses would be connected to the west terminal and the existing central terminal by an Automated People Mover. New air cargo facilities would be built on newly acquired land east of the airport. The LAX Northside project would be reconfigured into a

Page 2

smaller, 2.65 million square-foot mixed use development and would be renamed the Westchester Southside project. The Continental City site would be used for air cargo facilities.

Under Alternative B, a new runway would be added to the south airfield complex, and two existing runways would be lengthened; all runways would be further separated from one another. This alternative would fully meet the projected demand for aviation services at LAX by accommodating 97.9 million passengers and 4.2 million tons of cargo in 2015.

As with each of the three build alternatives (A, B and C), a new passenger terminal complex would be constructed at the west end of the airport on Pershing Drive connected to the I-105 and I-405 freeways by a ring road encircling the airport. An LAX Expressway would be built along side the I-405 and would provide direct freeway access to the airport via the MTA railroad right-of-way adjacent to Florence Avenue, and a connection to the ring road. New midfield concourses would be connected to the west terminal and the existing central terminal by an Automated People Mover. New air cargo facilities would be built on newly acquired land east of the airport. Again, the LAX Northside project would be reconfigured into a smaller, 2.65 million square-foot mixed use development and would be renamed the Westchester Southside project. The Continental City site would be used for air cargo facilities.

Under Alternative C, the number of runways would stay the same at four. Two existing runways would be moved, one runway widened, three runways lengthened and all runways further separated from one another to improve operational efficiency. This alternative would not fully meet the projected demand for aviation services at LAX. It would fully accommodate the cargo demand of 4.2 million tons in 2015. However, it would accommodate only 89.6 million passengers (a shortfall of 8.3 million passengers) in 2015. As with the other build alternatives, a new passenger terminal complex would be constructed at the west end of the airport on Pershing Drive connected to the I-105 and I-405 freeways by a ring road encircling the airport. An LAX Expressway would be built along side the I-405 and would provide direct freeway access to the airport via a connection to the ring road. New midfield concourses would be connected to the west terminal and the existing central terminal by an Automated People Mover. New air cargo facilities would be built on newly acquired land east of the airport. The LAX Northside project would be reconfigured into a smaller, 2.65-million-square-foot mixed use development and would be renamed the Westchester Southside project. The Continental City site would be used for air cargo facilities. LAWA staff has chosen this option as its preferred alternative. (The FAA has not yet identified its preferred alternative and, in accordance with its regulations, the FAA will identify a preferred alternative in the Final EIS/EIR.)

According to the DEIS/EIR, the proposed project will impact non-native grasslands, disturbed areas, valley needlegrass grasslands, southern foredune, southern dune scrub, and vernal ponds. Federally threatened and endangered species that will or have potential to be impacted by the project include the endangered El Segundo blue butterfly (*Euphilotes battoides*

SAS00004

**Jim Ritchie**

September 21, 2001

Page 3

*allyni*) and Riverside fairy shrimp (*Streptocephalus woottoni*). Sensitive species, including several California Species of Special Concern (CSC) that would potentially be impacted by the proposed project include the loggerhead shrike (*Lanius ludovicianus* - CSC), burrowing owl (*Athene cunicularia* - CSC), western spadefoot toad (*Scaphiopus hammondii* - CSC), silvery legless lizard (*Anniella pulchra* - CSC), San Diego horned lizard (*Prhynosoma coronatum blainvillei* - CSC), San Diego black tailed jackrabbit (*Lepus californicus bennettii* - CSC), Trask's snail (*Helminthoglypta traskii*), Henne's eucosman moth (*Eucosa hennei*), Ford's sand dune moth (*Psammobotys fordi*), and Globose dune beetle (*Coelus globosus*). Sensitive plant species include Lewis' evening primrose (*Camissonia lewisii*), duneflower or sand food (*Pholisma arenarium*), and California spineflower (*Mucronea californica*).

The Department offers the following comments concerning this project:

#### **Habitat Evaluation Procedures Methodology**

The DEIS/EIR relies on the Habitat Evaluation Procedures (HEP) methodology to define biological impacts and develop biological mitigation measures. For the reasons described below, the Department does not concur with the manner by which the HEP was applied; and, therefore we do not believe that the mitigation measures are acceptable.

The HEP methodology was first developed in the 1970's by the USFWS for the evaluation of impacts to individual species and their habitats. The HEP methodology is designed to quantify the habitat quality of given areas for a *particular* species. The HEP technique can be a useful tool for impact analysis for a target species by providing a consistent method of assessing the adverse or beneficial effects of a project and its alternatives. Using the *habitat requirements of the target species* as a basis for analysis, the importance of the study area's environmental variables to the target species are analyzed and used to generate a habitat suitability index (HSI), referred to as Habitat Value in the DEIS/EIR. A Habitat Value may range from 0.0-1.0, depending on the value to the target species. Multiplying the HSI or Habitat Value by the acreage of a study area yields habitat units (HU), a measure of a site's acreage and value for a particular species. For example, if a HEP analysis is conducted for two separate target species (Species "A" and Species "B") within an area supporting optimal habitat for Species A but only marginal habitat for Species B, the HSI values and HU values would be much higher for Species A than Species B. The HEP analysis presented in the DEIS/EIR does not follow this accepted methodology, and is flawed in the following fundamental ways:

1. The DEIS/EIR's HEP is developed based on idealized vernal pool/native grassland landscape characteristics that are not demonstrated as important features for any particular species of interest. The two reference sites chosen as idealized habitats for the analysis of the LAX project are the Santa Rosa Plateau and the Carrizo Plain Natural

SAS00004

Area, both inland areas that support some similar types of habitat (grassland, forb, and vernal pool) but their similarity to the historical coastal habitats of the study area is questionable. In fact, they are very dissimilar to the existing condition of the study area, and are not at all analogous to southern foredune and southern dune scrub. Rather than focusing on how high quality habitats associated with the reference sites might help define the specific habitat requirements of the target species found at LAX, the DEIS/EIR develops a generalized HEP that largely ignores the requirements of the target species. For instance, the analysis quantifies such factors as vernal pool flora, native grasses over 10%, and contiguous native habitat over 40 acres, which have very different relevance to species as diverse as the loggerhead shrike, Riverside fairy shrimp, black-tailed jackrabbit, or Lewis' evening primrose.

2. The HEP analysis arbitrarily assigns values to habitat components without any justification. For example, the category "under regulatory conservation" which measures the strength of environmental land-use laws for a given habitat type and fails to evaluate the quality of the habitat itself, is given twice the importance (0.10) as real habitat components such as "summer dessication" which is critical to the survival of Riverside fairy shrimp. On the other hand, "summer dessication" would not necessarily be an equally important element in consideration of the habitat requirements for the loggerhead shrike, burrowing owl, silvery legless lizard, etc.
3. The DEIS/EIR inappropriately assigns Habitat Values to all of the study area's different vegetation communities based on one vegetation community/landscape (the idealized reference sites). The artificially constructed habitat value measurements for vernal pools/native grasslands are applied to completely unrelated habitats using the same inappropriate categories. Southern foredune, for example, is downgraded because it does not contain "areas with periods of inundation of equal to or greater than 30 days", a habitat value that does not apply to the sandy substrates of southern foredune habitats. The southern foredune habitat on the El Segundo dunes, widely acknowledged as some of the highest quality and most diverse examples of its type in southern California, only rates a 0.45 value in the analysis because of this misapplication of specific habitat components to unrelated and structurally very different habitats. As a result, the entire project site is given artificially low Habitat Values because many areas do not exhibit "mound-depression microrelief," "native soils with slope less than 10%," "sensitive/listed vernal pool-associated species (reproducing)," etc. that are comparable to a vernal pool landscape. Many of the habitat components listed in Table 4.10-1 are insignificant in the context of assessing the importance of the site's vegetation resources.
4. The HEP used in the DEIS/EIR inappropriately "banks" habitat units of urbanized landscape areas that are subsequently used to downgrade the impacts of the proposed

project on unrelated habitats. For example, the EIS/EIR (Page 4-646) considers future ornamental landscaping within the facility (arbitrarily assigned a value of 2.68 habitat units for 53.6 acres of landscaping) to offset the loss of non-native grasslands and disturbed areas supporting sensitive species.

5. The DEIS/EIR proposes that the restoration of disturbed dune scrub/foredune (Habitat Value of 0.35 according to DEIS/EIR) to southern foredune (Habitat Value of 0.45 according to DEIS/EIR) would result in a mitigation credit value of 0.8 per acre, a higher value than southern foredune or *any other existing habitat* within the study area. Using the DEIS/EIR's methodology, a change in Habitat Value from 0.35 to 0.45 is a difference of 0.1, not 0.8. Using the DEIS/EIR's methodology and Table 4.10-1, the restored southern foredune community would "ideally" resemble grassland/vernal pool habitats of Santa Rosa Plateau and Carrizo Plain, an undesirable result.
6. The mitigation ratio of 1:1 (as measured in "Habitat Units" in the DEIS/EIR) results in inadequate compensation for the loss of habitats occupied by sensitive species including the loggerhead shrike, San Diego black-tailed jackrabbit, and western spadefoot toad. In the following discussion we will examine the example of the non-native grassland and disturbed/bare ground communities under 2015 Alternative "A". The entire study area contains approximately 704.9 acres of non-native grassland (designated as non-native grassland/ruderal in the DEIS/EIR). Approximately 363.4 acres would be impacted under Alternative A. Using the DEIS/EIR's HEP analysis, this 363.4 acres is equivalent to 54.47 Habitat Units. The DEIS/EIR then combines the impacts for disturbed/bare ground (94.8 acres or 9.48 Habitat Units) with the grassland habitat units (54.47+9.48=63.95 Habitat Units). An arbitrarily assigned credit for future landscaped areas is then subtracted from the total impacts to yield the total Habitat Units of impact (63.95 Habitat Units-2.68 Habitat Units (or 53.6 acres of landscaping) = 61.27 Habitat Units. The proposed mitigation plan consists of three components: (1) enhancement of 16.9 acres of non-native grassland to needlegrass grassland; (2) restoration of 18.06 acres of existing roadways within the El Segundo blue butterfly preserve to southern foredune; and (3) enhancement of 74.6 acres of disturbed dune scrub/foredune to southern foredune. Of this total, only 16.9 acres would provide comparable mitigation (enhancement of non-native grassland to native grassland) for losses of 363.4 acres of grassland and 94.8 acres of disturbed habitat supporting sensitive species.
7. Most of the habitats present on LAX are artificially assigned low values, which then are used as the basis for developing mitigation measures. After creating these artificial habitat units, the DEIS/EIR then proposes that units are fully exchangeable, such that impacts to one habitat type, for instance grasslands, could be mitigated through enhancement of different habitat types supporting different species, such as southern

**Jim Ritchie**

September 21, 2001

Page 6

foredone. By implying this arbitrary "exchange system" of mitigation, the DEIS/EIR has failed to establish a credible basis for the nexus and proportionality of the mitigation process.

8. In summary, we believe that the modified HEP method used for this analysis is flawed and misapplied, and is inappropriate for use in defining biological impacts and developing acceptable mitigation measures. The following discussion of impacts to habitats and sensitive species omits any references to habitat values as defined or used in the DEIS/EIR.

### **Federally-Listed Species**

9. We understand that the USFWS currently in formal consultation with the Federal Aviation Administration regarding proposed impacts to occupied habitat of the Riverside fairy shrimp.

Restoration of vernal pools sufficient to support Riverside fairy shrimp is experimental and often unsuccessful. Therefore, mitigation ratios typically vary from 3:1 to 5:1 for impacts to vernal pools depending on the quality of the pools to be disturbed. The "ephemerally wetted areas" on LAX are not high quality vernal pools, however, they do support two species of fairy shrimp and the western spadefoot toad, which require vernal pools for reproduction. Therefore, we recommend that the mitigation for impacts to the pools at LAX be 3:1, at the low end of the typical mitigation range. The surface area of the pools to be impacted on LAX is 1.3 acres, therefore the surface area of the mitigation ponds should be 3.9 acres.

Successful creation of functional vernal pool habitat must include provisions for the creation and management of surrounding upland habitats. These upland habitats serve both as buffers and watersheds for created vernal pools. The ratio of upland watershed to pool surface area on natural and successfully created pools is at least 10:1 and often 15:1. Therefore the amount of land minimally required to support the created pools will be 39 acres. We have recommended splitting this acreage between two or more sites, to increase the chances of successfully restoring the specific conditions which the fairy shrimp and western spadefoot toad require to breed.

Please review the Vernal Pool Construction Monitoring Protocol and Habitat Replacement Evaluation produced by the USFWS located at:  
<http://pacific.fws.gov/es/vpfinal.html>

10. Potential impacts to the El Segundo Blue butterfly include 320 square feet of occupied

SAS00004

habitat under Alternative A. Considering the rarity of the species and its habitat, direct, permanent impacts to southern foredune and dune scrub communities containing the butterfly should be mitigated at a 5:1 ratio. This would result in the creation of 0.05 acres of suitable habitat. We recommend that this restoration occur in currently unoccupied portions of the dune preserve, such as subsites 45 or 50, or in the 104 acres north of the existing preserve. Impacts to the high density butterfly population in subsite 9 from the proposed ring road and World Way West realignment have not been sufficiently investigated, as described below in the light emissions discussion. We recommend further disclosure of the engineering plans being considered for the World Way West interchange area, in order to fully analyze the potential impacts associated with this portion of the proposed project.

### **Other Impacts**

11. The ring road which is proposed to replace Pershing Drive and circle the expanded airport presents a number of potential impacts to wildlife and habitats that have not been analyzed or mitigated. The DEIS/EIR states that a number of rare vertebrate species, such as the black-tailed jackrabbit, San Diego horned lizard, and silvery legless lizard occur, or are proposed to be reintroduced to the dunes. However, no analysis is presented as to the effects of increased speeds and traffic volume on rates of road kill for these species. These populations of sensitive species are already reduced due to the limited extent of habitat available, and therefore significant rises in mortality rates due to increased road kill may render these populations unsustainable. New technologies for deterring road crossings by small vertebrates are currently available (<http://www.fhwa.dot.gov/environment/wildlifecrossings/index.htm>). These technologies should be incorporated into the designs of the ring road, so as to prevent increases in road kill of sensitive species.
12. Light emissions are known to disrupt the circadian rhythms of birds, butterflies, small mammals, and other species. This is especially true of nocturnal species, such as the numerous rare, endemic moth species restricted to the dunes. Light emissions along Pershing Drive are currently very low, with only a few street lights present adjacent to the preserve. However, as noted in the DEIS/EIR, several streetlights at the westerly end of World Way West light a wide area of the dunes preserve. The foot-candles emitted by these lights were not measured or analyzed in the DEIS/EIR. The number of additional streetlights proposed for the ring road and the additional infrastructure on the airport are also not disclosed, but the DEIS/EIR estimates that the light reaching the dunes preserve will increase to 0.60 foot-candles. How this figure was reached is not described. We recommend that the Final DEIS/EIR include a more detailed analysis of the biological effects of night lighting. Mitigation measures to offset potentially significant impacts

should also be proposed.

13. The effects of increased noise levels on sensitive species and habitats are not adequately analyzed in the DEIS/EIR. Research has shown that chronic noise levels can be disruptive to avian species, amphibians, and rodents.
14. The DEIS/EIR may fail to disclose and analyze proposed impacts to the northern 104 acres of the dunes. An approved EIR, circa 1983, was certified by the City of Los Angeles for the LAX Northside Project. The development of this area is considered part of the "no project alternative", but project changes since 1983 are not discussed in detail. The LAX Northside project has been re-named and reconfigured as the Westchester South project. However, the DEIS/EIR appears to present potential new impacts for project components not previously analyzed. Several figures in the DEIS/EIR Biological Assessment Technical Report depict a golf course, resort hotel, light industrial, and commercial/mixed use in the northern area of the dunes. We recommend that any reasonably foreseeable direct and/or indirect physical changes associated with the project should be included as part of the project and analyzed for potentially significant environmental effects and appropriate mitigation measures.

### **Mitigation**

15. Because of the regional significance of declining species and habitats found within the Master Plan boundaries, we recommend that all biological mitigation areas associated with the project, both within and outside of the current preserve area, are protected and managed in perpetuity. Department staff are available to work with LAWA in the design and implementation of maintenance and monitoring plans to meet long-term biological goals.
16. Long-term management of the dunes is essential if the area is to provide mitigation opportunities for project impacts. Currently, portions of the dune preserve are in a state of degradation due to a general lack of management. In the last several years the dunes have been allowed to deteriorate through invasion by exotic plant species, and contain a highly altered vertebrate community through the abundance of red fox. We recommend the creation of a non-wasting endowment to support implementation of an approved management plan. Management of the dunes should be accomplished through an independent management organization with extensive expertise in managing sensitive habitats and endangered species.
17. The DEIS/EIR contains language in virtually all of the biological mitigation measures limiting monitoring and maintenance to "not more than five years." The accepted

mitigation monitoring and maintenance period pursuant to CEQA is typically a period of not less than five years. In some cases five years or less is sufficient to meet performance standards; in other cases it is not. By limiting the maintenance and monitoring period to less than five years regardless of the success of the mitigation site, the DEIS/EIR implies that if performance criteria are not met within five years, no further maintenance or monitoring need be performed. If a mitigation site fails to meet acceptable performance standards, the significant impacts of the project would not be reduced below a level of significance. For these reasons, we recommend that all mitigation areas meet acceptable performance criteria, before LAWA is relieved of mitigation responsibility. On the other hand, it is often appropriate to cease maintenance and monitoring responsibilities if a mitigation site has clearly met acceptable performance standards prior to the end of five years.

18. The Department is concerned with the loss of grasslands in southern California, including both native and non-native grasslands. Grasslands and other open areas on the site provide foraging habitat for raptors, and support sensitive species including burrowing owl, loggerhead shrike, western spadefoot toad, and San Diego black-tailed jackrabbit. The mitigation proposed in the DEIS/EIR is unacceptable. The Department recommends that proposed impacts to annual grassland be mitigated in-kind at a ratio of 0.5:1 to compensate for the loss of raptor foraging habitat and sensitive species habitat. Because LAX is one of the last expanses of grassland in the area, nearby mitigation sites with sufficient acreage may not exist. If sufficient acreage is not available on the site or nearby, an off-site grassland preserve should be considered. Primary consideration should be given to areas supporting or capable of supporting sensitive species impacted by the project. The establishment of an off-site grassland preserve would not necessarily mitigate for losses of habitat on a local level, but would at least provide compensatory habitat within the region.
  
19. The success criteria outlined in the mitigation measure for impacts to Lewis' evening primrose (MM-BC-2) are not acceptable. The acreage currently occupied by the species is 2.5 acres according to the DEIS/EIR. The estimate of 300 individuals present likely only represents an estimate of flowering individuals present at a given time. This species, like most other annual plants, is likely very dynamic in both the spatial distribution and numbers of observable (flowering) individuals present from year to year. Due to various dormancy mechanisms, annuals of xeric habitats rarely exhaust the entire seedbank in any given year. Observations of flowering individuals of annual plant species do not necessarily provide a census of the entire population (i.e., the seedbank). To better quantify the loss and appropriate mitigation measures, the acreage of occupied habitat must be taken into account along with the estimated number of flowering plants observed. We recommend that MM-BC-2 is revised to establish an area of no less than 2.5 acres of

- currently unoccupied but otherwise suitable habitat to disperse seed. The success criteria should not only include the "establishment" (germination?) of 300 seeds in the first year after dispersal, but should also include true success criteria, including measures of seed set, recruitment, and spatial distribution over the mitigation area for the entire five-year monitoring/maintenance period.
20. We recommend that the planting of mature trees associated with MM-BC-3, as well as all landscaping associated with future improvements, avoid establishing non-native trees in areas where the presence of the trees could impact native dune or grassland communities. Impacts associated with non-native trees include the invasive tendencies of some plant materials, alterations of native arthropod communities due to irrigation and other changes, and creation of habitat for aggressive or non-native bird species. The Department recommends the use of locally native plants to the greatest extent feasible in the landscape areas. The applicant should not plant, seed or otherwise introduce invasive exotic plant species to the landscaped areas adjacent to or near mitigation or open space areas. Exotic plant species not to be used include those species listed on Lists A & B of the California Exotic Pest Plant Council's list of "Exotic Pest Plants of Greatest Ecological Concern in California as of October 1999." This list includes such species as: pepper trees, pampas grass, fountain grass, ice plant, myoporum, black locust, capeweed, tree of heaven, periwinkle, sweet alyssum, English ivy, and Spanish broom. A copy of the complete list can be obtained by contacting the California Exotic Pest Plant Council at 32912 Calle del Tesoro, San Juan Capistrano, CA 92675-4427, or by accessing their web site at <http://www.caleppc.org>
  21. We recommend that the spadefoot toad mitigation (MM-BC-4, in part) be coordinated with the relocation of vernal pool resources and Riverside fairy shrimp previously mentioned. All buffer areas and the watersheds of vernal pools (i.e., mitigation areas) should be managed in perpetuity for both Riverside fairy shrimp and spadefoot toad.
  22. The DEIS/EIR proposes to transport black-tailed jackrabbits to the dune preserve area (MM-BC-4, in part), and monitor their status for three years. Currently, jackrabbits inhabit a significant portion of the airfield west of the southern runway. Though the acreage occupied is not disclosed in the DEIS/EIR, it is likely greater than 100 acres. Within the habitat restoration area only 41 acres of grassland and dune scrub habitats are present. These two habitats are the primary habitats suitable for jackrabbits on the dunes. No analysis is presented to suggest that 41 acres of habitat is sufficient to establish a self sustaining population of jackrabbits. A much larger extent of these two habitats (92 acres) is present on the dunes to the north of the habitat restoration area. We recommend incorporating the northern dunes into the dune preserve and establishing a jackrabbit population on the combined acreage. As transplantation efforts are experimental and

**Jim Ritchie**

September 21, 2001

Page 11

prone to failure, we also recommend the selection of a second site to establish a new population. Potential sites may include those finally selected as suitable for Riverside fairy shrimp habitat creation. A red fox control program will be essential to maintaining jackrabbits on the dunes or potentially in off-site mitigation areas.

23. The DEIS/EIR states that currently three pairs of loggerhead shrikes inhabit the dunes west of Pershing Drive. From the distribution of observation points mapped on figure 4.10-5, it appears one to two other pairs use the western airfield east of Pershing Drive for nesting. Therefore the proposed project will result in a loss of habitat, and potentially the loss of two out of five pairs of shrikes on the property. Shrikes maintain large territories, and though the enhancement of the dunes preserve may increase the foraging value for the resident pairs, there is no evidence to show that an enhanced dune area will support two more pairs over what it supports currently. It is doubtful that the mitigation as proposed would reduce the impact below a level of significance. We recommend that the acquisition or restoration of occupied grassland habitat as previously mentioned as an effective mitigation measure.
24. As previously mentioned, the proposed mitigation measures for loss of habitat for the three build alternatives (MM-BC-5, MM-BC-6, and MM-BC-7) should be revised. The Department recommends that grassland mitigation should be provided at a ratio of at least 0.5 to 1 for losses of grassland habitats. The DEIS/EIR's mitigation measures propose container stock planting densities for dominant species comprising valley needlegrass grassland, provided in plants/habitat unit. Converting these densities to plants per acre, and on-center spacing (assuming an even distribution of the container stock), the proposed spacings include: nodding needlegrass (5.18 feet on-center), white everlasting (31.7 feet on-center), doveweed (31.7 feet on-center), California croton (29.9 feet on-center), and dune primrose (23.97 feet on-center). These proposed spacings would result in an extremely low amount of cover, not at all resembling a natural grassland or grassland/forb community. Furthermore, the species diversity as suggested in the DEIS/EIR would result in a target community lacking the diversity of a natural community. We recommend an increased container stock density as well as the inclusion of many more species. Both container stock and seed should be considered for this effort.

Most importantly, the proposed success criteria of "attainment of at least a 10 percent cover of native cover" is not acceptable. The Department and many local agencies have adopted a threshold of ten percent cover by *native grass species* as a determining factor in the classification and mapping of a given area as a native grassland type. An upland site dominated by herbaceous species with only ten percent cover of grasses may represent a native grassland/forb community, or more commonly may represent an extremely degraded native grassland community with a high percentage of non-native, disturbance-

SAS00004

**Jim Ritchie**

September 21, 2001

Page 12

adapted species. The Department does not accept ten percent total native cover as an acceptable performance criteria for natural communities that achieve up to 75%-100% cover during the spring season. Therefore, the Department recommends: (1) examination of high quality needlegrass/forb habitat within the Master Plan boundaries for use as a reference site; and (2) consideration of published data documenting historical plant species and communities of the area.<sup>1</sup> The success criteria for this mitigation measure should be the attainment of replacement habitat comparable to the existing and pre-disturbance condition of the reference site, rather than a goal of ten percent native cover.

25. The revegetation of needlegrass grassland is extremely difficult and has been subject to a high failure rate due primarily to competition by non-native plant species. Revegetation of native grassland is largely in the experimental phase, with many land managers and others currently exploring ways to increase the success of native grassland restoration. Site selection, cryptobiotic crusts, soil types, fire, soil and vegetation salvage, associated species, weed competition, and other factors interact to influence the success or failure of native grassland restoration. While the site may have historically supported more forbs than grasses, similar revegetation methods and constraints would apply. Based on past experience, the Department recommends an extended site preparation and installation period for revegetation of this plant community. In areas supporting non-native species, we recommend at least two to three years of weed control prior to the installation of native grass species, in addition to the five-year maintenance/monitoring period. In fact, some research has shown that five years may be only marginally sufficient for grassland revegetation sites to achieve significant native growth (see <http://www.hastingsreserve.org/GrassRestore/GrasRest2.html>) We recommend that the project use salvaged materials from the project site, including soils, cryptobiotic crusts, native grasses, and geophytes, if these are available.
26. Needlegrass grassland is designated as a Rare Natural Community (S.1.1) that has suffered a decline of well over 99 percent in southern California. Because of the rarity of this community, the Department recommends a higher mitigation ratio (2:1 to 3:1) for impacts to needlegrass grassland (discussed in MM-BC-8, MM-BC-9, and MM-BC-10). Likewise, previous comments regarding specific revegetation methodology also apply to MM-BC-8.
27. The DEIS/EIR suggests that "Any combination of habitat replacement completed by LAWA or its designee drawn from the above-listed opportunities that equals at least

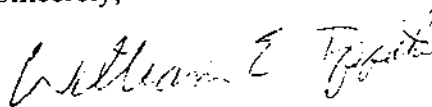

<sup>1</sup>Mattoni, R., and T. Longcore. 1997. The Los Angeles Coastal Prairie, a Vanished Community. Crossosoma 26(2): 71-102

**Jim Ritchie**  
September 21, 2001  
Page 13

61.27 habitat units shall be considered sufficient replacement for the loss of habitat resulting from implementation of Alternative A." As previously mentioned, the Department do not support this concept for this or any of the "build" alternatives.

We appreciate the opportunity to comment the on the DEIS/EIR for the Los Angeles International Airport Proposed Master Plan Improvements project. The Department has determined that the project as currently proposed would have significant, unmitigated impacts on sensitive biological resources. Specifically, the actions will substantially reduce the habitat of sensitive wildlife species, reduce the numbers of endangered, threatened or rare species, and result in impacts that are cumulatively significant in light of past habitat losses and the small amount of remaining habitat to support sensitive species in western Los Angeles County. We request that the FAA and the City of Los Angeles not take final certification action until the Department has had the opportunity to meet with the applicant to address the concerns identified in this letter. If you have any questions or comments please call Brad Henderson at (310) 214-9950.

Sincerely,

William E. Tippets

**South Bay Cities**  
COUNCIL OF GOVERNMENTS

5033 Rockvalley Road  
Rancho Palos Verdes, California 90275  
310/377-8987 • Fax 310/377-5790  
Email: jackibach@cox.net  
www.southbaycities.org

July 9, 2003

Mr. Jim Ritchie  
City of Los Angeles  
Los Angeles World Airports  
LAX Master Office  
P.O. Box 92216  
Los Angeles, California 90009-2216

Dear Mr. Ritchie:

The South Bay Cities Council of Governments (SBCCOG) has just been notified that we have received the Supplement to the Draft EIS/EIR, Draft EIS/EIR, Draft Master Plan and Draft Master Plan Addendum, which were erroneously sent to the City of Torrance. First, we would request that you change the address of record for the SBCCOG to:

South Bay Cities Council of Governments  
5033 Rockvalley Road  
Rancho Palos Verdes, Cal. 90275

While we are still in the process of picking the documents up from Torrance and have not yet seen the documents, we understand that they are 5000+ pages and that the review period is only the minimum legally required 45 days. We find this totally inadequate. Not only are the documents extensive, but also, the entire review period is in the summer when many agencies have employees in and out due to vacations. Also, the same is true for the public at large.

The need to make improvements at LAX is not in question. The extent and type of those improvements is in question. In order to develop the necessary consensus for a project that can be widely supported, the SBCCOG requests that you immediately extend the time period for comments so that the input you receive will be well thought out and meaningful.

We recognize the difficult task of bringing such a large amount of information to the public, but we also believe that more time taken now could speed up the actual implementation of a final project.

Sincerely,

JOHN J. PARSONS

Dear Mr. Ritchie,

On behalf of the South Bay Cities Council of Governments, I want to thank you and your staff for attending our October 23rd Aviation Issues Committee Meeting. The presentation was very informative and we appreciate your staying for the Board meeting to answer questions.

The remodel of LAX is an extremely ambitious project. Our Board members are very interested in understanding the impacts as needed modernization and improvement takes place. This meeting was an opportunity to provide them with accurate and complete information so that our responses to your plans can be helpful to the process.

A meeting after the work day is never an attractive proposition. Please know that the Board is very grateful for your taking the time to make the presentation to us.

Thank you.

Sincerely,

A handwritten signature in cursive script that reads "Jacki Bacharach".

Jacki Bacharach

Subject: Comments on LAX Master Plan EIR/EIS

Dear Mr. Kessler and Mr. Ritchie:

The El Toro Reuse Planning Authority (ETRPA) has consistently disputed two flawed premises frequently used in the SCAG region's aviation forecasting and planning: 1) aviation demand forecasts attributed to Orange County, and the resulting demand/capacity gap in Orange County, and 2) the legitimacy of allocating aviation demand and capacity on the basis of county political boundaries.

The LAX EIR/EIS relies entirely on the 2001 SCAG RTP demand projections for the six-county region. ETRPA has consistently disputed the validity of those projections, especially the assumptions used for Orange County. In 1999 the ratio of passengers per resident in the SCAG region was 5.0<sup>1</sup>. This ratio is very consistent with the ratio for the State of California (5.0) and for the United States as a whole (4.9).<sup>2</sup>

Based on 81.4 million passengers at Los Angeles, Ontario, John Wayne, Burbank, Long Beach, Palm Springs, Palmdale, and Oxnard in 1999 according to the FAA's December 2000 Terminal Area Forecast (TAF).

<sup>2</sup> Calculated from 1999 U.S. Census estimates and 1999 passenger statistics obtained from the TAF.

Based upon the FAA's Terminal Area Forecast and the U.S. Census Bureau's middle series population projections, by 2015 the national ratio of airline

passengers to residents will grow to 7.5. SCAG's regional projections of passengers and population are consistent with this ratio. With the 2001 RTP Medium (2025) Activity at Airports (Table TC-13 of the 2001 SCAG PEIR), the ratio of passengers per resident will be 7.6. With Scenario 8 of the 2001 RTP, the regional ratio will be 7.4 (Table PD-10 and Table PH-16 of the 2001 SCAG PEIR).

The county-by-county variations and projected changes in the ratio of passengers to residents are significant, as shown for Los Angeles and Orange Counties in the following table.

**Annual Airport Passengers per Resident**

	1999	2025 (Medium Activity)	2025 (Scenario 8)
All SCAG Counties	5.0	7.6	7.4
Los Angeles County	7.1	8.3	7.4
Orange County	2.7	9.7	11.1

With Scenario 8 of the 2001 RTP, Orange County would have 50 percent more passengers per resident than the SCAG region as a whole. Even if Orange County were to have a greater propensity to fly than other parts of the region, it would not be reasonable to expect that Orange County would generate 50 percent more air travel per capita than Southern California as a whole.

As shown in the following table, Orange County contains 17 percent of the region's population with only 2 percent of the land area, some of which cannot be developed due to mountainous terrain. Based on Scenario 8 of the 2001 RTP, Orange County would have 15 percent of the regional population and 23 percent of the air passengers.

**SCAG Population Distribution**

County	Area (square miles)	1999 Population	Population per Square Mile
Los Angeles	4,060	9,329,989	2,298
Orange	790	2,760,948	3,495
Riverside	7,208	1,530,653	212
Imperial	4,175	145,287	35
San Bernardino	20,062	1,669,934	83
Ventura	1,846	745,063	404
Total	38,141	16,181,874	424

The RADAM model used in the aviation analysis of SCAG's 2001 RTP PEIR offered almost no information about input or output. For example, no information was provided on which zones within the SCAG region (or outside) the passengers using individual airports are located. This information would allow one to test the logic of the passenger distribution. Although "passenger propensity to fly" is discussed as an important concept to the model, no specific information was provided to support the high propensity to fly in Orange County.

The LAX EIR/EIS recognizes that airlines make service decisions based upon a number of key factors, including the population within a reasonable travel distance and the cost to introduce service at a new airport (LAX Master Plan Addendum, p.1-18). Due to traffic congestion in the SCAG region travel time is used as a better indicator than travel distance. Therefore, the EIR/EIS recognizes that airlines' decisions on which airport(s) to serve are not based on county boundaries but based on the efficiency of ground access and distance from service areas and each airport's catchment area. However, the LAX EIR/EIS continues to use data and analysis which are based upon county political boundaries rather than the catchment area of the existing airports within the region.

Recognizing recent developments, including the impact of the September 11<sup>th</sup> terrorist attacks, the passage of Measure W in Orange County, as well as, increased emphasis on the importance of improved ground access in optimizing the use of existing regional aviation facilities, and the effectiveness of strategic land use and economic policies on maximizing transportation benefits, SCAG has revised its modeling assumptions and parameters which result in a more logical context for regional aviation planning.

These key developments resulting from the SCAG Growth Visioning process have been incorporated in the revised modeling, especially where it relates to regional aviation planning. As directed by the SCAG Aviation Task Force, the new Growth Visioning demographic projections have been incorporated in the regional aviation modeling. The Growth Vision alternative takes a strategic approach to regional land use distribution, which in turn maximizes both transportation and economic benefits. Among its strategies are increased housing opportunities near job centers, increased job opportunities in housing-rich areas, focusing growth along transit corridors, and revitalizing underutilized development sites. The SCAG Growth Vision Alternative puts a special emphasis on ways to support the implementation of a decentralized aviation strategy, by providing substantially improved balance of housing and employment opportunities in suburban locations in the Inland Empire and north Los Angeles County. Additionally, increased employment in manufacturing and goods movement results in higher regional air cargo volumes in areas where aviation capacity in cargo can support such growth.

The LAX Master Plan EIR/EIS makes no reference to this improved approach to demand forecasting and regional aviation planning strategy.

The LAX Master Plan Addendum, Section 1.3.2 references SCAG 2001 RTP aviation demand figures, excluding El Toro and concludes: "As illustrated in Table 1.3-3, the region's airports would have a projected shortfall of approximately 30 MAP." These

figures and ensuing conclusions are entirely in conflict with the most recent SCAG forecasts as approved by the Regional Council. Based on the revised methodology and modeling conducted under the oversight of the SCAG Aviation Task Force, ten (10) Southern California airports (excluding El Toro) will provide a combined 170 MAP capacity with Maglev and 155 MAP capacity without Maglev. The LAX Master Plan EIR/EIS must be revised to include a discussion of the currently employed modeling assumptions and the resulting regional airport capacity figures consistent with SCAG. A number of implementation mechanisms have been suggested by SCAG including those to be undertaken by LAWA. The EIR/EIS makes no reference to these actions which would effectively eliminate a shortfall in the regional aviation capacity.

The LAX Master Plan EIR/EIS offers no discussion of growth forecasts of the Inland Empire and the potential for the Inland Empire airports to absorb the projected regional passenger and cargo demand. During the past two years, the Inland Empire has become increasingly active and vocal in marketing its aviation assets, and there is increased cooperation between Los Angeles and the Inland Empire to better formulate regional solutions. In fact, on October 15, 2003, elected officials and representatives from Los Angeles and Inland Empire held a Press Conference and a Presentation to the Los Angeles City Council to launch a partnership on regional aviation issues. The Press Release stated that elected officials and airport executives from three counties in Southern California announced their "[i]ntention to pursue a working partnership with the City of Los Angeles to implement a regional airport plan with capacity limits at Los Angeles International Airport and that optimizes unused passenger and cargo capacity at existing airports in the Inland Empire."

In addition to the aviation assets in the SCAG region, the San Diego Regional Airport Authority has formed a Public Working Group to actively explore suitable sites for the development of a regional airport in the San Diego area.

Based on the recent developments in the aviation markets and a renewed regional emphasis on strategic land use and transportation policies that support the development of the Inland Empire airports, the LAX Master Plan EIR/EIS must be revised to incorporate regional aviation demand projections and capacity enhancements consistent with the 2004 SCAG RTP.

Sincerely,

Paul D. Eckles  
Executive Director

**Supplement to the Draft Environmental Impact Statement / Report (DEIS/R) for  
the Los Angeles International Airport Proposed Master Plan**

Dear Mr. Kessler:

The South Coast Air Quality Management District (SCAQMD) appreciates the opportunity to comment on the above-mentioned document. The following comments are meant as guidance for the state and federal Lead Agencies and should be incorporated in the Final Environmental Impact Statement / Environmental Impact Report.

Pursuant to Public Resources Code §21092.5, please provide the SCAQMD with written responses to all comments contained herein before the certification of the Final Environmental Impact Report. The SCAQMD would be happy to work with the Lead Agency to address these issues and any other questions that may arise. Please contact Susan Nakamura Planning and Rules Manager at 909.396.3105 if you have any questions regarding these comments.

Sincerely

November 7, 2003

**Supplement to the Draft Environmental Impact Statement /  
Environmental Impact Report (SEIS/R) for the Los Angeles  
International Airport Master Plan**

1. **Construction Emissions Analysis:** The SCAQMD previously submitted a comment letter dated 9/21/01 on the original Draft EIS/R, which noted that it was difficult to recreate construction emission estimates in the associated technical document because the emission estimate tables provided only total emissions without a breakdown of emissions by emissions source i.e., piece of equipment or construction task. The letter requested that a table, for example, be included providing peak daily emissions by emissions source showing equations used, assumptions made, etc. Review of the Draft Supplemental EIS/R (SEIS/R) indicates that this same problem persists. The SCAQMD again requests that this information be provided in the Final EIS/R.
2. **Rock Crushing Emissions:** On page 39 of Appendix S-E it is stated that rock crushing will eliminate some haul truck trips to transport debris offsite and that rock crushing emissions are accounted for in the construction analysis. Since emissions from specific emission sources have not been broken down by equipment or construction task, this statement could not be confirmed.
3. **Exclusion of Architectural Coatings and Asphalt Emission:** On page 3 of Appendix S-E it is stated that the construction analysis does not quantify architectural coating or asphalt emissions. The rationale for excluding architectural coating emissions is that they will be water based coatings. No rationale is given for excluding asphalt emissions. Although it is likely that most architectural coatings will likely be water based coatings by 2005, they are still expected to contain VOCs. If substantial volumes of coatings are applied on a daily basis, to paint the exteriors and interiors of new structures, stripe runways and roadways, etc., VOC emissions could be substantial. Further, architectural coatings applied in remote locations, such as runways, may not have access to electricity and may require generators to supply power to the coating application equipment. Similarly, paving roadways, runways, parking lots, etc., requires heavy-duty equipment to haul asphalt to the site (haul trucks), unload the asphalt (loaders), lay asphalt (asphalt pavers), etc. It is recommended the NEPA/CEQA lead agencies include architectural coating, asphalt, and associated equipment emissions in the analysis of construction emissions.
4. **CARB OFFROAD Model Emission Factors:** Additional clarification is needed to ensure that emission factors from CARB's OFFROAD Model were appropriately applied to construction equipment to calculate emissions. Section 4.6.2.2 Emission Estimates of the Draft SEIS/R indicates on Page 4-538 that emission factors used to estimate construction emission inventories have been updated based on CARB's OFFROAD Model. Appendix D of CARB's OFFROAD model contains emission factors for off-road engines, based on engine

SAR00004

David Kessler

-2-

November 7, 2003

size and model year. These emission factors are not composite emission factors that are representative of all off-road equipment in the year indicated in Appendix D, the emission factors should be used only for the equipment manufactured for that model year. Emission factors presented in CARB's OFFROAD Model, Appendix D can be applied to construction equipment provided, that the equipment is representative of that model year. If the NEPA/CEQA lead agencies intend to use new equipment each year, additional information is needed to clarify how this will be implemented. If, however, the NEPA/CEQA lead agencies will be using a mix of model years for construction equipment, it is recommended that off-road mobile source emissions be calculated using composite emission factors for specified years, which can be obtained by contacting CARB.

5. **Errors in Table S4.6-19:** Footnote 2 of Table S4.6-19 on page 4-393 of the Supplement indicates that the baseline, interim, and horizon year inventories that were originally calculated using EDMS 3.2 have been recalculated for the Draft SEIS/R using EDMS 4.11. It appears, however, that the percent reductions associated with each alternative have not been adjusted to reflect the revised inventories. This apparent discrepancy should be explained or corrected in the Final EIS/R.
6. **Overlapping Phases and Peak Emissions:** Section 4.20.3 on pages 4-539 and 4-540 of the Draft SEIS/R describes the three phases of construction that Alternative D, the preferred Alternative, would go through. It is projected that construction of the Alternative D master plan improvements will start in the 3<sup>rd</sup> quarter of 2004 and end by December 2014. Phase II will commence in 2007, one year before the end of Phase I in 2008. Similarly, Phase III will commence in 2010 one year before Phase II ends. Phase III will end in 2014. It appears therefore that the three phases will overlap one another during different stages of construction. These overlapping construction emissions do not appear to be reflected in the discussion or in the emissions tables. Similarly, the mass daily emission estimates do not appear to consider emissions from early phases of the project that begin operation overlapping with ongoing construction phases. For example, Tables S4.6-9 through S4.6-11 on pages 4-371 through 4-373 of the Supplement present the operational and construction emissions data for each of the project alternatives as discrete non-overlapping phases for 2004, 2005, 2013 and 2015. These tables do not reflect the emissions that will be occurring during the overlapping phases. As a result, emission estimate may underestimate peak day emissions. It is recommended that the NEPA/CEQA lead agencies identify all overlapping phases, both construction and operation, and show the peak daily emissions for each of these overlapping.
7. **Ground Service Equipment:** In Table S4.6-18 on page 4-389 of the Supplement, the lead agency claims that the conversion of the airport's ground service equipment to electric power or fuel cells will reduce NO<sub>x</sub>, VOC and CO emissions by up to 600 tons, 1,900 tons and 2,800 tons respectively per year by 2015. Comparing these emissions reductions to the 2000 emissions inventory in Table S4.6-7 on page 4-368 shows very substantial reductions from the base year.

SAR00004

David Kessler

-3-

November 7, 2003

To achieve these emissions reductions, the lead agency proposes to accelerate full conversion of the ground service equipment fleet through incentives or tenant lease requirements. The lead agency needs to describe some of these incentives and also demonstrate quantitatively how these very substantial emissions can be achieved. Further, on pages 35 and 40 of Appendix S-E, the lead agency refers to the non-binding memorandum of understanding (MOU) signed in December 2002 between California Air Resources Board and the major domestic air carriers to reduce NO<sub>x</sub> emissions from ground service equipment. Since the MOU is non-binding, the lead agency needs to demonstrate how it proposes to achieve those emission reductions and those beyond what is described in the MOU. If documentation already exists elsewhere in the Supplement, relating to how these emission reductions will be achieved, it is suggested that specific reference be made as part of the footnotes to the table to facilitate review.

8. **Ongoing Measures to Improve Air Quality:** Pages 34 through 37 in Appendix S-E list a number of programs, both regulatory and voluntary, implemented by LAWA to improve air quality. The SCAQMD is pleased that LAWA is maintaining its commitment to implement voluntary programs, in particular the energy saving measures, listed on page 36, such as the use of double-paned glass or accousti-glass tempered and shaded windows, high efficiency metal halide lights in parking areas, lighting controls and energy efficient lighting in indoor areas, energy efficient and automated controls for air conditioning, increased wall and ceiling insulation beyond existing regulatory requirements, alternative and low emission vehicles, etc, which could provide substantial air quality benefits. The SCAQMD is pleased that LAWA will be implementing a series of innovative mitigation measures such as incentives for SULEV/ZEV emission engines in commercial vehicles, electrical ground power and preconditioned air systems to existing aircraft at passenger gates, continued conversion of ground support equipment to alternative fuels, and specification of clean-fueled construction equipment to name a few. The SCAQMD also agrees that the NEPA/CEQA lead agencies should continue to implement the mitigation measures in Table S23 beginning on page 41 of Appendix S-E, even though emission reduction control efficiencies are not specifically identified for these measures. In addition, to the programs and mitigation measures identified in the Draft SEIS/R, it is also recommended that the NEPA/CEQA lead agencies also incorporate other programs such as the Leadership in Energy and Environmental Design (LEED) system developed by the U.S. Green Building Council into the list of mitigation measures identified in Table S4.6-18.

Other mitigation measures for consideration by the NEPA/CEQA lead agencies include the following:

- Provide temporary traffic control during all phases of construction activities to improve traffic flow, e.g., flag person;
- Suspend all grading when wind speeds exceed 25 miles per hour;
- Traffic speeds on all unpaved roads should be reduced to 15 miles per hours or less;

SAR00004

David Kessler

-4-

November 7, 2003

- Cover all haul trucks hauling dirt, sand, soil, or other loose materials;
- Sweep streets with AQMD Rule 1186-certified street sweepers whenever visible dust accumulates on roadways;
- Install wheel washers where vehicles enter and exit unpaved roads onto paved roads or wash off trucks and any equipment leaving the site each trip, etc.;
- Investigate using cleaner burning aircraft fuels, perhaps through a pilot program; and
- Use light-colored roofing materials, which reflect sunlight and, therefore, heat away from buildings.

The SCAQMD is willing to work with the NEPA/CEQA lead agencies to develop the above measures and other measures to mitigate air quality impacts from the proposed project.

9. **Control Efficiencies of Mitigation Measures:** The SCAQMD previously commented on the Draft EIS/R that the NEPA/CEQA lead agencies were taking emission reduction credit for programs required by regulation that relied on future approvals, or were voluntary. In response the Draft SEIS/R has removed required or duplicative measures. Further, the NEPA/CEQA lead agencies are no longer claiming emission reduction credit for unquantified or voluntary programs. Table 4.6-16, however, identifies several mitigation measures with associated emission reductions. The Draft SEIS/R does not appear to provide any supporting documentation regarding the methodology used to calculate the range of potential emission reductions, including assumptions, equations, emission factors, specific emission reduction control efficiencies by equipment, the source of the control efficiencies used, etc. The Final EIS/R should provide documentation to support the emission reductions shown in Table 4.6-16. Further, in some cases, emission reductions claimed may overestimate actual emission reductions that may result from applying the mitigation measure. For example, substantial emission reductions are identified for measures related to diesel powered construction equipment, such as catalytic oxidizers, particulate traps with exhaust gas recirculation, use of emulsified diesel fuels, etc. The NEPA/CEQA lead agencies should be aware that, with the exception of catalytic oxidizers certified at a control efficiency of 25 percent, these control technologies have not been certified for use on heavy-duty off-road mobile sources. The NEPA/CEQA lead agencies are encouraged to use these control technologies, but associated emission reductions may not be as great as claimed. Information certified control equipment for mobile sources can be found at the CARB website at the following internet address: <http://www.arb.ca.gov>.
10. **NO<sub>x</sub> to NO<sub>2</sub> Conversion:** Pollutant emissions are expressed as NO<sub>x</sub>, i.e., the sum of NO and NO<sub>2</sub>. However, the ambient air quality standards are for NO<sub>2</sub>. So a method is required to convert the NO<sub>x</sub> emissions into NO<sub>2</sub> concentrations. In the Draft SEIS/R two methods are used to estimate the maximum one-hour NO<sub>2</sub> concentrations, that is, the ozone limiting method (OLM) and the NO<sub>2</sub>/NO<sub>x</sub> ratio method. OLM, as described in Attachment P of Technical Report S-4, is an acceptable method for estimating 1-hour NO<sub>2</sub> impacts to demonstrate compliance

SAR00004

David Kessler

-5-

November 7, 2003

to District Rules. The NO<sub>2</sub>/NO<sub>x</sub> ratio method, as described in Attachment Q of Technical Report S-4, is not an approved method to demonstrate compliance with SCAQMD Rules, in particular modeling requirements contained in SCAQMD Rule 1303. However, the method appears to be reasonable and conservative for the application of determining localized significance for CEQA environmental analyses.

11. **Total One-Hour NO<sub>2</sub> Concentrations:** In Attachment P of Technical Report S-4, it is stated that "the modeled NO<sub>2</sub> concentrations were assumed as the actual NO<sub>2</sub> ambient concentrations." In other words, the project impacts are not added to local background concentrations to determine the total NO<sub>2</sub> concentrations for comparisons to ambient air quality standards. The NO<sub>2</sub> concentrations from the proposed project must be added to the local background NO<sub>2</sub> concentrations and the resulting total concentration compared to the ambient air quality standard to determine project significance. Since the background concentrations are not included, the project impacts are underestimated.
12. **Calm Wind Processing:** Based on the dispersion model input files provided as part of the review package, the calm wind processing option was applied in the model application. This has the effect of excluding many hours of light wind speeds and potentially high concentrations from dispersion modeling. This deviates from SCAQMD modeling procedures, which require that calm wind processing be turned off. The annual concentrations for all pollutants, including the cancer risks and the chronic non-cancer risks, may be underestimated.
13. **Human Health Risk Assessment (HHRA):** Based on the emission speciation profile in the HHRA, it is not clear whether the risk estimates include emissions from the future increase in the number of aircraft landing at LAX. Please clarify whether or not aircraft emissions are included in the HHRA and, if not, it is recommended that the HHRA be revised to include future aircraft emissions.
14. **Health Risk Assessment for Mobile Sources:** Because heavy-duty truck trips do not appear to be specifically identified in the Draft SEIS/R, it is unclear whether or not operational emissions include a substantial increase in the number of heavy-duty truck trips to the airport, especially the container cargo portion of LAX. If there is a substantial increase in future heavy-duty truck trips to LAX, a health risk assessment for mobile sources may be warranted. Guidance for such an analysis can be found on the SCAQMD's CEQA web pages at the following internet address: [http://www.aqmd.gov/ceqa/handbook/diesel\\_analysis.doc](http://www.aqmd.gov/ceqa/handbook/diesel_analysis.doc).
15. **Program EIS/R and Subsequent Projects:** It is understood that the EIS/R is a program document to analyze impacts from a long-term ongoing program to upgrade and enhance security at LAX. Further, it is understood that various components or phases of the proposed project will undergo subsequent project-specific environmental analyses under NEPA and CEQA. Please provide a list of the specific future projects that will undergo environmental analyses so that the SCAQMD can evaluate whether components of the proposed project that are not

SAR00004

David Kessler

-6-

November 7, 2003

specifically analyzed in future documents are adequately analyzed in the program EIS/R.

16. **Toxics Analysis:** The SCAQMD has reviewed the air toxics analysis prepared by the NEPA/CEQA lead agencies and believes that the modeling approach used for the human health risk assessment is not consistent with the FAA's LIDAR study regarding plume heights during jet queuing and taxi periods. The assumed plume heights in the toxics modeling analysis are higher than those observed in the LIDAR study and, therefore, the impacts in the human health risk assessment may be underestimated. The SCAQMD recommends that the toxics analysis be revised to be consistent with the LIDAR study recommendations regarding the effective plume heights of the jet exhaust.

Re: **Comments on the Supplement to the Draft Los Angeles International Airport Master Plan Environmental Impact Statement / Environmental Impact Report and Master Plan Addendum – SCAG No. I 20030374**

Dear Mr. Ritchie:

Thank you for submitting the **Supplement to the Draft Los Angeles International Airport Master Plan Environmental Impact Statement / Environmental Impact Report and Master Plan Addendum** to SCAG for review and comment. As areawide clearinghouse for regionally significant projects, SCAG reviews the consistency of local plans, projects and programs with regional plans. This activity is based on SCAG's responsibilities as a regional planning organization pursuant to state and federal laws and regulations. Guidance provided by these reviews is intended to assist local agencies and project sponsors to take actions that contribute to the attainment of regional goals and policies.

SCAG is a Joint Powers Agency established under California Government Code Section 6502. SCAG is designated as the Metropolitan Planning Organization (MPO) for the greater Los Angeles region including the Los Angeles International Airport service area. SCAG is also the designated Regional Transportation Planning Agency, and as such is responsible for both preparation of the Regional Transportation Plan (RTP) and Regional Transportation Improvement Plan (RTIP) under California Government Code Sections 65080 and 65082 respectively. In terms of project review, SCAG's mandated roles and responsibilities include, but are not limited to, the following:

- SCAG is the authorized regional agency for Inter-Governmental Review of programs proposed for federal financial assistance and direct development activities, pursuant to Presidential Executive Order 12,372 (replacing A-95 Review).
- Pursuant to Public Resources Code Section 21083, SCAG reviews Environmental Impact Reports of projects of regional significance for consistency with regional plans {California Environmental Quality Act Guidelines Sections 15206 and 15125(b)}.

The **Supplement to the Draft Los Angeles International Airport Master Plan Environmental Impact Statement / Environmental Impact Report and Master Plan Addendum** meets SCAG's criteria for classification of a project that is regionally significant. The focus of our review is on the consistency of the project with adopted regional transportation policy, as well as new aviation strategies that have been developed as part of the agency's 2004 RTP.

In general, Los Angeles World Airports (LAWA) is to be applauded for proposing a new LAX master plan alternative (Alternative D) that is generally consistent with SCAG's adopted passenger constraint for LAX of 78 million annual air passengers (MAP). We also commend the new alternative's emphasis on safety and security, and on increased transit usage to reduce airport ground access impacts.

Our response is divided into comments on the Master Plan Addendum (i.e., project description of Alternative D), and comments on the Draft EIS/EIR. They pertain to adopted

SAR00005

November 6, 2003  
Mr. Jim Ritchie  
Page 2

regional policy, as well as issues of regional concern that were previously reviewed by SCAG's Aviation Task Force, Transportation and Communications Committee and Regional Council. Some of the comments specifically relate to the Preferred Draft Regional Aviation Plan and implementation strategy that was approved for release as part of the Draft 2004 Regional Transportation Plan (RTP) by the Transportation and Communications Committee on October 2, 2003.

We recognize that Alternative D was developed well before the Preferred Draft Regional Aviation Plan was approved. However, the comments that relate to our proposed new regional aviation strategy should be considered by LAWA in light of potential future consistency with the 2004 RTP, and opportunities to revise and supplement Alternative D to achieve this consistency. These comments contain recommendations for achieving consistency between the new LAX master plan alternative and SCAG's new Preferred Regional Aviation Plan. To achieve this consistency, we urge LAWA work with SCAG in initiating the formation of a Regional Airport Consortium with other airports in the region. This consortium would coordinate all airport master planning and facility construction consistent with an adopted Regional Aviation Plan. It would also coordinate with the Maglev Joint Powers Authority to ensure seamless Maglev connections to airports, and increase air passenger ridership via Maglev through integrated fares and other market tools. By incorporating these elements from the Preferred Aviation Plan in SCAG's Draft 2004 Regional Transportation Plan, the LAX Master Plan would truly embrace an overall regional approach in a highly proactive manner.

A brief summary of SCAG staff comments includes the following: the Project should include an implementation mechanism to enforce its 78 million annual air passenger limitation; an explicit reference should be made to a potential future Maglev connection; a more proactive approach to implementing a regional aviation strategy should be described, incorporating elements of SCAG's recently issued Preferred Regional Aviation Plan; and cost and funding detail should be included for proposed off-airport ground access mitigation projects.

The project title and SCAG Clearinghouse number should be used in all correspondence with SCAG concerning this project. If you should have any questions, please contact me at (213) 236-1867. Thank you.

Sincerely,

JEFFREY M. SMITH, AICP  
Senior Regional Planner  
Intergovernmental Review

SAR00005

**COMMENTS ON THE SUPPLEMENT TO THE DRAFT  
LOS ANGELES INTERNATIONAL AIRPORT MASTER PLAN  
ENVIRONMENTAL IMPACT STATEMENT / ENVIRONMENTAL IMPACT REPORT  
AND MASTER PLAN ADDENDUM  
SCAG NO I 20030374.**

**A. COMMENTS ON THE LAX MASTER PLAN ADDENDUM/PROJECT DESCRIPTION**

**1. Consistency with Adopted Aviation Plan in 2001 Regional Transportation Plan**

- **Consistency with adopted regional passenger and cargo forecasts:** Alternative D is designed to accommodate 78.9 million annual air passengers (MAP) and 3.1 million tons of air cargo within the forecast period extending to 2015. These figures are generally consistent, but not specifically consistent, with the adopted forecast for LAX of 78.0 MAP and 3.0 million tons of air cargo by 2025 in the adopted aviation plan in SCAG's 2001 Regional Transportation Plan.
- **Implementation of Proposed Capacity Constraint:** The project proposes to maintain the passenger service at LAX to 78.9 MAP by extensively reconfiguring the existing passenger terminals and reducing the number of aircraft gates from the current 163 nominal gates to 153 nominal gates in Alternative D. However, the passenger carrying capacity of any particular terminal configuration cannot be exactly measured, since it is a function of the size of aircraft utilizing the gates and passenger load factors per aircraft. Also, remote aircraft parking positions would be eliminated by the alternative, which could always be reestablished as long as there is apron space to accommodate them. To maintain a 78 MAP constraint at LAX utilizing available gate capacity, an additional legally enforceable implementation mechanism would be needed to keep total passenger activity within the 78 MAP limitation. The mechanism would monitor passenger throughput at established gates, and adjust the number, size and configuration of gates as needed to keep local passenger activity within the 78 MAP limitation.
- **Consistency with adopted regional Maglev strategy:** A key element of the 2001 adopted aviation plan is a proposed regional high-speed rail network utilizing magnetic levitation (Maglev) technology. The proposed Maglev system is a vital component of the plan's decentralization strategy of distributing passengers and cargo to underutilized suburban airports in the Inland Empire and North Los Angeles County. The system enables the region to meet forecast aviation demand and minimize the potential economic loss that could result from having highly constrained and encroached urban airports including LAX. The system forecasts a Maglev connection to LAX from West Los Angeles (with connections from West Los Angeles running east to Ontario Airport, north to Palmdale Airport and south to Orange County), with the segment running down the median of I-405 and turning west along I-105 to access LAX. The segment is planned for completion within the 2010 to 2015 time period, which is within the forecast period for the LAX master plan process. SCAG's proposed Maglev system could provide significant potential mitigation of ground access impacts on local communities around LAX, since about 23% of total LAX passengers are estimated to access the airport via Maglev after a connection to LAX is completed. Maglev is also an essential component of SCAG's regional aviation strategy adopted for the 2001 RTP, and the Preferred Aviation Plan proposed for the Draft 2004 RTP. Alternative D is much more conducive to a potential Maglev connection than previously proposed master

plan alternatives, by virtue of a proposed Intermodal Transfer Center (ITC) to be located north of Imperial Highway and the I-105 freeway, and east of Aviation Boulevard. The ITC will serve as a major transfer center for regional bus serve, and will be connected to a Green Line station located just south of Imperial Highway via an elevated walkway. The ITC is also a logical juncture for connecting with the SCAG's proposed Maglev segment that would follow the I-105 freeway alignment. However, Alternative D is silent on Maglev, and makes no specific mention of a potential Maglev connection to LAX within the forecast period.

## 2. Regional Impact of LAX Master Plan Alternative D

- **Available regional airport capacity:** On page 1-12 of the Master Plan Addendum it should be noted that NAS Point Mugu is no longer available for possible joint use of that facility. On page 1-15 it should be noted that SCAG has updated its estimate of existing available capacity at existing urban air carrier airports in region (i.e., LAX, Burbank, John Wayne and Ontario airports) which totals about 132 MAP. This new figure reflects a recalculation of the runway capacity of Ontario Airport (to 30 MAP) and the recent renewal of John Wayne airport's settlement agreement from 8.4 MAP to 10.8 MAP.
- **Potential of Palmdale Airport:** On page 1-16, recent modeling of SCAG Preferred Aviation Plan for the 2004 indicates that Palmdale Airport has the potential to serve a high level of passenger demand. This modeling allocated 12.8 MAP to Palmdale Airport in 2030, including international demand, given a high-speed Maglev connection and brokering/coordination between LAWA and airlines. Table 1.3-3 should be revised to indicate that Palmdale Airport has more service potential than just a commuter airport within the 2015 time period.
- **Secondary airports:** On page 1-17 it is stated that "A sensitivity analysis conducted by SCAG in 1998 found that if LAX capacity was constrained in an effort to force demand to other regional airports, much of the traffic would relocate to other airports outside the region such as San Francisco, Denver and Dallas rather than to secondary regional airports within the region." This sentence should be qualified by noting that more recent modeling conducted by SCAG with a regional Maglev system assumed indicates that Ontario and Palmdale airports have the potential to serve long-haul and international demand, and help minimize the potential loss of demand to airports outside the region.
- **Concentration of Travel Demand:** Figure 1.3-2, which shows the distribution of domestic O&D passenger demand throughout the region, appears to be in error. The figure shows that most of Orange County generates lower passenger demand per square mile than central Los Angeles County, which conflicts with SCAG regional demand data. The figure should be qualified by saying that it is based on partial data taken from LAX and Ontario O&D surveys.
- **Airline deregulation and competition:** On page 1-26, it should be noted that after the events of September 11, 2001, many passengers now find secondary airports to be much more convenient and easier to access than a primary airport such as LAX. This is the primary reason why passenger growth at secondary airports in the region has largely rebounded over the last two years, as opposed to passenger levels at LAX.

### 3. Alternative D Development and Refinement

- **Design capacity of Alternative D:** On page 2-1 it is stated that "Alternative D would be designed to serve approximately 78 MAP, which is similar to the scenario adopted by SCAG for LAX." It should be noted that the specific activity level that Alternative D would be designed for is 78.9 MAP, not 78.0 MAP.
- **Regional approach of Alternative D:** On page 2-1 it is stated that Alternative D "would be developed to offer a regional development alternative to LAX." It is also stated that "The Alternative D design would encourage other airports in the region to develop facilities to accommodate regional demand beyond the level served by LAX." This language is similar to language on page 1-2 of the Supplemental Draft EIS/EIR (Chapter 1, Introduction) that describes the regional approach inherent in Alternative D: "whereby growth at LAX would be planned so as to place greater pressure on other regional airports to accommodate unmet future air travel demands." Also, on page 2-1 of the Supplemental Draft EIS/EIR (Chapter 2, Purpose and Need for the Proposed Action) it is stated that "Alternative D would respond to future demand for air transportation by encouraging, but not requiring, other airports in the Los Angeles area to increase capacity to make up for the limitations of LAX."

However, nowhere in the Master Plan Addendum or the EIS/EIR is it described how Alternative D would encourage other airports in the region to make up for the limitations of LAX. It is assumed that the design of Alternative D itself would encourage other airports to make appropriate capacity expansions. This is not a regional approach in that it is entirely passive, and does not actively involve other affected airports in the region in its implementation. A much more proactive regional approach is needed (see recommendations in Section C below). It should be noted that the impacts on other airports from the implementation of Alternative D could be significant. For example, Alternative D proposes to reduce the number of narrow body (short haul) aircraft gates from the current 51 to 40. This proposed sharp reduction in short haul capacity at LAX could have a significant impact on nearby urban airports to serve the short-haul market of Los Angeles County, particularly Burbank and Long Beach airports. These airports are as encroached and constrained as LAX, and have limited expansion opportunities.

## B. COMMENTS ON SUPPLEMENTAL TO DRAFT LAX MASTER PLAN EIS/EIR

### 1. Economic Impacts of Alternative D

- **Mitigation costs:** On page 9 of the Supplemental Economic Report, Table S5, the cost of proposed environmental mitigation projects including off-airport ground access improvements should be itemized and added to the total \$7.4 billion estimate for construction of Alternative D facilities and improvements.
- **Total economic impact:** On page 12, Table S10, it shows that the total economic output impact of Alternative D only exceeds that of the No Action/No Project Alternative by \$32 million. This is a very meager return on the \$7.4 billion estimated to construct Alternative D, not including mitigation projects. It is suggested that this section should include the non-quantifiable benefits that would accrue from implementing Alternative D, including its safety

and security benefits. Opportunity costs should also be identified, including projects at other LAWA-owned airports that could be funded if Alternative D was scaled down to a lesser expense.

## 2. Off-airport Ground Access Improvements

- **Cost data:** Alternative D has significantly lower estimated ground access impacts compared to previously proposed master plan alternatives. This is mainly because it is designed for a lower service level (i.e., 78 MAP) and places a markedly greater emphasis on transit access through the planning of an off-airport intermodal transfer center and five new off-airport FlyAway facilities (i.e., park-and-ride facilities for air passengers). However, significant off-airport ground access projects would still be needed to mitigate forecast traffic impacts, as listed in Technical Report 2b (Off-airport Surface Transportation). These include a new freeway interchange at I-405 and Lennox Boulevard, new freeway ramps off I-105 between Aviation Boulevard and La Cienega Boulevard, and a variety of intersection improvements and upgraded signal systems.

However, there is no cost or funding detail, including estimated costs and potential funding sources, accompanying these proposed mitigation projects, including the proposed new Flyaway facilities. This detail is necessary for the projects to be included in SCAG's 2004 RTP financial plan, and future Regional Transportation Improvement Plans (RTIPs). Without identification of their costs and funding sources, these projects are not enforceable as mitigation strategies. A schedule for the implementation of these projects is also needed, including time needed to plan, engineer, clear and construct each project within the 2015 horizon. As previously noted, the implementation of SCAG's inter-regional Maglev system with a connection to LAX could provide significant potential mitigation of airport ground access impacts on local communities around LAX, since it would carry about 23% of total LAX passengers.

- **Fair share contributions:** Report 2b states that "fair-share financial contributions to regional highway improvements and/or regional transit improvements will mitigate 17 intersections." The amount of these "fair share" contributions should be specified, and the mechanism for implementing this funding arrangement should be defined.

## C. CONCLUSIONS AND RECOMMENDATIONS

1. The proposed LAX master plan project (Alternative D) is generally consistent, but not specifically consistent, with the SCAG's adopted regional forecast for LAX.
  2. Alternative D would be held to about 78 MAP through passenger terminal reconfigurations and a reduction in the overall number of aircraft gates. To maintain a 78 MAP constraint at LAX utilizing available gate capacity, an additional legally enforceable implementation mechanism should be developed.
- Alternative D is more compatible than previously proposed LAX master plan alternatives with a proposed Maglev high-speed rail connection to LAX, planned for the 2010-2015 time period in SCAG's adopted regional Maglev strategy. The implementation of SCAG's inter-regional Maglev system with a connection to LAX could provide significant potential mitigation of airport ground access impacts on local communities around LAX, since it would

carry about 23% of total LAX passengers. Maglev is also an essential component of SCAG's regional aviation strategy adopted for the 2001 RTP, and the Preferred Aviation Plan proposed for the Draft 2004 RTP. However, the project description for Alternative D is silent on Maglev, and does not specifically mention or address a potential Maglev connection. An appropriate discussion of such a potential connection should be included in the final Master Plan Addendum and EIS/EIR.

3. The project description for Alternative D outlines a proposed regional approach that would encourage alternate airports in the region to develop their capacities to accommodate regional demand that cannot be served at LAX. However, no description is given of any active approach to encourage these airports to take appropriate actions to enhance their capacities. Alternate urban airports in the region such as Burbank and Long Beach are as constrained and encroached as LAX, and have very limited expansion opportunities.
4. SCAG's Draft 2004 Regional Transportation Plan proposes a Preferred Regional Aviation Plan that does contain a proactive regional approach to establishing increased coordination between LAX and alternate airports in the region. It is recommended that elements of the Preferred Regional Aviation Plan in the SCAG's Draft 2004 RTP be considered for inclusion in the Final LAX Master Plan and EIS/EIR. Elements of the decentralization strategy in this plan include:
  - Methods to increase Maglev passenger ridership to suburban airports, such as integrated pricing that would combine airfares with Maglev fares.
  - A wider range of flight offerings made available at suburban airports including Palmdale and Ontario airports. More point-to-point long haul and international service was assumed, using a new generation of highly efficient aircraft. Attractive financial packages would be offered to airlines to induce them to initiate and expand service at suburban airports. Airline "brokering" would also be implemented, to achieve coordination between airlines and between airlines and airports to achieve the greatest service efficiencies in combination with the provision of high-speed Maglev access to suburban airports.
  - LAWA would play a key role in implementing the plan by integrating master planning and brokering service between LAX, Palmdale and Ontario airports. It would also enter into contractual agreements and memoranda of understanding with other airports in the region, to establish a common framework for coordinating all airport master planning and facility construction consistent with an adopted Regional Aviation Plan.
  - Based on these contractual agreements and memoranda of understanding, an airport consortium would be formed that would define complementary roles and market niches between all airports in the regional system.
  - An implementation plan that outlines the basic steps and timeline for implementing the Preferred Regional Aviation Plan.
5. The economic impacts of Alternative D, compared to the No Project/No Action Alternative, totals only \$32 million. This is a very meager return on the estimated \$7.4 billion facility cost of Alternative D, that do not including the cost of mitigation projects. More justification should be included in support of this expenditure, including non-quantifiable benefits.

Opportunity costs should also be identified, including projects at other LAWA-owned airports that could be funded if Alternative D was scaled down to a lesser expense.

6. No cost or funding detail is included in the estimated costs and potential funding sources for off-airport ground access mitigation projects. Such detail should be included in the final master plan and EIR/EIS documents, since it is necessary for these projects to be included in SCAG's 2004 RTP Financial Plan and future Regional Transportation Improvement Plans (RTIPS) so that they can be enforceable as mitigation strategies.
7. All feasible measures needed to mitigate any potentially negative regional impacts associated with the proposed project should be implemented and monitored, as required by CEQA.

## SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS

### *Roles and Authorities*

**THE SOUTHERN CALIFORNIA ASSOCIATION OF GOVERNMENTS (SCAG)** is a **Joint Powers Agency** established under California Government Code Section 6502 et seq. Under federal and state law, SCAG is designated as a Council of Governments (COG), a Regional Transportation Planning Agency (RTPA), and a Metropolitan Planning Organization (MPO). SCAG's mandated roles and responsibilities include the following:

SCAG is designated by the federal government as the Region's **Metropolitan Planning Organization** and mandated to maintain a continuing, cooperative, and comprehensive transportation planning process resulting in a Regional Transportation Plan and a Regional Transportation Improvement Program pursuant to 23 U.S.C. '134, 49 U.S.C. '5301 et seq., 23 C.F.R. '450, and 49 C.F.R. '613. SCAG is also the designated **Regional Transportation Planning Agency**, and as such is responsible for both preparation of the Regional Transportation Plan (RTP) and Regional Transportation Improvement Program (RTIP) under California Government Code Section 65080 and 65082 respectively.

SCAG is responsible for developing the demographic projections and the integrated land use, housing, employment, and transportation programs, measures, and strategies portions of the **South Coast Air Quality Management Plan**, pursuant to California Health and Safety Code Section 40460(b)-(c). SCAG is also designated under 42 U.S.C. '7504(a) as a **Co-Lead Agency** for air quality planning for the Central Coast and Southeast Desert Air Basin District.

SCAG is responsible under the Federal Clean Air Act for determining **Conformity** of Projects, Plans and Programs to the State Implementation Plan, pursuant to 42 U.S.C. '7506.

Pursuant to California Government Code Section 65089.2, SCAG is responsible for **reviewing all Congestion Management Plans (CMPs) for consistency with regional transportation plans** required by Section 65080 of the Government Code. SCAG must also evaluate the consistency and compatibility of such programs within the region.

SCAG is the authorized regional agency for **Inter-Governmental Review** of Programs proposed for federal financial assistance and direct development activities, pursuant to Presidential Executive Order 12,372 (replacing A-95 Review).

SCAG reviews, pursuant to Public Resources Code Sections 21083 and 21087, Environmental Impacts Reports of projects of regional significance for consistency with regional plans [California Environmental Quality Act Guidelines Sections 15206 and 15125(b)].

Pursuant to 33 U.S.C. '1288(a)(2) (Section 208 of the Federal Water Pollution Control Act), SCAG is the authorized **Areawide Waste Treatment Management Planning Agency**.

SCAG is responsible for preparation of the **Regional Housing Needs Assessment**, pursuant to California Government Code Section 65584(a).

SCAG is responsible (with the Association of Bay Area Governments, the Sacramento Area Council of Governments, and the Association of Monterey Bay Area Governments) for preparing the **Southern California Hazardous Waste Management Plan** pursuant to California Health and Safety Code Section 25135.3.

**Re: SBCCOG Comments Regarding the Draft Supplemental EIS/EIR for the LAX Master Plan**

The South Bay Cities Council of Governments (SBCCOG) has reviewed the Draft Supplemental EIS/EIR for the LAX Master Plan. We have concerns about a variety of issues that are enumerated in the attachment to this letter. Our conclusion is that the document is inadequate to understand the full scope of impacts to ground access surrounding the airport, to the communities adjacent to the airport and in the flight path and to demonstrating enhanced safety and security from the development of Alternative D.

Our overriding concern is that Alternative D will not constrain capacity at LAX. We join with those who want a binding agreement to limit the airport's growth at 78 MAP.

We understand that LAX needs enhanced security and modernization. We do not oppose these goals. However, we want to be assured that the safeguards delineated in the plan are realistic and achievable and that additional mitigations are considered.

We look forward to your response to our comments.

Sincerely,

A handwritten signature in black ink that reads "John Parsons" with a small "dc" written below it.

John Parsons  
Chair, SBCCOG  
Councilman, Redondo Beach

## **Comments by South Bay Cities Council of Governments**

The comments that follow are divided into two sections. One representing the EIR/EIS process and the other focusing on the proposed design of the airport modernization. First however, we address our principal concern which is the size of the facility.

### **1. Limiting the capacity of LAX to 78 MAP**

The overriding issue for the SBCCOG is limiting the capacity of LAX to 78 million annual passengers. This can be accomplished using LAWA's ability to control the development of the facilities there. If this doesn't happen, then all other assumptions, analysis and conclusions in the documents are invalid since they depend upon the assertion that LAX will not serve more than 78 million annual passengers.

The SBCCOG is appreciative of Mayor Hahn's desire to limit the capacity at the airport to 78 MAP. Unfortunately, an aggressive strategy to implement a regional approach is not included in Alternative D and the intention to constrain airport growth to 78 MAP might not survive into the future. Alternative D alone will not necessarily constrain growth at LAX. Therefore, we support the efforts of the City of El Segundo and others to develop a binding agreement that limits facilities at LAX to assure its capacity will not exceed 78 MAP and we offer our support for actions that will encourage the development of a system of truly regional airports and support services.

### **2. Supplemental EIR Is Not In Compliance With CEQA**

The SBCCOG has concluded that the Alternative D project should have been reviewed through the preparation of a subsequent EIS/EIR. This would have provided the full record of information and potential impact since 2001.

The proposed Alternative D is a substantial change to the airport's configuration with a significant impact on all areas in, at and near the facility. The new central terminal area, a major automated people mover system (train), major new facilities near the freeways, new traffic patterns and a new intermodal transportation center are just some of the changes that will impact airport operations.

### **3. Baseline Year Not Adequate Or Consistent**

The Baseline Year of 1996 is not adequate for a 2003 assessment. In addition, it appears that there has been an update of the baseline year in those instances where new practices, e.g., the implementation of Stage III noise mitigation measures, have reduced impacts. This raises the question of not only inconsistent baseline years, but also whether those areas where the impacts might have gotten worse have been intentionally left out.

#### 4. Assumes All Proposed Projects Will Be Completed

SBCCOG shares the concerns expressed by others that the Supplemental Draft should acknowledge that some of the planned mitigations may not be implemented or even feasible. Measures such as the construction of an off ramp at the 405 Freeway and Lennox Boulevard, improvements adjacent to the Marina Freeway and numerous local traffic signal coordination and intersection improvements do not have assured funding. Given the budget situation, especially at the State level, it is a risky assumption to conclude that funding will remain available from traditional sources. Available revenue sources should be more clearly defined and conceptual approval for identified improvements should be obtained by the appropriate agencies before feasibility can be assured.

#### 5. Safety and Security at the Airport

The main purpose for the changes proposed in Alternative D has been presented as a way to enhance security at the airport. The SBCCOG is not convinced that the measures proposed will achieve this goal. SBCCOG shares the concerns expressed in the independent RAND Corporation study of the security measures proposed in the Plan which found that the proposed changes would not increase security compared to the current LAX configuration.

Planned centralized functions such as passenger check-in create a single point of possible disruption that would be more catastrophic than the current decentralized LAX terminal configuration. The same holds true for the proposed People Mover

Alternative D focuses on security of public entry to the airport terminal, but only lightly treats "backdoor" entry by the hundreds of vehicles (primarily trucks) required on airport property for aircraft services, maintenance/fuel farm, and cargo activities.

The realignment of the innermost runway north of the airport (24L) and the new location for the Rental Car facility at the end of that runway are also of concern. In light of the fact that past LAX runway incursions appear associated with causes other than runway configuration, SBCCOG asks that LAWA explain the reason for the proposed changes to the runway as well as the major causes for past runway incursions. While SBCCOG does not have the expertise to fully evaluate these safety issues, we remain concerned over the disagreements that have been expressed by those who do have such knowledge.

#### 6. Ground Access To And From The Facilities

Under Alternative D, traffic patterns will change on the freeways and on South Bay arterial streets. While the Draft Supplement states that drivers will be inclined to remain on the freeway for longer periods of time to get to the airport, moving the major vehicle transportation centers closer to the freeways will serve to add to the congestion on those freeways. The I-405 and I-105 freeways are already congested during both peak and non-peak hours and the construction of new freeway to airport interchanges which are included as mitigation measures will not address the freeway congestion that exists today and will only be worse in the future.

Furthermore, because of the freeway congestion, it is erroneous to think that drivers won't seek relief on arterial streets. Analysis of the changes proposed does not include the impact of the freeway congestion on the arterials and how the additional traffic coming to the new passenger processing locations will be mitigated. It is not clear that new off ramps and enhanced local traffic signal coordination and intersection improvements will provide the mitigation required and no other highway improvements are included. The SBCCOG is concerned that additional mitigation measures that are fully funded need to be identified to mitigate airport related traffic in the South Bay.

Because of the significant effect of freeway congestion on arterials, the SBCCOG has recently completed the I-405 Arterial Improvements Initiative. This study identified improvements to the Manchester/Florence/La Cienega access and egress to the I-405 which the SBCCOG believes should be included in the airport ground access mitigation since traffic in this area will be further exacerbated as passengers leave the freeway to access the airport. We formally request that the projects identified in this analysis – all relatively low cost yet extremely beneficial to traffic flow on and off the freeway – be added to the project mitigations.

Additionally, system preservation and pavement maintenance costs need to be included for the added traffic to major boulevards accessing the new terminals.

#### 7. Green Line Extensions

The Metro Green Line is an important transportation artery for the South Bay. SBCCOG would like the airport to ensure that no improvements made under Alternative D preclude any future extensions to the Green Line going further into the South Bay and to the North.

Additionally, more attention should be given to the final placement of the Green Line as an airport feeder. The route should be more clearly delineated. Minimally, the costs for the Green Line routing design and preliminary engineering should be included as part of the implementation of the Master Plan project.

#### 8. Noise

The Supplemental Draft EIS/EIR indicates that aircraft noise impacts will be significant, affecting 2,250 residents, 780 dwellings, 5 schools, 3 churches, 2 hospitals, and 3 parks. Additionally, new larger aircraft that the airport is being designed to accommodate will be louder affecting a wider area.

The SBCCOG is concerned that noise impacts not be shifted from one community to another. Furthermore, more attention should be given to single event noise. The single events are very disturbing to the affected areas and mitigation measures should extend to them. And, areas farther afield from the airport site, such as the Beach cities and Palos Verdes Peninsula experience noise impacts now. The report does not address impacts to these communities under the new plan.

The Automated People Mover (APM) operation will impose undesirable noise on all 10 existing hotels in the Century Boulevard/98<sup>th</sup> Street area. The draft EIS/EIR does not define how the noise from the high activity APM (about 2 passages per minute) will be mitigated.

Also, the documentation in the report appears to credit road traffic noise reductions that will come from increased congestion. This is an unacceptable noise mitigation measure.

#### 9. Cost

The cost of this project is very large for the benefit to the public. It will be extremely important that funds not run out before all of the mitigations can be put in place.

Also, significant off-airport ground access projects are identified to mitigate forecasted traffic impacts yet there is no cost or funding detail including estimated costs for identified projects, both within the South Bay and for the proposed new Flyaway facilities. Potential funding sources also need to be identified.

The SBCCOG further wants to be sure that the transportation mitigations called for do not use regional transportation funds that have been dedicated for other purposes (e.g. MTA Call for Projects) and do not modify funding priorities that have been established.

And, since the plan is to be funded through airport revenues, it does not appear to take into account the disruption that will be caused by construction on revenues that the airport generates, therefore calling into question the integrity of the funding plan through airport fees and charges.

#### 10. Impacts to Local Communities

As an organization of South Bay city governments, we are extremely concerned about the impacts to local schools, homes and other institutions. Air quality impacts of increased congestion and activity in and around the airport are also important. Furthermore, most of the negative impacts do not significantly affect the greater City of Los Angeles area except Westchester and Playa Del Rey. Most of the adverse impacts are to the south and east affecting many of the smaller cities and numerous school districts.

Additionally, the report shows no sensitivity to urban renewal, smart growth and redevelopment potentials in the Coastal Corridor areas.

SBCCOG believes that this plan is lacking in measures to minimize the adverse impacts to local communities outside the City of Los Angeles and what providing benefits to those same communities.

**Re: Request for an Extension of the Comment Deadline for the Supplement to the Los Angeles International Airport Master Plan Draft Environmental Impact Statement/Draft Environmental Impact Report**

Dear Messrs. Kessler and Ritchie:

On behalf of the City of El Segundo, I hereby request an extension of the deadline for public comments on the Supplement to the Los Angeles International Airport Master Plan Draft Environmental Impact Statement/Draft Environmental Impact Report (hereinafter "SDEIS/DEIR"). Public comments on the SDEIS/DEIR are currently due on August 25, 2003. The City of El Segundo requests that the due date be extended to November 6, 2003. This would give the public a total of 120 days from the July 9, 2003 release date in which to prepare comments on the SDEIS/DEIR.

This extension is warranted due to the voluminous nature of the SDEIS/DEIR as well as the magnitude and complexity of the environmental impacts associated with the Master Plan. Additionally, please note that we have experienced some delay in obtaining a paper copy of the SDEIS/DEIR for review. Although we ordered a paper copy of the SDEIS/DEIR immediately when its availability was announced, we did not receive it until today, nearly two weeks after the availability announcement.

Jim Ritchie, Deputy Executive Director  
Los Angeles World Airports  
1 World Way  
P.O. Box 92216  
Los Angeles, CA 90009-2216

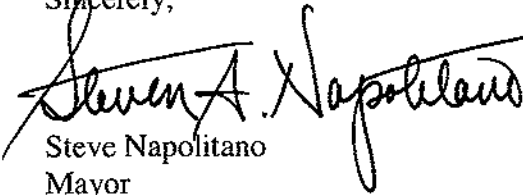

Dear Mr. Ritchie:

The City of Manhattan Beach has received the Supplement to the Draft EIS/EIR for the proposed master plan development of LAX. Due to the fact that we are within such close proximity to the airport and have such a potential for impacts to our community, we are vitally interested in any proposed expansion plan. To that end, the City Council has authorized me to write urging that LAWA approve a 90-day comment period on this supplement to the draft EIR/EIS.

The completed document is very large and complex and as such, we do not feel it is appropriate to expect that interested persons could review the material and have sufficient time to offer informed comment. It is our belief that all parties would benefit from an expanded comment period. Interested parties, such as the City of Manhattan Beach, need sufficient time to review the document thoroughly and comment on items of significance to our residents. In addition, all of the public hearings that have been set are scheduled for the month of August, a month when vacations normally occur, meaning many interested parties may not be available to attend these valuable hearings.

In closing, we urge strongly that LAWA approve a 90-day comment period for the Supplemental LAX Master Plan EIR/EIS. We appreciate your consideration of our request.

Sincerely,

  
Steve Napolitano  
Mayor

**RE: LOS ANGELES WORLD AIRPORTS MASTERPLAN ENVIRONMENTAL IMPACT REPORT**

Dear Mr. Ritchie:

Thank you for the opportunity to comment on the above-referenced environmental document. The Cultural Heritage Commission is concerned that the two locally designated buildings on airport property, namely the Airport Theme Building and Hangar Number One, have their building fabric and view sheds preserved in the Masterplan. The draft document correctly identifies and acknowledges these resources and the Commission looks forward to a successful completion of the LAWA Masterplan.

Very truly yours,

Jay Oren, Architect

The Honorable Board of Supervisors  
County of Los Angeles  
383 Kenneth Hahn Hall of Administration  
500 West Temple Street  
Los Angeles, CA 90012

Dear Supervisors:

**PRELIMINARY COMMENTS ON DRAFT SUPPLEMENTAL ENVIRONMENTAL IMPACT  
STATEMENT/SUPPLEMENTAL ENVIRONMENTAL IMPACT REPORT FOR PROPOSED  
MASTER PLAN IMPROVEMENTS AT LAX  
(ALL DISTRICTS AFFECTED) (3 VOTES)**

**IT IS RECOMMENDED THAT YOUR BOARD:**

1. Approve preliminary comments on the Draft Supplemental Environmental Impact Statement/Supplemental Environmental Impact Report (SEIS/SEIR) prepared for the Safety and Security Alternative for the Proposed Master Plan Improvements at Los Angeles International Airport (LAX); and authorize County staff and A.C. Lazzaretto & Associates to present preliminary comments at Los Angeles World Airports (LAWA) and Federal Aviation Administration (FAA) sponsored public hearings.

**PURPOSE/JUSTIFICATION OF RECOMMENDED ACTION**

The purpose of this recommended action is to accept the attached preliminary comments from A.C. Lazzaretto & Associates (Attachment I) and the Department of Public Works (Attachment II) as the County's initial response to the Draft SEIS/SEIR and present them at public hearings scheduled for August 20 through 23, 2003 (Attachment III is a list of currently scheduled hearings). Submission of the County's preliminary comments allows for concerns and suggestions detailed in the preliminary comments to be addressed by LAWA and the FAA.

**Implementation of Strategic Plan Goals**

These recommendations are consistent with the following Strategic Plan Goal:

**Goal:** **Organizational Effectiveness:** Ensure that service delivery systems are efficient, effective, and goal-oriented.

Honorable Board of Supervisors  
August 19, 2003  
Page 2

The County is seeking to ensure that any air service expansion plan is environmentally, economically, and socially beneficial to the residents of Los Angeles County.

### **FISCAL IMPACT/FINANCING**

Not applicable.

### **FACTS AND PROVISIONS/LEGAL REQUIREMENTS**

On July 10, 2001, your Board approved the final report on the Draft EIS/EIR for the Proposed Master Plan Improvements at LAX submitted by A.C. Lazzaretto & Associates as the County's official comments on the Draft EIS/EIR. Due to the events of September 11, 2001, newly elected Los Angeles Mayor James Hahn directed LAWA to develop a new alternative focused on safety and security. On January 21, 2003, your Board instructed this office to negotiate a delegated authority contract with A.C. Lazzaretto & Associates to conduct a review and analysis of the anticipated Draft SEIS/SEIR for the new alternative.

On July 9, 2003, the Draft SEIS/SEIR for the Safety and Security Alternative to the Proposed Master Plan Improvements (Alternative D) was released and a public review and comment period commenced. The Airport Commission recently extended the review and comment period from 45 days to 120 days.

On July 15, 2003, this office entered into agreement with A.C. Lazzaretto & Associates to conduct the requested review. The consultant has assembled a team of environmental and security experts to review the documents for consistency and accuracy, with special attention to the major areas of noise, traffic, security, air and water, and environmental justice. Consistent with their contract, the consultant is presenting preliminary comments to your Board on the Draft SEIS/SEIR. The Department of Public Works is also submitting preliminary comments on traffic impacts which have been coordinated with A.C. Lazzaretto & Associates. Final comments will be presented for Board approval within a time frame to allow for presentation at additional hearings anticipated to being set prior to the comment period deadline on November 7, 2003.

The following is a summary of preliminary comments from A.C. Lazzaretto & Associates and the Department of Public Works regarding the Draft SEIS/SEIR:

- The proposed Master Plan Alternative D may not constrain growth at LAX.
- Airport security may not be fully achieved by Alternative D.
- Environmental Justice may not be well served by Alternative D.
- The Baseline Year of 1996 is not adequate for a 2003 assessment.

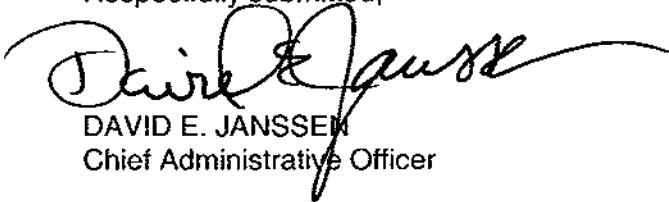

Honorable Board of Supervisors  
August 19, 2003  
Page 3

- The No Project Alternative does not offer a consistent yardstick for measuring project impacts.
- Traffic, noise, and air quality impacts have been shifted eastward.
- Major changes in the project may call for preparation of a subsequent EIR.
- Growth-inducing impacts may be significantly greater than stated.
- A new interchange for the I-405 Freeway at Lennox Blvd is recommended if Alternative D is chosen.
- Document is lacking in mitigation measures due to inadequate analysis/information of traffic/transportation projects, enhancements, and improvements.

**IMPACT ON CURRENT SERVICES**

This action will not have a direct impact on County services.

Respectfully submitted,

DAVID E. JANSSEN  
Chief Administrative Officer

**A Preliminary Review of Issues Associated with the  
LAX Master Plan Supplemental Draft EIS/EIR**

*Prepared for the Los Angeles County Board of Supervisors  
by A.C. Lazzaretto and Associates  
11 August 2003*

---

**INTRODUCTION**

The Federal Aviation Administration (FAA) and Los Angeles World Airports (LAWA) made available for public comment in early 2001 a Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) addressing three build alternatives, a no-build alternative, and the existing setting for the Los Angeles International Airport (LAX) Master Plan. In response to considerable public comment and the terrorist attacks that occurred on September 11, 2001, a fourth alternative -- Alternative D, the Enhanced Safety and Security Plan -- has been added to the LAX Master Plan. A Supplemental EIS/EIR was made available for public comment in July of 2003 to update information presented in the Draft EIS/EIR and to integrate Alternative D into the environmental review process.

Alternative D includes a number of airfield facility modifications. Although LAX would continue to operate with 4 runways, 2 of the existing runways would be moved, two would be lengthened, and all would be further separated from one another. The existing parking structures would be relocated and replaced by new centralized passenger terminals. The existing Terminals 1 through 7 would be reconfigured, including a new north/south linear concourse at the Tom Bradley International Terminal, flanked on the west by a new satellite concourse. A new ground transportation center and intermodal transportation center to be built east of Aviation Blvd. would serve as the primary access for all passenger drop-off and pick-up and vehicle parking. Some cargo facilities would be modified, although overall square footage would be equivalent to the No Action/No Project Alternative.

A brief preliminary review of the Supplemental EIS/EIR for the LAX Master Plan has been conducted to assess changes between the Draft and Supplemental EIS/EIR, consistency of information within the documents, and accuracy of the Supplemental EIS/EIR. The initial review points to several issues requiring further comment and discussion.

One of these issues was central to County comments on the earlier LAX Master Plan review, and remains an area of potential concern for the current document: although LAWA indicates that its goal is to limit growth, improvements proposed as part of Alternative D would in reality serve to reinforce LAX as the preeminent airport of the southern California region, and may undermine attempts to strengthen the role of outlying airports. In addition to this thematic concern, there are a number of additional points that merit further consideration. The preliminary findings are outlined briefly in the discussion below.

**DISCUSSION**

**1. The Proposed Master Plan Alternative D May Not Constrain Growth at LAX**

The stated goal of Alternative D is to limit growth at LAX to 78 Million Annual Passengers (MAP) and induce growth at other regional airports. The primary means to accomplish this is to limit aircraft gates to 153 which is the same number of gates that exist in the No Project Alternative (NPA). However, the NPA includes 48 remote gates

that are simply aircraft parking spaces on concrete. Alternative D provides 153 fully functional and high capacity gates and does not remove the concrete which will remain available for aircraft parking. The true number of gates is therefore over 200. Furthermore, the design of the new gates is a linear configuration as opposed to the existing cul-de-sac configuration. The linear configuration is more flexible and has more capacity. Also, space in the western portion of the airport will remain available for future consideration of a new west terminal, as proposed in Alternatives A, B and C. Therefore, the gate limitation is not an effective constraint on passenger levels.

Alternative D includes other improvements that would support growth beyond the 78 MAP level. In particular, the new remote terminal in the Manchester Square area provides 6.5 million square feet of terminal space -- more that 50% greater than the 4 million square feet proposed in the 98 MAP Alternatives A, B and C. Further, many of the proposed improvements to the north airfield are designed to accommodate the new generation of larger aircraft.

Orientation of new LAX facilities to the new larger aircraft could have long-term, pervasive effects. Because the new larger aircraft require many smaller connecting flights to fill its 600 seats, these improvements will strengthen the "confluence of connections" that reinforce LAX as the preeminent airport of the southern California region, and at the same time reduce the incentive for airlines to utilize other regional facilities. A true constraint on the growth of LAX would be to make it inhospitable towards the new larger aircraft, coupled with improvements to serve new larger aircraft at another regional airport, and transit links to join the two facilities.

**2. Airport Security May Not be Fully Achieved by Alternative D**

Preliminary review suggests that the Supplemental EIS/EIR may fall short of an adequate review of airport security issues. Although the Executive Summary to the Addendum refers the reader to Appendix I '*for a detailed assessment of the security and safety features of Alternative D,*' Appendix I offers a heavily conceptual and theoretical document that falls significantly short on detail. Anomalies include contradictory content and a lack of clarity expected of a public information document.

**3. Environmental Justice May Not be Well Served by Alternative D**

Presidential Executive Order 12898, issued in February 1994, requires all federal agencies to analyze environmental justice impacts when proposing public projects. The analysis is intended to determine whether minority and low-income communities are unfairly burdened by project impacts, with the goal of using mitigation measures to create a level playing field. In 1999, Senate Bill 115 was passed making environmental justice a requirement of CEQA as well.

Despite the importance of this subject, the original Draft EIS/EIR was found to lack even the most elementary NEPA requirements for environmental justice. Preliminary review suggests that the Supplemental EIS/EIR has corrected some but not all of the earlier deficiencies. In particular, the Supplemental EIS/EIR again limits the area of analysis (reviewing only those census tracts surrounding LAX), improperly omits assessment of many effects due to the preparers' inability to quantify or analyze the impacts, and defers a determination of significance pending completion of the mitigation program.

The assessment does not appear to consider the trade-offs between environmental protection and environmental justice pertaining to the placement and length of LAX runways: runway extension to the west would have significant adverse impacts on biological resources (particularly the El Segundo Blue Butterfly), but would serve environmental justice through a significant lessening of noise, air quality and traffic impacts on Lennox, Inglewood and other disadvantaged communities around LAX. Nor does the assessment apply rigorous standards in assessing the proportionality of impacts and mitigation measures between the wealthier northside area and communities east of LAX including Lennox and Inglewood. These relevant issues require further review as part of the Supplemental EIS/EIR.

**4. The Baseline Year of 1996 is Not Adequate for a 2003 Impact Assessment**

It appears that the Supplemental Draft EIS/EIR continues to use 1996 data to establish baseline conditions for a number of topical issues. This outdated reference point was considered inadequate for the original EIS/EIR, and remains unsuitable for use in the current Supplemental EIS/EIR.

**5. The No Project Alternative Does Not Offer a Consistent Yardstick for Measuring Project Impacts**

The original EIS/EIR provided an incomplete discussion of the No Project Alternative by incorporating improvements that were then only in the "planning stages" and overstating the service levels and capacity of the existing facilities. This approach made it difficult to draw meaningful comparisons with project alternatives. Preliminary review indicates that the Supplemental EIS/EIR may also provide an incomplete picture of impacts associated with the No Project Alternative. In particular, the Supplemental EIS/EIR appears to substantially overstate passenger and cargo handling capacity under the no-build scenario, while understating both for the build scenarios.

Additionally, the No Project Alternative has not represented passenger capacity in a consistent manner. In the original 1997 Notice of Preparation, the No Project Alternative was linked to a range of 68-72 MAP whereas the 2001 and 2003 EIS/EIR documents increased this estimate to 71.2-78.7 MAP. Based on communications provided by LAWA at the Environmental Justice Workshop held in Inglewood, the increase between 1997 and 2001 reflected actual increases in passenger demand during that period. However, there was no equivalent adjustment for the period from 2001-2003, when passenger demand has fallen by almost one-third.

The Supplemental EIS/EIR states that the No Project Alternative is provided as a benchmark for comparison of the four build alternatives. However, use of a higher baseline passenger number minimizes the extent of the difference between existing and future conditions at LAX, which in turn affects comparative impact assessments throughout the EIS/EIR. Use of a *worst-case scenario*, in which the baseline was based on a low estimate of existing passenger demand, would have better served the goals of CEQA and NEPA, and given a more realistic picture of the changes between current and future conditions at LAX. The County believes that LAWA should revisit key impact findings in light of actual 2003 passenger demand, instead of the estimates developed for 2001.

**6. Traffic, Noise and Air Quality Impacts have been Shifted Eastward**

The revised Master Plan represents a major shift of improvements away from neighboring areas north and south of LAX and toward communities to the east. The unincorporated community of Lennox and the City of Inglewood now appear to bear the

brunt of added traffic, while Manchester will be the primary location for passenger processing. This shift heightens the need for close scrutiny of the proposed mitigation plan and the analysis of Environmental Justice.

#### **7. Major Changes in the Project Call for Preparation of a Subsequent EIS/EIR**

CEQA Guidelines require that a Subsequent EIR for a project must be completed if the Lead Agency determines that changes in a project will require major revisions to the previous EIR; a Supplemental EIR may be prepared if the changes in the proposed project are not considered major (§15162(a)). Both Subsequent and Supplemental EIRs are subject to the same notice and public review requirements as the original EIR, but Subsequent EIRs must make available all the information in the environmental evaluation, whereas Supplemental EIRs only need circulate new or revised information.

Preliminary review of the Supplemental EIS/EIR indicates that changes to the proposed project are major. Thus, the project should have been addressed through preparation of a Subsequent EIS/EIR in which the full record of information was consolidated in an effort to facilitate public review.

Public review and lead agency decision-making would also have been better served by providing copies of the comment letters submitted during public review of the original EIS/EIR. Instead, the Supplemental EIS/EIR makes no effort to present or even summarize the earlier comment letters. This approach creates a process that is confusing and cumbersome for reviewing agencies and organizations, and thwarts an opportunity to advance public participation.

#### **8. Growth-Inducing Impacts May Be Significantly Greater than Stated**

The Supplemental EIS/EIR bases its analysis of growth inducement on projected cargo and passenger activity. It concludes that by 2015, Alternative D would yield a direct economic output of \$63.7 billion and 350,500 jobs, plus an indirect economic output of \$93.8 billion and 629,000 jobs through a multiplier effect of 1.5. The EIS/EIR assumes that all of the jobs would be within the 5-County SCAG region, 78% of the jobs would be within a 20-mile radius, and 40% within a 10-mile radius of LAX. Finally, it concludes that Alternative D would be similar in terms of job formation to the No Action/No Project Alternative, differing by an increase of about 1%. With respect to collateral development, the EIS/EIR finds Alternative D impacts equivalent to the No Project Alternative for LAX Northside<sup>1</sup>, Westchester Southside and Belford, and less than the No Project Alternative for Continental City and Manchester South.

In taking this approach, the document ignores the synergistic effects that would result if LAX Northside is constructed in tandem with the LAX improvements. The increase in cargo will create corresponding increases in off-airport services and place extraordinary pressures on commercial and residential land uses in the immediate neighborhood. The Growth-Inducing Analysis does not appear to address these more localized impacts at all, even though the past history of LAX shows them to be potentially significant.

---

<sup>1</sup> LAX Northside is approximately 330-acres of land located on the north side of LAX (bisected by Westchester Parkway) and owned by LAWA. Tentative Map #34836, approved for this site during the mid-1980s, would allow development of about 4.5 million square feet of office, hotel, restaurant, retail, research and airport-related land uses.

LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS

LAX MASTER PLAN DRAFT EIS/EIR  
COMMENTS FOR ON-AIRPORT AND OFF-AIRPORT SURFACE TRANSPORTATION  
JULY 2003

The supplement to the Draft EIS/EIR serves to integrate Alternative D into the existing environmental review process for the LAX Master Plan, providing a level of analysis comparable to that which was previously prepared for the other alternatives addressed in the January 2001 Draft EIS/EIR.

Under the new plan, the projected passenger activity in the planning year of 2015 is 78.9 million annual passengers (MAP), which is reduced from the previous alternatives. The 78.9 MAP would be substantially the same as the No Action/No Project alternative and the passenger ground access trips would also be similar to the No Action/No Project alternative.

Alternative D, also known as "The Enhanced Safety and Security Plan," is in response to public comments received during the review period for the Draft EIS/EIR in January 2001. Its lower MAP aims to encourage a long-term regional approach to serving air traffic demand in the Los Angeles basin. The lowered MAP is designed to encourage other airports to accommodate future air travel demand in the region. The report indicates Alternative D would enhance security by limiting access by private vehicles to the main airport infrastructure to reduce the risk to airport users.

Alternative D significantly changes surface transportation access to LAX. Vehicular access is planned on the east and south sides of airport property via La Cienega Boulevard and the I-105 Freeway/Imperial Highway, respectively. Public Works staff conceived and advanced a proposal for new interchange for the I-405 Freeway at Lennox Boulevard and install a cul-de-sac on Lennox Boulevard just east of the freeway. The interchange would provide direct access between the I-405 Freeway and LAX. It would help mitigate the traffic impact at several intersections in the unincorporated Lennox community, reduce the amount of airport-related traffic in the Lennox community, and significantly reduce the travel time for airport-related traffic. Public Works coordinated the proposal with Supervisorial Districts 2 and 4 and presented it to the Lennox Coordinating Council. The Board offices and the Lennox Coordinating Council strongly support the new interchange for the I-405 Freeway at Lennox Boulevard should Alternative D be chosen for LAX.

The following comments are generic and apply to various mitigation measures recommended in the Draft EIS/EIR:

The document indicated mitigation measures may include fair-share contributions to certain projects, such as the Marina Expressway (SR 90) Connector Road to Admiralty Way project. The document should indicate which transportation projects have committed funds programmed and which projects, such as the SR 90 project, have not yet completed the EIR process and have not been funded.

The document should indicate that if a transportation project does not get approved and constructed, mitigation may not be feasible and the LAX Master Plan would have to be approved by overriding considerations.

The document should indicate that the Lincoln Corridor Task Force (LCTF) is studying transportation enhancements and aesthetic improvements along the Lincoln Boulevard corridor from the Santa Monica Freeway to Manchester Boulevard. It should indicate that the LAX project should pay its fair share of traffic mitigation measures recommended by the LCTF in order to mitigate project impacts that are not otherwise able to be mitigated.

A traffic impact analysis was not conducted per the Caltrans Guide for the Preparation for the Traffic Impact Studies. The Guide indicates that a traffic impact study should be performed when a project adds one or more vehicle trips during the peak hour for a freeway segment that is operating at level of service (LOS) E or F.

The following comments pertain to specific information pertaining to traffic and transportation in the Draft EIS/EIR:

#### Executive Summary

4-282 At the intersection of Lincoln Boulevard/Washington Boulevard, improvements for 2015 indicates mitigation is performed in 2008. The County's Marina Expressway (SR 90) Connector Road to Admiralty Way project is targeted for completion in 2011, pending approval by all jurisdictions and funds (\$15 million) are in place. A footnote should be placed by this and all other transportation projects specified as mitigation not approved and funded.

4-288 The document states "Y Lennox Boulevard will terminate east of I-405 at Redfern Avenue, resulting in the elimination of access to Lennox Boulevard from La Cienega Boulevard." It should state that pedestrian access between Lennox Boulevard and La Cienega Boulevard will be maintained and sufficient right of way will be made available for community needs in the vicinity.

4-290 The document indicates signal synchronization (ATSAC, ATCS, or equivalent) for segments of La Cienega Boulevard in the County's jurisdiction is recommended as

a mitigation. Since the County does not participate in the City of Los Angeles= ATSAC program, the possible traffic signal synchronization improvements should be to integrate the intersections into the County Traffic Control System (TCS) as part of the Traffic Management Center (TMC).

4-293 We agree with the statement "Along the northbound side of I-405 near Lennox Boulevard, elevated roadways would extend from the I-405 interchange to Lennox Boulevard. These roadways would run adjacent to two local schools and along residences. Sound walls would need to be placed along these stretches of the roadway to reduce the amount of noise impact to the schools and residences."

#### Technical Report S-2a: On-Airport Surface Transportation

11 The capacity for main access roads (Century Boulevard and Sepulveda Boulevard) assumed in the study of 1,500 to 1,700 vehicles per hour per lane (vphpl) appears to be high. HCM 2000 (page 10-10) suggests around 1,140 for these types of roadways which are classified as Class I Urban Streets. For transitions from main access roads to curb approaches, a capacity of approximately 850 vphpl is suggested in HCM 2000. The capacities for other road types appear to be on the high side as well. Justifications for these capacity assumptions should be provided or reduced to a more realistic capacities suggested in HCM 2000.

#### Technical Report 2b: Off-Airport Surface Transportation

4 Figure S1 shows the study area and key study locations. Figure S4 shows increase in traffic due to the airport expansion project along Lincoln Boulevard and La Cienega Boulevard, north of the I-405. Also, traffic in the Lincoln Boulevard corridor uses Admiralty Way as an alternate to Lincoln Boulevard. Approximately 35 to 40 percent of traffic on Admiralty Way is bypass traffic, some of which is from Lincoln Boulevard. Therefore, the traffic analysis should include all the intersections along Admiralty Way and the Washington Boulevard/Via Marina intersection. In addition, the following intersections in the unincorporated Baldwin Hills area should be analyzed:

- La Cienega Boulevard at Stocker Street
- La Cienega Boulevard at Slauson Avenue ramps
- Stocker Street at La Brea Avenue
- Slauson Avenue at La Brea Avenue

30 Figure S3, Differences in LAX Passenger Trips B 2015 PM Peak Hour B Alternative D B Adjusted Environmental Baseline, shows decrease in traffic along Pershing Drive with the project. This does not make sense since employee parking structure for 12,400 stalls is proposed east of Pershing Drive north of Imperial Hwy. There should be an increase in airport traffic due to the proposed parking structure.

- 35 Additional Fly-Away sites are proposed and assumed in the traffic impact analysis. Specific locations should be identified and some level of commitment must be made to ensure these additional sites will be implemented. It should also state that a separate environmental impact analysis will be conducted for any additional sites.
- 36 Sufficient capacity should be provided for the intersection of the ITC and GTC connector road and the new access road proposed with the Lennox Boulevard/I-405 interchange. Free right-turn lanes should be provided to ensure sufficient turning movement capacity. The level of service should be conducted to ensure that adequate capacity exists.
- 47 Project fair share estimates for the impacted Congestion Management Program (CMP) routes and intersections are based on the growth between 1996 (Environmental Baseline) and 2015. This seems inconsistent with the impact analysis since the project impact was evaluated based on comparing to the 2015 Adjusted Environmental Baseline.
- 62 The haul and detour routes for any airport construction near the unincorporated areas should also be submitted to the County of Los Angeles Department of Public Works for review.

Dear Mr.  Ritchie:

Enclosed is a copy of a recent news article from the June 12, 2003 Argonaut titled "Airport will build taxiway before LAX master plan okayed because of FAA pressure, LAX officials says."

In an effort to dispel community concerns that the airport is attempting fragmented development outside of the master plan, I would appreciate copies of correspondence from the Federal Aviation Administration (FAA) to support this action.

As always, your assistance is appreciated.

Sincerely,

DON KNABE  
Chairman Pro-Tem

**LAX:  
Airport will build taxiway before  
LAX master plan okayed because  
of FAA pressure, LAX official says**

BY HELGA CARR

Los Angeles International Airport (LAX) officials won't wait for approval of a new LAX master plan before building a new center taxiway at the airport.

Pressure from the Federal Aviation Administration concerning LAX runway incursions is cited as the reason LAX officials will build the center taxiway before the LAX master plan is approved.

airport deputy director of long-term planning Jim Ritchie told a group of community members formed by Los Angeles Councilwoman Cindy Miskowski to learn about the LAX master plan.

Ritchie said the center taxiway would be built as an airport improvement project with federal funds of approximately \$240 to \$280 million.

Mayor James Hahn is sched-

uled to release his proposed LAX master plan Alternative D this month. The proposed Hahn alternative will have nine public hearings, Ritchie said.

The LAX master plan may not be approved by the federal government or by the Los Angeles City Council, so the taxiway will be a stand-alone project with a separate plan and environmental study, Ritchie said.

## ATTACHMENT II

## LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS

**LAX MASTER PLAN DRAFT EIS/EIR  
COMMENTS FOR ON-AIRPORT AND OFF-AIRPORT SURFACE TRANSPORTATION  
JULY 2003**

The supplement to the Draft EIS/EIR serves to integrate Alternative D into the existing environmental review process for the LAX Master Plan, providing a level of analysis comparable to that which was previously prepared for the other alternatives addressed in the January 2001 Draft EIS/EIR.

Under the new plan, the projected passenger activity in the planning year of 2015 is 78.9 million annual passengers (MAP), which is reduced from the previous alternatives. The 78.9 MAP would be substantially the same as the No Action/No Project alternative and the passenger ground access trips would also be similar to the No Action/No Project alternative.

Alternative D, also known as "The Enhanced Safety and Security Plan," is in response to public comments received during the review period for the Draft EIS/EIR in January 2001. Its lower MAP aims to encourage a long-term regional approach to serving air traffic demand in the Los Angeles basin. The lowered MAP is designed to encourage other airports to accommodate future air travel demand in the region. The report indicates Alternative D would enhance security by limiting access by private vehicles to the main airport infrastructure to reduce the risk to airport users.

Alternative D significantly changes surface transportation access to LAX. Vehicular access is planned on the east and south sides of airport property via La Cienega Boulevard and the I-105 Freeway/Imperial Highway, respectively. Public Works staff conceived and advanced a proposal for new interchange for the I-405 Freeway at Lennox Boulevard and install a cul-de-sac on Lennox Boulevard just east of the freeway. The interchange would provide direct access between the I-405 Freeway and LAX. It would help mitigate the traffic impact at several intersections in the unincorporated Lennox community, reduce the amount of airport-related traffic in the Lennox community, and significantly reduce the travel time for airport-related traffic. Public Works coordinated the proposal with Supervisorial Districts 2 and 4 and presented it to the Lennox Coordinating Council. The Board offices and the Lennox Coordinating Council strongly support the new interchange for the I-405 Freeway at Lennox Boulevard should Alternative D be chosen for LAX.

LAX Master Plan Draft EIS/EIR  
July 24, 2003  
Page 2

The following comments are generic and apply to various mitigation measures recommended in the Draft EIS/EIR:

The document indicated mitigation measures may include fair-share contributions to certain projects, such as the Marina Expressway (SR 90) Connector Road to Admiralty Way project. The document should indicate which transportation projects have committed funds programmed and which projects, such as the SR 90 project, have not yet completed the EIR process and have not been funded.

The document should indicate that if a transportation project does not get approved and constructed, mitigation may not be feasible and the LAX Master Plan would have to be approved by overriding considerations.

The document should indicate that the Lincoln Corridor Task Force (LCTF) is studying transportation enhancements and aesthetic improvements along the Lincoln Boulevard corridor from the Santa Monica Freeway to Manchester Boulevard. It should indicate that the LAX project should pay its fair share of traffic mitigation measures recommended by the LCTF in order to mitigate project impacts that are not otherwise able to be mitigated.

A traffic impact analysis was not conducted per the Caltrans Guide for the Preparation for the Traffic Impact Studies. The Guide indicates that a traffic impact study should be performed when a project adds one or more vehicle trips during the peak hour for a freeway segment that is operating at level of service (LOS) E or F.

The following comments pertain to specific information pertaining to traffic and transportation in the Draft EIS/EIR:

#### Executive Summary

4-282 At the intersection of Lincoln Boulevard/Washington Boulevard, Improvements for 2015 indicates mitigation is performed in 2008. The County's Marina Expressway (SR 90) Connector Road to Admiralty Way project is targeted for completion in 2011, pending approval by all jurisdictions and funds (\$15 million) are in place. A footnote should be placed by this and all other transportation projects specified as mitigation not approved and funded.

4-288 The document states "Y Lennox Boulevard will terminate east of I-405 at Redfern Avenue, resulting in the elimination of access to Lennox Boulevard from La Cienega Boulevard." It should state that pedestrian access between Lennox Boulevard and La Cienega Boulevard will be maintained and sufficient right of way will be made available for community needs in the vicinity.

4-290 The document indicates signal synchronization (ATSAC, ATCS, or equivalent) for segments of La Cienega Boulevard in the County's jurisdiction is recommended as

LAX Master Plan Draft EIS/EIR  
 July 24, 2003  
 Page 3

a mitigation. Since the County does not participate in the City of Los Angeles=ATSAC program, the possible traffic signal synchronization improvements should be to integrate the intersections into the County Traffic Control System (TCS) as part of the Traffic Management Center (TMC).

- 4-293 We agree with the statement "Along the northbound side of I-405 near Lennox Boulevard, elevated roadways would extend from the I-405 interchange to Lennox Boulevard. These roadways would run adjacent to two local schools and along residences. Sound walls would need to be placed along these stretches of the roadway to reduce the amount of noise impact to the schools and residences."

#### Technical Report S-2a: On-Airport Surface Transportation

- 11 The capacity for main access roads (Century Boulevard and Sepulveda Boulevard) assumed in the study of 1,500 to 1,700 vehicles per hour per lane (vphpl) appears to be high. HCM 2000 (page 10-10) suggests around 1,140 for these types of roadways which are classified as Class I Urban Streets. For transitions from main access roads to curb approaches, a capacity of approximately 850 vphpl is suggested in HCM 2000. The capacities for other road types appear to be on the high side as well. Justifications for these capacity assumptions should be provided or reduced to a more realistic capacities suggested in HCM 2000.

#### Technical Report 2b: Off-Airport Surface Transportation

- 4 Figure S1 shows the study area and key study locations. Figure S4 shows increase in traffic due to the airport expansion project along Lincoln Boulevard and La Cienega Boulevard, north of the I-405. Also, traffic in the Lincoln Boulevard corridor uses Admiralty Way as an alternate to Lincoln Boulevard. Approximately 35 to 40 percent of traffic on Admiralty Way is bypass traffic, some of which is from Lincoln Boulevard. Therefore, the traffic analysis should include all the intersections along Admiralty Way and the Washington Boulevard/Via Marina intersection. In addition, the following intersections in the unincorporated Baldwin Hills area should be analyzed:

- La Cienega Boulevard at Stocker Street
- La Cienega Boulevard at Slauson Avenue ramps
- Stocker Street at La Brea Avenue
- Slauson Avenue at La Brea Avenue

- 30 Figure S3, Differences in LAX Passenger Trips B 2015 PM Peak Hour B Alternative D B Adjusted Environmental Baseline, shows decrease in traffic along Pershing Drive with the project. This does not make sense since employee parking structure for 12,400 stalls is proposed east of Pershing Drive north of Imperial Hwy. There should be an increase in airport traffic due to the proposed parking structure.

LAX Master Plan Draft EIS/EIR  
July 24, 2003  
Page 4

- 35 Additional Fly-Away sites are proposed and assumed in the traffic impact analysis. Specific locations should be identified and some level of commitment must be made to ensure these additional sites will be implemented. It should also state that a separate environmental impact analysis will be conducted for any additional sites.
- 36 Sufficient capacity should be provided for the intersection of the ITC and GTC connector road and the new access road proposed with the Lennox Boulevard/I-405 interchange. Free right-turn lanes should be provided to ensure sufficient turning movement capacity. The level of service should be conducted to ensure that adequate capacity exists.
- 47 Project fair share estimates for the impacted Congestion Management Program (CMP) routes and intersections are based on the growth between 1996 (Environmental Baseline) and 2015. This seems inconsistent with the impact analysis since the project impact was evaluated based on comparing to the 2015 Adjusted Environmental Baseline.
- 62 The haul and detour routes for any airport construction near the unincorporated areas should also be submitted to the County of Los Angeles Department of Public Works for review.

Dear Mr. Ritchie:

**COUNTY OF LOS ANGELES BOARD OF SUPERVISORS: PRELIMINARY  
COMMENTS ON LAX MASTER PLAN DRAFT SUPPLEMENTAL EIS/EIR**

On behalf of the Los Angeles County Board of Supervisors, I am submitting preliminary comments on the Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (Supplemental Draft EIS/EIR) for the Los Angeles International Airport Master Plan. The Board of Supervisors approved these comments for submission at their meeting of August 19, 2003. In addition, Board Chair Yvonne Brathwaite Burke and Supervisor Don Knabe along with representatives of the County's airport consultants, A. C. Lazzaretto and Associates, will appear at the public hearing scheduled for August 23, 2003, to verbally enter the Board of Supervisors' comments into the record.

The Board of Supervisors commends Mayor Hahn and the Board of Airport Commissioners for their decision to extend the public comment period on the Supplemental Draft EIS/EIR to November 7, 2003. The County of Los Angeles reserves the right to augment and/or supercede any of the comments transmitted herewith prior to the close of the public comment period.

Sincerely,

DAVID E. JANSSEN  
Chief Administrative Officer

# **A Preliminary Review of Issues Associated with the LAX Master Plan Supplement to the Draft EIS/EIR**

*Prepared for the Los Angeles County Board of Supervisors  
by A.C. Lazzaretto and Associates  
August 2003*

---

## **INTRODUCTION**

The Federal Aviation Administration (FAA) and Los Angeles World Airports (LAWA) made available for public comment in early 2001 a Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) addressing three build alternatives, a no-build alternative, and the existing setting for the Los Angeles International Airport (LAX) Master Plan. In response to considerable public comment and the terrorist attacks that occurred on September 11, 2001, a fourth alternative -- Alternative D, the Enhanced Safety and Security Plan -- has been added to the LAX Master Plan. A Supplement to the Draft EIS/EIR was made available for public comment in July of 2003 to update information presented in the Draft EIS/EIR and to integrate Alternative D into the environmental review process.

Alternative D includes a number of airfield facility modifications. Although LAX would continue to operate with 4 runways, 2 of the existing runways would be moved, two would be lengthened, and all would be further separated from one another. The existing parking structures would be relocated and replaced by new centralized passenger terminals. The existing Terminals 1 through 7 would be reconfigured, including a new north/south linear concourse at the Tom Bradley International Terminal, flanked on the west by a new satellite concourse. A new ground transportation center and intermodal transportation center to be built east of Aviation Blvd. would serve as the primary access for all passenger drop-off and pick-up and vehicle parking. Some cargo facilities would be modified, although overall square footage would be equivalent to the No Action/No Project Alternative.

A brief preliminary review has been conducted to assess changes between the original Draft EIS/EIR and the 2003 Supplement to the Draft EIS/EIR for the LAX Master Plan, as well as consistency and accuracy of information within the documents. The initial review points to several issues requiring further comment and discussion.

One of these issues was central to County comments on the earlier LAX Master Plan review, and remains an area of potential concern for the current document: although LAWA indicates that its goal is to limit growth, improvements proposed as part of Alternative D would in reality serve to reinforce LAX as the preeminent airport of the southern California region, and may undermine attempts to strengthen the role of outlying airports. In addition to this thematic concern, there are a number of additional points that merit further consideration. The preliminary findings are outlined briefly in the discussion below.

## **DISCUSSION**

### **1. The Proposed Master Plan Alternative D May Not Constrain Growth at LAX**

The stated goal of Alternative D is to limit growth at LAX to 78 Million Annual Passengers (MAP) and induce growth at other regional airports. The primary means to accomplish this is to limit aircraft gates to 153 which is the same number of gates that exist in the No Project Alternative (NPA). However, the NPA includes 48 remote gates that are simply aircraft parking spaces on concrete. Alternative D provides 153 fully

functional and high capacity gates and does not remove the concrete which will remain available for aircraft parking. The true number of gates is therefore over 200. Furthermore, the design of the new gates is a linear configuration as opposed to the existing cul-de-sac configuration. The linear configuration is more flexible and has more capacity. Also, space in the western portion of the airport will remain available for future consideration of a new west terminal, as proposed in Alternatives A, B and C. Therefore, the gate limitation is not an effective constraint on passenger levels.

Alternative D includes other improvements that would support growth beyond the 78 MAP level. In particular, the new remote terminal in the Manchester Square area provides 6.5 million square feet of terminal space -- more than 50% greater than the 4 million square feet proposed in the 98 MAP Alternatives A, B and C. Further, many of the proposed improvements to the north airfield are designed to accommodate the new generation of larger aircraft.

Orientation of new LAX facilities to the new larger aircraft could have long-term, pervasive effects. Because the new larger aircraft require many smaller connecting flights to fill its 600 seats, these improvements will strengthen the "confluence of connections" that reinforce LAX as the preeminent airport of the southern California region, and at the same time reduce the incentive for airlines to utilize other regional facilities. A true constraint on the growth of LAX would be to make it inhospitable towards the new larger aircraft, coupled with improvements to serve new larger aircraft at another regional airport, and transit links to join the two facilities.

## **2. Airport Security May Not be Fully Achieved by Alternative D**

Preliminary review suggests that the Supplement to the Draft EIS/EIR may fall short of an adequate review of airport security issues. Although the Executive Summary to the Addendum refers the reader to Appendix I 'for a detailed assessment of the security and safety features of Alternative D,' Appendix I offers a heavily conceptual and theoretical document that falls significantly short on detail. Anomalies include contradictory content and a lack of clarity expected of a public information document.

## **3. Environmental Justice May Not be Well Served by Alternative D**

Presidential Executive Order 12898, issued in February 1994, requires all federal agencies to analyze environmental justice impacts when proposing public projects. The analysis is intended to determine whether minority and low-income communities are unfairly burdened by project impacts, with the goal of using mitigation measures to create a level playing field. In 1999, Senate Bill 115 was passed making environmental justice a requirement of CEQA as well.

Despite the importance of this subject, the original Draft EIS/EIR was found to lack even the most elementary NEPA requirements for environmental justice. Preliminary review suggests that the Supplement to the Draft EIS/EIR has corrected some but not all of the earlier deficiencies. In particular, the Supplement to the Draft EIS/EIR again limits the area of analysis (reviewing only those census tracts surrounding LAX), improperly omits assessment of many effects due to the preparers' inability to quantify or analyze the impacts, and defers a determination of significance pending completion of the mitigation program.

The assessment does not appear to consider the trade-offs between environmental protection and environmental justice pertaining to the placement and length of LAX runways: runway extension to the west would have significant adverse impacts on biological resources (particularly the El Segundo Blue Butterfly), but would serve

environmental justice through a significant lessening of noise, air quality and traffic impacts on Lennox, Inglewood and other disadvantaged communities around LAX. Nor does the assessment apply rigorous standards in assessing the proportionality of impacts and mitigation measures between the wealthier northside area and communities east of LAX including Lennox and Inglewood. These relevant issues require further review as part of the Supplement to the Draft EIS/EIR.

#### **4. The Baseline Year of 1996 is Not Adequate for a 2003 Impact Assessment**

It appears that the Supplement to the Draft EIS/EIR continues to use 1996 data to establish baseline conditions for a number of topical issues. This outdated reference point was considered inadequate for the original EIS/EIR, and remains unsuitable for use in the current Supplement to the Draft EIS/EIR.

#### **5. The No Project Alternative does not offer a Consistent Yardstick for Measuring Project Impacts**

The original EIS/EIR provided an incomplete discussion of the No Project Alternative by incorporating improvements that were then only in the "planning stages" and overstating the service levels and capacity of the existing facilities. This approach made it difficult to draw meaningful comparisons with project alternatives. Preliminary review indicates that the Supplement to the Draft EIS/EIR may also provide an incomplete picture of impacts associated with the No Project Alternative. In particular, the Supplement to the Draft EIS/EIR appears to substantially overstate passenger and cargo handling capacity under the no-build scenario, while understating both for the build scenarios.

Additionally, the No Project Alternative has not represented passenger capacity in a consistent manner. In the original 1997 Notice of Preparation, the No Project Alternative was linked to a range of 68-72 MAP whereas the 2001 and 2003 EIS/EIR documents increased this estimate to 71.2-78.7 MAP. Based on communications provided by LAWA at the Environmental Justice Workshop held in Inglewood, the increase between 1997 and 2001 reflected actual increases in passenger demand during that period. However, there was no equivalent adjustment for the period from 2001-2003, when passenger demand has fallen by almost one-third.

The Supplement to the Draft EIS/EIR states that the No Project Alternative is provided as a benchmark for comparison of the four build alternatives. However, use of a higher baseline passenger number minimizes the extent of the difference between existing and future conditions at LAX, which in turn affects comparative impact assessments throughout the EIS/EIR. Use of a *worst-case scenario*, in which the baseline was based on a low estimate of existing passenger demand, would have better served the goals of CEQA and NEPA, and given a more realistic picture of the changes between current and future conditions at LAX. The County believes that LAWA should revisit key impact findings in light of actual 2003 passenger demand, instead of the estimates developed for 2001.

#### **6. Traffic, Noise and Air Quality Impacts have been Shifted Eastward**

The revised Master Plan represents a major shift of improvements away from neighboring areas north and south of LAX and toward communities to the east. The unincorporated community of Lennox and the City of Inglewood now appear to bear the brunt of added traffic, while Manchester will be the primary location for passenger processing. This shift heightens the need for close scrutiny of the proposed mitigation plan and the analysis of Environmental Justice.

**7. Major Changes in the Project Call for Preparation of a Comprehensive Revised Draft EIS/EIR**

CEQA Guidelines require that a Subsequent EIR for a project must be completed if the Lead Agency determines that changes in a project will require major revisions to a previous EIR; a Supplement to an EIR may be prepared if changes in the project are not considered major (§15162(a)). Both Subsequent and Supplemental EIRs are subject to the same notice and public review requirements as the original EIR, but Subsequent EIRs must make available all the information in the environmental evaluation, whereas Supplemental EIRs only need circulate new or revised information. Discussion provided in the CEQA Guidelines indicates that both types of review are intended for use in connection with *previously certified or approved* environmental documents.

In the present case, there is no previously certified or approved document. Furthermore, preliminary review of the Supplement to the Draft EIS/EIR indicates that changes to the proposed project are major. Thus, even an adaptation of the Guidelines (i.e., to encompass a document that has *not* been previously certified or approved) would indicate the project should have been addressed through preparation of a comprehensive revised Draft EIS/EIR, in which the full record of information was consolidated in an effort to facilitate public review.

Public review and lead agency decision-making would also have been better served by providing copies of the comment letters submitted during public review of the original EIS/EIR. Instead, the Supplement to the Draft EIS/EIR makes no effort to present or even summarize the earlier comment letters. This approach creates a process that is confusing and cumbersome for reviewing agencies and organizations, and thwarts an opportunity to advance public participation.

**8. Growth-Inducing Impacts May Be Significantly Greater than Stated**

The Supplement to the Draft EIS/EIR bases its analysis of growth inducement on projected cargo and passenger activity. It concludes that by 2015, Alternative D would yield a direct economic output of \$63.7 billion and 350,500 jobs, plus an indirect economic output of \$93.8 billion and 629,000 jobs through a multiplier effect of 1.5. The EIS/EIR assumes that all of the jobs would be within the 5-County SCAG region, 78% of the jobs would be within a 20-mile radius, and 40% within a 10-mile radius of LAX. Finally, it concludes that Alternative D would be similar in terms of job formation to the No Action/No Project Alternative, differing by an increase of about 1%. With respect to collateral development, the EIS/EIR finds Alternative D impacts equivalent to the No Project Alternative for LAX Northside<sup>1</sup>, Westchester Southside and Belford, and less than the No Project Alternative for Continental City and Manchester South.

In taking this approach, the document ignores the cumulative synergistic effects that would result if LAX Northside is constructed in tandem with the LAX improvements. The increase in cargo will create corresponding increases in off-airport services and place extraordinary pressures on commercial and residential land uses in the immediate neighborhood. The Growth-Inducing Impact Analysis does not appear to address these more localized impacts at all, even though the past history of LAX shows them to be potentially significant.

---

<sup>1</sup> LAX Northside is approximately 330-acres of land located on the north side of LAX (bisected by Westchester Parkway) and owned by LAWA. Tentative Map #34836, approved for this site during the mid-1980s, would allow development of about 4.5 million square feet of office, hotel, restaurant, retail, research and airport-related land uses.

**LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS**

**LAX MASTER PLAN DRAFT EIS/EIR  
COMMENTS FOR ON-AIRPORT AND OFF-AIRPORT SURFACE TRANSPORTATION  
JULY 2003**

The supplement to the Draft EIS/EIR serves to integrate Alternative D into the existing environmental review process for the LAX Master Plan, providing a level of analysis comparable to that which was previously prepared for the other alternatives addressed in the January 2001 Draft EIS/EIR.

Under the new plan, the projected passenger activity in the planning year of 2015 is 78.9 million annual passengers (MAP), which is reduced from the previous alternatives. The 78.9 MAP would be substantially the same as the No Action/No Project alternative and the passenger ground access trips would also be similar to the No Action/No Project alternative.

Alternative D, also known as "The Enhanced Safety and Security Plan," is in response to public comments received during the review period for the Draft EIS/EIR in January 2001. Its lower MAP aims to encourage a long-term regional approach to serving air traffic demand in the Los Angeles basin. The lowered MAP is designed to encourage other airports to accommodate future air travel demand in the region. The report indicates Alternative D would enhance security by limiting access by private vehicles to the main airport infrastructure to reduce the risk to airport users.

Alternative D significantly changes surface transportation access to LAX. Vehicular access is planned on the east and south sides of airport property via La Cienega Boulevard and the I-105 Freeway/Imperial Highway, respectively. Public Works staff conceived and advanced a proposal for new interchange for the I-405 Freeway at Lennox Boulevard and install a cul-de-sac on Lennox Boulevard just east of the freeway. The interchange would provide direct access between the I-405 Freeway and LAX. It would help mitigate the traffic impact at several intersections in the unincorporated Lennox community, reduce the amount of airport-related traffic in the Lennox community, and significantly reduce the travel time for airport-related traffic. Public Works coordinated the proposal with Supervisorial Districts 2 and 4 and presented it to the Lennox Coordinating Council. The Board offices and the Lennox Coordinating Council strongly support the new interchange for the I-405 Freeway at Lennox Boulevard should Alternative D be chosen for LAX.

The following comments are generic and apply to various mitigation measures recommended in the Draft EIS/EIR:

The document indicated mitigation measures may include fair-share contributions to certain projects, such as the Marina Expressway (SR 90) Connector Road to Admiralty Way project. The document should indicate which transportation projects have committed funds programmed and which projects, such as the SR 90 project, have not yet completed the EIR process and have not been funded.

The document should indicate that if a transportation project does not get approved and constructed, mitigation may not be feasible and the LAX Master Plan would have to be approved by overriding considerations.

The document should indicate that the Lincoln Corridor Task Force (LCTF) is studying transportation enhancements and aesthetic improvements along the Lincoln Boulevard corridor from the Santa Monica Freeway to Manchester Boulevard. It should indicate that the LAX project should pay its fair share of traffic mitigation measures recommended by the LCTF in order to mitigate project impacts that are not otherwise able to be mitigated.

A traffic impact analysis was not conducted per the Caltrans Guide for the Preparation for the Traffic Impact Studies. The Guide indicates that a traffic impact study should be performed when a project adds one or more vehicle trips during the peak hour for a freeway segment that is operating at level of service (LOS) E or F.

The following comments pertain to specific information pertaining to traffic and transportation in the Draft EIS/EIR:

#### Executive Summary

4-282 At the intersection of Lincoln Boulevard/Washington Boulevard, improvements for 2015 indicates mitigation is performed in 2008. The County's Marina Expressway (SR 90) Connector Road to Admiralty Way project is targeted for completion in 2011, pending approval by all jurisdictions and funds (\$15 million) are in place. A footnote should be placed by this and all other transportation projects specified as mitigation not approved and funded.

4-288 The document states "Y Lennox Boulevard will terminate east of I-405 at Redfern Avenue, resulting in the elimination of access to Lennox Boulevard from La Cienega Boulevard." It should state that pedestrian access between Lennox Boulevard and La Cienega Boulevard will be maintained and sufficient right of way will be made available for community needs in the vicinity.

4-290 The document indicates signal synchronization (ATSAC, ATCS, or equivalent) for segments of La Cienega Boulevard in the County's jurisdiction is recommended as a mitigation. Since the County does not participate in the City of Los Angeles=ATSAC program, the possible traffic signal synchronization improvements should be to integrate the intersections into the County Traffic Control System (TCS) as part of the Traffic Management Center (TMC).

4-293 We agree with the statement "Along the northbound side of I-405 near Lennox Boulevard, elevated roadways would extend from the I-405 interchange to Lennox Boulevard. These roadways would run adjacent to two local schools and along residences. Sound walls would need to be placed along these stretches of the roadway to reduce the amount of noise impact to the schools and residences."

#### Technical Report S-2a: On-Airport Surface Transportation

11 The capacity for main access roads (Century Boulevard and Sepulveda Boulevard) assumed in the study of 1,500 to 1,700 vehicles per hour per lane (vphpl) appears to be high. HCM 2000 (page 10-10) suggests around 1,140 for these types of roadways which are classified as Class I Urban Streets. For transitions from main access roads to curb approaches, a capacity of approximately 850 vphpl is suggested in HCM 2000. The capacities for other road types appear to be on the high side as well. Justifications for these capacity assumptions should be provided or reduced to a more realistic capacities suggested in HCM 2000.

#### Technical Report 2b: Off-Airport Surface Transportation

4 Figure S1 shows the study area and key study locations. Figure S4 shows increase in traffic due to the airport expansion project along Lincoln Boulevard and La Cienega Boulevard, north of the I-405. Also, traffic in the Lincoln Boulevard corridor uses Admiralty Way as an alternate to Lincoln Boulevard. Approximately 35 to 40 percent of traffic on Admiralty Way is bypass traffic, some of which is from Lincoln Boulevard. Therefore, the traffic analysis should include all the intersections along Admiralty Way and the Washington Boulevard/Via Marina intersection. In addition, the following intersections in the unincorporated Baldwin Hills area should be analyzed:

- La Cienega Boulevard at Stocker Street
- La Cienega Boulevard at Slauson Avenue ramps
- Stocker Street at La Brea Avenue
- Slauson Avenue at La Brea Avenue

- 30 Figure S3, Differences in LAX Passenger Trips B 2015 PM Peak Hour B Alternative D B Adjusted Environmental Baseline, shows decrease in traffic along Pershing Drive with the project. This does not make sense since employee parking structure for 12,400 stalls is proposed east of Pershing Drive north of Imperial Hwy. There should be an increase in airport traffic due to the proposed parking structure.
- 35 Additional Fly-Away sites are proposed and assumed in the traffic impact analysis. Specific locations should be identified and some level of commitment must be made to ensure these additional sites will be implemented. It should also state that a separate environmental impact analysis will be conducted for any additional sites.
- 36 Sufficient capacity should be provided for the intersection of the ITC and GTC connector road and the new access road proposed with the Lennox Boulevard/I-405 interchange. Free right-turn lanes should be provided to ensure sufficient turning movement capacity. The level of service should be conducted to ensure that adequate capacity exists.
- 47 Project fair share estimates for the impacted Congestion Management Program (CMP) routes and intersections are based on the growth between 1996 (Environmental Baseline) and 2015. This seems inconsistent with the impact analysis since the project impact was evaluated based on comparing to the 2015 Adjusted Environmental Baseline.
- 62 The haul and detour routes for any airport construction near the unincorporated areas should also be submitted to the County of Los Angeles Department of Public Works for review.

Dear Mr. Kessler:

**COUNTY OF LOS ANGELES BOARD OF SUPERVISORS: PRELIMINARY  
COMMENTS ON LAX MASTER PLAN DRAFT SUPPLEMENTAL EIS/EIR**

On behalf of the Los Angeles County Board of Supervisors, I am submitting preliminary comments on the Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (Supplemental Draft EIS/EIR) for the Los Angeles International Airport Master Plan. The Board of Supervisors approved these comments for submission at their meeting of August 19, 2003. In addition, Board Chair Yvonne Brathwaite Burke and Supervisor Don Knabe along with representatives of the County's airport consultants, A. C. Lazzaretto and Associates, will appear at the public hearing scheduled for August 23, 2003, to verbally enter the Board of Supervisors' comments into the record.

The Board of Supervisors commends Mayor Hahn and the Board of Airport Commissioners for their decision to extend the public comment period on the Supplemental Draft EIS/EIR to November 7, 2003. The County of Los Angeles reserves the right to augment and/or supercede any of the comments transmitted herewith prior to the close of the public comment period.

Sincerely,

DAVID E. JANSSEN  
Chief Administrative Officer

# **A Preliminary Review of Issues Associated with the LAX Master Plan Supplement to the Draft EIS/EIR**

*Prepared for the Los Angeles County Board of Supervisors  
by A.C. Lazzaretto and Associates  
August 2003*

---

## **INTRODUCTION**

The Federal Aviation Administration (FAA) and Los Angeles World Airports (LAWA) made available for public comment in early 2001 a Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) addressing three build alternatives, a no-build alternative, and the existing setting for the Los Angeles International Airport (LAX) Master Plan. In response to considerable public comment and the terrorist attacks that occurred on September 11, 2001, a fourth alternative -- Alternative D, the Enhanced Safety and Security Plan -- has been added to the LAX Master Plan. A Supplement to the Draft EIS/EIR was made available for public comment in July of 2003 to update information presented in the Draft EIS/EIR and to integrate Alternative D into the environmental review process.

Alternative D includes a number airfield facility modifications. Although LAX would continue to operate with 4 runways, 2 of the existing runways would be moved, two would be lengthened, and all would be further separated from one another. The existing parking structures would be relocated and replaced by new centralized passenger terminals. The existing Terminals 1 through 7 would be reconfigured, including a new north/south linear concourse at the Tom Bradley International Terminal, flanked on the west by a new satellite concourse. A new ground transportation center and intermodal transportation center to be built east of Aviation Blvd. would serve as the primary access for all passenger drop-off and pick-up and vehicle parking. Some cargo facilities would be modified, although overall square footage would be equivalent to the No Action/No Project Alternative.

A brief preliminary review has been conducted to assess changes between the original Draft EIS/EIR and the 2003 Supplement to the Draft EIS/EIR for the LAX Master Plan, as well as consistency and accuracy of information within the documents. The initial review points to several issues requiring further comment and discussion.

One of these issues was central to County comments on the earlier LAX Master Plan review, and remains an area of potential concern for the current document: although LAWA indicates that its goal is to limit growth, improvements proposed as part of Alternative D would in reality serve to reinforce LAX as the preeminent airport of the southern California region, and may undermine attempts to strengthen the role of outlying airports. In addition to this thematic concern, there are a number of additional points that merit further consideration. The preliminary findings are outlined briefly in the discussion below.

## **DISCUSSION**

### **1. The Proposed Master Plan Alternative D May Not Constrain Growth at LAX**

The stated goal of Alternative D is to limit growth at LAX to 78 Million Annual Passengers (MAP) and induce growth at other regional airports. The primary means to accomplish this is to limit aircraft gates to 153 which is the same number of gates that exist in the No Project Alternative (NPA). However, the NPA includes 48 remote gates that are simply aircraft parking spaces on concrete. Alternative D provides 153 fully

functional and high capacity gates and does not remove the concrete which will remain available for aircraft parking. The true number of gates is therefore over 200. Furthermore, the design of the new gates is a linear configuration as opposed to the existing cul-de-sac configuration. The linear configuration is more flexible and has more capacity. Also, space in the western portion of the airport will remain available for future consideration of a new west terminal, as proposed in Alternatives A, B and C. Therefore, the gate limitation is not an effective constraint on passenger levels.

Alternative D includes other improvements that would support growth beyond the 78 MAP level. In particular, the new remote terminal in the Manchester Square area provides 6.5 million square feet of terminal space -- more that 50% greater than the 4 million square feet proposed in the 98 MAP Alternatives A, B and C. Further, many of the proposed improvements to the north airfield are designed to accommodate the new generation of larger aircraft.

Orientation of new LAX facilities to the new larger aircraft could have long-term, pervasive effects. Because the new larger aircraft require many smaller connecting flights to fill its 600 seats, these improvements will strengthen the "confluence of connections" that reinforce LAX as the preeminent airport of the southern California region, and at the same time reduce the incentive for airlines to utilize other regional facilities. A true constraint on the growth of LAX would be to make it inhospitable towards the new larger aircraft, coupled with improvements to serve new larger aircraft at another regional airport, and transit links to join the two facilities.

## **2. Airport Security May Not be Fully Achieved by Alternative D**

Preliminary review suggests that the Supplement to the Draft EIS/EIR may fall short of an adequate review of airport security issues. Although the Executive Summary to the Addendum refers the reader to Appendix I *'for a detailed assessment of the security and safety features of Alternative D,'* Appendix I offers a heavily conceptual and theoretical document that falls significantly short on detail. Anomalies include contradictory content and a lack of clarity expected of a public information document.

## **3. Environmental Justice May Not be Well Served by Alternative D**

Presidential Executive Order 12898, issued in February 1994, requires all federal agencies to analyze environmental justice impacts when proposing public projects. The analysis is intended to determine whether minority and low-income communities are unfairly burdened by project impacts, with the goal of using mitigation measures to create a level playing field. In 1999, Senate Bill 115 was passed making environmental justice a requirement of CEQA as well.

Despite the importance of this subject, the original Draft EIS/EIR was found to lack even the most elementary NEPA requirements for environmental justice. Preliminary review suggests that the Supplement to the Draft EIS/EIR has corrected some but not all of the earlier deficiencies. In particular, the Supplement to the Draft EIS/EIR again limits the area of analysis (reviewing only those census tracts surrounding LAX), improperly omits assessment of many effects due to the preparers' inability to quantify or analyze the impacts, and defers a determination of significance pending completion of the mitigation program.

The assessment does not appear to consider the trade-offs between environmental protection and environmental justice pertaining to the placement and length of LAX runways: runway extension to the west would have significant adverse impacts on biological resources (particularly the El Segundo Blue Butterfly), but would serve

environmental justice through a significant lessening of noise, air quality and traffic impacts on Lennox, Inglewood and other disadvantaged communities around LAX. Nor does the assessment apply rigorous standards in assessing the proportionality of impacts and mitigation measures between the wealthier northside area and communities east of LAX including Lennox and Inglewood. These relevant issues require further review as part of the Supplement to the Draft EIS/EIR.

**4. The Baseline Year of 1996 is Not Adequate for a 2003 Impact Assessment**

It appears that the Supplement to the Draft EIS/EIR continues to use 1996 data to establish baseline conditions for a number of topical issues. This outdated reference point was considered inadequate for the original EIS/EIR, and remains unsuitable for use in the current Supplement to the Draft EIS/EIR.

**5. The No Project Alternative does not offer a Consistent Yardstick for Measuring Project Impacts**

The original EIS/EIR provided an incomplete discussion of the No Project Alternative by incorporating improvements that were then only in the "planning stages" and overstating the service levels and capacity of the existing facilities. This approach made it difficult to draw meaningful comparisons with project alternatives. Preliminary review indicates that the Supplement to the Draft EIS/EIR may also provide an incomplete picture of impacts associated with the No Project Alternative. In particular, the Supplement to the Draft EIS/EIR appears to substantially overstate passenger and cargo handling capacity under the no-build scenario, while understating both for the build scenarios.

Additionally, the No Project Alternative has not represented passenger capacity in a consistent manner. In the original 1997 Notice of Preparation, the No Project Alternative was linked to a range of 68-72 MAP whereas the 2001 and 2003 EIS/EIR documents increased this estimate to 71.2-78.7 MAP. Based on communications provided by LAWA at the Environmental Justice Workshop held in Inglewood, the increase between 1997 and 2001 reflected actual increases in passenger demand during that period. However, there was no equivalent adjustment for the period from 2001-2003, when passenger demand has fallen by almost one-third.

The Supplement to the Draft EIS/EIR states that the No Project Alternative is provided as a benchmark for comparison of the four build alternatives. However, use of a higher baseline passenger number minimizes the extent of the difference between existing and future conditions at LAX, which in turn affects comparative impact assessments throughout the EIS/EIR. Use of a *worst-case scenario*, in which the baseline was based on a low estimate of existing passenger demand, would have better served the goals of CEQA and NEPA, and given a more realistic picture of the changes between current and future conditions at LAX. The County believes that LAWA should revisit key impact findings in light of actual 2003 passenger demand, instead of the estimates developed for 2001.

**6. Traffic, Noise and Air Quality Impacts have been Shifted Eastward**

The revised Master Plan represents a major shift of improvements away from neighboring areas north and south of LAX and toward communities to the east. The unincorporated community of Lennox and the City of Inglewood now appear to bear the brunt of added traffic, while Manchester will be the primary location for passenger processing. This shift heightens the need for close scrutiny of the proposed mitigation plan and the analysis of Environmental Justice.

**7. Major Changes in the Project Call for Preparation of a Comprehensive Revised Draft EIS/EIR**

CEQA Guidelines require that a Subsequent EIR for a project must be completed if the Lead Agency determines that changes in a project will require major revisions to a previous EIR; a Supplement to an EIR may be prepared if changes in the project are not considered major (§15162(a)). Both Subsequent and Supplemental EIRs are subject to the same notice and public review requirements as the original EIR, but Subsequent EIRs must make available all the information in the environmental evaluation, whereas Supplemental EIRs only need circulate new or revised information. Discussion provided in the CEQA Guidelines indicates that both types of review are intended for use in connection with *previously certified or approved* environmental documents.

In the present case, there is no previously certified or approved document. Furthermore, preliminary review of the Supplement to the Draft EIS/EIR indicates that changes to the proposed project are major. Thus, even an adaptation of the Guidelines (i.e., to encompass a document that has *not* been previously certified or approved) would indicate the project should have been addressed through preparation of a comprehensive revised Draft EIS/EIR, in which the full record of information was consolidated in an effort to facilitate public review.

Public review and lead agency decision-making would also have been better served by providing copies of the comment letters submitted during public review of the original EIS/EIR. Instead, the Supplement to the Draft EIS/EIR makes no effort to present or even summarize the earlier comment letters. This approach creates a process that is confusing and cumbersome for reviewing agencies and organizations, and thwarts an opportunity to advance public participation.

**8. Growth-Inducing Impacts May Be Significantly Greater than Stated**

The Supplement to the Draft EIS/EIR bases its analysis of growth inducement on projected cargo and passenger activity. It concludes that by 2015, Alternative D would yield a direct economic output of \$63.7 billion and 350,500 jobs, plus an indirect economic output of \$93.8 billion and 629,000 jobs through a multiplier effect of 1.5. The EIS/EIR assumes that all of the jobs would be within the 5-County SCAG region, 78% of the jobs would be within a 20-mile radius, and 40% within a 10-mile radius of LAX. Finally, it concludes that Alternative D would be similar in terms of job formation to the No Action/No Project Alternative, differing by an increase of about 1%. With respect to collateral development, the EIS/EIR finds Alternative D impacts equivalent to the No Project Alternative for LAX Northside<sup>1</sup>, Westchester Southside and Belford, and less than the No Project Alternative for Continental City and Manchester South.

In taking this approach, the document ignores the cumulative synergistic effects that would result if LAX Northside is constructed in tandem with the LAX improvements. The increase in cargo will create corresponding increases in off-airport services and place extraordinary pressures on commercial and residential land uses in the immediate neighborhood. The Growth-Inducing Impact Analysis does not appear to address these more localized impacts at all, even though the past history of LAX shows them to be potentially significant.

---

<sup>1</sup> LAX Northside is approximately 330-acres of land located on the north side of LAX (bisected by Westchester Parkway) and owned by LAWA. Tentative Map #34836, approved for this site during the mid-1980s, would allow development of about 4.5 million square feet of office, hotel, restaurant, retail, research and airport-related land uses.

**LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS**

**LAX MASTER PLAN DRAFT EIS/EIR  
COMMENTS FOR ON-AIRPORT AND OFF-AIRPORT SURFACE TRANSPORTATION  
JULY 2003**

The supplement to the Draft EIS/EIR serves to integrate Alternative D into the existing environmental review process for the LAX Master Plan, providing a level of analysis comparable to that which was previously prepared for the other alternatives addressed in the January 2001 Draft EIS/EIR.

Under the new plan, the projected passenger activity in the planning year of 2015 is 78.9 million annual passengers (MAP), which is reduced from the previous alternatives. The 78.9 MAP would be substantially the same as the No Action/No Project alternative and the passenger ground access trips would also be similar to the No Action/No Project alternative.

Alternative D, also known as "The Enhanced Safety and Security Plan," is in response to public comments received during the review period for the Draft EIS/EIR in January 2001. Its lower MAP aims to encourage a long-term regional approach to serving air traffic demand in the Los Angeles basin. The lowered MAP is designed to encourage other airports to accommodate future air travel demand in the region. The report indicates Alternative D would enhance security by limiting access by private vehicles to the main airport infrastructure to reduce the risk to airport users.

Alternative D significantly changes surface transportation access to LAX. Vehicular access is planned on the east and south sides of airport property via La Cienega Boulevard and the I-105 Freeway/Imperial Highway, respectively. Public Works staff conceived and advanced a proposal for new interchange for the I-405 Freeway at Lennox Boulevard and install a cul-de-sac on Lennox Boulevard just east of the freeway. The interchange would provide direct access between the I-405 Freeway and LAX. It would help mitigate the traffic impact at several intersections in the unincorporated Lennox community, reduce the amount of airport-related traffic in the Lennox community, and significantly reduce the travel time for airport-related traffic. Public Works coordinated the proposal with Supervisorial Districts 2 and 4 and presented it to the Lennox Coordinating Council. The Board offices and the Lennox Coordinating Council strongly support the new interchange for the I-405 Freeway at Lennox Boulevard should Alternative D be chosen for LAX.

The following comments are generic and apply to various mitigation measures recommended in the Draft EIS/EIR:

The document indicated mitigation measures may include fair-share contributions to certain projects, such as the Marina Expressway (SR 90) Connector Road to Admiralty Way project. The document should indicate which transportation projects have committed funds programmed and which projects, such as the SR 90 project, have not yet completed the EIR process and have not been funded.

The document should indicate that if a transportation project does not get approved and constructed, mitigation may not be feasible and the LAX Master Plan would have to be approved by overriding considerations.

The document should indicate that the Lincoln Corridor Task Force (LCTF) is studying transportation enhancements and aesthetic improvements along the Lincoln Boulevard corridor from the Santa Monica Freeway to Manchester Boulevard. It should indicate that the LAX project should pay its fair share of traffic mitigation measures recommended by the LCTF in order to mitigate project impacts that are not otherwise able to be mitigated.

A traffic impact analysis was not conducted per the Caltrans Guide for the Preparation for the Traffic Impact Studies. The Guide indicates that a traffic impact study should be performed when a project adds one or more vehicle trips during the peak hour for a freeway segment that is operating at level of service (LOS) E or F.

The following comments pertain to specific information pertaining to traffic and transportation in the Draft EIS/EIR:

#### Executive Summary

4-282 At the intersection of Lincoln Boulevard/Washington Boulevard, improvements for 2015 indicates mitigation is performed in 2008. The County's Marina Expressway (SR 90) Connector Road to Admiralty Way project is targeted for completion in 2011, pending approval by all jurisdictions and funds (\$15 million) are in place. A footnote should be placed by this and all other transportation projects specified as mitigation not approved and funded.

4-288 The document states "Y Lennox Boulevard will terminate east of I-405 at Redfern Avenue, resulting in the elimination of access to Lennox Boulevard from La Cienega Boulevard." It should state that pedestrian access between Lennox Boulevard and La Cienega Boulevard will be maintained and sufficient right of way will be made available for community needs in the vicinity.

4-290 The document indicates signal synchronization (ATSAC, ATCS, or equivalent) for segments of La Cienega Boulevard in the County's jurisdiction is recommended as a mitigation. Since the County does not participate in the City of Los Angeles=ATSAC program, the possible traffic signal synchronization improvements should be to integrate the intersections into the County Traffic Control System (TCS) as part of the Traffic Management Center (TMC).

4-293 We agree with the statement "Along the northbound side of I-405 near Lennox Boulevard, elevated roadways would extend from the I-405 interchange to Lennox Boulevard. These roadways would run adjacent to two local schools and along residences. Sound walls would need to be placed along these stretches of the roadway to reduce the amount of noise impact to the schools and residences."

#### Technical Report S-2a: On-Airport Surface Transportation

11 The capacity for main access roads (Century Boulevard and Sepulveda Boulevard) assumed in the study of 1,500 to 1,700 vehicles per hour per lane (vphpl) appears to be high. HCM 2000 (page 10-10) suggests around 1,140 for these types of roadways which are classified as Class I Urban Streets. For transitions from main access roads to curb approaches, a capacity of approximately 850 vphpl is suggested in HCM 2000. The capacities for other road types appear to be on the high side as well. Justifications for these capacity assumptions should be provided or reduced to a more realistic capacities suggested in HCM 2000.

#### Technical Report 2b: Off-Airport Surface Transportation

4 Figure S1 shows the study area and key study locations. Figure S4 shows increase in traffic due to the airport expansion project along Lincoln Boulevard and La Cienega Boulevard, north of the I-405. Also, traffic in the Lincoln Boulevard corridor uses Admiralty Way as an alternate to Lincoln Boulevard. Approximately 35 to 40 percent of traffic on Admiralty Way is bypass traffic, some of which is from Lincoln Boulevard. Therefore, the traffic analysis should include all the intersections along Admiralty Way and the Washington Boulevard/Via Marina intersection. In addition, the following intersections in the unincorporated Baldwin Hills area should be analyzed:

- La Cienega Boulevard at Stocker Street
- La Cienega Boulevard at Slauson Avenue ramps
- Stocker Street at La Brea Avenue
- Slauson Avenue at La Brea Avenue

- 30 Figure S3, Differences in LAX Passenger Trips B 2015 PM Peak Hour B Alternative D B Adjusted Environmental Baseline, shows decrease in traffic along Pershing Drive with the project. This does not make sense since employee parking structure for 12,400 stalls is proposed east of Pershing Drive north of Imperial Hwy. There should be an increase in airport traffic due to the proposed parking structure.
- 35 Additional Fly-Away sites are proposed and assumed in the traffic impact analysis. Specific locations should be identified and some level of commitment must be made to ensure these additional sites will be implemented. It should also state that a separate environmental impact analysis will be conducted for any additional sites.
- 36 Sufficient capacity should be provided for the intersection of the ITC and GTC connector road and the new access road proposed with the Lennox Boulevard/I-405 interchange. Free right-turn lanes should be provided to ensure sufficient turning movement capacity. The level of service should be conducted to ensure that adequate capacity exists.
- 47 Project fair share estimates for the impacted Congestion Management Program (CMP) routes and intersections are based on the growth between 1996 (Environmental Baseline) and 2015. This seems inconsistent with the impact analysis since the project impact was evaluated based on comparing to the 2015 Adjusted Environmental Baseline.
- 62 The haul and detour routes for any airport construction near the unincorporated areas should also be submitted to the County of Los Angeles Department of Public Works for review.

P.O. Box 92007  
Los Angeles, California 90009-2007

Dear Mr. Kessler:

The Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) has been reviewed by the Facilities Management Division of the Los Angeles Police Department. In response to your request for public review and comment, the following questions and comments were compiled:

- Who will provide law-enforcement services to the people mover?
- Is the people mover to be constructed above ground, below ground or at ground level?
- Where will the LAPD Substation be located? What size facility is planned for the Substation?
- The Supplemental Draft Book 1 states that "Law-enforcement will need to increase, traffic may impede response times, and law-enforcement facilities need to change for the future." There were no actual plans to address these issues, except a referral to "work with concerned entities as the process moves forward." Is there any plan in place to begin to address these issues? When will this occur?
- Who will provide staff for the Traffic Operations Center?
- What are the specific duties and roles of TSA, LAPD, and LAXPD?
- Supplemental Draft Book 2 states that "LAPD should increase staff from 72 to 84 to maintain staff-to-passenger ratios." Does the project specify any funding for this increase? Will the new positions be budgeted into the project?
- Are the comments on entitlements available for review?

Mr. David B. Kessler

Dear Supervisors:

**FINAL REPORT ON THE SUPPLEMENTAL TO THE DRAFT  
ENVIRONMENTAL IMPACT STATEMENT/ENVIRONMENTAL IMPACT REPORT  
FOR PROPOSED MASTER PLAN IMPROVEMENTS AT LAX  
(ALL DISTRICTS AFFECTED) (3 VOTES)**

**IT IS RECOMMENDED THAT YOUR BOARD:**

1. Approve the final report on the Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (SDEIS/EIR) for the proposed Safety and Security Alternative (Alternative D) for the Proposed Master Plan Improvements at Los Angeles International Airport (LAX) submitted by A.C. Lazzaretto & Associates as the County's official comments.
2. Authorize the Chief Administrative Officer to transmit the final report to the Los Angeles World Airports (LAWA) and Federal Aviation Administration (FAA) as the Board's final comments on the SDEIS/EIR for Alternative D.

**PURPOSE/JUSTIFICATION OF RECOMMENDED ACTION**

The purpose of this recommended action is to accept the attached final report as the County's official response to the SDEIS/EIR for Alternative D and present it to LAWA and FAA prior to the November 7, 2003 comment period deadline. Submission of the County's official response allows for the concerns and suggestions detailed in the final report to be addressed by LAWA and FAA. If the County's concerns and suggestions are not adequately addressed and/or incorporated into the Final EIS/EIR, the County retains the ability and opportunity to challenge the LAX Master Plan Improvements project based on those issues discussed in the final report.

URS # 00425  
Rec'd 10/23/03  
From: LAWA

Honorable Board of Supervisors  
October 28, 2003  
Page 2

### Implementation of Strategic Plan Goals

These recommendations are consistent with the following Strategic Plan Goal:

Goal:      **Organizational Effectiveness:** Ensure that service delivery systems are efficient, effective, and goal-oriented.

The County is seeking to ensure that any air service expansion plan is environmentally, economically, and socially beneficial to the residents of Los Angeles County.

### FISCAL IMPACT/FINANCING

Not applicable.

### FACTS AND PROVISIONS/LEGAL REQUIREMENTS

On July 10, 2001, your Board approved the final report on the Draft EIS/EIR for the Proposed Master Plan Improvements at LAX submitted by A.C. Lazzaretto & Associates as the County's official comments on the Draft EIS/EIR. Due to the events of September 11, 2001, newly elected Los Angeles Mayor James Hahn directed LAWA to develop a new alternative focused on safety and security. On January 21, 2003, your Board instructed this office to negotiate a delegated authority contract with A.C. Lazzaretto & Associates to conduct a review and analysis of the anticipated Supplement to the Draft EIS/EIR for the new alternative.

On July 9, 2003, the SDEIS/EIR for the Safety and Security Alternative to the Proposed Master Plan Improvements (Alternative D) was released and a public review and comment period commenced. On July 15, 2003, this office entered into agreement with A.C. Lazzaretto & Associates to conduct the requested review. The consultant assembled a team of environmental and security experts to review the documents for consistency and accuracy, with special attention to the major areas of noise, traffic, security, air quality, and environmental justice. On August 19, 2003, your Board approved preliminary comments regarding the SDEIS/EIR developed by the consultant and the Department of Public Works.

Consistent with their contract, the consultant is presenting the attached final report to your Board commenting on the SDEIS/EIR for Alternative D which incorporates comments by the Departments of Public Works, County Counsel, and Regional Planning, and the Chief Administrative Office. The consultant concludes there is an obvious and pressing need for improvements at LAX, mostly to ensure the safety and security of air travel. However, the consultant believes LAWA is proposing to implement a flawed project, and that the process is further compromised by an inadequate environmental review. Moreover, the problems with the SDEIS/EIR are so serious, pervasive, and universal that the only practical remedy is to start the process over again and prepare a truly comprehensive revised EIS/EIR. The following are key findings supporting the conclusion:

Honorable Board of Supervisors  
October 28, 2003  
Page 3

- Alternative D will not constrain growth at LAX.
- Alternative D will not adequately serve the security goals for which it was formulated.
- The security plan relies heavily on technologies, some of which have been discredited, and does not address serious security exposures.
- Use of a Supplement to the 2001 Draft EIS/EIR was improper under the guidelines of California Environmental Quality Act.
- Scoping outreach did not include input from Los Angeles County or the public at large regarding either Alternative C (the 2001 preferred project) or Alternative D (the 2003 preferred project) and thus fails to meet National Environmental Policy Act requirements.
- The baseline year used in the SDEIS/EIR is 7 years old and does not offer a reasonable yardstick against which to measure the impacts of Alternative D or any other project alternative, especially since the events of September 11 changed the baseline so fundamentally.
- The SDEIS/EIR contains numerous comments and statements that create an appearance of project advocacy.
- Alternative D shifts many impacts toward the more economically disadvantaged communities east and northeast of LAX, and appears to protect biological resources at the expense of residents in Lennox, Inglewood, and Manchester.
- The noise assessment contains significant discrepancies.
- The 2001 Draft EIS/EIR acknowledged that it omitted quantitative assessment of toxic air pollutant exposure due to lack of time; the 2003 document also omitted the assessment, but did not so note.
- Additional environmental documentation is lacking and LAWA decision makers will be unable to make an informed project determination until inadequacies in the SDEIS/EIR are remedied.

Honorable Board of Supervisors  
October 28, 2003

**IMPACT ON CURRENT SERVICES**

This action will not have a direct impact on current County services. County involvement is important to ensure that any improvements at LAX meet and enhance air service for the region at the same time protecting the quality of life of impacted communities and the County as a whole.

Respectfully submitted,

  
for DAVID E. JANSSEN  
Chief Administrative Officer

## **1.0 BACKGROUND AND EXECUTIVE SUMMARY**

### **1.1 BACKGROUND**

During 2001, A.C. Lazzaretto & Associates was retained by the Los Angeles County Chief Administrative Office to review and comment on the Draft Environmental Impact Statement/Environmental Impact Report (DEIS/EIR) prepared for Los Angeles World Airport's (LAWA) Proposed Los Angeles International Airport (LAX) Master Plan. The 2001 Draft EIS/EIR addressed three build alternatives, a no-build alternative, and the existing setting for the Los Angeles International Airport (LAX) Master Plan.

A.C. Lazzaretto & Associates assembled a team of environmental review experts to review the document for consistency and accuracy. Working in collaboration with County staff, a detailed comment letter was prepared and submitted to LAWA on 28 June 2001. Thereafter, in response to considerable public comment and the terrorist attacks that occurred on September 11, 2001, LAWA suspended work on the earlier EIS/EIR to develop a fourth alternative -- Alternative D, the Enhanced Safety and Security Plan. LAWA made a Supplement to the Draft EIS/EIR (SDEIS/EIR) available for public comment in July of 2003 to update information presented in the Draft EIS/EIR and to integrate Alternative D into the environmental review process. The Supplement offered no response to comments submitted on the 2001 DEIS/EIR.

Alternative D includes a number of airfield facility modifications. Although LAX would continue to operate with 4 runways, 2 of the existing runways would be moved, two would be lengthened, and all would be further separated from one another. New centralized passenger terminals would replace the existing parking structures. The existing Terminals 1 through 7 would be reconfigured, including a new north/south linear concourse at the Tom Bradley International Terminal, flanked on the west by a new satellite concourse. A new ground transportation center and intermodal transportation center to be built east of Aviation Blvd. would serve as the primary access for all passenger drop-off and pick-up and vehicle parking. Some cargo facilities would be modified, although overall square footage would be equivalent to the No Action/No Project Alternative.

Following publication of the SDEIS/EIR, the Los Angeles County Chief Administrative Office again retained A.C. Lazzaretto & Associates to review and comment on the revised document. A.C. Lazzaretto & Associates in turn assembled the team of environmental review experts that had reviewed the 2001 document, in order to assess the 2003 Supplement for consistency, accuracy, and changes since the original Draft EIS/EIR was prepared. The information has been evaluated using the following criteria: reasonableness of input data and assumptions, appropriateness and accuracy of analyses and mitigation measures, and conformity with requirements of the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA).

Results of the current review indicate that many of the concerns expressed in our earlier comment letter still remain, including one that was central to County comments on the earlier LAX Master Plan review: although LAWA indicates that its goal is to limit growth, improvements proposed as part of Alternative D would in reality serve to reinforce LAX as the preeminent airport of the southern California region, and may undermine attempts to strengthen the role of outlying airports. There are a number of points, in addition to this thematic concern, that merit further consideration and discussion before LAWA considers certification of the Supplement to the EIS/EIR and approval of the preferred alternative.

To facilitate LAWA's review and response, the County has revised and updated the comment letter originally submitted in June of 2001. The current comment letter incorporates all issues for which a response is sought from LAWA. As before, the review team has paid special attention to the major issues of noise, traffic, environmental justice, and air quality, and the team has again made every attempt to offer objective, constructive comments concerning the major elements of the Supplement to the DEIS/EIR.

## 1.2 EXECUTIVE SUMMARY

A.C. Lazzaretto & Associates has been retained by the Los Angeles County Chief Administrative Office to review and update comments on the 2001 Draft DEIS/EIR prepared for LAWA's Proposed LAX Master Plan, consistent with changes in the current 2003 Supplement to the Draft EIS/EIR. The 2001 Draft EIS/EIR addressed three build alternatives, a no-build alternative, and the existing setting for the Los Angeles International Airport (LAX) Master Plan. The 2003 Supplement incorporates a new Alternative D (the "enhanced safety and security plan") that LAWA has designated as the preferred project option. To address safety issues, the review team has been expanded to include participation by BoydForbes, Inc., a renowned airport safety consulting firm based in Denver.

The County has a special responsibility in this process, since it represents the unincorporated communities that are most directly impacted by LAX operations. It is for this reason that the County has taken a highly active stance during 2001 and 2003, and in both instances we have focused on issues of greatest concern to our constituents. During 2001, we submitted comments to LAWA in which we expressed a number of serious concerns. With publication of the 2003 Supplement we find that most of our earlier concerns remain unaddressed and new issues have been identified that are of even greater potential concern for Los Angeles County constituents. The County has twice sought to meet with LAWA's consulting team to discuss these issues, and on both occasions has been rebuffed. In so doing, LAWA has bypassed an opportunity for identification of joint solutions that could facilitate improvements at LAX while minimizing impacts on LAX's neighbors in Manchester, Lennox, Westchester and other adjoining communities.

Fundamentally, the County of Los Angeles believes that LAWA is proposing to implement a flawed project, and that LAWA has developed an inadequate environmental document to review the project. The following report covers a wide range of issues, many in considerable detail. While all of these issues are important, we would like to call special attention to the following key points:

- ▶ Contrary to statements made throughout the SDEIS/EIR, our review clearly shows that Alternative D will not constrain growth at LAX. LAWA has misrepresented this alternative, to the jeopardy of the environmental analysis.
- ▶ Alternative D will also not serve the security goals for which it was formulated. The Plan focuses on hardening security for the east-side entry to LAX but largely ignores the perimeter, maintenance/fuel farm, and cargo areas -- leaving the back door wide open.
- ▶ The separation concept is diminished in value by the expensive and vulnerable mass transit link proposed between the Central Terminal Area and remote landside ground facilities. It is further diminished by the lack of Flow Process Mapping data; the consequential risk of task overload and failure to achieve target reduction; and by the potential alienation of a public that may perceive screening requirements as excessive.

- ▶ The Security plan relies heavily on technologies, some of which have been discredited (e.g., facial recognition surveillance). Additionally, greater thought must be given to the risk of data saturation. Over-dependence on security technology may lead to higher risk of error and, ironically, diminished protection.
- ▶ There are a number of existing, unexplained security exposures at LAX, including several areas characterized by extreme weakness in access control, that should be remedied as soon as possible; it is recommended that LAWA take steps to close Pershing Drive to public traffic as soon as practicable.
- ▶ Use of a Supplement to the 2001 Draft EIS/EIR was improper under guidelines for CEQA. LAWA should have addressed Alternative D in a comprehensive revised draft EIS/EIR in which the full record of information was available for public review and agency decision-making.
- ▶ The Purpose & Need statement emphasizes LAX's role in meeting regional growth, investment return, and international trade, and claims that Alternative D will fill these objectives. Yet the EIS/EIR asserts that Alternative D has the same socioeconomic characteristics as No Action, but for construction jobs, and finds that No Action would fail to meet project purpose and need. Either Alternative D fails to meet the stated goals, or Alternative D has not been described in accordance with full disclosure requirements.
- ▶ The environmental assessment does not offer a reasonable range of Alternatives that would feasibly meet most objectives, but would avoid or lessen significant effects of the project, and thus the SDEIS/EIR fails to fulfill the "Rule of Reason."
- ▶ Scoping Outreach did not include input from Los Angeles County Government or the public at large regarding either Alternative C (the 2001 preferred project) or Alternative D (the 2003 preferred project) and thus fails to meet basic NEPA requirements.
- ▶ The SDEIS/EIR offers a baseline now 7 years old: conditions in 1996 do not represent the baseline of 2003. The events of 9/11 changed the baseline so fundamentally that LAWA withdrew its 2001 documents to formulate an entirely new preferred project. The 1996 baseline does not offer a reasonable yardstick against which to measure the impacts of Alternative D or any other project alternative (including No Action).
- ▶ Piecemeal efforts to remedy the outdated baseline have further obscured understanding. The frequent shifting from one baseline nomenclature and timeframe to another is, at best, confusing. At worst, it conceals the underlying impacts that this 2003 Supplemental Draft EIS/EIR is intended to illuminate.
- ▶ The most pressing problems at LAX are lack of adequate runway length on the north complex, the security threat of private autos near the terminals, and lack of international gates. Yet the Phase One construction plan addresses none of these for many years and instead concentrates on the airport fringes (the GTC and ITC) and on demolishing and rebuilding perfectly useable terminals to accommodate New Large Aircraft. This sequence does not match the environmental and congestion priorities evident at LAX.
- ▶ The SDEIS/EIR contains numerous comments and statements that create an appearance of project advocacy. Even the appearance of advocacy is inappropriate given the policy guidelines contained in CEQA and NEPA and it seriously undermines confidence in the objectivity of the Draft EIS/EIR and its commitment to full disclosure.
- ▶ The 2001 DEIS/EIR was found to lack even the most elementary NEPA requirements for Environmental Justice; many deficiencies remain in the 2003 SDEIS/EIR. In particular, Alternative D shifts many impacts toward the more economically disadvantaged communities east and northeast of LAX, and appears to protect biological resources at the expense of residents in Lennox, Inglewood & Manchester.

- ▶ The document fails to disclose issues and concerns raised in Environmental Justice (EJ) workshops, defers evaluation of critical environmental justice impacts (including Air Quality and Health Effects) due to lack of data, offers ill-defined mitigations, and offers a preferred project that protects butterflies at the expense of residents and schoolchildren.
- ▶ The noise assessment contains significant discrepancies in the number of dwelling units and population impacted between the baseline year and the data published by LAWA. Additionally, there is an unexplained discrepancy in the year 2000 noise contours shown in the 2001 and the 2003 documents.
- ▶ The 2001 EIS/EIR acknowledged that it omitted quantitative assessment of toxic air pollutant exposure due to lack of time; the 2003 document also omitted this assessment, but did not so note. Completion of such studies independent of the environmental review, as proposed, would preclude establishment of baseline conditions. LAWA decision-makers will be unable to make an informed project determination until this data is developed and disclosed. The noise modeling results were based on inadequate flight track data.
- ▶ Nitrogen oxides were determined to have significant impacts before and after mitigation, but would be reduced the least under the proposed mitigation measures. The proposed mitigation measures do not appear to successfully address nitrogen oxides.
- ▶ The 'rationing' technique used to update the analyses of airport pollutant sources for Alternatives A, B and C, and No Action, makes it difficult to fairly compare the alternatives.
- ▶ LAWA Decision-Makers will not be adequately informed until the environmental documentation provides thorough review of the following alternatives:
  - ❑ Relocation of New Large Aircraft Facilities to Another Airport
  - ❑ Major Shift of Airport Facility Improvements from East (Human Habitat) to West (Butterfly Habitat)
  - ❑ Development of a Minimum Airport Improvement Plan incorporating only High Priority elements

The County looks forward to reviewing LAWA's responses, particularly with respect to the additional commitments requested throughout this comment letter. At the same time, the County believes that LAWA's interests would be best served through preparation of a *comprehensive revised Draft EIS/EIR* in which *the full record* of information is consolidated in a manner that facilitates public review and agency decision-making.

## **2.0 INTRODUCTION TO THE COMMENT LETTER AND REPORT ORGANIZATION**

A.C. Lazzaretto & Associates has again been retained by the Los Angeles County Chief Administrative Office to review and comment on a Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (SDEIS/EIR) prepared by Los Angeles World Airport (LAWA) to address the impacts of a proposed Master Plan for Los Angeles International Airport (LAX). The SDEIS/EIS was issued in response to considerable public comment on the Draft EIS/EIR and Master Plan presented during 2001 and in response to the terrorist attacks that occurred on September 11<sup>th</sup> of that year. The SDEIS/EIR introduces a new preferred alternative -- Alternative D, the Enhanced Safety and Security Plan. In reviewing the Supplement, we have again noted the high quality of writing, and the thoughtful organization and presentation of materials that is evident in many of the technical reports. We again conclude, however, that the documents are substantially compromised by significant errors, omissions, and biases. We submit that LAWA has used improper procedures -- under CEQA and NEPA -- to introduce the new

preferred Alternative D, and we conclude that LAWA has offered misleading statements concerning the potential for further growth at LAX.

The review team assembled by A.C. Lazzaretto & Associates includes all firms who contributed to the 2001 review, as well as a new firm – BoydForbes, Inc. – that was brought in to review the highly technical, and critically important issues pertaining to airport safety and security. Based in Colorado, BoydForbes, Inc. is one of a handful of firms that specialize in airport security and have the ability to critically review the environmental documentation pertaining to this topical issue. Team members who also participated in the earlier effort include Michael Brandman Associates, Bauer Environmental Services, Austin-Foust Associates, and Mestre Greve Associates. Each of these firms is a leader in the field of environmental review and key members have extensive experience working with the environmental review of airport projects.

In performing the task of reviewing the Draft EIS/EIR, the County has made every attempt to offer objective, constructive comments concerning the major elements of the Draft EIS/EIR. We have made note as appropriate where issues may involve diverse views among experts.

The following report is organized to facilitate LAWA's review and response to the issues raised. As such, the general flow of this review document follows the topic pattern of the Supplement to the DEIS/EIR; however, there are many sections that have been rearranged in order to emphasize a particular point or to clarify the issue at hand. This is particularly true in the following discussion (§3.0 below) which deals with general issues that are evident throughout the SDEIS/EIR document and are not specific to any single section.

This document focuses only on issues of concern to the County from a legal standpoint, and does not attempt to identify or discuss those sections in the SDEIS/EIR that appear to meet State or Federal guidelines. This is not to say that sections not mentioned in this document can be assumed adequate; rather, the sections are omitted from this document in order to focus on areas of greatest concern to the Los Angeles County Board of Supervisors.

### **3.0 GENERAL ISSUES**

This section identifies issues that are evident throughout the entire Supplement to the DEIS/EIR document. Typically, the issues raised in this section deal with the backbone of the SDEIS/EIR and, therefore, the errors, omissions, and faulty conclusions identified herein are those that compromise the validity of the Supplement to the Draft EIS/EIR as a whole.

#### **3.1 ALTERNATIVE "D" DOES NOT CONSTRAIN GROWTH AT LAX**

##### **3.1.1 Airside Gate Frontage Far Exceeds Stated Levels**

The SDEIS/EIR claims that Alternative D would serve, in the year 2015, no more passengers than would be expected with current airport facilities (approximately 78 Million Annual Passengers [MAP]). Despite massive improvements to the capacity of the runways and terminals, the SDEIS/EIR also claims that passenger limits will be assured by limiting "airside gate frontage." These assertions do not hold up to scrutiny. In fact, Alternative D increases "airside gate frontage", increases the number of aircraft gates, and increases aircraft gate efficiency beyond the levels contained in the No Project Alternative. The Master Plan states that:

*“Alternative D is described as constrained because...facilities would not be designed to accommodate the unconstrained aviation demand forecast profile. Specifically, the terminal frontage available in Alternative D to park aircraft side-by-side is less than the equivalent terminal frontage available in the No Action/No Project Alternative.” (emphasis added)*

Further, the Supplement to the EIS/EIR states:

*“The net effect of these terminal changes would be a reduction in the total airside gate frontage available for aircraft gates and in the number of available aircraft gates to match the peak gate requirements identified in the Alternative D design day schedule.”*

Neither the Supplement to the Master Plan nor the Supplement to the Draft EIS/EIR provides any further explanation, data or calculations to substantiate those statements. On the contrary, as shown on the attached table, Aircraft Gate Comparison, various graphics in the Master Plan provide evidence directly contravening those statements.

**Table 1**  
**AIRCRAFT GATE COMPARISON**  
**EXISTING, NO PROJECT & ALTERNATIVE “D”<sup>1</sup>**

Terminal	1996 Existing			2015 No Project		Alternative D		
	Air Carrier Contact Gates	Commuter Parking	Frontage Length (ft.)	Air Carrier Contact Gates	Commuter Parking	Air Carrier Contact Gates	Commuter Parking	Frontage Length (ft.)
1	14	6	1,740	16	0	0	0	0
2	10	0	1,201	10	0	0	0	0
3	12	3	2,104	12	0	0	0	0
4	10	10	n/a	13	0	16	0	n/a
5	16	0	n/a	16	0	16	0	n/a
6	10	14	n/a	13	0	13	0	n/a
7	12	0	n/a	12	0	15	0	n/a
8	8	0	n/a	8	0	0	19	n/a
TBIT	12	0	2,111	12	0	19	0	3,184
Remote	0	0	0	19	33	0	0	0
New West	0	0	0	0	0	27	13	4,148
New North	0	0	0	0	0	15	0	3,416
<b>TOTAL</b>	<b>104</b>	<b>33</b>	<b>7,156</b>	<b>131</b>	<b>33</b>	<b>121</b>	<b>32</b>	<b>10,748</b>

The amount of “airside gate frontage available for aircraft gates” is easily calculated using scaled drawings contained in the Master Plan. As shown on the attached Table 1, Alternative D includes an increase of nearly 3,600 linear feet of terminal frontage: Terminals 1, 2 and 3 will be replaced by the New North Terminal; Tom Bradley International Terminal will be reconfigured; and a New West Terminal will be built. No changes will be made to Terminals 4 thru 8. The total *existing* frontage of the terminals being modified is thus 7,156 feet; following proposed modifications, the terminals will encompass 10,748 feet — an increase of 3,592 feet. To substantiate its claim concerning existing conditions, the Master Plan must be including the “remote gates” that are little

<sup>1</sup>‘1996 Existing’ data obtained from Master Plan Figure II-3.2; ‘2015 No Project’ data obtained from Figure ES-1; ‘Alternative D’ data obtained from Figure 2.2-4.

more than apron area where aircraft are parked. These areas with their low efficiency are not a suitable comparison to actual aircraft gates with jetways linked to a terminal. To suggest differently is to ignore well-established planning factors for passenger processing.

The number of aircraft gates also increases with Alternative D. The Master Plan Supplement uses figures in its summary tables to indicate that the No Project Alternative has 163 gates and that Alternative D has 153 gates -- indicating a reduction. However, these figures do not correspond to other figures in the Master Plan. For example, Table ES-2 in the Master Plan Supplement indicates 115 contact gates<sup>2</sup> and 48 remote gates for an existing total of 163. However, Figure II-3.2 of the Existing Conditions Working Paper (Chapter 2 of the Draft Master Plan), provides a detailed accounting of all existing gates and aircraft parking spaces, and it shows quite clearly that there are only 104 contact air carrier gates at present. Additionally, it shows 33 parking places for commuter aircraft located adjacent to terminals 1, 3, 4 and 6 and accessed via stairways. Except for one passing reference to 36 Narrow Body Equivalent Gates with access to the Bradley Terminal, Chapter Two makes no mention of the 19 remote gates in the northwest corner.

In the No Project Alternative, some of the parking spaces used for commuter flights have been converted to parking spaces for air carriers, and those spaces are now counted among the air carrier gates in the No Project Alternative. Furthermore, the 19 remote aircraft parking spaces have become prominent in the SDEIS/EIR No Project Alternative, implying that there are now 131 "gates" for air carriers and 32 "gates" for commuters. In reality, there are no more true contact gates today than there were in 1997. It is only that some existing concrete apron space formerly used for maintenance and other uses is now being used on a regular basis to park scheduled aircraft. This practice requires that passengers are bussed to the terminals, in a manner that the Master Plan admits is costly and inefficient. In simpler terms, there are now 112 air carrier parking spaces adjacent to the terminals, 19 remote air carrier parking spaces in the northwest corner, and areas for parking approximately 32 commuter aircraft at two remote locations.

Aircraft gates for Alternative D are depicted very clearly on Figure 2.2-4 Gate Layout and Utilization in the Supplement to the Master Plan. This Figure shows 121 air carrier contact gates and 32 parking spaces for commuter aircraft and/or regional jets. Alternative D also includes the conversion of 8 existing air carrier contact gates in Terminal 8 to spaces to park 19 commuter turbo props/regional jets.

The evidence is quite clear that Alternative D provides 8 more air carrier contact gates than the No Project Alternative, and in a configuration that is more efficient.<sup>3</sup> Additionally, under Alternative D LAWA retains the flexibility to create remote gates on available apron space. As the historical evidence shows, LAWA has not prepared environmental documentation for similar operational modifications at LAX in past years. Furthermore, LAWA could easily retain the eight contact gates in Terminal 8, thereby boosting the total for Alternative D to 129 contact gates -- 15% more than the existing LAX layout. Accordingly, under Alternative D LAWA has the potential to increase the number aircraft gates, increase airside terminal front footage, replace inefficient aircraft gates with more efficient ones and create additional remote gates.

---

<sup>2</sup> A "contact gate" includes traditional numbered gates in the terminal and a jet way to a waiting aircraft.

<sup>3</sup> Linear configurations offer more flexibility than the current cul-de-sac design; the Construction Phasing Plan notes that the reconstruction of terminals 1, 2, & 3 into a linear configuration will create a "continuous Group VI flightline."

### 3.1.2 Runway Design Capacity is Understated

The preferred alternative will also serve future growth through the proposed runway design: the runway configuration for Alternative D has the same or higher capacity as Alternative C -- 90 MAP. Alternative D, in the same manner as Alternative C, addresses existing runway constraints by lengthening both of the north complex runways and by increasing the separation distance between them. The fact that the new four runway system can handle more than 78 MAP is stated very clearly in the Master Plan addendum on page 3-4: *“Alternative C’s projected annual passenger activity level served is limited by the capacity of the four-runway system and is forecast to be approximately 89.6 million (air passengers.)”* Given that Alternative D uses the same 4-runway configuration as Alternative C, and Alternative D extends RW 6L/24R an additional 1,000 feet farther than does Alternative C, it can be concluded that the capacity of the runways under Alternative D is the same or more than Alternative C -- approximately 90 MAP.

### 3.1.3 Passenger Levels will be Much Higher than Forecast for Alternative D

Alternative D will allow unconstrained growth through the year 2015. Unlike the most recent FAA forecasts, the “unconstrained forecast” of 98 MAP in the Master Plan has not been updated to reflect changes in the air industry that have occurred following the events of 9/11. The most recent FAA Terminal Area Forecasts for LAX indicate that service levels at LAX will not reach the year 2000 levels (64 MAP) until the year 2008 and that service levels in 2015 will be approximately 81.6 MAP. Using those figures, Alternative D provides little if any constraint on growth.

Alternative D understates the passengers per operation. Alternative D accommodates the new Super Jumbo A380 (referred to in the Master Plan as the New Large Aircraft by creating a separation of 1040 feet between the two northern runways and by demolishing terminals 1, 2 and 3 and reconstructing a “continuous Group VI flightline.”<sup>4</sup> The arrival of the New Large Aircraft, with almost 600 seats, will increase the passenger handling capacity of the runways and airspace by increasing the number of passengers per aircraft operation. Nevertheless, the Master Plan forecasts that Alternative D will have a lower number of passengers per operation than Alternative C and in fact forecasts a lower number than currently exists. As indicated on Table 3.3-1 of the Master Plan Addendum, Alternative D is forecast to have only 121.06 passengers per air carrier operation, while Alternative C is forecast to have 124.95. The table fails to include the actual numbers for the years 1996 and 2000. However, information from the LAWA web site indicates that passengers per air carrier operation totaled 109.5 in 1996, 119.65 in 2000, 116.62 in 2001, 123.18 in 2002, and 125.4 thru July of 2003. The number of passengers per operation is expected to continue to increase as airlines increase the size of aircraft and increase their load factors (percentage of sold seats.) Furthermore, there is a large and unexplained increase in the number of commuter flights (from 109,000 in Alternative C to 183,000 in Alternative D). Commuter flights average only about 20 passengers per aircraft. If some of the capacity used for commuter operations was used instead for air carrier operations, the number of passengers would again increase. There is thus abundant evidence that the runway capacity proposed under Alternative D is much greater than 78 MAP.

<sup>4</sup> In contrast, the south runways will be separated only by 795 feet which is sufficient for aircraft such as the B747.

### 3.1.4 Terminal Space in Alternative D is Equivalent to Alternative C

Alternative D increases terminal space by 70%. The proposed increase in terminal space from 4 million square feet (msf) to 6.8 msf represents a considerable increase -- 70% higher than existing. The resulting capacity is only 8% less than Alternative C, again indicating an ability to handle many more than 78 MAP.

### 3.1.5 The No Project Alternative Cannot be used to Evaluate Alternative D.

Comparison with the No Project Alternative does not provide a reasonable basis to conclude there will be no additional growth. As discussed below in §3.4.2, the origins of the service levels used in the No Project Alternative are obscure and undocumented, thus casting some doubt upon their validity. If the No Project service levels are inflated, as we anticipate, then Alternative D would surely be promoting growth as the service levels increased from the current 55 MAP to 78 MAP.

## 3.2 IMPROPER USE OF A SUPPLEMENT TO THE DRAFT EIS/EIR

The CEQA Guidelines state that a Supplement to an EIR may be prepared if changes to a project are not considered major (§15162(a)). Where the changes necessitate major revision to a previous EIR, CEQA requires preparation of a Subsequent EIR. Both types of documents must receive the same notice and public review requirements as the original EIR. However, in a Subsequent EIR, *all information* must be presented, whereas in a Supplemental EIR only *new or revised information* need be presented. Discussion provided in Public Resources Code §21166 (and CEQA Guidelines §15162 and §15163) indicate that both types of review are intended for use in connection with *previously certified or approved* environmental documents. For documents that have not yet been certified, CEQA outlines a procedure for recirculation. Discussion provided with the CEQA Guidelines states specifically that, "*Circulating a subsequent EIR or supplement to an EIR is not "recirculation" as described under §15088.5.*"

In the present case, there is no previously certified or approved document. Furthermore, review of the Supplement to the Draft EIS/EIR provides incontrovertible evidence that changes to the proposed project are major and affect the entire environmental assessment: LAWA has presented an *entirely new alternative* as the preferred project, and the alternative was *created to meet safety and security challenges that did not exist in 2001*. In effect, the entire framework for this project -- from the baseline conditions, to the project purpose and need, to the very project itself -- changed following September of 2001, and yet LAWA used a CEQA format intended for minor changes to a certified EIR.

Finally, the format used by LAWA serves to obfuscate rather than facilitate understanding of this complex project.<sup>5</sup> Every reasonable interpretation of CEQA would indicate that LAWA should have addressed the project through preparation of a comprehensive revised Draft EIS/EIR, in which

---

<sup>5</sup> At a minimum, the SDEIS/EIR Index (§7.7) could have provided the reader with a more listing of topical issues and where they can be found, along with a cross reference to text discussions in the 2001 and 2001 documents. Instead, the Index offers only a cursory guide to topical discussions (for example, the Index contains no references for "cumulative impacts") and provides no useful tools for locating or accessing analyses from the 2001 Draft EIS/EIR.

the *full record* of information was consolidated in an effort to facilitate public review and agency decision-making.

Public review and lead agency decision-making would also have been far better served by providing copies of the comment letters submitted during public review of the original EIS/EIR. During 2001, the County of Los Angeles devoted considerable time, public funds and staff effort to review and submit comments on the extensive Draft EIS/EIR and Master Plan documentation released by LAWA at that time. Surely a similar effort was spent by many other agencies, organizations and individuals, and it is probable that the collective comments contained a wide range of information that would have been relevant to the current review. Despite this fact, the Supplement to the Draft EIS/EIR makes no effort to present *or even summarize* the earlier comment letters. This approach creates a process that is confusing and cumbersome for reviewing agencies and organizations, and thwarts an opportunity to advance public participation. A response to the earlier comments would have served to advance public discourse, strengthen the opportunity for environmental protection, and facilitate an understanding of the Lead Agency's thinking on a wide range of key issues. We acknowledge that LAWA was under no obligation to respond or acknowledge the earlier comment letters. However, the failure to have done so belies a continuing pattern of disinterest in public views that was established in 2001.

### 3.3 INCONSISTENT PURPOSE & NEED STATEMENT

The apparent contradiction between SDEIS/EIR statements and actual intent is also evident in the discussion of project purpose and need. The SDEIS/EIR states, on page ES-1, that the purpose and need for the project have not changed:

*"The purpose and need for the LAX Master Plan has not changed since the publication of the Draft EIS/EIR...In particular, the Master Plan project objectives are to:*

- ▶ *Respond to local and regional demand for air transportation during the period 2000-2015, taking into consideration the amount, type, location, and timing of such demand.*
- ▶ *Ensure that new investments in airport capacity are efficient and cost-effective, maximizing the return on existing infrastructure capital.*
- ▶ *Sustain and advance the international trade component of the regional economy and the international commercial gateway role of the City of Los Angeles."*

In a number of text discussions, the SDEIS/EIR affirms that Alternative D responds to the stated purpose and need for this Master Plan, as shown in the excerpts below from pages 2-1 and 3-25:

*"Alternative D, the "Enhanced Safety and Security" alternative, offers a well-planned and rational 'regional approach' alternative for improvement of LAX. Alternative D would respond to future demand for air transportation by encouraging, but not requiring, other airports in the Los Angeles area to increase capacity to make up for the limitations of LAX. It would allow airlines to accommodate the demand for international aviation at LAX to the greatest extent possible without otherwise increasing capacity of the airport generally. It would also maintain the return on existing capital investments at LAX. Thus, Alternative D would allow the Los Angeles region to realize some of the important economic benefits outlined in the Draft EIS/EIR, while at the same time enhancing security and safety at the airport and significantly reducing environmental impacts from airport operations to the surrounding communities."*

*“Alternative D, as stated previously in § 3.1, Formulation and Refinement of Alternatives, of this document, is a direct response to the strongly expressed desire of many citizens, as indicated in comments received on the Draft EIS/EIR, for a regional approach to airport planning in Southern California that is more aggressive than demonstrated by the previously considered Master Plan build alternatives. The Mayor of Los Angeles, noting the need to fully examine a regional approach to satisfy air transportation demand, directed LAWA to develop a new Master Plan alternative for the improvement of LAX. Responding to the Mayor's direction, the new alternative is designed to:*

- ▶ *Enhance safety and security at LAX for users and to protect the airport infrastructure*
- ▶ *Encourage the development and use of regional airports to serve local demand by constraining the facility capacity at LAX to approximately the same aviation activity levels identified in the No Action/No Project Alternative;*
- ▶ *Maintain LAX as the International Gateway to Southern California; and*
- ▶ *Mitigate the impacts of LAX's continued operation.”*

At the same time, the SDEIS/EIR emphasizes that Alternative D is equivalent in many ways to the No Action /No Project Alternative. For example, SDEIS/EIR page ES-17 includes the following statement:

*“Alternative D would encourage a long-term regional approach to serving air traffic demand in the Los Angeles basin by designing facilities at LAX to accommodate passenger and cargo activity levels equivalent to the No Action/No Project Alternative activity level, but would be designed to allow air carriers to emphasize international routes at LAX.”*

The Project Description (page 3-25) expands on this theme, including the statement below:

*“LAWA determined that constraining the aircraft gate frontage at the terminals is a component of the airport system that is fully within its control. LAWA can constrain the development of this frontage and believes that this will, in turn, place an effective constraint on total passenger activity at LAX. LAWA can also control the amount of available cargo warehouse and processing space at LAX. By constraining the development of these cargo facilities, total cargo activity at LAX would be constrained.”*

Further, the SDEIS/EIR provides quantitative data to support these statements, as shown below with information excerpted from SDEIS/EIR Tables ES-1 and ES-2.

**Table 2  
COMPARISON OF NO PROJECT WITH ALTERNATIVES ‘C’ AND ‘D’<sup>6</sup>**

Facility	No Action/No Project Alternative	Previously-Preferred Alternative C	Currently Preferred Alternative D
Cargo-Annual Tons	3,120,000	4,172,000	3,120,000
Total # Nominal Gates	163	168	153
Million Air Passengers	78.7	89.6	78.9

<sup>6</sup> Note again that the 163 gates shown for the No Project alternative includes 52 remote parking spaces.

And yet the SDEIS/EIR claims that the No Action/No Project Alternative is seriously deficient. For example, discussion on page ES-7 states that the No Action/No Project Alternative “would fall far short of meeting the projected demand for aviation services at LAX by accommodating approximately 78.7 million passengers (a shortfall of approximately 19.2 million) and 3.1 million tons of cargo (a shortfall of approximately 1 million tons) in 2015.”

The SDEIS/EIR also portrays the No Action alternative as *de minimis* in the scope of its improvements, but allowing for increased passenger and cargo volumes, as shown in discussion from page 3-6:

*“This [No Project] alternative includes only minor airport improvements approved as of the publication of the Draft EIS/EIR in January 2001 or that were in the planning stages at that time. The improvements include minor taxiway improvements, new cargo building space, construction of at least one off-airport parking structure, and reconstruction of an on-airport parking structure. Passenger and cargo volumes would continue to increase in response to projected demand, reaching activity levels in 2015 of approximately 78.7 MAP and 3.12 MAT, respectively.”*

In essence, the Supplement to the DEIS/EIR offers the following unsupportable syllogism: Alternative D meets project goals, Alternative D is substantially the same as No Action, and No Action fails to meet project goals. As discussed more fully below (and in previous sections), we believe that this inconsistency arises from the fact that the EIS/EIR is misleading in its description of alternatives.

### **3.4 INADEQUATE ASSESSMENT OF ALTERNATIVES**

#### **3.4.1 Inadequate Definition and Evaluation of Project Alternatives**

The SDEIS/EIR fails to comply with two cornerstone elements of CEQA – that an EIR must describe a reasonable range of Alternatives that would feasibly meet most objectives, but would avoid or lessen significant effects of the project,<sup>7</sup> and that preparation of an EIR should be guided by a good faith effort at full disclosure.

The Supplement to the Draft EIS/EIR carries forward the project goals that were previously established in the 2001 DEIS/EIR. These goals included: (a) to respond to local and regional demand for air transportation during the period 2000-2015; (b) to ensure that the investment in airport capacity maximizes the return on existing infrastructure capital; and (c) to advance the role of LAX as the international commercial gateway to the region. Alternative D is presented as an option that would fulfill key aspects of the project purpose and need.

The SDEIS/EIR also emphasizes, repeatedly, that Alternative D is substantially the same as the No Action Alternative in terms of meeting transportation demand -- as measured by number of gates, number of passengers, number of aircraft operations, and cargo tonnage. Yet the No Action Alternative as presented is clearly deficient in terms of meeting demand for aviation and cargo services.

<sup>7</sup> CEQA §15126.6(f) states, “Alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project.”

If this inconsistency has a sound explanation, it is the job of the SDEIS/EIR to provide that explanation. Instead, the SDEIS/EIR is permeated with unexplained inconsistencies. Similar incongruities were apparent in the 2001 document. The 2001 Draft EIS/EIR presented Alternative C as the preferred action, yet concluded that Alternative C would have more significant unavoidable adverse effects than either of the other two build Alternatives (25 for C; 23 for A; 22 for B), and would fail to meet projected demand.

In this regard, both the Draft and the Supplement to the Draft EIS/EIR fall short of the requirement that environmental documents must provide a *clear definition of project goals* in association with the selected range of alternatives. As now presented, the data suggest either that Alternative D fails to meet essential aspects of the stated goals, or that Alternative D has not been described in accordance with full disclosure requirements.

### **3.4.2 Alternatives are Inconsistent with Baseline Data**

On close review, the numbers provided in the Tables entitled "Summary of Activity, Comparison of Alternatives and Summary of Features, Comparison of Alternatives"<sup>8</sup> do not present a cohesive picture. When compared with data provided throughout the baseline and impact analyses, information contained in this summary statement appears to be fundamentally lacking in logical internal consistency. For example, in describing assumptions made for the No Project Alternative, the Socioeconomic Technical Report<sup>9</sup> indicates, "The schedule of operations would still show variations throughout the day but the peak period would be at or exceed the airfield's capacity. Congestion, delays and passenger inconvenience would be common all year, not just during peak holiday periods." However, the "Summary of Features, Comparison of Alternatives" contradicts these claims. The Summary indicates that the No Project Alternative would have: (a) fewer all-weather delays than Alternative C (13.2 vs. 13.6); (b) fewer annual cancellations than Alternatives A and C (9,969 vs. 15,477 and 15,814); (c) more public parking stalls than Alternative B; and (d) the same number of all-weather peak operations and 3-hour average operations.

Similar inconsistencies occur with the addition of Alternative D. Most notably, the Design Day activity levels should approximate those for Alternative C given that the runway improvements are nearly identical. Further, public parking stalls and employee parking stalls are equal to or greater than other build alternatives, and rental car acreage is doubled over other alternatives. Passenger terminal square footage is 93% of Alternative C, but the passengers are 88%. This indicates faulty project design without consistent use of planning factors.

### **3.4.3 Alternative D may Exceed the Stated Growth Levels**

The SDEIS/EIR states that Alternative D evolved from a decision on the part of LAWA and the City of Los Angeles to limit growth. Alternative D does limit growth below that of Alternative A and B. However, as discussed in § 3.1, this alternative would not limit LAX to 78.7 MAP as claimed. Considering the extensive improvements to the airfield, passenger terminals, roadways and other facilities, it is more reasonable to assume that Alternative D will achieve service levels equaling or exceeding those of Alternative C (90 MAP). Furthermore, many elements of Alternative D resemble the Phase I construction of other alternatives: in future years, land area in

<sup>8</sup> Pages ES-9 through ES-11.

<sup>9</sup> Section 5.1.1.

the western part of the airport can be used for additional terminal space, and available apron space can be readily converted to remote terminal space. These possibilities merit evaluation in the SDEIS/EIR.

The SDEIS/EIR makes certain assumptions that require further explanation or verification. Why for example do commuter flights increase from 109,000 in Alternative C to 183,000 in Alternative D? If commuters fail to materialize, will the excess capacity be used for air carrier aircraft? Similarly, as discussed earlier in regard to the No Project Alternative, air cargo growth may also not be constrained.

Many of the more capital-intensive improvements in Alternative D seem to contravene the intended purposes. For example, Alternative D would require that significant resources be devoted to separating runways and demolishing existing terminals to provide for the New Large Aircraft. In fact, many major airports in the USA have already taken a position that they will not underwrite these costs. Yet easing the way for the New Large Aircraft at LAX will surely enhance the concentration of air service at LAX to the detriment of the other regional airports. If provisions for the new 600-seat New Large Aircraft were instead placed at Ontario International Airport, it would provide a powerful incentive for the airlines to increase service there. It takes many connecting flights to fill a 600 seat aircraft; if LAX is designed to accommodate these aircraft, one outcome will be to strongly reinforce the ability of LAX to attract the bulk of the region's air service.

The stated security enhancement goals can be achieved without the expense and vulnerabilities of an Automated People Mover by building the three principal ground processing landside facilities in a strategic configuration closer to the Central Terminal Area.

#### **3.4.4 Regional Alternatives would be Best Served by Relocating New Large Aircraft Inland**

The Master Plan is at odds with itself in regards to constraining or expanding LAX. As set forth in the Draft Master Plan and SDEIS/EIR, serious economic consequences will befall the region if LAX is not expanded to accommodate the unconstrained demand, and then the Supplement presents a Preferred Alternative that purports to do just that. The recent growth spurts at Long Beach and John Wayne will soon peak out. LAX will continue to attract cargo and international flights because the carriers continue to resist using other regional airports, particularly those in the inland empire. The proposed expansion of LAX and particularly the provisions for the New Large Aircraft are simply another chapter in the long history of incremental growth. As soon as these improvements are completed in twenty years or so, there is every indication that there will be another round of master planning to continue that pattern. As stated above, this master plan claims to support a regional approach to air transportation, but does not incorporate the one feature that would most secure it – i.e., relocation of the New Large Aircraft improvements to Ontario or Palmdale International Airports.

#### **3.4.5 Additional Alternatives to Evaluate**

Under CEQA, the range of alternatives addressed in an EIR should be governed by the 'Rule of Reason' which states that an EIR need only address those alternatives necessary to provide decision makers with a reasoned choice. Under this Rule, the selection of alternatives is guided by feasibility, efficacy in reducing or avoiding impacts, and ability to foster public participation and informed decision-making. 'Feasibility' includes site suitability, economic viability, availability of

infrastructure, compatibility with relevant planning documents and jurisdictional controls, and proponent access in cases where the alternative involves another location. In considering alternate locations, the "key question" to be asked is whether any of the significant project impacts could be lessened or avoided by relocating the project to another site.

**Relocation of New Large Aircraft Facilities to another Airport:** The Rule of Reason applies to the LAX Master Plan SDEIS/EIR, and this document will not meet the standards of adequacy until it evaluates relocation of all or part of the project to another site. The County of Los Angeles requests that LAWA provide such analysis for the following alternative: relocation of facilities oriented to the New Larger Aircraft to Ontario International and/or Palmdale International, both of which *were designed to accommodate international travel, are underutilized, and are owned and operated by LAWA.* Such an alternative would almost certainly enable LAWA to reduce project impacts around LAX substantially, without concomitant impacts at the relocation sites.

**Shift Airport Improvements from the East to the West:** The County also requests that LAWA evaluate an alternative in which improvements are shifted away from human habitat on the north and east and into the butterfly habitat on the west. We understand why LAWA may have wished to avoid this assessment in light of the complex background and history surrounding the El Segundo Blue Butterfly Habitat Restoration Area and the Los Angeles/El Segundo Dunes. However, the path of omission forecloses an important opportunity for informed decision-making. In this case, *the proposed Master Plan improvements will cause new, significant and unavoidable adverse new impacts to thousands of human beings* (i.e. elevated noise levels, increased single-event exposures, increased school disruption, loss of industrial jobs and historical resources, elevated pollutant levels, etc.). Due to omission *decision makers will not know* whether it may have been possible to lessen or avoid these impacts by shifting the improvements westward and instead imposing the significant unavoidable adverse impacts on a population of 7,000-87,000 endangered El Segundo Blue Butterflies. *Decision makers will not know* how the mitigation costs for the human impacts would compare with the mitigation costs for relocating butterfly habitat. Due to omission, *decision-makers will be unable fulfill their statutory obligation* to weigh, balance and consider the trade-offs, costs and opportunities associated with environmental justice and resource protection. To avoid this outcome, the County of Los Angeles asks that LAWA provide the public and LAWA decision-maker with a full and complete assessment of this alternative.

**Redesign and Reprioritize Proposed Airport Improvements:** Finally, in furtherance of finding an environmentally superior alternative that fulfills the basic objectives of the project, the County asks that LAWA develop, consider and comment on a new Alternative that would solve the urgent needs LAX in a timely manner and also eliminates costly, time consuming and controversial items. The following elements should be addressed:

- ▶ Fast track the addition of international gates on the west side of Tom Bradley International Terminal.
- ▶ Fast track the lengthening of RW 6R/24L in its present position.
- ▶ Widen the north complex runways by moving RW6L/24R to the north as proposed in Alternative C.
- ▶ Eliminate the Ground Transportation Center and the Automated People Mover. Prohibit private vehicles on World Way in the Central Terminal Area, and provide security screening for a fleet of zero emission vans that would serve the many airport and privately owned garages around the airport. (Note that this trend is already evident.)

- ▶ Eliminate all provisions for the New Large Aircraft including the Design Category VI spacing of the north complex runways and provision of larger aircraft gates.
- ▶ Provide additional space in the Central Terminal Area as proposed in Alternative D.
- ▶ Close Pershing Drive to all public access.

#### **3.4.6 Scoping Outreach did not Include Alternative D**

LAWA made the 2003 SDEIS/EIR available for public comment in July of 2003 to update information presented in the 2001 Draft EIS/EIR and to integrate Alternative "D" into the environmental review process. Alternative D, the "Enhanced Safety and Security Plan," introduces numerous infrastructure and concept changes into the alternatives analysis including a reprioritization of project goals to emphasize safety. In turn, the shift in project objectives changes the manner in which alternatives must be assessed in the environmental analysis. The objectives of the CEQA process include fostering interagency coordination early in the review of projects and encourage public participation in the planning process.<sup>10</sup> Similarly, the purpose of the scoping process required by NEPA is to identify and disclose all of the potential Alternatives under consideration by the lead agency. This provides the public with the greatest ability to understand project issues and thus contribute useful information, suggestions and comment for consideration by the lead agency decision-makers.<sup>11</sup>

In the present case, the scoping outreach and early consultation with Responsible and Trustee Agencies did not include Alternative D, which became the preferred project. This denies the public of the opportunity to comment, and it also raises questions as to the validity of the process by which "D" became the preferred Alternative -- between the 1996 circulation of the Notice of Preparation (NOP), and scoping outreach, and the circulation of the 2003 SDEIS/EIR. If the objectives and scope of the project changed sufficiently between initial outreach and circulation of the Supplement to the Draft to warrant incorporation of a preferred Alternative that was not even included in the original Draft EIS/EIR, then the NEPA scoping process should have started again. CEQA also requires, at minimum, circulation of a comprehensive Subsequent Draft EIR that includes full disclosure of the alternatives analysis and process used to select the preferred Alternative.<sup>12</sup>

### **3.5 INADEQUATE AND OUTDATED BASELINE SETTING**

#### **3.5.1 The 1996 Baseline is not Applicable to Existing Conditions in 2003**

The Draft and Supplement to the Draft EIS/EIR both comply with the CEQA requirement that the baseline be defined by conditions extant at the time the Notice of Preparation was released. However, because the baseline was already five years old at the time of the 2001 Draft EIS/EIR release, and is now 7 years old for analyses contained in the Supplement, the review fails to comply with the intent of CEQA to facilitate an understanding of changes in the environment associated with the proposed project. Use of the five-year old baseline, coupled with the document's frequent assumption that mitigative actions addressing air quality, noise, traffic, water quality, and other topical issues will occur primarily (or only) through project-related activities, tends to consistently overstate the impacts of the No Project Alternative relative to other Alternatives. Although the

<sup>10</sup> CEQA Guidelines § 15002, § 15086, and § 1587

<sup>11</sup> NEPA Guidelines: 40 C.F.R. § 1508.25

<sup>12</sup> CEQA Guidelines §15162(a)

2003 SDEIS/EIR provides the “normally” accepted “baseline” of conditions extant at the time the NOP was released, CEQA Guidelines by implication allow the Lead Agency to use a baseline different than the NOP released date when “non-normal” circumstances occur.<sup>13</sup>

In the present case, several “non-normal” circumstances have occurred that necessitate an updated baseline. In particular, the NOP is now seven years old and conditions extant in 1996 do not represent existing conditions at the project site. More significantly, the extraordinary events of September 11, 2001 significantly altered baseline conditions – physical and social -- from what existed when the NOP was released. So fundamental were these changes that LAWA withdrew the then-pending Draft EIS/EIR and Master Plan, and proceeded to formulate an entirely new alternative, which it then identified as its preferred project. Clearly, the 1996 baseline material provides an inadequate yardstick against which to measure and understand the impacts of Alternative D or any other project alternative (especially including the No Action Alternative).

It is generally understood that air travel will not soon return to pre-9/11 conditions. After 9/11, LAX implemented new operational procedures that in turn changed (1) the location and distribution of passengers and visitors, (2) the length of time passengers are at the airport, (3) the number of passengers arriving, and (4) the number of aircraft taking off and landing.

For all of these reasons the 2003 Supplemental Draft EIS/EIR fails to comply with the intent and judicial interpretation of CEQA relative to the Baseline Analysis – i.e., to facilitate an understanding of changes in the environment associated with the proposed project and project Alternatives. Furthermore, use of this 7-year old baseline tends to consistently overstate the impacts of the No Project Alternative relative to other Alternatives. When coupled with the Draft EIS/EIRs frequent assumption that mitigative actions addressing air quality, noise, traffic, water quality, and other topical issues will occur primarily (or only) through project-related activities, the error is even more apparent. CEQA clearly intends that the baseline should reflect the existing level of actual development to the maximum extent possible; since the Draft EIS/EIR baseline is set at 58 MAP (vs. 67+ MAP at present – a 15%+ discrepancy), this intent is clearly unmet.

In order to achieve an adequate document, LAWA needs to provide an updated baseline for all topical sections where current data is available. Doing so will minimize the risk of an unfavorable ruling such as the situation encountered by Logan Airport in Boston. The United States Environmental Protection Agency rated the 1999 Logan Airport EIS as “Environmental Objection, Insufficient Information” for, among other concerns, the use of the outdated baseline year of 1993.

### **3.5.2 Baseline Terminology is Inconsistent and Confusing**

The baseline data is also inconsistent. This problem extends not only to the many different years used as the “baseline”, but also to incorrect identification of the base year for given data sets. For example, the 4<sup>th</sup> quarter 1996 database cited for the noise calibration does not match actual 4<sup>th</sup> quarter data according to published noise contours.

---

<sup>13</sup> CEQA Guidelines § 15125

**Table 3  
DIFFERENCES BETWEEN EIS/EIR NOISE IMPACT  
& LAWA 1996 QUARTERLY REPORT**

	Dwellings Inside 65 CNEL	Population Inside 65 CNEL
LAWA 1996 4 <sup>th</sup> Quarter Report	31,968	85,907
EIS/EIR Table 4.1-2 For 1996	16,900	49,000
Difference	<b>15,068</b>	<b>36,907</b>

The question therefore arises as to how LAWA actually defines the “Environmental Baseline.” Is the Environmental Baseline the same as the “Adjusted Environmental Baseline?” Or the “Future Without Project Scenario” (i.e., cumulative without project)? Or the “No Action/No Project Alternative?” Or none of these? Although each of these scenarios may serve a useful purpose, such gains can be realized only when the scenarios are properly defined, adequately differentiated, and consistently employed – none of which is true for the LAX Master Plan SDEIS/EIR. Does the environmental baseline include the phase-out of older, noisier Stage 2 jets, as assumed with the build Alternatives? The forecast reduction in noise exposure for Alternatives A, C and D, as compared with the No Action/No Project Alternative,<sup>14</sup> appears to conflict with the numbers cited in the penultimate paragraph on page ES-21. It is not clear which of the congestion relief package features are scheduled for completion in Phase 1 and which will be deferred to Phase 2.

The Summary of Alternatives<sup>15</sup> notes, in discussing baseline conditions, that “physical conditions are represented as they existed in 1997 and in more current years when possible to provide the most up-to-date information available.” It is not clear why “up-to-date” information is possible in some categories but not others. LAWA has had five years to update the information and is anticipating spending significant funds to implement the project; there is in truth no justifiable reason for denying the public and LAWA decision-makers access to current information.

LAWA must clearly define each of the baseline and future condition scenarios used in the 2003 Supplemental Draft EIS/EIR, with an explicit statement of the rationale for its use. Perhaps LAWA should delete one or more of these scenarios from discussion. Referenced scenarios include “environmental baseline,” “environmental baseline (1996),” “environmental baseline (2000),” “adjusted environmental baseline,” “environmental baseline (2015),” “non-LAX development having cumulative impact,” “future without project scenario” (i.e., cumulative without project), and “No Action/No Project”. Incredibly, the Glossary defines none of these terms. The analysis constantly shifts the baseline timeframe to manipulate the comparative assessment of project impacts -- using 1996 baseline data for traffic, air and aircraft noise, while using 2000 through 2002 for biology, earth, and water resources. The frequent shifting from one baseline nomenclature and timeframe to another is, at best, confusing. At worst, it conceals the underlying impacts that this 2003 Supplemental Draft EIS/EIR is intended to illuminate.

<sup>14</sup> First bar chart on Page ES-22 titled, “Population Exposed to Noise Above 65 CNEL in 2015.”

<sup>15</sup> 2001 Draft EIS/EIR, Section 3.2.1, Pages 3-8 through 3-18.

### **3.5.3 Baseline Terms are Not Defined**

There is no clear definition of the term “Unconstrained Forecast” anywhere in the Environmental Summary or in Sections 1, 2 or 3. The reader is left to guess what the term is intended to portray, where it fits into the long-range forecasts for LAX and other regional airports<sup>16</sup> and the estimates of rising aviation demand.<sup>17</sup>

This lack of definition and intent extends to the term “Adjusted Baseline.” This condition has never existed, and will never exist (i.e., 1996/97 airport activity and physical facilities plus 2005 and 2015 land use activity and regional traffic). There is no basis in CEQA and/or NEPA for use of this term and it therefore requires either clarification or removal from the document in favor of more traditional and more clearly defined comparative data.

### **3.6 PROJECT PHASING DOES NOT REFLECT STATED PRIORITIES**

The proposed project phasing illustrates the Master Plan’s embrace of an environmentally inferior alternative. The most pressing problems on the airport are the lack of adequate runway length on the north complex, the security threat of private autos near the terminals, and the lack of international gates. Taxiing of loaded B747 aircraft to the south runway complex and the bussing of international passengers across the airfield creates air quality impacts, congestion, delay, and general lack of capacity. Yet the Phase 1 construction plan addresses none of these issues for many years and instead concentrates initially on the fringes of the airport preparing for the Ground Transportation Center and Intermodal Transportation Center, and on demolishing and rebuilding perfectly useable terminals in preparation for moving a runway to accommodate the New Large Aircraft. This sequence does not match the urgent environmental and congestion priorities evident on the airport.

### **3.7 APPEARANCE OF ADVOCACY**

Both the Draft EIS/EIR and the Supplement to the Draft EIS/EIR contain numerous comments and conclusive statements that create an appearance of project advocacy. This is inappropriate given the policy guidelines contained in CEQA and NEPA. It undermines confidence in the objectivity of the analyses and casts doubt on the Lead Agency commitment to full disclosure. We are particularly concerned about technical assumptions that understate the growth potential and overstate the benefits of Alternative D, as paired with assumptions that overstate the adverse impacts of the No Project Alternative (please see §3.5.2 above for further elaboration of this concern).

### **3.8 INADEQUATE SCOPING OUTREACH**

Both the 2001 Draft EIS/EIR and the 2003 Supplemental Draft EIS/EIR make frequent mention of the regional significance of LAX and of the Master Plan process. This emphasis on regional context is evident in discussions and analyses provided throughout the text, but more significantly is an integral part of the Purpose and Objectives statement. As stated, *“The purpose and objectives of the Master Plan are to provide...sufficient airport capacity for passengers and freight in the Los*

<sup>16</sup> 2001 Draft EIS/EIR, Table 1-13.

<sup>17</sup> 2001 Draft EIS/EIR, Depicted in the Exhibit on Page ES-3.

*Angeles region to sustain and advance the economic growth and vitality of the Los Angeles region...*<sup>18</sup>

Nevertheless, the original scoping outreach effort did not include a single agency within the county governments of San Bernardino County, Orange County, Riverside County, or Ventura County.<sup>19</sup> Nor did the scoping outreach include any municipal agencies, airport officials, businesses, or services within any of these four counties, although many such entities would have an interest in the regional issues addressed and in the development and analysis of project Alternatives. This is a serious omission, particularly in light of the NEPA mandate to establish close nexus between project goals and project Alternatives. It may also explain why none of the project Alternatives incorporates even minimal regional elements.

Furthermore, the scoping process is intended to identify and disclose all of the potential Alternatives under consideration by the lead agency. This provides the public with the greatest ability for input and understanding into the potential project and offers an opportunity to comment. In fact, it is common for lead agencies to remove Alternatives from further consideration between the scoping process and the distribution of the Draft EIS/EIR. In this case, the scoping outreach did not include Alternative C (the 2001 preferred alternative) or Alternative D (the 2003 preferred alternative). As noted previously, this approach forecloses the opportunity for public comment and casts doubt on the adequacy of the process by which LAWA screened and selected the alternatives. In any case, the SDEIS/EIR fails to meet CEQA and NEPA standards because LAWA did not disclose the preferred Alternative D to the public prior to document release.

Furthermore, although LAWA presented the original 2001 draft master plan at a number of public meetings held specifically for minority citizens, it is unfortunate that the same level of outreach has not occurred for the Supplement to the Master Plan. The minority segment of the population will experience the greatest exposure to the effects of changes at LAX. In particular, the County's interest in this issue is again with the unincorporated Lennox community. LAWA should develop a more thorough outreach program for Alternative D that fully informs the citizens in this area of the complete range of options and how the proposed master plan would specifically affect them. LAWA should fully disclose the decision to extend runways to the east and avoid the endangered species habitat to the west along the beaches.

### **3.9 PROGRAM ASSESSMENT OF BASELINE, IMPACTS, MITIGATIONS**

The analytic framework of the 2001 Draft EIS/EIR was described as one in which the document was meant to set the basis for "tiered" environmental review pursuant to both NEPA and CEQA.<sup>20</sup> The tiered concept assumes that subsequent environmental documents will be required to focus the analysis on site-specific, project-level issues, impacts, and mitigation measures. The 2003 Supplemental Draft EIS/EIR does describe many concepts in more detail, but continues to keep the analysis at a program level. The program-level analyses and vague mitigation commitments may not provide the Federal Aviation Administration (FAA) with an adequate basis on which to issue an "unconditional approval" of the airport layout plan (ALP). An unconditional approval assumes that

<sup>18</sup> 2001 Draft and 2003 Supplemental Draft EIS/EIR, Section 2.1, Page 2-1.

<sup>19</sup> Based on review of EIS Agency Scoping Coordination Letter Mailing List and other materials provided in Appx. A.

<sup>20</sup> Section 4, Pages 4-5 and 4-6.

LAWA has completed appropriate analyses for all development actions, and the circulated document does not fulfill this requirement.

### **3.10 GROWTH & CUMULATIVE IMPACTS MAY BE UNDERSTATED**

The Supplement to the Draft EIS/EIR bases its analysis of growth inducement on projected cargo and passenger activity. It concludes that by 2015, Alternative D would yield a direct economic output of \$63.7 billion and 350,500 jobs, plus an indirect economic output of \$93.8 billion and 629,000 jobs through a multiplier effect of 1.5. The EIS/EIR assumes that all of the jobs would be within the 5-County SCAG region, 78% of the jobs would be within a 20-mile radius, and 40% within a 10-mile radius of LAX. Finally, it concludes that Alternative D would be similar in terms of job formation to the No Action/No Project Alternative, differing by an increase of about 1%. With respect to collateral development, the EIS/EIR finds Alternative D impacts equivalent to the No Project Alternative for LAX Northside<sup>21</sup>, Westchester Southside and Belford, and less than the No Project Alternative for Continental City and Manchester South.

In taking this approach, the document ignores the cumulative synergistic effects that would result if LAX Northside is constructed in tandem with the LAX improvements, as proposed under Alternative D (but not Alternatives A, B or C). The increase in cargo will create corresponding increases in off-airport services and place extraordinary pressures on commercial and residential land uses in the immediate neighborhood. Apart from a discussion of the proposed cap on peak hour traffic from the LAX Northside project, the Growth-Inducing Impact Analysis (which is also the Cumulative Impact Analysis for Alternative D) does not address these more localized impacts at all, even though the history of LAX shows them to be potentially significant.

## **4.0 COMMENTS SPECIFIC TO THE SUPPLEMENT TO THE DRAFT EIS/EIR**

### **4.1 AIRPORT SECURITY ASSESSMENT IS INCOMPLETE**

#### **4.1.1 Summary of Findings Concerning the Analysis of LAX Master Plan Security**

As detailed at length in the discussion that follows, the security content of Alternative D documentation is inconsistent and contradictory, leaving important questions unanswered and an urgent need for definitive clarification of the true policy and planning direction. The security analysis has been treated in an aloof and disconnected manner, is preoccupied with the public approaches and the eastern half of the infrastructure; and fails to address total airport security vulnerabilities and risk management planning. These inconsistencies imply an absence of coordination in the planning process. Of greater concern is the possibility that the professed emphasis on security enhancement is not the true priority in terms of planning and phased implementation.

There is a strong case for the separate ground processing facilities and for dispersal of target populations by reducing density, controlling and limiting vehicular access and proximity. Access

<sup>21</sup>LAX Northside is approximately 330-acres of land located on the north side of LAX (bisected by Westchester Parkway) and owned by LAWA. Tentative Map #34836, approved for this site during the mid-1980s, would allow development of about 4.5 million square feet of office, hotel, restaurant, retail, research and airport-related land uses.

roadways merit greater emphasis on security design, demonstrating a clearer commitment to specific contingencies while anticipating traffic impacts.

The separation concept is diminished in value by the expensive and vulnerable mass transit link between the Central Terminal Area and remote landside ground facilities. It is further diminished by the lack of Flow Process Mapping data, the risk of task overload and failure to achieve target reduction, and by potential alienation if the public perceives screening requirements as excessive.

For reasons discussed in this report, we believe that the Automated People Mover is a weak link in the overall security plan. Security enhancement goals can be achieved without the Automated People Mover by moving the 3 main ground processing facilities closer to the Central Terminal Area. The western half of the airport should be drawn into the Plan with all subcomponents receiving 'substantial treatment' as required of federal regulators and stated early in the analysis. In the course of addressing the western end of the airport, *and as a matter of urgency*, LAWA should conduct a detailed assessment of the vulnerability to terrorist attack. LAWA should give serious consideration to the permanent closure of Pershing Drive as a public thoroughfare.

LAWA should provide an illustration that shows anticipated concentric ring security applications along with an explanation of the capabilities for surveillance of adjoining commercial and residential neighborhoods. Finally, the analysis should offer a quantitative projection of the demands on security and law enforcement personnel, and the intended ratio of manpower to technological devices.

#### **4.1.2 Introduction to the Analysis of the LAX Master Plan Security Component**

The LAX Master Plan Security Component addresses known and implied security issues, with a focus on Alternative D (the Enhanced Safety and Security Alternative), while also referencing the more limited discussions found in the Master Plan and SDEIS/EIR documents as a whole. The events of September 11, 2001 are commonly referenced in the Alternative D documentation, and security issues predictably appear in documentation released by the City of Los Angeles on July 9, 2003. However, it has been more difficult to obtain security plan elements for earlier plan options, namely Alternatives A, B and C, and also the No Project Alternative.

Fundamental to the integrity of the exercise is simulation of the process by which an ordinary member of the public would gain access to this public documentation. Although airport security is a relevant topical in the context of environmental review, it did not receive any attention in the pre-9/11 public deliberations for the 2001 LAX Master Plan. This is an extraordinary fact considering the status of LAX as a world-class destination and departure airport. The public documentation search process is therefore discussed here because the security content, its location within the Master Plan and the priority afforded to it, bears directly on the credibility of the stated title of Alternative D, 'The Enhanced Safety and Security Initiative' and therefore upon the worth of the security planning component.

The documentation is voluminous and consequently electronic key word searches were employed to locate security related sections in the earlier documentation, i.e. up to June of 2001. Key words used included 'security', 'threat' and 'terrorism;' Master Plan documentation published during 2003 was

also searched using electronic means. The major portions of the documentation subjected to analysis from the security perspective, after search and filtering are:

- ▶ The LAX Master Plan SDEIS/EIR: Chapter 3 Alternatives (Including Proposed Action).
- ▶ LAX Master Plan Addendum Draft dated June 2003.
- ▶ Appendix I to the LAX Master Plan Addendum Draft: Comparative Security Analysis of Alternative D and the No Action/No Project.

#### **4.1.3 Review of the LAX Master Plan Supplement to the Draft EIS/EIR**

**Chapter 3, Alternatives:** The Introduction notes that Council on Environmental Quality (CEQ) regulations for NEPA require federal regulators to “*Devote substantial treatment to each alternative considered in detail...*” The SDEIS/EIR offers an historical explanation of the Draft Master Plan and the context in which Alternative D was developed. An excerpt from page 3-1 illustrates some of the extraordinary circumstances applicable to long-term security planning:

*“Alternative D is designed to protect airport users and critical airport infrastructure in response to the increased risk of terrorism aimed at aviation and commercial assets. The Plan is designed with the flexibility to incorporate evolving federal airport security requirements. Alternative D is also designed to enhance the on-airport presence of law enforcement and emergency response teams.”*

The words ‘flexibility’ and ‘evolving’ effectively equate at the time of public deliberation to ‘unknown’. The discussion of baseline conditions (Ch. 3.2) does not address security planning in terms of existing conditions, and, the discussion of airport security (Ch. 3.3.1) provides no explanation for the failure to address security planning in the pre-9/11 options. A vague attempt is made to reassure the reader that security plans are available for Alternatives A, B, and C should these be chosen (as opposed to Alternative D), yet the discussion is wholly inadequate. Noting that ‘these alternatives would provide on-airport space for the Transportation Security Administration to conduct its mission,’ the report goes on to state:

- ▶ *“At the time this supplement to the Draft EIS/EIR was published, the federal government’s security requirements were continuing to evolve and LAWA officials were working with TSA to determine and accommodate its needs to the greatest extent possible,”* and
- ▶ *“...it is anticipated that an extensive array of security features and operational practices if/as required could be accommodated by any of the build alternatives.”*

These statements suggest that the public disclosure of security plans is unnecessarily vague, and that security planning has been overly deferred to federal regulators.

The SDEIS/EIR summarizes conceptual points making up the new approach to airport security on page 3-27 under Alternative D: “*The end goal of this design concept is to achieve a new balance between the needs of both passenger security and passenger convenience.*” Besides claiming public safety and security benefits in very sweeping terms, it also refers to the physical layout of Alternative D and mentions the Master Plan boundaries. But it does not provide any detail concerning the features of the security plan that will deliver these benefits.

The description of Alternative D Facilities (p. 3-43) repeats the message that "*Alternative D is designed to be flexible in accommodating new federal security requirements.*" There follows brief mention of 'important security features' referring to elimination of private vehicles from the Central Terminal Area roadways and elimination of the public parking structures within the Central Terminal Area. This and subsequent statements are not so much 'security features' as 'security objectives' or 'security outcomes'. The difference is important, because it is the details that impart greater understanding and thereby enable the public to judge and offer comment. For example, when the text states that passengers and employees will access the Central Terminal Area via the Automated People Mover, there is no explanation of the methodologies that would be used to secure the safety of that journey. It is thus unclear that the APM would be safer than the Central Terminal Area public parking facility. The document also declares that "*The presence of law enforcement and emergency response teams would be enhanced with Alternative D.*" Although it then goes on to speak of two new Aircraft Rescue and Fire Fighting facilities, a new police headquarters and Terminal police posts, again it resorts to generalized claims of the advantages without supportive detail. In fact, the planned police headquarter (at Westchester Parkway and Emerson Avenue), is located outside of the operating boundary of the airport.

In subsequent pages (3-47 to 3-56), the following topics are listed and discussed without reference to any specific security component: Terminal Facilities; Traffic/Parking/Circulation Facilities; Automated People Mover; Cargo Facilities; Ancillary Facilities; Land Acquisition and Relocation; Collateral Development; and Proposed Phasing. The text states that publicly available data show that airport facilities have to be upgraded to improve security. However, the Transportation Security Administration is not the only arbiter of security issues. Security is becoming an integrated component across all airport functions. Given the size of the LAX Master Plan project, it is reasonable to expect discussion of the security plan for each listed action, each function and each facility. Cargo and Phasing offer good illustrations of this need: Cargo security is currently the focus of attention by TSA and others. It is unarguable that cargo security processes will affect airport operations, logistics and facilities access over the next 2 years, but the Supplement does not appear to anticipate this. Moreover, the 3-part Phasing Plan does not even acknowledge advance security preparation for a protracted construction project during which exceptional and extraordinary vulnerabilities will apply to the airport and its environs. The new police headquarter is not listed in the phasing, nor is there any apparent recognition of the significant perimeter and core security demands. All of these elements should be addressed before project commencement.

Discussion of the Preferred Alternative (Ch. 3.5) and the CEQA Environmentally Superior Alternative (Ch. 3.6) does not elaborate on the security benefits from traffic and incident management. Security plan elements discussed in other parts of the Master Plan suggest that the security surveillance and detection system will extend well beyond the airport infrastructure into the wider public environs, but there is no detail to confirm this. We request that LAWA provide further discussion, in keeping with full public accountability, so that long-term impacts can be considered.

The role of the Transportation Security Administration is briefly discussed in Chapter 4 (p. 4-698). The remainder of this subsection describes post 9/11 security measures, including government-mandated deadlines on baggage screening that LAWA states it has met, together with current and long term plans for deployment of 'inline' screening systems. A statement in this discussion indicates that: "...TSA is in the process of developing additional recommendations and requirements to increase security at the nation's airports" but provides no details. We request

discussion of the additional TSA recommendations and requirements and how they may be applied to the LAX Master Plan.

#### **4.1.4 Review of the LAX Master Plan Addendum Draft June 2003**

The Executive Summary to the Draft Addendum speaks of Alternative D as 'a new design approach to securing airports for the future' (page i-1). It states that "*The alternative would incorporate, to the greatest extent possible, [TSA] recommendations as they are developed as well as the latest passenger and baggage screening technologies;*" and "...*would also enhance the on-airport presence of law enforcement, surveillance, security, and response teams.*" These statements merit further explanation as to how this would be accomplished, and with what impact. The following page (i-2) describes conceptual goals for deterrence and prevention of terrorist attacks. In shorter form the goals stated are:

1. Reduced concentrations of people in the public areas of the airport;
2. Relatively rapid movement of departing passengers and baggage through the necessary processes to the secure (sterile) parts of the airport; and
3. Reducing vehicular access to the Central Terminal Area and avoiding concentrations of people and vehicles in other ground processing areas.

On the same page, it is stated that, "*Alternative D would utilize an expanded LAWA-operated FlyAway Program throughout the region to disperse passenger processing. This service would include remote check-in of passengers and baggage, and provide direct access into the Central Terminal Area. Refer to Appendix I for a detailed assessment of the security and safety features of Alternative D.*" Although the foregoing suggests that an explanation will be forthcoming from Appendix I, our analysis has shown that Appendix I *does not present a detailed assessment* as promised, especially when compared with other parts of the documentation. Accordingly, some comment is due concerning the generalizations stated in the Executive Summary.

As noted above, the third goal is to permit only known, screened and controlled vehicles into the Central Terminal Area; this means that some vehicles will still have access. Expansion of the FlyAway program throughout the region would also offer access to the Central Terminal Area. These two factors may compromise the intent to prevent vehicle bombs imposing heavy casualties in and around the Central Terminal Area. Terrorists seeking weak links in the protective systems would have the opportunity to exploit both approaches, e.g. by hijacking, stealing or attaching bombs to vehicles that they know have privileged access. The County requests further review and comment on this issue.

Furthermore, a number of questions arise about the modes of permit, identification (vehicle and driver) and screening of so-called 'controlled vehicles.' Access and special egress road design, emergency diversion contingencies, fully equipped road vehicle inspection checkpoints, chokepoints, and barriers -- all away from the concentrations of people -- come into play here. An efficient system should impose structural constraints on all roadways, with special allowance for those passengers and foreign drivers who will make mistakes or misinterpret airport road signs. This need appears to have been underestimated (in contrast, Appendix I does enter into speculative possibilities on roadway security controls) and we ask for a reassessment of this issue.

It is extremely doubtful that regional expansion of the FlyAway service can satisfactorily and consistently secure a fully screened passenger and baggage load to justify a bus being brought close to the Central Terminal Area, especially given the threat of suicide attack. The description of the proposed passenger screening systems for those passing through the Ground Transportation Center, Intermodal Transportation Center and Rental Car facilities will be discussed later, as there are some contradictions to address. But it is necessary to point out here that a 'level one' screening will not be adequate for passengers at the FlyAway bus stations. The TSA 'level two' screening would be essential, but would have to be repeated in the Central Terminal Area because of the mixing of people from different modes of access at that location. It is unlikely that LAWA can consistently operate fully equipped remote resources (and sterile station-to-bus areas) to accomplish full screening prior to embarking on the FlyAway bus, and then keep that bus closed and secure for its entire journey. Such a system is prone to error and penetration. Moreover, the 'hassle factor' from lengthy duplication of screening operations would to some extent defeat the initial reason for using this service. We request further review of the screening operations, including assessment of the feasibility of operating the remote resource to complete screening in advance of the FlyAway bus.

Still on page i-2, the document briefly describes the Ground Transportation Center as the primary pick-up and drop off for LAX passengers. It states "*The facility would combine a controlled and monitored roadway access system with first level passenger security screening and profiling to further enhance the safety and security of all passengers using LAX.*" The interested observer might wonder what this actually means. Parts of the Draft Addendum on this topic contradict other parts of the same document, creating confusion if not doubt about the ultimate intention for security risk management of the various facilities. LAWA has made an effort in the right direction, but the analysis below shows that the documentation for Alternative D must be significantly expanded before its title as the enhanced safety and security alternative can be justified.

Discussion of the Terminal/Passenger Processing Facilities for Alternative D (Ch. 2.2) includes a statement that, "*The Central Terminal Area reconfiguration would prohibit private and commercial vehicle access to the area, eliminating the threat of vehicular blast at the curb front, which exists today in the Central Terminal Area.*" What vehicles would LAWA permit to enter the area? Would FlyAway buses and 'screened, controlled vehicles' be allowed, as mentioned in the Executive Summary?

Text on page 2-20 mentions a baggage tunnel that connects the new airport terminals with the Ground Transportation Center, and notes that this tunnel would allow passengers to check their baggage at the Ground Transportation Center, with arriving passengers using the system to re-check their baggage back to the Ground Transportation Center from the Central Terminal Area. This statement is somewhat confusing -- does this refer to Skycap check-in service only? What security process would LAWA use for departing passengers? Is the baggage tunnel available for use by departing passengers who will check in at the Central Terminal Area? If so, is there a plan to screen 100% of this baggage? Further, what are the implications for synchronizing transit of passengers and their baggage to the Central Terminal Area?

Ch. 2.2.5 describes an airside secure underground Automated People Mover linking the West Satellite Concourse with the reconfigured Central Terminal Area. Given that a geological fault exists in or close to the area, we request discussion concerning the resulting safety implications as well as contingency plans for emergencies including Automated People Mover breakdown.

**The Ground Transportation Center:** Discussion in Ch. 2.2.8 notes the theoretical role of the Ground Transportation Center in drawing concentrations of people away from the check-in queues by separating curbside pick up, drop off, and parking. Some of the statements in this discussion require further clarification:

*“...limiting large congregations of passengers by moving ticketing, security screening, and baggage claim to the Central Terminal Area would improve passenger safety and security. Passengers would be subjected to a first level security screening process at the Ground Transportation Center. It is anticipated that the process would include a random checking of baggage and passengers using sniffing dogs, video surveillance systems, and other security devices. Second level screening would occur at the Central Terminal Area; however the Ground Transportation Center would be designed to accommodate second level screening at any time.”* (Underlined words relate to later comment in this review).

Eight major functions are proposed to be included in the Ground Transportation Center, including E-Kiosk check in, Skycap baggage check-in and first level ‘passenger security screening.’ We assume that the passenger screening would also apply to visitors and employees (not just passengers), but it is unclear what is meant by ‘random checking.’ The deployment of explosive detection canine units, given their limitations, suggests that far less than 100% of people and bags would be screened at the Ground Transportation Center. Please provide further clarification for this part of the plan.

Discussion of the baggage tunnel (p. 2-36) tends to reinforce the assumption that the baggage transit system between the Ground Transportation Center and the Central Terminal Area will not incorporate EDS screening or, if some check is applied, it will not be to the standard required for aircraft loading. The discussion leaves open the question as to whether passengers not using the Skycap service would be able to send baggage through the tunnel to the Central Terminal Area, but it does say ‘*Passengers that do not use Skycap baggage check-in may carry [note, not ‘must carry’] baggage on the Automated People Mover*’. There are two important qualifying statements about the process: “*Bags carried by passengers on the Automated People Mover would need to be checked by the appropriate airline in the Central Terminal Area. No airline agents are initially anticipated to be located in the Ground Transportation Area.*” The foregoing suggests a confused and difficult process, particularly for passengers who do not use the Skycap service (potentially 60% of all LAX traffic).

There is also risk of a terrorist attack via baggage used to carry a device for detonation on the APM. The terrorist objective in this case would be 3-fold: (1) killing and maiming a maximum number of Automated People Mover passengers; (2) closing a critical part of the system down; and (3) terrorizing the public so that they will not use LAX. In logistical terms an APM journey that involves loading, mixing and unloading of passenger baggage would reduce the potential frequency of Automated People Mover arrivals and departures and the subsequent loop journey time. Please comment on this issue.

**Intermodal Transportation Center (ITC):** The description of random screening in the ITC section (page 2-45) is almost identical to that describing the processes at the Ground Transportation Center. Also mentioned is the intent to monitor all approaching vehicles using video surveillance systems. Please see the discussion of Appendix I for further comment on this subject.

**Consolidated Rental Car Facility (RAC):** This section does not address security issues, and so the review process defers to Appendix I for explanation.

**Ground Access and Parking:** Discussion in Chapter 2.3 emphasizes means to reduce terrorist target density and the County does not dispute the validity of this approach. However, the document lacks data to show that the projected dispersal pattern would justify the expense and disruption of reconfiguration. For example, if an improvised explosive device was detonated at the Ground Transportation Center, curbside, on or near the Automated People Mover, or at the reconfigured Central Terminal Area, what casualty rate would LAWA anticipate at, say, peak travel time? Are the projected measurements of time, distance, people dispersal, response capabilities and resources proportionate to the desired gain? Part of the improved protection evidently comes from proposed blast mitigation measures that combine structural design with open space, but we request more data on the flow of people and vehicles in order to evaluate the plan. For example, if the needed dispersal percentages are achieved by adding 3 outlying facilities, is it necessary to operate an automated train system for a distance of 1.5 miles away from the Central Terminal Area? Could LAWA achieve the same goals closer in, with resultant savings and safety mitigations on Automated People Mover operations? If LAWA holds that there is a logistical and dispersal advantage by having the Automated People Mover further out, thereby staggering the flow of people, we request that an explanation of the basis for this advantage.

In discussion of the Central Terminal (Ch. 2.3.2.1) the document says that *"access points to the Central Terminal Area road system would be controlled to enhance security in the areas immediately surrounding the airport's infrastructure."* It then mentions FlyAway buses and vehicles cleared to drive on the secure airside. This appears to open a security loophole. Would it not be better to provide FlyAway passengers with a dedicated lane or fast track, using the public entrance to the Central Terminal Area while having their baggage processed through the level two TSA screening checkpoint? It appears feasible to screen all FlyAway buses, passengers and baggage with a unit contracted or employed by LAWA with TSA approval. Sufficient user numbers within the FlyAway expansion plan would justify this investment. Moreover, this additional service feature, once given the security planning attention it requires, may offer a more cost effective use of reconfiguration, in addition to its target dispersal contribution. Please comment on this proposal.

Discussion of the Ground Transportation Center (p. 2-60) mentions use of video surveillance to monitor activity, and cites the ability to pre-screen vehicles before they approach the Ground Transportation Center as an integral part of security. Some very simple calculations show this to be an extremely optimistic expectation in terms of prevention. Current, developing and anticipated surveillance technology may offer improved detection and interception, but the distances covered by vehicles at various speeds (whether at normal or excessive traffic flow rates) significantly limit the ability of responding security or law enforcement officers to prevent a determined attack. A number of examples of the speed of attack execution exist, such as terrorist bombings of military installations overseas. A vehicle traveling a linear mile at 20 mph would cover the ground, if unhindered, in 3 minutes; at 40 mph, in 1.5 minutes. Some type of substantial physical obstacle, such as a hydraulic arrest barrier built into a choke point, should therefore be part of the roadway design. Such equipment does need some visibility for deterrent value; in a multi-lane setting, the barrier could be used to moderate traffic volume for other goals. We request that LAWA comment on roadway design from a security perspective, including the concept outlined above.

Security features for access to/from the Intermodal Transportation Center and the Rental Car Facility are not discussed in Chapters 2.3.2.3 and 2.3.2.4. We thus repeat our previous comments on controlled choke points, and request that LAWA provide discussion of security design. The reduction of people and vehicle density is but one layer in the defensive design that will allow the 'protection, detection, assessment, and response' concept to become reality. The fact that a target density at one location is reduced from say, 1000 to 100 people will not in itself deter an attacker. The possibility remains that a back up of people could be orchestrated to deliberately increase congestion, density and target volume. This possibility must be addressed at every airport ground processing facility in order to eliminate weakness in the overall security plan and avoid the need to later retrofit the roadways. The suggested control would also apply to design of exit roads, to prevent reverse flow access by an attacking vehicle. The intermodal and rental car facilities would probably not benefit from as much close-in law enforcement and security personnel coverage as the Ground Transportation Center and Central Terminal Area. This compounds the need for optimum security design features on roadways and building access. Please comment on these points.

Discussion of the Air Cargo Roadway (§2.3.2.5) offers no discussion about security planning, conveying the assumption that there are no security considerations. Is this a correct assumption? Similarly, there is no discussion of security planning for Off-Airport Public Road Access (§ 2.3.3), conveying the assumption that there are no security considerations. Is this a correct assumption?

In §2.3.6 it is noted that the proposed 12,400-stall employee garage (accessed via Pershing Drive) would *"be designed to help diffuse blast impacts from surrounding vehicles. It would be designed with a security-screening checkpoint for all employees using the garage."* Why does LAWA emphasize this point for the employee parking facility but not for public parking facilities at the Ground Transportation Center, the Intermodal Transportation Center, or the rental car facility?

Discussion of the Automated People Mover (§ 2.4 et seq.) touches briefly on security in a reference to video surveillance. We have indicated previously our concern about the vulnerability of the Automated People Mover, but would add that the expected security issues and management plans for the Automated People Mover deserve more public disclosure. Please provide an assessment of this risk and the steps proposed to address it.

In discussing Cargo Facilities, Chapter 2.5 acknowledges that new security requirements are being developed by the TSA and advises that *"LAWA would incorporate any new requirements into the cargo facilities as those standards are developed."* This section does not adequately address LAWA's own 'industry capability' -- i.e. using its own initiative to offer options. The future direction of air cargo security management may not be fully known from a regulatory perspective, but in terms of public safety we believe that it would be responsible for LAWA to pioneer its own air cargo security standard. Alternative D by virtue of its title claims to answer security concerns and to offer innovation in the process. Yet innovation is decidedly absent from the cargo aspect of the plan. The ultimate test may come from an attack on commercial aircraft via air cargo: adequate warnings exist in industry circles to justify a stronger effort in this regard. We request that the SDEIS/EIR provide more detailed discussion of air cargo security measures, and respond to the suggestion that LAWA pioneer its own standards.

Among the measures that could be considered for air cargo facilities is a plan that would allow airline operators to provide, at short notice, an integrated roadway and security system to screen and clear inbound vehicles, and a 'cold' or 'hot' operational facility for dual technology screening of

outbound cargo. In combination, these facilities could routinely earn additional airport revenue and facilitate business continuity during periods of high alert. Please comment on this suggestion.

**Addendum Illustrations:** The various plan drawings and artists impressions found in the Master Plan Alternative D documentation are helpful and informative. There are, however, several considerations for improving public articulation. Residents of the surrounding environs are a valuable part of airport protection. The eyes, ears and voices of local residents can provide superior protection of community assets. This holds true even when compared with trained law enforcement personnel who have access to advanced technologies. Citizens and local residents who perceive that they have a stake in the future of their airport, and who are consulted in the security planning aspects, are most likely to participate constructively. What efforts have been or will be taken by LAWA to provide public education sufficient to harness this resource?

#### **4.1.5 Review of Appendix I: Comparative Security Analysis**

The Master Plan Draft Addendum refers to Appendix I as “*a detailed assessment of the security and safety features of Alternative D.*” This statement, combined with the lack of detail in other Master Plan documents, creates high expectations as to the quality of its articulation. In practice, our review has found the experience to be disappointing. The discussion is inconsistent with other documentation and falls short of the detail that should be available for public scrutiny. We are in a new era of risk management. Traditional or conventional thinking will not successfully address future vulnerabilities unless there is a respectful treatment of the public debate. The physical and operational reach of the defensive concept will extend beyond the footprint of the airport infrastructure. In fact, the security component will have environmental effects that are unprecedented in American commercial airport planning, particularly in urban and suburban settings. The Master Plan Alternative D must offer detailed projection, measurement and quantification of these impacts.

**Discussion of the Concept:** The document states, on page I-2 of the Executive Summary, “*The first level (Level 1) entails screening of all persons and bags prior to entering the Central Terminal Area. Level 1 screening is focused on preventing attacks on the ground and ensuring a safe passenger environment. This level of screening will occur prior to entering the Automated People Mover system or FlyAway shuttle buses and focuses on weapons and explosive.*” This directly contradicts the ‘random screening, sniffing dogs’ explanation in the main Draft Addendum document; clarification is requested.

On page I-4 of the Appendix, under Methodology, reference is made to the Department of Homeland Security and General Accounting Office validation of “concentric rings of security” to bring protection, detection, assessment, and response” capability ‘*to the extended airport perimeter*’. The following statements from that Chapter appears to contradict the approach offered in the prior two documents:

*‘Anyone entering the airport property whether to visit or travel will undergo security inspections. There are at least two levels of personnel and baggage inspection that will take place. Level 1 inspection requires screening for explosives and weapons prior to transport by the Automated People Mover or FlyAway shuttle bus to the Central Terminal Area. Using current technology, Level 1 inspection would include screening of persons and bags similar to checks made upon entering federal buildings today. These checks should be*

*designed to be as unobtrusive and not impede the flow of transportation to the Central Terminal Area and should take advantage of the emerging technology. Level 2 inspections will consist of current security screening criteria as mandated by TSA for departing passengers and baggage which is more intrusive and detailed than level 1'.*

We offer the following observations on the above excerpt, and request that LAWA provide comment and clarification for each point:

- ▶ Level 1 inspection as described here does not match the 'random selection, sniffing dogs' explanation offered in the Draft Addendum.
- ▶ There is no mention of profiling people and baggage for selective screening.
- ▶ The stated similarity to 'checks made upon entering federal buildings today' is meaningless to people who have never seen or experienced the federal security screening process.
- ▶ At federal buildings 100% of those who enter are screened, but these systems rarely (if ever) encounter baggage in size and volume such as will be common to an airport.
- ▶ The statement above contradicts itself: the process for federal buildings is obtrusive and would impede flow if applied literally as a Level 1 screening protocol.
- ▶ The possibility of 2 levels of screening that are both obtrusive, even with Level 1 proving to be selective, implies a need to estimate consequential density effects that might in some circumstances defeat the desire to disperse people rapidly into the airport controlled areas.
- ▶ The reader is left wondering whether there is agreement and/or coordination between the planning entities on security policy and practice.

The same page refers to Figures 4-1 & 4-2 as illustrations of the concentric rings of security and deterrence strategy respectively. These very simplistic figures are of no value in helping the public to understand what the strategies mean for LAX, and no other drawings are included in Appendix I. Why is this not done, given the proliferation of site drawings and artists' impressions in the other parts of the Alternative D documentation? We ask that LAWA superimpose the concentric rings over the airport plan and explain the resulting figure. The following statement from the same page is offered for its relevance to further comment:

*"PDAR facilitates the detection of possible malevolent acts prior to the hostile force coming within range of the target. By increasing the distance between critical areas and the point of detection, law enforcement officers and security personnel have additional time to assess the act as benign, dangerous, or overtly hostile, and respond appropriately."*

We offer the following observations on the above excerpt, and request that LAWA provide comment and clarification for each point:

- ▶ Is it correct to assume from the statements about bomb threat dispersal that 'critical areas' include public areas where concentrations of people can be expected (e.g. the Ground Transportation and Intermodal Transportation Centers, the Central Terminal and perhaps to a lesser extent, the Rental Car Facility)?
- ▶ A rough calculation of available response times (using existing travel distances and transit times) indicates that Alternative D roadway configurations will not significantly increase response time 'prior to the hostile force coming within range of the target.' What does LAWA anticipate in terms of this issue?

- ▶ By inference, the 'protection, detection, assessment, and response' system would prove of value only if the outer concentric circles encompass more distant roadways and areas including commercial and residential areas, beyond the immediate airport environs. Is LAWA contemplating an expansion of the concentric circles to include these areas?
- ▶ Implementation of a multiple concentric ring system defies imagination in its practical application to LAX. The airport has an irregular property boundary that may be poorly suited to this system. There is no logical center point for the concentric rings, apart from the large Air Operations Area, and the critical areas at LAX are disparate and scattered. In this setting, what is the feasibility of developing the concept with a series of overlapping concentric rings?

Discussion in Ch. 5 (Threat) evaluates LAX as a target. This is a complex topic; we understand that evolving trends in terrorist tactics may unexpectedly shift some of the security emphasis and strategy over time. However, we believe that the threat may have been understated and ask for further discussion and comment on this issue.

The discussion of Potential Mitigations (pp. I-12, I-13) describes security measures that will be applied to MTA Green Line connections with the proposed Intermodal Transportation Center. The discussion refers to use of Closed Circuit Television surveillance and related intelligent devices (as yet unidentified), and specifically mentions facial recognition technology. Several security industry reports in 2002 and 2003 have discredited the so-called 'face in the crowd' facial recognition applications. Original hopes for this technology were overly optimistic, and recent experience has shown this application to be flawed. In a number of cases (for example, Ybor City, Tampa, FL) the systems have been withdrawn from use.<sup>22</sup> Further comment will be made later in regard to use of an array of technology and the finite value of detection data inflow.

The final paragraph discussing the MTA Green Line states that "*The Green Line connection enhancements in Alternative D provide for a better security solution because no unscreened people or luggage would be permitted to enter the Central Terminal Area.*" This suggests 100% screening of people and bags, yet there is no reference elsewhere in the Addendum or Supplement to confirm this. Please comment on whether 100% screening will be provided.

There is also no discussion of the planned accommodation for and type of screening equipment, other than a vague mention: "*The MTA Green Line connection facilitates the future employment of security technology allowing a level of initial screening to occur prior to entering the Intermodal Transportation Center or Central Terminal Area.*" What form of screening will actually take place there initially, and to what extent? What increase in screening activity is planned or accommodated in the contingencies for change?

Chapter 6.2 offers a more comprehensive description of the Intermodal Transportation Center. The Comparative Analysis acknowledges that the Intermodal Transportation Center is an integral part of the concentric rings of security and 'protection, detection, assessment, and response' concept. The concentric rings processes are described, with the final stage described thus: "*Prior to boarding the APM, all people and bags will be screened using appropriate technology to identify weapons and explosives.*" Two benefits are cited: one is that it would permit initial screening of passengers and

<sup>22</sup> Note that biometric facial identification systems, which are used to match individuals on a one-on-one basis, are a different form of this technology and continue to show successful results.

vehicles that without the reconfiguration would not occur; and the other is that it adds a measure of protection to passengers using the APM as they move to the Central Terminal Area. This appears to contradict other elements of the Master Plan documentation, raising questions about the consistency between security components. LAWA should define the word 'screening' and use the classification 'Level 1' more consistently. Otherwise this suggests the emergence of different security standards for access to the Automated People Mover and Central Terminal Area.

Pages I-16 and I-17 cover general security matters pertaining to the reconfigured roadways. Again we note that security technology is a valuable adjunct to trained security patrols but it is not a panacea; it is instead a management tool. Please articulate the contingency plan for interception and management of roadway incidents with minimal disruption to airport operations. This is particularly important at the policy setting stage, as large projects are notorious for paring back security expenditures and thereby compromising protection standards. Will LAWA policy identify agreed-upon security standards so that this does not occur?

In practice, the performance of Closed Circuit TV will depend on the ratio of trained personnel to monitoring devices. Although the stated benefits of roadway monitoring are attractive, the increased data will require monitoring, interpretation and action. How much thought has LAWA given to the risk of data saturation? Over-dependence on security technology may lead to higher risk of error and, ironically, diminished protection. Occupied space is projected under this plan to increase from 3.9 to 6.8 msf. In combination with increased separation distances, this increase will impose substantial new constraints and demands on emergency and enforcement response, and also upon patrol/deterrent services.

Mitchell Gray, in a University of British Columbia paper title *Urban Surveillance and Panopticism* (<http://www.surveillance-and-society.org>) explores many of the more complex issues associated with surveillance in the community. It is worthy reading for any elected official attempting to understand the implications and potential unintended consequences of surveillance systems. The basic message to be gained from Gray's treatise is contained in the following extract: "*It is rapidly becoming an urban instinct to grasp at security through surveillance and knowledge, but this, paradoxically, may add to urban insecurity in a fundamental way: by transforming society in unforeseen directions. There is a threshold point in urban surveillance beyond which quantitative change – the addition of devices used and areas watched – becomes qualitative change.*" Please comment on how LAWA has addressed the potential for over-dependence on security technology at LAX as part of the proposed Master Plan improvements.

A review of the Ground Transportation Center in Appendix I (Ch. 6.4) restates the threat and target dispersal philosophy along with the 'protection, detection, assessment, and response' protocols. According to discussion on page I-19, passengers will go through a well-organized Level 1 screening point at the Ground Transportation Center before transport on the Automated People Mover to the Central Terminal Area. The Level 1 screening serves to insure the integrity of the Automated People Mover and common areas of the Central Terminal Area, and represents the first opportunity to check passengers and employees for concealed weapons and explosive devices. Yet again there is a clear contradiction with the main part of the Draft Addendum, reinforced by a listing of measures that makes reference to design and installation of passenger and baggage screening devices; please clarify. Additional comment and questions are provided below:

- ▶ Is it the planned intention to have two levels of screening, to include 100% of pedestrians accessing the APM and Central Terminal Area?
- ▶ How would 100% screening of Level 1 people and baggage affect the risk of congestion and increased people density at the Ground Transportation Center and other remote locations? Has LAWA analyzed this risk? If so, where are the results?
- ▶ What ergonomic design factors will optimize rapid movement of people and bags? Has LAWA considered the impact of Level 1 screening on the elderly, infirm, and people traveling with small children?
- ▶ Has any field market research been conducted to assess the tolerance for earlier arrivals to negotiate two levels of screening and transportation of baggage between those two levels?

Discussion of the Rental Car Facility (Appendix I Ch. 6.5) repeats the intention to screen all personnel from the Rental Car area to the Automated People Mover. However, the same discussion notes: *'should the current Central Terminal Area roadway need to be secured' inspection of an estimated 1 million shuttle bus trips annually would be time consuming and subject to human error even if state-of-the-art security inspection equipment was employed*. If Alternative D removes vehicular traffic, and thereby mitigates vehicle bomb risk, then would not the passenger and baggage security factor shift to the Automated People Mover? The APM system could become an attractive and vulnerable target. We are therefore concerned about the potential need to police and manage a much larger area (including an occupied mix of separate facilities), that may from the outset require equal standards of screening at Levels 1 and 2. Please comment on this concern.

The Rental Car Facility mitigation measures offer a blend of logical and speculative measures, including the discredited facial recognition system. We again raise earlier comments about discredited systems, data saturation and over-dependence on technology. This is particularly pertinent since the assessment does not refer to an equivalent demand for the increased training and numbers of security operatives (ranging from technicians through guards to airport dedicated law enforcement personnel). Please comment on LAWA's plans with respect to the presence and role of security personnel at the Rental Car Facility.

We request that LAWA provide a security deployment projection for Alternative D, together with a security technology and equipment schedule. Please illustrate how 'protection, detection, assessment, and response' can be accomplished using only technology available today, and describe any credible security equipment advances that can be expected over the next 5 years that might justify an investment in this program. It may be unwise to count on as-yet undeveloped technologies, particularly since reliable and proven technology is with us today, sufficient for planning purposes. More problematic may be the use of human resources, including appropriate numbers, competence and strategic locations.

The comparative analysis in Chapter 6.6 indicates that the Automated People Mover will be a key component for dispersal of vehicular traffic from the Central Terminal Area roadway network. This may be true, but could LAWA accomplish the same dispersal by reducing the distance between the remote ground processing points and the Central Terminal Area? Please provide a vulnerability analysis to address this issue. Further comment and questions are provided below:

- ▶ Please provide additional discussion about screening for weapons and explosives at the inbound remote Automated People Mover station access points

- ▶ Please discuss the security logistics and practical challenges of handling heavy baggage, multiple bags, and elderly and disabled passengers and children when loading and unloading the Automated People Mover. It is extremely difficult to imagine how screening, loading and offloading of passengers and baggage could be accommodated at the Ground Transportation and Intermodal Transportation Centers and the Rental Car Facility, with sufficient frequency to achieve the level of service promised in the Plan -- especially with the reconfiguration objective of rapid dispersal of people.
- ▶ The Draft Addendum states (p.2-37) "*It is also assumed that luggage carts would be allowed on the Automated People Mover and highly utilized in the transfer of people and baggage.*" This chaotic image invites questions about safety factors and load capabilities, neither of which is discussed in the Appendix I security assessment. Please address this issue.
- ▶ Please provide an exhibit showing street-to-departure ergonomics, flow and density patterns, and screening equipment layout of the remote people mover access points. Although security screening equipment is implied, space utilization is at odds with this statement from page 2-37: "*it is anticipated that passenger assembly would be limited to the passenger platform.*"
- ▶ The prevention of unscreened vehicular and bomb access to the Central Terminal Area could be offset by the APM: the train could actually carry the device to its target if Level 1 does not screen for explosives carried on the person (as in suicide attacks in Israel). Magnetometers do not detect explosives. Please address this potential security threat.
- ▶ The APM could be attacked via vehicles using Century Blvd. and 98<sup>th</sup> Street, and/or from commercial buildings and hotels overlooking the Automated People Mover guide way system. Please address this potential security threat.
- ▶ The primary vulnerability appears to come from the track distance and elevated nature of the Automated People Mover, and its target worth (i.e., elimination of a critical airport transit link, serious disruption to operations, high casualties, public terror and a prestigious but discredited security program). In effect, the Automated People Mover may serve to reintroduce the target potential that Alternative D was purportedly designed to reduce.
- ▶ If the Automated People Mover concept is to be pursued, we ask that LAWA consider the possibility of building a grade level (surface) operation, with blast diffusion techniques and materials applied to a protective wall and an armored one-way-transparent canopy for the length of the track
- ▶ Overall this part of the Plan is conceptual and idealistic. It lacks data that is essential to show how and when the processes interconnect and will be successfully negotiated while achieving safe dispersal objectives. If the main part of the Addendum (Page 2-35) is correct in its description of the intended screening activity (i.e., "*random checking of baggage and passengers using sniffing dogs, video surveillance systems and other security devices*") then the Automated People Mover will be vulnerable. Acceptance of that risk is a matter for public policy debate, but moving walkway bridges would obviate need for the Automated People Mover. We request comment and discussion on each of the points raised in this item.

Discussion of the Expanded FlyAway (Ch. 6.7.1) attempts to instill confidence in a speculative system to protect buses from becoming unwitting vehicles for terrorist attack. We have already expressed our doubts on this topic, including the considerable physical spread of the security requirement, the attendant cost, and serious questions as to the ability to control bus security within remote stations and in transit. The FlyAway bus operations would come inside the concentric circles, and it is unclear how the protection would be achieved. The technology to address these

concerns (such as under-vehicle inspections) is simplistic and conceptual. Please provide more detail concerning this system, with discussion of the attendant human resource requirements.

In the Chapter 8 Summary, Appendix I uses a subtitle 'Alternative D Advantages and Disadvantages.' It then lists five primary advantages followed immediately by three 'potential enhancements'. We request that LAWA provide more explanation of each, as we believe they merit greater priority. Note that the first suggests the provision of a Vehicle Inspection Center. We have already made reference to the need for this in roadway planning.

We believe that the Remote Delivery Facility will become a reality for many critical government facilities in the United States over the next 5 years, closely followed by other critical infrastructure sectors including commercial airports. It is already operating policy for a variety of private and public sector facilities in different parts of the world, and has seen an increase since the Anthrax mail attacks of late 2001. Accordingly, we ask that LAWA give serious consideration to an extension of this prospective facility to include an Identification and Authorization Processing Center, including some discussion in the response to this comment.

During this review we have established an unquantifiable but extensive (potentially massive) future demand for data input, retrieval, analysis, interpretation and sharing. The data will be diverse, covering audio & visual, electronic signaling, text, numerical, pictorial, computer code, identification systems, people, vehicles, transactions etc. etc. Our understanding of the transactional volume and complexities for a busy international airport shows that a dedicated Identification and Authorization Processing Center is justified to monitor the demand for access to different parts of the airport. This security-controlled service provides identification and clearance for individuals and vehicles, engaging electronic tagging, biometrics, and the administration of airport asset and airside vehicle tracking. Variables allow for individual issue of identification and access control media whether the subject is escorted or unescorted, permanent or temporary, urgent or routine. This facility should be off-airport, based on long established methods employed overseas. The processes will relate directly to the interests of law enforcement agencies and the security resource. This facility should be located close to the planned new police headquarters. Please comment on the possibility of incorporating these suggestions into the Master Plan.

The third enhancement described in Appendix I relates to the Automated People Mover, previously discussed in this review. There is, however, *a distinct and in fact total, absence of listed disadvantages relating to Alternative D security.* Our concerns are deepened by the fact that Appendix I lists 5 disadvantages of the No Action/No Project Alternative and then proceeds to mix conceded points with counter argument on 5 other points, thereby maintaining absolute opposition to the No Action/No Project Alternative. A similarly critical eye needs to be cast upon all alternatives. The current approach significantly weakens the value and integrity of the discussion as a comparative analysis, and echoes the concerns for bias and lack of full disclosure that we have stated elsewhere. We request that LAWA provide a full discussion of the disadvantages associated with the proposed security plans for each of the project Alternatives.

#### **4.1.6 Other Security Considerations**

In a project of this size, with a title of the Safety and Security Alternative, the County of Los Angeles would expect the LAX Master Plan Alternative D to embrace a total security concept. It is

therefore notable that the documentation does not elaborate on plans to secure areas that are known to have major security implications, such as cargo, maintenance hangars and facilities, fuel farm operations, and the perimeter fence lines. During an airport environs tour, the review team saw many security exposures at the west end of LAX and witnessed extreme weaknesses in access control allowing commercial delivery vehicles to enter facilities unchecked (in one instance by simple tailgating). This unauthorized access provided close quarter observation and potential access to parked wide body passenger aircraft in the vicinity. Please comment on this apparent lack of existing security at the west end, and any plans to remedy the situation.

We are aware that in a September 2002 press release, Mayor Hahn announced installation of more than 1,200 video cameras throughout the airport complex. We are unsure whether the word 'complex' refers to all LAWA managed airports, or just LAX; please clarify. We also request discussion of the current status of this project; is it correct that bids have been invited for installation of surveillance technology on the LAX perimeter? With respect to perimeter areas, we offer the following comments, along with a request that LAWA respond to each:

- ▶ The Alternative D Plan provides a substantial, expensive (albeit imperfect) protection system for the 'front door' to LAX. But it leaves the back door wide open.
- ▶ LAWA should give much more effort to security planning for the individual cargo area, the maintenance and fuel farm complex and roadways, and for the entire perimeter. Otherwise there is a danger that the environmental impact will not receive public scrutiny or will consume unacceptable time when that becomes urgent and essential.
- ▶ It is evident that LAX is vulnerable and that security improvements are relatively urgent. LAWA should prioritize the work so that the new security enhancements, when selected, come on stream as early as practicable. Special need exists for a thoughtful security risk management program during construction.
- ▶ Serious consideration should be given to the permanent closure of Pershing Drive to public access, and to introduction of a controlled, partially-automated access and egress system for vehicles with legitimate business in the maintenance, fuel farm and employee parking areas.
- ▶ In 1994 the Irish Republican Army fired four mortar bombs onto the runway at London Heathrow from a pick-up truck parked outside the perimeter fence. Two bombs hit the runway but failed to detonate. Two more recent attempts to attack aircraft with rocket-propelled grenade have occurred in Africa and at a military air base in the Middle East. The vulnerability arising from use of surface-to-air missiles is acute at the western end of the LAX airport environs. The location of the Segundo Blue Butterfly Habitat/Reserve, the topography and rough shrub cover, is almost perfect for the launch of shoulder-fired missiles and offers target range proximity to ascending and descending aircraft. As disturbing as it may be to be so candid, it is necessary to point out that a passenger, cargo and fuel laden wide-body passenger aircraft heading out for a long haul trans-Pacific flight could be attacked without sufficient time to implement successful counter measures. The suicidal nature of modern day terrorist attack reduces the notional response time even further. We recommend that an urgent and intensive review be undertaken to address this vulnerability and to proffer solutions that meet both public safety and environmental review requirements.
- ▶ Security and law enforcement personnel requirements merit discussion, as the number and need for specialized training would increase under Alternative D. For the sake of efficiency and public safety, this review should consider ways to reduce potential for jurisdictional and operational law enforcement conflict. It is our understanding that senior officers of the Los

Angeles Police Dept. in 1991 proposed a merger of policing entities for the airport, but without progress at that time. This may be a good opportunity to revisit that proposal.

#### 4.2 THE ENVIRONMENTAL JUSTICE ASSESSMENT IS DEFICIENT

Presidential Executive Order 12898, issued in February 1994, requires all federal agencies to analyze environmental justice impacts when proposing public projects. The analysis is intended to determine whether minority and low-income communities are unfairly burdened by project impacts, with the goal of using mitigation measures to create a level playing field. In 1999, Senate Bill 115 was passed making environmental justice a requirement of CEQA as well (PRC §.72000-72001).

Despite the importance of this subject, the original Draft EIS/EIR was found to lack even the most elementary NEPA requirements for this topical issue. Review of the Supplement to the Draft EIS/EIR indicates that many of the same deficiencies in the analysis remain. The impacts associated with Environmental Justice demand a far more rigorous analysis than has been provided in the 2001 and 2003 environmental reviews. As discussed below, NEPA requires that information be included in the EIS if costs of obtaining the information are not exorbitant. Where such costs are exorbitant, NEPA requires that the EIS: (1) state that the information is complete or unavailable; (2) state the relevance of the information to the analysis; (3) summarize credible scientific information about the impacts; and/or (4) use other methods of assessing impacts that are generally accepted by the scientific community. CEQA also addresses the issue of analytic detail, requiring that an EIR provide information and analyses with a sufficient level of detail to permit informed decision-making and public participation. LAWA must apply these very basic NEPA and CEQA requirements to the SDEIS/EIR assessment of Environmental Justice.

We are also concerned about the method used to compare alternatives in the environmental justice analysis. In both the 2001 and the 2003 documents, the No Project Alternative incorporates future planned improvements that were not actually being built, and overstates the capacity of existing facilities. Consequently, the No Project Alternative appears to have far more environmental impacts than any of the proposed Build Alternatives.

Further, the 2003 Supplemental Draft EIS/EIR describes Alternative "D" as an option that would limit growth to 78 MAP. However, as described previously in § 3.1, Alternative D provides 153 fully functional, high capacity gates and does not remove concrete areas that can be used for aircraft parking. By parking aircraft, Alternative "D" can function as though it has over 200 gates. In overstating the capacity of the No Project Alternative and minimizing the capacity of the build alternatives, the impacts relating to air emissions, air toxics, noise, and traffic are all underestimated for the build alternatives. *Underestimating these impacts skews the environmental justice assessment.* This is particularly true for Alternative "D," which shifts many of the impacts toward the more economically disadvantaged communities east and northeast of LAX.

Finally, in designing runway extensions and facilities to the east under Alternative D, this plan appears to protect biological resources (especially the El Segundo Blue Butterfly) at the expense of residents in Lennox, Inglewood & Manchester. As part of the Environmental Justice assessment, a revision to the 2003 Supplemental Draft EIS/EIR needs to be made that compares the disproportionately high and adverse human health and environmental effects that will be incurred by

minority and/or low-income communities in order to protect a limited habitat area on the coast (see also our discussion under § 3.4.5). Our concerns are discussed further in the sections below.

#### **4.2.1 Results of Scoping Outreach Must Be Discussed**

Scoping is a public process, required by NEPA, that should be conducted as early as possible after a Lead Agency decides to prepare an EIS. The scoping process is designed to determine the scope of issues to be addressed in an EIS, and should be conducted as early as possible after a Lead Agency decides to prepare an EIS. It is intended to be an open process, incorporating the views of other agencies and the public regarding the scope of an EIS.

Environmental Justice issues are usually a major component of the scoping process, and the 2001 Draft EIS/EIR does list 126 outreach efforts with low-income and minority communities and Appendix S-D of the 2003 Supplemental Draft EIS/EIR includes copies of the material (in both Spanish and English) handed out during these outreach efforts. The 2003 SDEIS/EIR also lists four additional Environmental Justice Workshops conducted in 2001. However, neither the 2001 DEIS/EIR nor the 2003 SDEIS/EIR provides an indication of concerns or issues raised by those that were contacted, or details of what transpired during these meetings. The public is thus unable to assess whether or how LAWA may have used the information developed through these efforts. The County of Los Angeles hereby requests that the 2003 SDEIS/EIR be expanded to include specific descriptions of the efforts made to gather information from low-income and minority communities, with a table that identifies the specific concerns raised by each of these groups and discusses LAWA's steps to address those concerns.

#### **4.2.2 The Level of Analytic Detail is Inadequate**<sup>23</sup>

Many potential Environmental Justice impacts were not fully evaluated, reportedly because LAWA was unable to quantify the impacts. NEPA states that when information is incomplete or unavailable, the Lead Agency must obtain that information unless costs are exorbitant.<sup>24</sup> According to CEQA, the analysis must be specific enough to permit informed decision-making and public participation. The following subsections include some of the impact discussions considered inadequate.

In discussing Air Quality and Health Effects, the 2001 Draft EIS/EIR and the 2003 Supplement both state: "Due to the lack of available background data and limited information on the cumulative effect of multiple air pollutants, the effect of the Master Plan on cumulative health risks among minority and low-income population cannot be quantified or fully analyzed." NEPA regulations do not permit such a deferral of obligation. All available data must be included, consistent with the mandate of NEPA, and the report must document the efforts made to obtain needed data. Where data is found to be unavailable or limited, the report should identify the cost associated with developing original data and indicate why such cost was determined to be exorbitant in the context of overall project costs.

The 2001 Draft EIS/EIR further asserts, "*Due to the lack of available background data, the cumulative or synergistic health effects of [toxic air pollutants (TAP)] emissions associated with the*

<sup>23</sup> 2001 Draft EIS/EIR, Section 4.4.3.

<sup>24</sup> NEPA Guidelines ; 40 C.F.R. § 15022.22.

build Alternatives and other environmental hazards could not be quantitatively analyzed within the scope and timeframe of this Draft EIS/EIR.” The 2003 SDEIS/EIR dropped this discussion and did not provide new information related to cumulative or synergistic health effects. The 2003 Supplemental Draft EIS/EIR could and should have made assumptions in order to determine such impacts. The County asks that LAWA develop and apply these assumptions to a quantitative analysis of the cumulative and synergistic health effects of TAP emissions associated with the build Alternatives and other hazards.

#### **4.2.3 The Relocation Plan and Requirements are Unsubstantiated**<sup>25</sup>

The 2001 Draft EIS/EIR stated that, “*Minority-owned businesses or businesses with a high proportion of minority employees or minority/low-income customers may face special challenges that need to be considered in developing a Business Relocation Plan*” but provided no explanation or definition of “special challenges.” LAWA needs to clarify this term and indicate how these challenges would be considered in developing a business relocation plan.

The 2001 Draft EIS/EIR further stated that, “*Data is currently not available regarding the number of minority owned businesses or minority employees that might be affected by proposed acquisition.*” In fact, the referenced data is generally available and can be obtained with reasonable effort. LAWA must obtain and analyze this data in the SDEIS/EIR.

The 2003 assessment of Alternative D relocation impacts includes this statement: “*While it is possible that certain of these businesses may be minority owned, they are mostly airport related uses or uses that serve the largely non-minority/non-low-income community of Westchester-Playa del Rey.*” This statement is unsubstantiated by any facts presented in the 2001 Draft EIS/EIR or the 2003 SDEIS/EIR. Neither of these documents presents data showing how many businesses are minority owned or serve minority communities. The County requests that LAWA present such information in the SDEIS/EIR.

#### **4.2.4 Noise Impact Mitigations Require Further Discussion**

Both the 2001 and 2003 environmental documents assert that “*Certain areas affected by noise would still be faced with significant impacts due to constraints that apply most directly to minority and/or low-income communities. These include residential areas ineligible for mitigation due to inconsistent zoning or land use designations and substandard housing that may be infeasible to insulate.*”<sup>26</sup> At the very least, the 2003 Supplemental Draft EIS/EIR needs to clearly delineate the location of these impacted areas. A more appropriate solution would be to identify and implement specific mitigation measures to reduce impacts on minority neighborhoods; the document did not contain any noise mitigation measures, as discussed in detail later in this report.

#### **4.2.5 LAWA Must Develop a Build Alternative Based on Community Input**

Scoping is intended to be an open process, incorporating the views of other agencies and the public regarding the scope and focus of the EIS. CEQ regulations require Federal Agencies to identify an environmentally preferable alternative in the record of decision.<sup>27</sup> When the agency has identified a

<sup>25</sup> Discussion in this section is based on 2001 Draft EIS/EIR, §4.4.3 and SDEIS/EIR §4.4.3.

<sup>26</sup> 2001 Draft EIS/EIR, Section 4.4.3, Page 4-423; Supplemental Draft EIS/EIR, Section 4.4.3, Page 4-323.

<sup>27</sup> NEPA Guidelines: 40 C.F.R. § 1505.2(b)

disproportionately high and adverse human health or environmental effect on minority and/or low-income populations, as occurs in the 2001 and 2003 EIS/EIR documents, NEPA requires that the distribution as well as the magnitude of the disproportionate impacts should be a factor in determining the environmentally preferable alternative. This mandate is evidence in the following excerpt from the CEQ Environmental Justice Guidance document:<sup>28</sup>

*"Agencies should encourage the members of the communities that may suffer a disproportionately high and adverse human health or environmental effect from a proposed agency action to help develop and comment on possible alternatives to the proposed agency actions as early as possible in the process."*

To conform to these requirements, LAWA and FHWA must develop an environmentally superior alternative based in part on input from members of minority and/or low-income communities that may suffer a disproportionately high and adverse human health or environmental effect. The 2001 Draft EIS/EIR and the 2003 Supplemental Draft EIS/EIR are void of any evidence indicating that comments or input offered by impacted members of minority or low-income communities were considered in developing an environmentally superior alternative. LAWA must revise the 2003 SDEIS/EIR to incorporate an environmentally superior alternative.

#### **4.2.6 The Area of Analysis is Arbitrarily Limited**

The Environmental Justice analysis of existing conditions and impacts focuses only on census tracts surrounding LAX. LAWA completed no regional analyses, although it was stated that the area of included the region as a whole. The analysis needs to be expanded to incorporate the region that is referenced in § 2 titled the Purpose and Need for the Proposed Action in both the 2001 Draft EIS/EIR and the 2003 Supplemental Draft EIS/EIR.

#### **4.2.7 Environmental Justice Mitigation Measures are Vague and/or Deferred<sup>29</sup>**

The 2003 Supplemental Draft EIS/EIR describes Environmental Justice mitigation in vague terms, deferring some of the mitigation to future studies. For example, aircraft noise mitigation measure MM-LU-1 (2003 SDEIS/EIR) states that LAWA will revise the Aircraft Noise Mitigation Program (ANMP) to include:

*"Aspects that are particularly relevant to addressing the unique issues and conditions in minority and low-income areas include provision by LAWA of additional technical assistance to local jurisdictions to support more rapid and efficient mitigation, and the reduction and elimination of structural and building code compliance constraints to mitigation of substandard housing."*

Although the language suggests that LAWA has addressed this problem, the measure does not in fact commit LAWA to any definable actions that would reduce impacts. The 2003 SDEIS/EIR also describes future studies as mitigation. Of particular concern is mitigation measure MM-LU-3 calling for a study of the relationship between aircraft noise levels and the ability of children to learn:

<sup>28</sup> Environmental Justice Guidance Under NEPA, Section 5, page 15.

<sup>29</sup> Discussion is based on review of 2003 Supplemental Draft EIS/EIR Section 4.2.8.

*"This measure requires that LAWA conduct a comprehensive study to determine the relationship between learning and the disruptions caused by aircraft noise with the intent to set a threshold of significance for classroom disruption due to aircraft noise"*

This description suggests that the children of disadvantaged communities may be subjected to harmful noise levels in order to define thresholds of significance. A more responsible and conservative approach is needed that does not have the potential to do additional harm.

While the 2003 Supplemental Draft EIS/EIR elaborates on mitigation concepts more fully than the 2001 document, in many cases the mitigations still do not commit LAWA to definable actions that meet the CEQA and NEPA requirement to avoid, minimize, rectify, reduce, or compensate for adverse project impacts. All identified adverse impacts need to be accompanied by specific and defined mitigation measures. LAWA must evaluate the efficacy of the proposed measures in reducing identified primary and secondary impacts. The EIS/EIR should clearly identify impacts for which no measures are proposed, and should provide an indication of their severity. LAWA should then offer the amended analysis for public review and comment as part of a revised (or entirely new) Draft EIS/EIR. Only by these means can the EIS/EIR achieve adequacy with respect to the analysis of Environmental Justice.

#### **4.3 TRAFFIC ASSESSMENT**

##### **4.3.1 The LAX Interchange at Lennox Boulevard**

If Alternative D is chosen for the LAX Master Plan, the County of Los Angeles recommends the LAX Interchange be constructed on the 405 Freeway at Lennox Boulevard. The LAX Interchange would provide direct access between the 405 Freeway and LAX and significantly reduce the traffic impact of LAX on the unincorporated Lennox community and surrounding area. The name "LAX Interchange" is recommended, rather than Lennox Interchange, is to avoid the impression that motorists on the 405 Freeway can exit the freeway and travel to Lennox. Additionally, some form of interchange at Lennox Boulevard is recommended regardless of the plan chosen for LAX. Traffic demand at LAX is expected to increase steadily to the 78.9 MAP, even under the no-build scenario. Therefore, intersection or interchange improvements will be needed to mitigate LAX's traffic impact on the Lennox community and nearby area.

County staff has met with Mr. Bruce McDaniel, Superintendent of the Lennox School District, and his staff to consider the School District's input about the LAX Interchange. In response to their concerns, County staff informed the School District that the EIR/EIS for the LAX Interchange would include a noise study of the proposed interchange ramps. County staff also informed Mr. McDaniel the study would consider Lennox School District's new pre-school recently constructed at the west end of 106<sup>th</sup> Street. Mr. McDaniel also expressed concern that the LAX Interchange may affect the visibility of signs to be installed on Lennox School District property adjacent to the LAX Interchange. Public Works referred the School District's concern about the signs to LAWA's representatives for their review and response.

### 4.3.2 Traffic Model Questions

A. C. Lazzaretto retained Mr. Terry Austin of Austin Foust and Associates to review the traffic model used in the LAX traffic study. Public Works staff coordinated its traffic review with Mr. Austin, and agrees with the questions and concerns raised by Mr. Austin in the discussion below.

**Trip Generation:** The trip generation table (Attachment A in Technical Report S2B) gives information by activity component but is hard to follow for the "Airport Miscellaneous" category. For example, what items represent the trip generation for the 12,400 space west employee parking structure and the 1,300 east employee parking structure? With respect to the employee trips, why are 54 percent assigned to the east parking structure with 1,300 spaces and only 46 percent to the 12,400-space west parking structure? (See Page 22 of the Supplemental On-Airport Surface Transportation Technical Report).

**Trip Distribution:** The trip distribution diagram (Figure B-1) is difficult to follow (while not labeled, it appears to be airport peak hour trips). Is there information that can more clearly show the trip distribution? The methodology discussion suggests that employee/other trips have a different trip distribution than air passenger trips. This would certainly be appropriate, but there does not appear to be any elaboration on this or any quantitative description.

**General:** There does not appear to be a reference for a description of the traffic model. There presumably is such a report which describes the model and provides a peak hour intersection level validation. Other questions that are also presumably addressed in that document pertain to the intersection forecasting process. For example, does the traffic model use post-processing for year 2015, and if so, is it 2000-2015 or some other interval? If there is no post-processing, then considerable reliance is being placed on the raw modeled data for 2015. This is particularly critical for peak hour intersection turn movement volumes.

## 4.4 NOISE ASSESSMENT

The County previously submitted to LAWA a lengthy set of comments on the noise analysis contained in the 2001 Draft EIR/EIS for the LAX Master Plan. The prior comments addressed noise impacts associated with the project Alternatives (A, B and C) under review at that time. The 2003 SDEIS/EIR expands on analyses contained in the original EIR/EIS to cover the new preferred project, Alternative D. The SDEIS/EIR also contains an analysis of single event noise impacts on sleep disturbance as well as an expanded analysis of noise impacts on schools. The sleep disturbance and school noise impacts analyses were prepared in response to CEQA litigation on the Oakland International Airport Master Plan commonly known as "Berkeley Jets." The SDEIR/EIS presents Year 2000 noise data for comparison in addition to the Base Year 1996 data.

The comments presented here are ones made specific to the analysis of Alternative D and the sleep and school analyses that are presented in the supplemental EIR/EIS. The comments submitted in 2001 concerning Alternatives A, B and C also apply to Alternative D. Accordingly, we have organized the following review to include all of the comments originally submitted in 2001, as well as the new comments appropriate to Alternative D as described in the SDEIS/EIR.

#### 4.4.1 Restatement of Critical Review Submitted in 2001

It is important to note that the findings of the Draft EIS/EIR include a finding of significant noise impact that cannot be mitigated to a point of insignificance. The issues raised in our analysis do not change this finding of significance. The comments presented here address whether or not the Draft EIS/EIR adequately discloses the extent and magnitude of the impact and whether or not mitigation issues are addressed adequately.

**Determination of Potentially Significant Impacts:** CEQA requires that the Draft EIR identify all impacts that could arise to significant levels and must employ the proper “thresholds of significance” to make that identification. CEQA also requires that the document “challenge” and “update” thresholds that may not be current or protective of the public interest. This notion includes the idea of setting thresholds that will improve the quality of life of residents. As it relates to the impacts identified below, LAWA should seize this opportunity to push the SDEIS/EIR beyond mere minimum standards or code compliance, and assert a more conservative approach to identifying significant impacts. The following identified impacts relate to the use of minimum standards.

CEQA does not mandate, require or endorse a specific decibel standard or noise metric to determine if a project engenders a significant adverse environmental impact with respect to aircraft noise. However, a significant aircraft noise impact is said to have occurred if one or both of the following conditions exist:<sup>30</sup> (a) noise sensitive areas (such as residences, churches, and hospitals) are newly exposed to 65 CNEL or greater; and/or (b) noise sensitive uses in the 65 CNEL contour of a “build” alternative experience an increase of 1.5 CNEL or greater compared with the environmental baseline conditions.

The Airport Noise Compatibility Planning guideline<sup>31</sup> is the primary Federal regulation guiding and controlling planning for aviation noise compatibility on and around airports. It establishes, for most land uses and noise sensitive uses, the standard of < 65 day-night average noise level (DNL or Ldn) as “acceptable,” although it recognizes that local communities may choose to mitigate impacts below the Ldn of 65 dB.

The Federal Interagency Commission of Noise has identified 65 Ldn as the 24-hour day-night average sound level at which most people become highly annoyed by noise. However, FICON has acknowledged that people may and do become highly annoyed by noise levels well below 65 Ldn. Indeed, many commentators and acoustic researchers are seriously questioning the validity of the 65 dB Ldn criteria for planning purposes: research has shown that at this level about 15% of the population remains “highly annoyed” and that the standard is an average sound level, not a measurement of individual sound events that tend to affect people more than average levels.

The SDEIS/EIR should have employed these conservative criteria to allow a survey of a larger area and reveal the true pervasiveness of sound that was not identified in the Draft EIS/EIR. This would be important in the discussion of impacts and mitigation of noise to show that “average” threshold levels were not sufficient to show the chronic and long-term effects within the LAX flight path. It is likely that there will be exacerbated and disproportionate levels of impacts on unincorporated neighborhoods under the flight path approaches to LAX.

<sup>30</sup> California Aircraft Noise Standards, Title 21 of the California Code of Regulations.

<sup>31</sup> Title 14 of the Code of Federal Regulations, Part 150.

**Number of People Impacted by Noise:** There is a significant discrepancy in the number of dwelling units and population impacted between the EIS/EIR baseline year impacts and data published by LAWA. Under California law, the airport must publish a quarterly report that describes the noise impact of the airport. This law has been in effect since the early 1970s and LAWA has published the Quarterly Reports as required. Appendix D of the EIS/EIR states that the base year noise impact is based on data published by LAWA in the 1996 Fourth Quarter Report.<sup>32</sup> Chapter 4, § 4.1.3.1.2 states that the EIS/EIR relies on the Fourth Quarter 1996 operational data but does adjust the EIS/EIR contours to reflect the noise monitoring data that are collected by the airport. The difference between the impacts as defined by the EIS/EIR and the impacts as identified by LAWA in its Quarterly Report is dramatic and significant. The following data compare the number of dwellings and population impacted as defined by LAWA in the 1996 Fourth Quarter Report and as defined in the EIS/EIR for baseline year 1996.

**Table 4**  
**Difference Between Draft EIS/EIR Noise Impact and LAWA 1996 Quarterly Report**

	Dwellings Inside 65 CNEL	Population Inside 65 CNEL
LAWA 1996 Fourth Quarter Report	31,968	85,907
EIS/EIR Table 4.1-2 For 1996	16,900	49,000
<b>Difference</b>	<b>15,068</b>	<b>36,907</b>

The differences shown in Table 4 are not presented, reconciled, or explained in the SDEIS/EIR. The population and dwelling data shown in the LAWA 1996 Quarterly Report are not mentioned in the Supplement to the Draft EIS/EIR even though the Quarterly Report shows noise impacts nearly twice as large as those reported in the SDEIS/EIR. Section 4.1.3.1.2 and Appendix D § 2.2 discuss the LAWA Quarterly Reports and the fact that noise contours in the Quarterly Reports are adjusted to reflect noise monitoring data. Appendix D presents the difference between the noise monitoring results and the EIS/EIR noise model results in the terms of dB CNEL in Table 5. The average difference between the two is presented as an under-prediction in the model of approximately 1.1 dB. Examination of the data shows that the noise monitor sites east of the airport, primarily in Inglewood, consistently show noise levels nearly 3 dB greater than the EIS/EIR noise modeling predicts. While the differences are smaller in other communities, the bulk of the population impacted is in the area where monitors show that the noise model has under-predicted the impact.

LAWA operates a permanent noise monitoring system as required by the California Airport Noise Regulations that has been approved by the State of California Division of Aeronautics. LAWA has been monitoring noise on a continuous basis and submitting Quarterly Reports since the early 1970's and every Quarterly Report includes noise impact data based on noise contours that have been adjusted to match noise monitoring data. Nevertheless, the Draft EIS/EIR relies on a noise computer model output that has not been adjusted to reflect the noise monitoring data even though the noise monitoring data show a consistent 3 dB bias in the east approach corridor to LAX.

<sup>32</sup> Appendix D Section 2.1, Appendix D Section 2.2.

There is no doubt that there is a consistent bias in modeling data in the Inglewood approach corridor; the size of the difference in the Inglewood area compared to the system accuracy is significant. Appendix D, in the paragraph just below Table 6 makes the misleading and inaccurate statement that the SDEIS/EIR noise contours "were generally confirmed by the actual noise measurements." This statement is based on the overall average difference at all sites, and fails to recognize the bias in the Inglewood approach corridor. The Draft EIS/EIR contours under-predict the noise impact as measured by the number of dwellings and population within the 65 CNEL contour by an amount that makes it difficult to establish a credible disclosure statement to the general public.

The SDEIS/EIR does not attempt to examine the reason for the under-prediction of aircraft noise by this noise model. Instead, the SDEIS/EIR rationalizes the lack of contour adjustment by stating, "draft FAA Order 1050.E indicates that measurements should not be used to calibrate noise contours;"<sup>33</sup> the cause of the discrepancy is not identified. The difference may be due to errors in input data to the noise model, not a calibration issue. Failure to adequately account for flight track dispersion could cause the kind of discrepancies the data shows. The model has the capability to report noise levels by aircraft type at each location. Such data should be compared to measurement data for those aircraft and a rational and detailed explanation of the model/measurement differences should be made. At the least, the source of the difference would then be identified (i.e., input data errors, model database differences, or model algorithm shortcomings).

The FAA has a history of being reluctant to adjust noise contours based on measurement data. This policy was based on historical attempts to use short term monitoring data to make adjustments that are not statistically justified. Such a policy is justified, in particular when attempts are made to use a few hours of monitoring data as a basis for moving noise contours. In this case, however, LAWA operates noise-monitoring sites 24 hours a day, measuring every aircraft, and has been doing so for over 20 years. These data do warrant adjustment to the noise contours; either by correcting input errors or modifying model databases (such as noise curves and aircraft profiles). FAA does not prohibit these changes and, in fact, FAA provides a mechanism for user changes to the database. The "INM Users Guide,"<sup>34</sup> contains Appendix B, "FAA Profile Review Checklist." The first paragraph of that appendix contains the following statement,

*"The Office of Environment and Energy (AEE) requires prior written approval for all user changes to the Integrated Noise Model (INM) standard profiles for FAR Part 150 studies. A similar requirement under National Environmental Policy Act (NEPA) will take effect pending FAA Order 1050.1E".*

Following that paragraph is a detailed list of information required for the FAA review of user made changes. It is not known if any attempt was made to seek FAA approval of changes needed to make the model better match measurement data. If there was no attempt, the decision should be explained. This last comment is especially appropriate if input errors have already been eliminated as a possible source of the difference.

**Change in Number of People Impacted by Noise:** The Draft EIS/EIR relies on the noise model to identify relative changes between baseline and future Alternative conditions. The Draft states, "the

<sup>33</sup> Appendix D, Page 17.

<sup>34</sup> For INM Version 6, dated September 1999.

*modeled noise levels associated with environmental baseline conditions will have consistent relative relationships to future noise patterns prepared with the INM.*"<sup>35</sup> This statement, while possibly true for changes in noise level, is not accurate with respect to the area of noise impact, the number of dwelling units, and the population within the noise contours. The implication of the statement quoted above is that the increased number of people identified as impacted will be the same whether or not the noise contours are adjusted to reflect results of noise monitoring. This is not true and fails to reflect that area, dwelling units, and population are second order functions of the size of the contour. The change in the number of people residing inside the 65 CNEL contour will be much larger than reported in the Draft EIS/EIR. The percent change may remain nearly constant, but the absolute magnitude will be larger.

If LAWA does not adjust the Draft EIS/EIR contours to reflect monitoring data then the document should attempt to estimate the correct number of dwellings and people inside the contours by using an adjustment factor based on the differences identified for the baseline conditions. While this is far less satisfactory than adjusting the contours, the impacts identified would be a far better disclosure of the magnitude of the impact than is now included in the document.

**Use of 1996 as Base Year:** There is reason to question the validity of 1996 as the baseline year. Use of the 1996 baseline appears to underestimate the impact of the project (in addition to the contour adjustment issue identified above). To demonstrate this concern, the following table compares 1996, 1999, and Year 2000 noise impacts at LAX:

**Table 5  
LAWA 1996, 1999 and 2000 Quarterly Report Noise Impacts**

	Dwellings Inside 65 CNEL	Population Inside 65 CNEL
1996 Fourth Quarter Report	31,968	85,907
1999 Fourth Quarter Report	26,422	78,026
2000 Fourth Quarter Report	27,312	80,211

The above data show that the use of the 1996 baseline, with its larger impact area, would result in underestimating impacts compared to using 1999 or 2000. The difference in the number of people impacted for the year 1996 and the year 2000 is potentially large enough to change the conclusions as to whether future year contours impact a larger or smaller number of people than baseline conditions. As a result, LAWA should update the noise study to a more current year.

**Project Description/Operational Assumptions:** The noise analysis is a comprehensive analysis that attempts to identify cumulative and single event noise impacts as well as detailed tables of time above specific thresholds. However, in addition to failing to adjust the contours to reflect noise monitoring data, there is substantial uncertainty associated with the future operational assumptions. The operational assumptions are in many cases counterintuitive and lack justification. This makes any analysis of the noise impacts speculative, and potentially under-predicts the impact. The following are examples of areas of concern and point to a need to do a "worst case" analysis in the

<sup>35</sup> Appendix D, Page 17.

event that these assumptions cannot be assured or justified. The following data were taken from the Executive Summary, Pages ES-9 and ES-10.

**Passengers Per Departure:** The baseline passengers per departure are 90.76 while Alternative C assumes 145.09. It is not explained how LAWA expects the project to result in a relocation of short haul operations to some other airport and an increase in average aircraft size. There is no component of Alternative C that results in a nearly 60% increase in passengers per departure. This increase is extraordinarily large given that no part of the project forces commuter or short haul aircraft to move or even includes a design feature that discourages these aircraft. In light of this, the Draft EIS/EIR should contemplate the noise impacts if this assumption proves to be false and commuter and short haul carriers do not move to some other airport. Further, the extent to which the passenger per departure increase is due to increased load factors needs to be addressed and a discussion of whether or not this increase in load factor (expressed as an increase in aircraft weight) was included in the INM input for the future case scenarios needs to be explored.

**Cargo Activity/Cargo Building Space:** The baseline cargo activity is 1.9 million tons of cargo using 1.9 million square feet of space. Alternative C activity is 4.1 million tons using 5 million square feet. The future ratio assumes that new cargo facilities are no more efficient than the old LAX facilities and fails to recognize that modern facilities may handle twice the amount of cargo per square foot. LAWA does not provide the basis for this assumption. The noise analysis should be based on the potential impact of far more cargo traffic than is currently estimated.

**Maximum Airside Capacity:** The Draft EIS/EIR nearly doubles the terminal space but assumes a very modest increase in passengers and operations. This is based on the assumption that future technology will not increase the capacity of existing runways. However, LAWA should also explore the opposite: what would result if improved technology results in increased airside capacity? Given the increase in terminal space, how much air traffic could those terminals handle? LAWA should disclose noise impacts for air traffic estimates based on maximum terminal capacity for the proposed project.

**Peak Hour Operations/Delay:** The All Weather Peak Hour Operations are identified as 150 for the baseline condition and 145 for Alternative C. The All Weather Average Delay is identified as 8.69 minutes while the Alternative C delay is identified as 13.59 minutes. This statement is counterintuitive and, at the very least, challenges the credibility of the aviation forecasts upon which the noise analyses are based. Please explain the basis for these findings.

**Terminal Space/Number of Gates:** Alternative C increases terminal space from 4 to 7.3 msf while gates increase from 165 to 172 (186 to 228 narrow body equivalents). The narrow body equivalent ratio increases from 21,500 sq. ft. per narrow body equivalent gate (baseline) to 32,000 square feet per gate, which is nearly a 50% increase. It appears that the project will have a larger gate capacity than is being reported and, if so, this needs to be accounted for in the noise analysis.

**Regional Issues:** The project is primarily a landside development project (terminals and roads) with no new runways. A major assumption in the document is that some other airport in the region will absorb the unmet aviation demand. The Draft EIS/EIR does not identify which airports will meet this demand or any mechanism to ensure that this assumption is valid. LAWA, as proprietor of multiple airports is lead agency for the EIR and the FAA is a lead agency for the EIS. Both agencies have the ability to commit to or fund airport projects outside of LAX. The document

needs to address the noise issues in the event that future airport capacity is not developed elsewhere in the region. The SDEIS/EIR should include an Alternative that meets aviation demand for the region – either through committing to a regional solution or anticipating additional runways in Alternative C – and discloses the noise impact of that Alternative.

**Health Effects of Noise Technical Report:** Technical Report 14b contains a general discussion of the effects of noise on people. In the last paragraph of §1 the report concludes with the statement, “It is, therefore, assumed that compliance with the compatibility criteria is sufficient to protect human health.” The statement in itself is correct, but is misleading in its implication that LAX complies with the compatibility criteria. The report fails to make a most important conclusion related to health effects of noise: LAX does not comply with the compatibility criteria. Based on this factor, it can then be concluded that noise levels associated with aircraft operations at LAX have adverse health effects on people. This should be addressed in the Technical Report and the DEIS/EIR should identify the health effects associated with high noise levels including the fact that in 1996 over 85,000 people resided in areas that exceeded the compatibility criteria.

**Mitigation of Noise Impacts:** The proposed project includes no noise mitigation recommendations for the proposed project. It should be noted and clearly recognized that LAWA has for many years conducted an ongoing noise mitigation program and has periodically introduced new programs as appropriate. What is not clear is why the proposed project does not address any new noise mitigation programs. Several mitigations are discussed in detail in Appendix D but not recommended for adoption by LAWA. Appendix D includes the following measures that LAWA should consider for inclusion as recommended programs for the proposed project:

- ▶ Shorten the downwind leg approach to reduce the number of overflights to communities well east of the airport.<sup>36</sup>
- ▶ Eliminate early turns over El Segundo.
- ▶ Reevaluate the benefit of restricting outboard runways to arrivals only in terms of number of people and dwellings inside the 65 CNEL contour.

The analysis in Appendix D describes benefits and impacts in only general terms of change in noise level but not in area impacted. Further, the analysis appears to rely on questionable economic data to estimate mitigation costs. Specifically, the analysis assumes that the delay of 2-4 minutes associated with the measure would apply to all flights independent of time of day. It would be more logical to assume that the delay would be longer during peak periods and shorter during off peaks.

An important aspect of the existing LAX noise mitigation program is the preference for west flow departure operations. The project assumptions presented in Appendix D appear to assume some degradation in the amount of time that the airport is in west flow for departures. Figure 10 of Appendix D shows 5.71% of operations in east flow for the proposed project. Table 3 of Appendix D indicates that less than 1% of departures are to the east for baseline conditions. Figure 10 and Table 3 are in different formats, so the above comparison may not be fair; however, the SDEIS/EIR does not provide assurance that the project will not result in an increase in east flow departures.

A final mitigation that should be given consideration is expansion of the sound insulation program to homes within the 60 CNEL contour. Such a program may not qualify for traditional Federal

<sup>36</sup> Exhibit 29 of Appendix D.

funding but there may be an opportunity to use passenger facility charge (PFC) funding for such a program. Because community concerns about the impact of aircraft noise goes so far beyond the boundary of the 65 CNEL contour (particularly when the contour is not adjusted to match noise measurement data), consideration of expanding the program should be given a thorough evaluation in the Draft EIS/EIR. Figure 4.2-5 shows the 1992 65 CNEL contour upon which the insulation program is based. The Draft EIS/EIR should compare this contour with the project 60 CNEL contour and evaluate the cost of expanding the program to include the 60 CNEL contour.

#### **Miscellaneous Noise Comments:**

Data Sources and Assumptions: In §2.1, the third from last sentence, 2<sup>nd</sup> paragraph states, “this EIS/EIR will rely on the results of the Noise Management Bureau’s system in the definition of environmental baseline noise levels (per the 4<sup>th</sup> Quarter 1996 Report).” This statement is categorically wrong and misleading. It implies that the report relies on the calibrated noise contours produced by LAWA. The report relies on uncalibrated noise contours generated by the noise model that are considerably smaller than the contours presented in the 4<sup>th</sup> Quarter 1996 Report.

Environmental Baseline vs. Quarterly Noise Report: Discussion in §2.2 attempts to downplay differences between the Quarterly Report contours and the baseline contours in the SDEIS/EIR. The first paragraph cites a Figure<sup>37</sup> that would help the reader understand that the Draft EIS/EIR baseline is considerably smaller than the Quarterly Report contours, but the figure is missing from the report. The statistical analysis of the noise measurement data and noise model results from Table 6 is completely inadequate and fails to identify the bias in the noise model to under-predict noise levels in the approach corridor over Inglewood. Please address this concern.

Impact on Schools: §3.3 of Technical Report 14b (Health Effects of Noise) has a footnote explaining the 1980 lawsuit settlement with the school district. The analysis appears to assume that because of this settlement there is no impact on schools. Please identify which schools have been insulated, which schools remain to be insulated, and how many more schools will need to be insulated as a result of the project.

Federal Standards: § 4.1.4.1.2 in the last sentence states that the “...FAA has adopted standards and guidance governing airport noise compatibility.” The FAA has only published land use compatibility guidelines and has not adopted noise standards. It is up to the local authorities to adopt noise/land use compatibility standards.

Construction Noise: § 4.1.4.3.1 should reference the City of Los Angeles and the County of Los Angeles Noise Ordinances which contain noise limits and limits on the hours of activity. The County requests that LAWA identify noise limits in the ordinance as a threshold of significance, and provide analyses in accordance with that threshold.

Operations Data: In the discussion on noise patterns,<sup>38</sup> the first bullet point outlines an increase in heavy aircraft and a decrease in small aircraft. There is no explanation as to how Alternative C accomplishes this transition and there are no explicit features of Alternative C that would appear to

---

<sup>37</sup> Figure 2.3.

<sup>38</sup> Section 4.1.6.1.2.2, Alternative C, Aircraft Noise Pattern at 2015.

encourage it. If the assumption cannot be justified, the noise analysis should be revised to reflect the trend toward a fleet mix that does not rely on heavy aircraft for achieving the passenger demand.

Construction Scheduling: The City and County of Los Angeles have ordinances that limit the hours of construction activity. § 4.1.8.3, MM-N-9, should reference those ordinances and identify the hours that construction is permitted.

Location Impact Analysis: The last sentence of the last paragraph on Page 87 states that only CNEL and DNL have a regulatory function. This is a very limiting assumption and fails to recognize that for some types of impacts, these metrics may be inadequate. Specifically, FICON identifies these metrics as potentially inadequate for assessing noise impacts on sleep or noise impacts on the classroom environment. FICON recommends use of supplement metrics for analysis of these impacts; the County requests that LAWA use the metrics to analyze these impacts. While the document does present some Sound Exposure Level (SEL) contours and tables of time above data at specific points, the Draft EIS/EIR fails to use these data to assess sleep disturbance or school impacts.

No-Action/No Project Comparisons: The first sentence of § 5.1.3 identifies that 11 grid points will be exposed to increases of 1.5 dB. This comparison of the number of grid points is used throughout the analysis. This type of analysis fails to account for the land use that may occur at the grid points. In effect, the grid points, while regularly spaced, are located on random land uses. It would be more accurate to use INM to construct a different contour that shows all areas exposed to a change of 1.5 dB or more; the County requests that LAWA use this contour to quantify the land use impact. The INM has the ability to construct such a different contour.

Noise Mitigation: The first sentence of §7 identifies the need for mitigation of significant impacts. Since the project is shown to have a significant impact, the County requests that LAWA propose appropriate noise mitigation measures.

Alternative C Figures: Alternative C, Figure 11, does not use flight track dispersion in the noise model; however, LAWA has radar-tracking ability. Please provide a 24-hour period of actual radar tracks as an example of the extent of track dispersion over the affected areas.

Area Wide Flight Paths: Please supplement Alternative C, Figure 17 with one chart for existing conditions so the reader can identify differences. At a minimum, the text should describe how this chart changes paths relative to existing conditions.

Appendix D: Table 7 of Appendix D identifies the forecast year 2005 baseline as 2,107 operations per day and year 2015 as 2,124 operations per day.<sup>39</sup> The Quarterly Report for the 4<sup>th</sup> Quarter of the year 2000 shows that current operation levels are 2,280 operations per day (201,347 quarterly operations). Existing operations are already exceeding the 10 and 20-year projections for the No Action/No Project case. Please revise the noise analyses and comparisons to reflect realistic descriptions of future no project conditions.

Reduced Impact of Approach Overflights: Exhibit 29, Reduced Impact of Approach Overflights, shows (and the accompanying text contains) an analysis of this approach procedure and there

<sup>39</sup> Table 8.

appear to be community benefits to this procedure. Therefore, it is concerning as to why it is not included as a recommended mitigation measure.

#### **4.4.2 New Comments on the Supplemental EIR/EIS for Alternative D**

The following comments are provided based on an analysis of EIR/EIS § 4.1, "Noise," and Appendix S-C1, "Supplemental Aircraft Noise Technical Report:"

**Noise Modeling:** Section 2.1 implies that noise monitoring and flight track system data were used to generate noise contours, but should be revised to state that the noise analysis and noise contours were based entirely on a computer noise model. The noise data presented in the Supplemental EIR/EIS do not use any of the noise data collected by the airports noise monitoring system. The airports noise monitoring and flight track system was used only to obtain operations and runway utilization data. In fact, there is a significant conflict between the noise monitoring data published by the airport and the noise modeling done as part of the EIR/EIS.

**Noise Contour Errors:** § 2.1.7 The noise contours presented in the SDEIR/EIS for the year 2000 are smaller than the noise contours published by the LAWA in its Year 2000 Q4 report. No attempt is made in the SDEIS/EIR to examine the reason for the noise model under-predicting aircraft noise. The Supplemental EIS/EIR rationalizes the lack of contour adjustment by stating, "draft FAA Order 1050.E indicates that measurements should not be used to calibrate noise contours." However, no attempt is made to identify the cause of the discrepancy. The difference could be due to errors in input data to the noise model, not a calibration issue. Failure to adequately account for flight track dispersion could cause the kind of discrepancies the data shows. The model has the capability to report noise levels by aircraft type at each location. LAWA should compare the data to measurement data for those aircraft and offer a rational and detailed explanation of the model/measurement differences. At the least, the source of the difference would then be identified (i.e., input data errors, model database differences, or model algorithm shortcomings).

**Noise Contours Require Adjustment:** The FAA has a history of being reluctant to adjust noise contours based on measurement data. This policy was based on historical attempts to use short term monitoring data to make adjustments that are not statistically justified. Such a policy is justified, in particular when attempts are made to use a few hours of monitoring data to move noise contours; however, in this case LAWA operates noise monitoring sites 24 hours a day, measuring every aircraft and has been doing so for over 20 years. These data do justify adjusting the noise contours either by correcting input errors or modifying model databases, such as noise curves and aircraft profiles. FAA does not prohibit these changes. The FAA provides a mechanism for user changes to the database. The "INM Users Guide"<sup>40</sup>, contains Appendix B, "FAA Profile Review Checklist." The first paragraph of that appendix contains the following statement, "The Office of Environment and Energy (AEE) requires prior written approval for all user changes to the Integrated Noise Model (INM) standard profiles for FAR Part 150 studies. A similar requirement under National Environmental Policy Act (NEPA) will take effect pending FAA Order 1050.1E." Following that paragraph is a detailed list of information required for the FAA review of user made changes. It is not known if any attempt was made to seek FAA approval of changes needed to make the model better match measurement data. If there was no attempt, LAWA should explain the decision—particularly if input errors have already been eliminated as a possible source of the difference.

<sup>40</sup> For INM Version 6, dated September 1999.

**Mitigation Must Reflect Validated Contours:** The Supplemental EIR/EIS should explicitly show the difference in noise contour location and the number of dwellings and population for the Year 2000 noise contours contained in the Quarterly Report published by LAWA and the Year 2000 noise contours contained in the Supplemental EIR/EIS. The Supplemental EIR/EIS further rationalizes the use of the noise modeling information in spite of the differences to the measurement data by stating that future measured contours will be used to adjust mitigation area. If noise mitigation programs will be based on noise measurement validated noise contours, then the mitigation measures should include a specific commitment to use such validated contours.

**Assumptions Concerning Future Noise Contours lack Validation:** The supplemental EIR/EIS further states in § 2.1.7 of S-C1 that using the smaller computer generated contour will result in showing greater noise impacts. This latter statement is based on the erroneous assumption that the noise contours presented for future conditions are accurate and that the noise contours for 1996, 2000 and the future no project case are underestimated. On what basis does the Supplemental EIR/EIS conclude that the future noise contours are more correct than the existing noise contours when the same model and methodology are used for each?

**Inadequate Number of Flight Tracks for Modeling:** Footnote 3 of § 2.1.3 states that the 74 flight tracks were adequate to produce an adequate noise model input. What data did LAWA use to draw this conclusion? Why did LAWA not complete a sensitivity analysis to determine if the discrepancy between measured noise data and modeled result differences was due to inaccurate or insufficient number of flight tracks used in the INM model? In particular, why weren't additional flight tracks used to simulate track dispersion for aircraft approaches? In the absence of supporting data, footnote 3 is misleading and should be eliminated.

**Table S11 is Mislabeled:** The title of this table indicates it is a comparison of single event noise. It is in fact a table of runway utilization data during runway construction. Please revise the title to Table S11 accordingly.

**Sleep Disturbance Data Require Clarification:** In § 6.1.1, the threshold of significance for sleep disturbance is based on the 94 SEL contour which represents a 10% awakening rate for noise events that occur at least once every 10 days. The number of awakenings presented in the data tables is not the total number of people awakened but the number awakened within the 94 SEL contour. In fact, at lower noise levels there is still sleep disturbance, albeit at a lower rate. For example, the FICAN curve shows that for an interior noise level of 45 SEL (58 SEL exterior noise level with windows open) about 1% of the population will be awakened. The awakening rate of 1% is quite low, but when applied to a large population such as that located in a 58 SEL contour, would produce a large number of people awakened. The Supplemental EIR/EIS should make it clear that the sleep disturbance data presented are not total awakenings, but awakenings within a specific contour. The methodology used in the EIR/EIS allows the comparison of alternatives within a contour that can be practically estimated and appears to be a fair basis for comparison.

**Sleep Disturbance Flight Tracks Must be Identified:** Analysis of single event for sleep disturbance does not make it clear whether or not the analysis relied on the same flight tracks as used for developing the CNEL model. Did LAWA use the same flight tracks? If so, then the sleep analysis fails to account for flight track dispersion, and given that the significance threshold is based on an event that occurs at least once every 10 days, the results are misleading. If flight track dispersion is not included in the analysis then the County requests that LAWA describe the results

as comparing the number of awakenings within a specific SEL contour for aircraft flown on the nominal flight tracks and aircraft flight deviations that occur on other tracks would cause further awakenings.

**Sound Insulation Eligibility:** §6.1.3 adds an important criterion to the eligibility program for sound insulation. The sound insulation area is now based on ANMP CNEL contours and this section adds the SEL contour map. Is this a proposed formal policy that is clearly stated in the mitigation measures (including the requirement that the location of the 94 SEL contour be verified by measurements)? Has the cost of insulating the additional homes been included in the reported costs for the Master Plan improvements? If single event contours are underestimated relative to measured noise as is the case with the CNEL contours, how would this affect the study results? How many more homes and schools would be impacted if the SEL noise is underestimated by the same amount that the CNEL contours are underestimated (as measured by comparing baseline model results to baseline year measurement results)?

**Lennox Preschool Mitigation Required:** The Lennox School District operates a preschool at 10417 Felton. The site of this school is affected by both aircraft noise and roadway noise. The SDEIR/EIS addresses only aircraft noise at this site and does not address roadway noise. How does the combined noise from aircraft and motor vehicles affect impact this school? Further, how would roadway improvements in the vicinity of this site affect roadway noise levels and what would be the corresponding impact on the school? The SDEIR/EIS identifies a significant impact for Alternative B, but fails to address noise level changes that may result from roadway improvements that will occur with other alternatives. Similarly, in §6.2.3 the statements on school mitigation contain no commitment to mitigate identified impacts, only a commitment to study further. The County requests affirmative commitment from LAWA for the full mitigation of noise impacts at all affected schools in the project area.

**Soundproofing Homes to Reduce Noise Impacts:** LAWA has outlined a number of important noise attenuation goals in Mitigation Measures MM-LU-1, MM-LU-2, MM-LU-3 and MM-LU-4. However, it is not clear how or when or even if the goals would be achieved because many of the implementation components lack definition. We are particularly concerned about the following:

**MM-LU-1: Implement Revised Aircraft Noise Mitigation Program.**

- ▶ Under the measure calling for 'Accelerated rate of land use mitigation to eliminate noise impact areas in the most timely and efficient manner possible,' LAWA calls for "*Increased annual funding by LAWA for land use mitigation.*" Please specify an annual dollar amount for which LAWA is willing to make a commitment.
- ▶ Under the same measure, LAWA calls for "*Reevaluating requirement for granting of aviation easements with sound insulation mitigation.*" Please specify the performance criteria that LAWA would use in this reevaluation. Under what conditions would LAWA waive the requirement for granting of aviation easements with sound insulation?
- ▶ Under the same measure, LAWA calls for "*Reduction or elimination, to the extent feasible, of structural and building code compliance constraints to mitigation of sub-standard housing.*" Please define the criteria that would justify a reduction of code compliance constraints, and the criteria that would justify the elimination of code compliance constraints. Please also estimate the proportion of currently code-constrained units that would become eligible with application of these criteria, including a specific estimate for the community of Lennox.

MM-LU-2: Incorporate Residential Dwelling Units Exposed to Single Event Awakenings Threshold into Aircraft Noise Mitigation Program:

- ▶ Although this measure adds a large number of homes to the insulation program, none of the additional units is located on unincorporated land even though many impacted homes are in Los Angeles County jurisdiction: please explain why this mitigation omits County homes.
- ▶ MM-LU-2 includes the following commitment, "*actual adjustments to the ANMP contour would be based on periodic reevaluation of the 94 dBA SEL noise contour by LAWA.*" The statement implies, but does not actually state that measurements will be used to make the actual adjustments. Please incorporate the word 'measurements' into this commitment.

MM-LU-3: Conduct Study of the Relationship Between Aircraft Noise Levels and Ability of Children to Learn. This measure commits LAWA to a program to reevaluate the single event threshold for schools and using results to select "*an acceptable replacement threshold of significance for classroom disruption.*" What group or groups will provide peer review of these studies and judge the acceptability of proposed significance thresholds?

MM-LU-4: Provide Additional Sound Insulation for Schools Shown by MM-LU-3 to be Significantly Impacted by Aircraft Noise. Please see the comment above concerning a key aspect of this mitigation measure calling for "*acceptance of results by peer review of industry experts.*" Again, the measure does not indicate which agencies will be involved in the selection of the industry experts for the peer review. Please indicate whether and which of the affected cities, county, and school districts will have a role in selecting the experts for the peer review.

#### 4.5 AIR QUALITY ASSESSMENT

##### 4.5.1 Review of Ambient Air Quality Data used in the 2001 Draft EIS/EIR

Ambient air quality data were used for two purposes in the 2001 study. One purpose was to define baseline conditions and the other was to estimate background concentrations. Baseline conditions in this case were defined as the maximum air quality concentrations in the vicinity of the airport for existing conditions (an approximate 1996-98 timeframe). Background concentrations, on the other hand, were defined as the concentrations present in the absence of nearby sources. In other words, the concentrations due to multiple small sources and distant large sources were not directly accounted for in the air quality impact assessment. Estimates of background concentrations were used in the analysis to add to the concentration estimates generated by computer dispersion models for the airport and other nearby sources to arrive at estimates of total ambient concentrations.

Data from two air quality monitoring stations were used to characterize both baseline and background ambient air quality conditions. One station was located onsite and immediately to the east of the airport runways in the South Airfield Complex. LAWA operated this station for approximately 7.5 months, from August 1997 until March 1998, and measured carbon monoxide (CO), nitrogen dioxide (NO<sub>2</sub>), sulfur dioxide (SO<sub>2</sub>) and particulate matter (PM<sub>10</sub>). The other station was located approximately 0.6 mile south of LAX. This station, located in Hawthorne and designated as Station No. 094, was operated by the South Coast Air Quality Management District (SCAQMD) and measured ozone (O<sub>3</sub>), lead (Pb), sulfates, CO, NO<sub>2</sub>, SO<sub>2</sub> and PM<sub>10</sub>.

The 2001 Draft EIS/EIR did not provide any justification for the location of the onsite ambient air quality monitoring station or any information concerning the primary purpose of the station. Typically, a monitoring station will be located and operated to either measure background concentrations or maximum source impact. Given the location of the station with respect to the prevailing wind direction and the airport runways, the station appears to be situated near the likely maximum source impact area. Data from the station are used to describe "Environmental Baseline" conditions, which apparently refers to maximum source impact for existing conditions. In most cases, computer modeling would be used to identify the locations of maximum concentrations for baseline conditions, and then one or more monitoring stations would be positioned at these locations. If the onsite monitoring station was not positioned at the expected location of maximum concentration, then it is possible that concentrations higher than those reported at the station occurred in the area.

The 2001 DEIS/EIR did not discuss this, but maximum concentrations from the nearby SCAQMD station are comparable to the concentrations reported onsite by LAWA for the same timeframe. This suggests either that maximum concentrations do not vary significantly in the area or that both stations are similarly affected by nearby sources. The document shows that the maximum concentrations from the onsite monitoring station actually occurred when the station was upwind of the airport.<sup>41</sup> Thus, the maximum 1-hour CO concentration shown as the Environmental Baseline value in Table 4.6-11 was apparently due to other sources in the area and not the airport. This needs to be rectified.

LAWA needs to explain the basis for siting of the onsite ambient air quality monitoring station. If it was located at or near the expected location of maximum concentration (for all pollutants), please explain how this location was selected. It is also unclear whether data from the onsite monitoring station characterized true maximum baseline concentrations in the area or only the maximum concentrations at the monitoring site location. If the data did not characterize the maximum concentrations, please identify them. Finally, the Environmental Baseline concentrations shown in the 2001 DEIS/EIR Table 4.6-11 need to identify whether they represented maximum impacts from the airport emissions or if they are due to other sources in the area.

#### **4.5.2 Review of Ambient Air Quality Data used in the 2003 Supplement to the Draft EIS/EIR**

Additional baseline data is provided in the Supplement to the Draft EIS/EIR. Baseline data are taken to include background plus contributions from airport and non-airport sources. This additional baseline data includes measurements by the SCAQMD for the period 1998 through 2000 at a nearby monitoring station. Previously, baseline data were reported for 1996 through 1998 at the same SCAQMD station and also for on-site measurements collected during 1997-98. These data are presented together in Table S4-6.5, so presumably they are reasonably comparable.

Together, these two data sets comprise approximately five years of data. No discussion of the comparison of the two data sets is provided in the Supplement DEIS, but one obvious thing to look for is data trending. In comparing the data reported in Table S4.6-5, it appears that there has been little change or a slight increase in air pollution levels during the five-year period. Elsewhere in the Supplement to the DEIS/EIR future background concentrations of air pollutants are assumed to decrease substantially over time. Although it is possible that future area-wide emission reductions

---

<sup>41</sup> Technical Report 4, Attachment Y.

will be greater than achieved during this five-year period, the ambient monitoring data do not appear to support a significant reduction in background concentrations during the next several years. Most of the comments and questions offered previously regarding ambient air quality data are still relevant and applicable.

#### Suggested Questions / Comments for LAWA

- ▶ The trends in baseline ambient air quality data given in Table S4.6-5 do not support the substantial decrease in background concentrations that are assumed to occur in future years. Can LAWA explain this and can the forecast reductions in future background air pollution levels be relied upon?

#### **4.5.3 Review of Emission Data used in the 2003 Supplement**

Baseline emissions data are given in Tables S4.6-6 and S4.6-7 for 1996 and 2000 on-airport emissions sources, respectively. The 1996 data have been updated while the 2000 estimates are new in the Supplemental DEIS. It is worth noting that the estimates for 1996 given in the Supplemental DEIS are all higher than the values given in the DEIS, and in the case of VOC and sulfur dioxide, the increases are very substantial. Compared to the original estimates given in the DEIS, the estimated emissions of VOC and sulfur dioxide are more than two times higher. The revised emission estimates for future scenarios have also increased compared to the original estimates given in the DEIS. Again, this is particularly so for VOC and sulfur dioxide which are now two to three times higher than the previous estimates.

#### Suggested Questions / Comments for LAWA

- ▶ The estimated emissions for on-airport sources given in the SDEIS/EIR have changed substantially from the estimates given in 2001. Can the estimated emissions for on-airport sources given in the Supplemental DEIS be relied upon to be reasonably accurate?

#### **4.5.4 Review of Meteorological Data used in the 2003 SDEIS/EIR**

The Supplemental DEIS indicates that the revised analyses were performed using upper air data from a location near San Diego.

#### Suggested Questions / Comments for LAWA

- ▶ Is the upper air data from the San Diego Miramar Weather Service Contract Meteorological Observatory representative of the LAX area?
- ▶ Other comments offered previously concerning the use of 10-m onsite wind data for modeling off site impacts are still applicable.

#### 4.5.5 Appropriateness of the Analysis Methodology

**General Approach:** As commented in the previous review, the Supplemental DEIS includes the results of computer modeling for future scenarios only. No analysis of the existing/baseline situation is provided, which could provide a benchmark of how well the models were performing.

##### Suggested Questions / Comments for LAWA

- ▶ Why did LAWA not model the existing/baseline situation and compare the results to existing ambient air quality monitoring data to get a benchmark of how well the models were performing?

**Aircraft Operations:** The comments and questions provided previously appear to remain applicable. Perhaps the most important of these is that it remains unclear how aircraft queuing was estimated, which is critical to the accuracy of the analysis. Also, it is not clear whether the reduced airport capacity during IFR conditions has been considered in the evaluation of worst-case air quality conditions.

The Supplement to the DEIS indicates that an updated version (Version 4.11) of the EDMS model has been used to evaluate Alternative D impacts. In so doing, the version used for the previous assessments (Version 3.2) was applied to Alternative D, and a ratio of the resulting estimated emissions for the two versions was computed for each air pollutant. These ratios were then used to estimate impacts for the other alternatives based on the results originally obtained with the older version of EDMS.

The EDMS model performs two major functions for airport sources. It estimates emissions and it calculates atmospheric dispersion. In updating the EDMS model, changes were made to both sections of the model. Hence, simply 'ratioing' the previous results based on the old and new emission estimates will not account for any changes in the dispersion algorithms. Thus, use of the developed ratios to update the previous results may not be appropriate.

##### Suggested Questions / Comments for LAWA

- ▶ How was aircraft queuing estimated? Is this critical to the air quality impact analysis?
- ▶ Did LAWA consider IFR conditions in evaluating air quality impacts and the effect this could have on reduced runway capacity and increased aircraft queuing?
- ▶ Did the 'ratioing' technique that was used to update the previous air quality impact analyses generated by EDMS account for all changes in the model or does it only account for changes in the emission algorithms?

**Off-Airport Motor Vehicles:** In the previous review, it was commented that use of wind data from a height of 10-m at the airport may not be representative of winds at off-airport intersections and that using only four receptors at each intersection may also result in underestimated maximum concentrations. These comments appear to remain applicable for the Supplemental DEIS.

#### **4.5.6 Accuracy of the Analysis**

The accuracy of the air quality analyses will depend to a large extent on the computer models used and the input data for the models. Presumably, the use of the updated EDMS model for the airport sources has resulted in improved accuracy for Alternative D compared to the previous analyses. Simple ratios were developed and applied to the previous analyses in an attempt to update the results for the other alternatives. If the ratios are based on the old and new emission estimates only, which appears to be the case, it is doubtful if the predicted concentrations for the other alternatives will be very accurate. This is because the new version of the model includes changes to both the emissions and the dispersion algorithms, and the 'ratioing' of predicted concentrations based on the emission ratios would account for changes to the emission components only. Some of the resulting concentration estimates for the other with-project alternatives given in Table S4.6-12 are considerably higher than those for Alternative D. It is conceivable that a complete assessment of these other alternatives with the new version of EDMS might yield different results.

As commented before, the accuracy of the predicted impacts from the airport sources will depend to a large extent on the aircraft queuing estimates and the estimated airport runway capacity, especially during IFR conditions. It is not clear from the analysis how these issues were addressed.

The unmitigated off-airport impacts for carbon monoxide given in Table S4.6-13 appear unreasonably low. Presumably, traffic approach volumes at many of these intersections are at least several hundred vehicles per hour and perhaps several thousand during peak hours. Yet, the predicted maximum concentrations are only marginally higher (and in some cases even equal to) the estimated background concentration. Assuming that the background concentration estimates are accurate, then maximum concentrations near congested roadway intersections could be expected to be substantially higher.

The accuracy of the predicted maximum concentrations at both on- and off-airport locations depends to some extent on the validity of the assumed substantial decrease in background concentrations of some air pollutants over the next several years. If the projected decrease in background concentrations turns out to be too optimistic, the projected maximum concentrations will likely be too low.

#### **4.5.7 Gaps in the Analysis**

The lack of an analysis of existing conditions using the same computer models and methodologies that were used to evaluate future scenarios continues to be a shortcoming. Without doing this, it is difficult to judge the accuracy of the predicted future conditions. Further, the 'ratioing' technique that was used to update the analyses of airport sources for Alternatives A, B and C and for the no-project case makes it difficult to fairly compare the alternatives.

#### **4.5.8 Appropriateness and Adequacy of Mitigation Measures**

Tables S4.6-6 and S4.6-7 provide emission estimates by source category for on-airport sources for the years 1996 (baseline) and 2000. Emission estimates are provided later in Table S4.6-9 for future years and project alternatives, but these estimates are not given by source category. Only the totals for the various air pollutants are shown. In Tables S4.6-14 and S4.6-16, it indicates that NO<sub>x</sub> and SO<sub>2</sub> emissions from on-airport sources will be significant. In developing a mitigation plan to

address this, it would be very useful to know what the major sources of on-airport NO<sub>x</sub> and SO<sub>2</sub> are so that mitigation measures could be focused where they will be the most effective. Tables S4.6-6 and S4.6-7 indicate that aircraft emit a substantial portion of the NO<sub>x</sub> and SO<sub>2</sub> emissions for the baseline and year 2000 cases. Thus, it seems probable that this will be true for the future scenarios, too. Table S4.6-18 provides a long list of proposed mitigation measures, but none of these involve measures to reduce aircraft emissions.

#### **4.6 LAND USE ASSESSMENT (Transportation)**

Information within the 2003 Supplemental Draft EIS/EIR on each of the project build alternatives relating to consistency with the 2002 Regional Transportation Plan (RTP) and Regional Aviation Plan (RAP) are too vague to draw meaningful conclusions. Of the four build alternatives in the LAX Master Plan, only Alternative D has any discussion of consistency with the current RAP and this discussion is contradictory. As an example, the 2003 Supplemental Draft EIS/EIR in discussing compatibility with the SCAG Regional Comprehensive Plan and Guide states that: *"Under Alternative D additional job opportunities, infrastructure growth, and indirect housing demand would occur."* However, in discussing compatibility with the SCAG RAP it states that: *"Under Alternative D, the LAX Master Plan would be consistent with the policy of the Regional Aviation Plan, which calls for no expansion of LAX."*<sup>42</sup>

How is it possible that infrastructure growth would occur at LAX without expansion of LAX? The fact of the matter is that massive infrastructure expansion would occur under Alternative "D". The result of the infrastructure expansion provides 153 fully functional, high capacity gates and does not remove concrete areas that can be used for aircraft parking. By parking aircraft, Alternative "D" can function as though it has over 200 gates and the capacity of LAX is greatly expanded. As such, Alternative "D" is incompatible with the SCAG RAP.

Revisions to the LAX Master Plan EIS/EIR need to be made that discuss compatibility of the build alternatives to the SCAG RTP and RAP including a discussion of either how Alternative "D" can be made compatible to the current RAP, or explain why it is not feasible for Alternative "D" to be made compatible. Without these discussions, meaningful analysis of this issue is not possible.

##### **4.6.1 Master Plan Commitments Lack Substance**

The referenced Neighborhood Compatibility Program<sup>43</sup> is vague. The details and "teeth" of this commitment must be clarified in order to allow an assessment of its value. The Program should be linked to the Mitigation Monitoring Program, including identification of a formal role for neighborhood review in the formulation and monitoring of specific development plans at the airport/neighborhood interface.

##### **4.6.2 Other Land Use Inconsistencies**

Discussion on Page 4-189 of the 2001 Draft EIS/EIR asserts that Master Plan Commitments LI-1 and DA-2 will reduce land use impacts of the Ring Road on the apartments on Morley Road to less than significant levels; however, these measures are not described in the 2001 Draft EIS/EIR or

<sup>42</sup> 2003 Supplemental Draft EIS/EIR, Section 4.2.6.5, page 4-169

<sup>43</sup> 2001 Draft EIS/EIR, Section 4.2.5, Page 4-116.

2003 Supplemental Draft EIS/EIR, but only referenced. In fact, throughout the 2001 Draft EIS/EIR text §§-1 through 7, references are made to impacts and mitigation measures described in Appendix K, without any explanation or summary describing such impacts and mitigation measures. The 2003 Supplemental Draft EIS/EIR also provides no discussion of this issue. Since the LAX Expressway and State Route 1 (SR 1) improvements are integral features of the build Alternatives A through C, the 2003 Supplemental Draft EIS/EIR should be revised to incorporate this information in the body of the text.

The 2003 Supplemental Draft EIS/EIR presents additional analysis of single event noise levels as mandated by a recent court ruling by the California Court of Appeal (*Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners*, (2001) 91 Cal. App. 4<sup>th</sup> 1344.). It is commendable that LAWA chose to include this evaluation so critically important in assessing impacts to land uses surrounding airports. Of particular concern are single event noise levels as they relate to school disruptions. However, inconsistencies again appear in this evaluation: Table S4.2-2 in the Land Use Section shows that 29 schools would be affected by single event noise levels, whereas Table S4.1-2 in the Noise Section shows that 50 schools would be affected by single event noise levels. These inconsistencies need to be reconciled.

#### **4.6.3 The Land Use Assurance Letter should be Disclosed**

The contents of the Land Use Assurance Letter<sup>44</sup> should be summarized in the text and the document should describe how conflicts would be avoided. This discussion emphasizes noise compatibility considerations and minimizes the combined effects of noise, safety, air quality, lighting, and aesthetics. After acknowledging that land use compatibility is a function of these types of combined effects, very little discussion of combined effects is included in the 2001 Draft EIS/EIR or the 2003 Supplemental Draft EIS/EIR. Please identify properties that are subject to such combined effects.

#### **4.6.4 Key Mitigation Measures may Not be Implemented**

Substantial reliance is placed on Mitigation Measure MM-LU-1 "Implement Revised Aircraft Noise Mitigation Program." This measure is broad in scope, and depends upon the cooperation and funding of agencies outside of LAWA. Consequently, there is no assurance that LAWA will be able to implement this measure in a timely manner. Moreover, LAWA does not have an outstanding track record, as a number of commitments to properties already included within the current boundaries of the ANMP have not been fulfilled. A discussion of unmet commitments from prior actions should be provided along with an evaluation of the impacts that would result if LAWA were unable to fulfill the new commitments described in the 2001 Draft EIS/EIR and 2003 Supplemental Draft EIS/EIR.

Mitigation Measures MM-LU-3 and MM-LU-4 dealing with single event noise levels disrupting school sessions are of particular concern. Mitigation Measure MM-LU-3 commits LAWA to conduct a study of the relationship between aircraft noise levels and the ability of children to learn that in essence allows single event noise levels to continue and monitors the effects of these impacts on schoolchildren in the affected classrooms. As stated earlier, this approach may harm the

---

<sup>44</sup> 2001 Draft EIS/EIR, Appendix E.

children. A more responsible and conservative approach is needed that does not have the potential to do additional harm. Mitigation Measure MM-LU-4 states that:

*"Upon completion of the study required by Mitigation Measure MM-LU-3 and acceptance of its results by peer review of industry experts, any schools found to exceed a newly established threshold of significance for classroom disruption shall be incorporated into the ANMP administered by LAWA. Based on the Master Plan alternative that is ultimately approved and thresholds set forth in § 4.1, Noise, that address single overflight event noise and the ability of children to learn in the classroom, and subject to modification based on the study required by MM-LU-3 those schools listed . . . may be eligible for sound insulation."*

Although the mitigation reads as though it is addressing the problem, it does not commit LAWA to any definable actions that would reduce impacts other than a vague reference that schools may be eligible for sound insulation. LAWA must describe mitigation measures in enough detail to commit the lead agency to an action that reduces the impact. Further, mitigation measures must be defined in enough detail to analyze the potential environmental impacts that may result from the implementation of the mitigation measure.

## **4.7 SOCIOECONOMIC ASSESSMENT**

### **4.7.1 Productivity Variables are based on Flawed Assumptions**

The 2001 assessment of Employment and Socioeconomic Impacts (and therefore the Growth Inducement Analysis as well) was substantially flawed by assumptions made at the outset of the analysis concerning productivity gains. This conclusion is directed largely at the assumption made in 2001 that productivity gains would be the same for all of the build Alternatives. In fact, productivity rates are variable over time and highly sensitive to changes in the economy's overall rate of growth. These cycles are evident in statistics over the past 50 years, which show national annual productivity growth in the range of 2.8% from 1948-1973, compared with 1.2% during the economic slowdown of 1992-1995.<sup>45</sup> When Gross Domestic Product growth is decelerating, productivity slows. Given the repeated emphasis throughout the 2001 Draft and 2003 Supplement to the Draft EIS/EIR that failure to pursue the expansion project would have a negative ripple effect throughout the southern California economy, it would have been more logical to link the No Project Alternative with productivity gains lower than those associated with the build Alternatives. Similarly, to the extent that Alternative D resembles the No Project Alternative it too would be associated with productivity gains lower than those associated with the remaining build. Accordingly, the SDEIS/EIR should reassess Employment and Socioeconomic impacts for Alternative D and the No Project Alternative using a lower estimate of productivity gains.

### **4.7.2 Productivity Forecasts Require Further Justification**

The Socioeconomic Technical Report (provided only in the 2001 Draft EIS/EIR) made note of the labor-intensive nature of many service industries, and identified the tendency toward stable or reduced productivity (and resulting job growth per unit of service) in hotels, restaurants, and numerous high-end personal, household and business services.<sup>46</sup> At the same time, assumptions in

<sup>45</sup> Alejandro Bodipo-Memba, "U.S. Productivity Surged During 1998, Hinting at Escape from 25-Year Slump," Wall Street Journal, February 10, 1999.

<sup>46</sup> Section 3.2.3.

the Draft and 2003 Supplement to the Draft regarding the No Project Alternative show passenger volumes increasing from 71.2 MAP in 2005 and 78.7 MAP in 2015 (about a 10% gain). The Technical Report noted that the services and tourism/entertainment sectors showed the most substantial employment gains between 1972-1992 and again between 1992-1997.<sup>47</sup> Finally, the Report allocated substantial passenger spending on these services, particularly for hotels and dining facilities, through the 2015 horizon.

In combination, these facts would point to positive employment gains in at least those sectors for which productivity is forecast to slow – eating and drinking establishments, hotels, and amusement and recreation facilities at a minimum. Nevertheless, and in apparent contradiction of its own assessment, the Socioeconomic Technical Report forecast losses in direct LAX-related employment for both sectors between 2005 and 2015 under the No Project Alternative. Eating and drinking establishments were forecast to sustain job losses on the order of 1,725 (a 4% drop); hotels were forecast to sustain job losses on the order of 3,467 (a 7.5% drop); and amusement/recreation facilities were forecast to sustain losses on the order of 4,514 (a 14.8% drop).

An explanation is needed to justify the Technical Report forecasts of job losses that conflict with the discussion of anticipated productivity trends for hotels, restaurants, and services. Job growth in the specified service sectors should be projected.

#### **4.7.3 Definition of the No Project Alternative is Artificially Narrow**

The artificially narrow definition of the No Project Analysis weakens the analyses contained in the Socioeconomic Technical Report. As discussed previously, the 2001 Draft EIS/EIR and the 2003 Supplement both assume that under the No Project Alternative there would be no new improvements at LAX beyond those now underway, planned, or programmed. Both CEQA and NEPA favor “worst case” assessment. In this light, it would be more reasonable and informative to anticipate that LAWA would pursue a wide range of additional improvements that would in turn boost direct and indirect employment and spending, with far different socioeconomic impacts than indicated in Technical Report estimates for the No Project Alternative. The analysis of Employment and Socioeconomic impacts should be revised to incorporate the expanded assessment of actions that may in the future be taken by LAWA in the event the project is not approved and the outcomes that could reasonably be expected to result from such actions should be addressed.

The 2003 discussion of socioeconomic effects associated with Alternative D repeats a form of the unsupportable syllogism described in § 3.3.2. In the current section, Alternative D is concluded to have beneficial socioeconomic effects, Alternative D is described as substantially the same as No Action, and No Action is found to have adverse socioeconomic effects. In fact, an increase in construction jobs is the only socioeconomic difference between No Project and Alternative D that is acknowledged in the Supplement to the Draft EIS. Again, we believe that the inconsistency is due to misrepresentation in the description of alternatives – particularly Alternative D and the No Project Alternative.

---

<sup>47</sup> Section 4.1.1.

#### **4.7.4 Distribution of Passenger Spending Requires Explanation**

In estimating the distribution of passenger spending, §3.4.3.1 of Technical Report 5 indicated that it was assumed that LAX would represent the sole source for international traffic, based on historical data for the years 1985-1994. Additionally, the Section noted that:

*“As a working assumption, it was assumed that there was no connecting traffic at any of the other 4 major airports in the region...the single exception to this rule results from the fact that Ontario ‘International’ Airport did serve an estimated 50,000 international passengers during late 1993 and early 1994.”*

It is unclear how the “working assumption” and exception were applied in estimating future contributions under the 2005 and 2015 scenarios. Did the analysis treat the 50,000 international passengers as a one-time event, or did it assume that Ontario would continue to serve 50,000 international passengers (per year) through 2015? In either case, the document should have explored the factors that allowed Ontario to successfully enter this competitive market, with the goal of assessing Ontario’s ability to accept future unmet need in the region as a whole. This analysis would have been especially relevant to the socioeconomic analyses of the No Project Alternative, and may have resulted in far different conclusions. If the Socioeconomic Technical Report did base its 2005 and 2015 No Project Alternative scenarios on the assumption that Ontario would serve 0 or 50,000 international passengers (but no more), the analysis should provide a more detailed assessment of the potential role of Ontario in meeting international travel demand.

In general, and although the Technical Report promised such an assessment, the Socioeconomic Technical Report did not make any substantive effort to determine the degree to which the No Project Alternative might result in a redistribution of air services and associated economic activity to other airports in the region. As it stands, the analysis shines a very bright light on variables influencing the LAX growth scenarios, but does little to apply its powerful tools on the potential future role of other facilities in the region. This approach shortchanges the No Project Alternative. It also shortchanges the newly-proposed and preferred Alternative D. As noted above, the only socioeconomic difference between ‘No Project’ and Alternative D, according to the SDEIS/EIR, is construction employment. If true, then Alternative D would also be similar to No Project in its potential to redistribute non-construction air services and economic activity to other airports in the region. LAWA should expand the Supplement to the Draft EIS/EIR to take a closer look at this issue, considering the amount and type of activity that could reasonably be expected to shift within region, and the direct and indirect economic effects that might result.

#### **4.7.5 Distribution of Regional Spending Requires Explanation**

§3.4.3.1 of the 2001 Draft EIS/EIR noted,<sup>48</sup>

*“Parking costs are the only local impacts attributed to Resident passengers in the current analysis...[and to] the extent that such passengers spend money at restaurant and retail establishments during the time they spend in one of the region’s airports, this analysis may, to a small degree, have underestimated the impacts of Resident passengers.”*

<sup>48</sup> In Footnote 32.

The analysis also discounted resident expenditures on transportation to and from the airport:

*"To the extent that such transportation is provided by a private taxicab, limousine or shuttle service will cause some additional impacts on the local economy. This does not apply to connecting and visitor passengers, for whom these impacts have been measured."*

On the surface, these assumptions would be expected to impact regional spending estimates in a neutral manner, because it is applied to all airports in the region. However, since the analysis: (1) assumed that facilities other than LAX will be essentially limited to resident passengers; (2) discounted the retail, restaurant and travel expenditures of these passengers; and (3) measured such expenditures for connecting and visitor passengers, the net effect is to disproportionately minimize the regional spending contributions of airports other than LAX. Once again, the assumptions would cast an artificially unfavorable light on the No Project Alternative (though not, apparently, on Alternative D, though it is presented as equivalent apart from construction impacts).

#### **4.8 REGIONAL TRANSPORTATION**

All of the alternatives, including the No Action Alternative, call for a 41% increase in passenger activity and a 60% increase in air cargo at LAX. Passenger volume would increase from 56 MAP to 79 MAP, and air cargo would increase from 1.95 million tons to 3.2 million tons in only 12 years. Those amounts are greater than 95% of all other national airports and are greater than all the other Los Angeles regional airports combined!

If indeed the LAX Master Plan aims to promote meaningful growth at other regional airports, then realistic growth control measures must be included. The inland airports have abundant capacity and are crying for air service, and the LAX Master Plan must include measures that lead to region wide cooperation to move air service to those areas. The City of Los Angeles has refused to participate in activities of the Southern California Regional Airport Authority, which has generated several proposals to promote such efforts. Without active measures to move air traffic to other airports, the Master Plan serves only to create another incremental step in the unabated growth of LAX. We understand that LAWA has recently hired a consultant to market Ontario International Airport,<sup>49</sup> and would request that LAWA outline the goals of that marketing plan.

#### **4.9 BIOLOGICAL RESOURCES**

##### **4.9.1 Review of Baseline Conditions**

The SDEIS/EIR identifies eight distinctive biotic communities without clearly distinguishing among the following: naturally occurring communities; man-influenced/modified natural communities; man-created biotic situations; or areas under complete development, which no longer have biotic value for sensitive plant and animal species. The acreages of biotic habitats were rates in terms of value for sensitive species, and compared with marginal habitats, non-native habitats, and areas that are developed and no longer supporting habitats. The review indicated that the airport is largely developed, with open areas that are highly disturbed and offers little or no viable

<sup>49</sup> Press Enterprise Newspaper, "Still awaiting takeoff," September 21, 2003.

habitat for sensitive plant and animal species. The Los Angeles/El Segundo Dunes and, to a lesser extent, the non-restructured dunes north of this area stand out as the only areas having high biological value that merits recognition and a conservation effort by LAWA. It is therefore recommended that the Master Plan include a "conservation element" dictating how the Los Angeles/El Segundo Dunes will be managed. This goes beyond the requirements to manage the Habitat Restoration Area for the El Segundo Blue Butterfly.

#### **4.9.2 Review of Mitigation Measures**

Several mitigation measures are listed in § 4.10.8 that would, if successful, reduce potential impacts to sensitive biological resources to a less than significant level. The selection of mitigation measures will depend on which Alternative is chosen. It is expected that a mitigation monitoring program (MMP) will be developed and implemented. However, we recommend that LAWA separate the biological mitigation measures from the larger MMP and create a Conservation Program that focuses on the Los Angeles/El Segundo Dunes and surrounding areas. This would enhance the biological program and provide LAWA with a stronger negotiating position with United States Fish and Wildlife Service on future projects.

Section 4.11.2 mentions that LAWA initiated a formal Section 7 consultation with USFWS on September 5, 2000. The remainder of § 4.11 discusses several mitigation measures that will be implemented to reduce impacts to listed species to below a significant level. It is not clear whether these mitigation measures are the basis for the formal Section 7 or if they have been included in the required Biological Assessment. Although completion of the Section 7 consultation process by the FAA is not required to be a part of the Draft EIS/EIR analysis, the level of analysis and detail presented in this Draft would suggest that it has been included.

Apparently, USFWS and LAWA have not come to terms on the level of mitigation required to mitigate impacts to the Riverside Fairy Shrimp and its habitat. There is a brief mention of this divide at the top of page 4-691. The FAA is rightly concerned that the creation/restoration of fairy shrimp habitat (vernal pools) will create significant safety issues for aircraft by attracting birds (bird air strike hazards). However, the final endangered species mitigation measures and/or conservation management strategies will depend on final resolution of this issue between USFWS and the FAA.

The Draft EIS/EIR does not give an indication whether the present mitigation measures will be satisfactory to USFWS, or whether these measures will allow the FAA to complete its obligations under the Endangered Species Act. If this is the case, it should be clearly stated. If it is not, the reader needs to know that the mitigation measures have not been approved by USFWS and could change significantly before the Section 7 consultation process is completed and a Biological Opinion is issued by the USFWS.

As discussed above under comments for § 4.10.5 Master Plan Commitment, all biological mitigation measures should be integrated into a Conservation Program for LAWA with focus on the Los Angeles/El Segundo Dunes and the Riverside Fairy Shrimp.

#### **4.9.3 Wetlands Concerns Must be Integrated**

Only U.S. Army Corps of Engineers jurisdiction was found to occur within the Air Operation Area or the Los Angeles/El Segundo Dunes; no California Department of Fish and Game (CDFG)

jurisdiction was determined to occur. The permanent conversion/loss of the 1.3 acres of atypical wetlands is a significant impact that will require a 404 permit. It will also require a Section 7 consultation between the Corps and USFWS because of the presence of embedded Riverside Fairy Shrimp cysts in soil samples.

The biological concerns associated with wetlands should also be included in a Conservation Program rather than addressed as a separate biological issue for which no Master Plan commitments are made. Although there is very limited natural habitat at LAX, any loss of these remaining natural habitats will be considered significant by USFWS, CDFG, and local wildlife protection groups. It would seem an opportune time to develop a long-term management plan for biological resources on airport lands. Once in place, this plan/strategy would set policies and procedures (officially approved by the resources regulators) for the next several years. As the Draft EIS/EIR currently reads, LAWA has identified several biological concerns that are being addressed separately and on a one-time basis. This would leave LAWA vulnerable to future challenges as unanticipated development/programs are proposed.

#### **4.9.4 Reference to 2001 Comments from Land Protection Partners**

During 2001, the Land Protection Partners (LPP) submitted a comment letter to LAWA entitled "Review of Biological Resources Analysis in LAX Master Plan Draft Environmental Impact Statement/Environmental Impact Report" as a review of the 2001 LAX Master Plan Draft EIS/EIR (please see the original comment letter in Attachment I). Based on a preliminary assessment of points made in the LPP letter, the County of Los Angeles has concluded that their comments raise some significant issues regarding incomplete or vague project descriptions of the build alternatives, outdated CEQA analyses, questionable survey methods, questionable El Segundo Blue Butterfly population counts, underestimating impacts, and inadequate mitigation. Many of Land Protection Partners' comments echo concerns raised in this comment letter, but with a particular focus on how the concerns impact the assessment of potential biological impacts. The County endorses the points raised by LPP, which are briefly summarized below, and looks forward to reviewing LAWA's responses:

**Vague and Confusing Descriptions of the Build Alternatives:** LPP noted that the Draft EIR/EIS does not give a complete project description of the build alternatives. Within the extent of the LAX Master Plan boundaries, it is unclear how LAWA proposes to use certain areas of biologically significant property. Designations such as "Airport Related" are useless in evaluating the potential biological impacts associated with that designation.

**Outdated CEQA Analysis:** The Draft EIR/EIS describes the LAX Northside Project as "Collateral Development" that previously was entitled through a 1983 CEQA process. No new or updated analysis is found in the Draft EIR/EIS, even though development of this project appears to be contingent on the project alternative selected for LAX. In this light, reliance on 1983 CEQA documentation that did not consider LAX as a contingent project is problematic at best.

**Questionable Survey Methods:** Land Protection Partners' document raised questions concerning survey results, particularly with respect to the incorrect choice of survey methods. LPP noted that LAWA did not conduct general biological surveys in all habitats within the proposed project site.

LPP also references impacts to 100 acres of the El Segundo Dunes habitat that was not surveyed by LAWA, even though it would be converted to a golf course under the Westchester Southside Project described in the 2001 Draft EIR/EIS.

**Questionable El Segundo Blue Butterfly Population Counts:** Land Protection Partners suggests that the surveys conducted by LAWA did not use the best available scientific methods for calculating population numbers of the Federally-endangered El Segundo Blue Butterfly (ESBB). In overestimating the ESBB population, the Draft EIR/EIS gives the false impression that the ESBB is able to sustain viable populations on limited habitat, and confuses the analysis by downplaying the need for land to be kept as conservation areas.

**Underestimates Impacts of the Proposed Project Alternatives:** The methods used to determine impacts to habitat were misleading and not used accurately. LPP concluded that the combined affect of not surveying all potential habitat, using questionable survey methods, and overestimating ESBB populations resulted in a misleading impact assessment.

**Inadequate Mitigation Measures:** LPP found that use of a point system to rate 'habitat units' resulted in inadequate mitigation for lost habitat. For example, the Draft EIR justifies preserving smaller areas of prime habitat in exchange for the conversion of larger areas of occupied but marginally disturbed habitat. LPP noted that species need both the space and the quality of habitat, concluding that 10 acres of prime habitat may not be adequate to sustain a population that had previously lived on 50 acres of marginally disturbed habitat.

#### **4.9.5 General Comments**

The 2001 Draft EIS/EIR and 2003 Supplemental Draft EIS/EIR do not give complete project descriptions of the build alternatives. Within the extent of the LAX Master Plan boundaries, it is unclear what the disposition of certain areas of biologically significant property will be indicating designations such as "Airport Related" which are useless in evaluating the potential biological impacts associated with that designation.

LAWA did not conduct general biological surveys in all habitats within the proposed project site. As an example, the 2001 Draft EIS/EIR and 2003 Supplemental Draft EIS/EIR describe impacts to 100 acres of the El Segundo Dunes habitat that was not surveyed and would be converted to a golf course under the Westchester Southside Project.

Unfortunately, given the amount of time and effort devoted to assessing baseline biological conditions, the remaining step of integrating and folding this information into a long-term Conservation Program is missing. This may be a conscious choice by LAWA management and the City of Los Angeles; however, this approach may deprive LAWA of the opportunity to gain long-term control of its own biological resources.

## 4.10 ADDITIONAL ISSUES

### 4.10.1 Historical Resources

Illustration of the different impacts associated with the Single v. Split Viaduct LAX Expressway Alternatives should be carried forward from the Appendices to the Historic/Architectural section of the Supplemental Draft EIS/EIR.

The commitment to have a qualified architectural historian supervise noise abatement of historic properties does not assure that the historic values and character of such properties will not be altered or lost. The SDEIS/EIR should discuss this possibility and attach alternate mitigation measures or a revised significance finding, if appropriate.

The 2003 Supplemental Draft EIS/EIR concludes for all the build alternatives that:

*"The demolition of a historic/architectural resource is considered a significant impact at the state level that cannot be mitigated to a less than significant level without abandoning the project. A Statement of Overriding Considerations would be necessary to address unavoidable impacts on the International Airport Industrial District."<sup>50</sup>*

This is insufficient information to support an override. Revisions to the SDEIS/EIR need to explain why demolition of this historic/architectural resource is required to implement the project and what benefits will result from the project that override this significant impact.

### 4.10.2 Human Health

The analyses indicated that aircraft emissions account for about 97% of total emissions and also contribute most to emissions of individual Toxic Air Pollutants,<sup>51</sup> yet none of the mitigation measures address aircraft emissions. Many of the mitigation measures would be expected to occur regardless of what happens with the proposed Master Plan – for example, parking pricing policies to encourage single trips or to minimize idle time at the curb, steps to encourage employee telecommuting, and expanded off-airport intermodal services to other airports. Others would have no air quality benefit – for example, where unmitigated impacts result in payments to a trust fund for unrelated community improvements.

In this context, it is difficult to understand how the HHRA determined that the build Alternatives, with mitigation, would have no significant human health impacts at either horizon year. A clarification of the assumptions that were made in order to reach this conclusion is necessary to validate this conclusion.

The California Office of Environmental Health Hazards Assessment (OEHHA) evaluates non-cancer risks and has established maximum reference exposure levels (REL) for each TAP. No adverse health effects are foreseen for exposures at or below the REL. The exposure of TAP at concentrations equal to the REL represents a non-cancer hazard index level of 1.0. Exposure above

<sup>50</sup> 2003 Supplemental Draft EIS/EIR, Section 4.9.1, page 4-443

<sup>51</sup> Technical Report 14a, Section 3.3.

a hazard index of 1.0 is considered a significant impact by OEHHA. The relationship for non-cancer health effects of Toxic Air Pollutants is shown in the following equation:

$HI = C / REL$ , where:

HI = Hazard Index; an expression of the potential for non-cancer health effects

C = Annual average TAP concentration ( $\mu\text{g}/\text{m}^3$ )

REL = Reference exposure level (REL) for TAP; the TAP concentration at which no adverse health effects are anticipated

The Supplemental HHRA Technical Report provided as Appendix 9a in the 2003 Supplemental Draft EIS/EIR states that the REL for acrolein used in the HHRA is  $0.19 \mu\text{g}/\text{m}^3$ .<sup>52</sup> This same document further states that under Alternative "D", total acrolein concentrations might range between  $14 \mu\text{g}/\text{m}^3$  and  $87 \mu\text{g}/\text{m}^3$  with an overall average of  $23 \mu\text{g}/\text{m}^3$ .<sup>53</sup> Using the OEHHA equation for determining the hazard index as shown above, the resulting hazard index would range between 73.68 and 457.90, well above the OEHHA threshold of significance set at a hazard index of 1.0. Evaluation of all scenarios indicates that the hazard index for acrolein are all above the OEHHA threshold, even in the existing condition and while the Supplemental HHRA indicates that Alternative D has the lowest exposure levels of all these scenarios it is nevertheless above the threshold of significance set by OEHHA. How is it that both the 2003 Supplemental Draft EIS/EIR determined that this impact is less than significant? Revisions to the SDEIS/EIR need to be made that disclose this significant impact and either mitigate to less than significant or provide the evidence that supports a Statement of Overriding Consideration for this significant impact.

#### **4.10.3 Environmental Action Plan**

Many of the key Master Plan Commitments and mitigation measures in the Environmental Action Plan (EAP) are broad and programmatic in nature. Many will require further study, with choices among specific options deferred to the Final EIS/EIR and other stages of the decision making process. The EAP needs to be expanded to identify when and where such subsequent environmental reviews will be required, with discussion as to how these timeframes relate to the improvement phasing plan set forth by LAWA, and to the sequence for FAA and LAWA consideration of required discretionary actions. The EAP, including all Master Plan Commitments and mitigation measures, should be refined and detailed to adequately serve as the CEQA Mitigation Monitoring Program, pursuant to Public Resources Code 21081.6.

#### **4.10.4 Video-Conferencing**

In the § 1.3 discussion of Alternatives to air travel, the 2001 Draft EIS/EIR notes a study by Apogee Research that contains key findings that video-conferencing has potential to satisfy (1) from 5-30% of non-discretionary travel; and (2) less than 5% of discretionary travel. The discussion in § 1.3 concludes with: "Given that 50% of LAX users are leisure travelers, it is projected that less than 5% of air travel demand at LAX could be satisfied by communication technologies in 2015. These amounts were factored into the assumptions of the LAX Master Plan forecasts." The Supplement to the Draft EIS/EIR did not resolve this error. The total amount of air travel demand at LAX that

<sup>52</sup> Technical Report 9a, Section 5.1

<sup>53</sup> Technical Report 9a, Section 6.1.2

could be satisfied by communication technologies should equal the combined amounts for discretionary travel PLUS non-discretionary travel (i.e., [5-30% of demand x 50% of travel = 2.5% to 15%] + [5% of demand x 50% of travel = <2.5%] = ~2.5% - 17.5%). It seems that a higher number should be factored into the assumptions of the LAX Master Plan forecasts.

#### **4.10.5 Sixty-Minute Access Zone**

The Zone Boundaries shown in Figure 1-3 of the 2001 Draft EIS/EIR showing the 60-minute travel time accessibility zones for airports in southern California appear to overstate driving times for at least some of the airports shown. The assumptions used in developing this map need to be discussed and clarified in order to support the map, as drawn.

#### **4.10.6 Weather Conditions**

The 2001 Draft EIS/EIR notes that only one of the four runways is sufficiently long to serve the largest aircraft when fully loaded under adverse weather conditions (hot days with little wind).<sup>54</sup> However, there is no discussion as to how many days of the year, on average, are characterized by these adverse weather conditions. There is also no discussion as to how many runways can accommodate the largest aircraft when fully loaded. Both of these issues require further explanation and investigation by LAWA.

#### **4.10.7 Remote Terminals**

The 2001 Draft EIS/EIR includes discussions of the possibility of remote terminals. However, no analysis is undertaken to determine their location or impacts. Alternative "D" described in the 2003 Supplemental Draft EIS/EIR includes a Ground Transportation Center connected to the main terminal buildings by an Automatic People Mover that appears to fit the descriptions of remote terminals mentioned in the 2001 Draft EIS/EIR. However, it is unclear whether or not the Ground Transportation Center within Alternative "D" is the remote terminal mentioned in the 2001 Draft EIS/EIR. LAWA should clarify this in revisions to the Supplemental Draft EIS/EIR, and if there are other possibilities for remote terminals, then include a full characterization of these other remote terminals as well as a description of the baseline setting for the proposed locations, the impacts of their construction and use, and mitigation measures to address any adverse effects.

#### **4.10.8 Hydrology and Water Quality**

Section 4.7 of the SDEIS/EIR inadequately addresses SUSMP and drainage issues. The environmental document does not provide sufficient information to determine what drainage impacts, if any, the project may have on County facilities (MTD 992, storm drain Project Number 5241, 647, 670, etc.). To properly assess drainage and SUSMP impacts and to determine appropriate mitigation, a Drainage Concept/SUSMP report will be required. We recommend that the applicant prepare a Drainage Concept/SUSMP report showing the extent of drainage and SUSMP quality impacts, and if necessary, provide mitigation acceptable to the County. The analysis should address increases in runoff, any change in drainage patterns, treatment method proposed for SUSMP regulations, and the capacity of storm drain facilities.

<sup>54</sup> 2001 Draft EIS/EIR, Section 2.2.2, Page 2-6.

We also recommend that the Drainage Concept/SUSMP report should be reviewed and approved by the County of Los Angeles Land Development Division - Subdivision Plan-checking Section before the City considers its own approval. Once approved, a copy of the final Drainage Concept/SUSMP report should be included in the environmental document.

#### **4.10.9 Solid Waste Generation and Landfill Capacity**

Chapter 4 of the Master Plan Supplement to the Draft EIS/EIR, identifies the amount of solid waste generation as a result of construction and demolition activities of alternatives No Action/No Project, A, B, C, and D. The tonnage of waste generated from construction and demolition activities alone for Alternative D – the LAWA staff-preferred alternative – is well over 130,000 tons. Although LAWA states that it will require that contractors recycle a “specified” minimum percentage of waste materials generated during construction and demolition, a significant commitment is necessary to insure adequate mitigation of the scale of impact resulting from waste generated by this project. Therefore, the minimum percentage should be specified within the EIR, with a target of at least 50 percent of the waste diverted from disposal. Similarly, the percentage of minimum recycled content for materials used on site, and the specific diversion goals that will be required of lessors, should also be specified in the EIR.

Under heading of Master Plan Commitments (§4.19.5, p. 4-534), the SDEIS/EIR proposes implementation of a more aggressive recycling program, by expansion of the existing terminal recycling program to all terminals; lease provisions requiring that tenants meet specific diversion goals; and preference for recycled materials during procurement. The document should expand the discussion to include the type of material that might be targeted and the overall recycling goal.

The environmental document recognized that due to the uncertainty regarding future landfill capacity, impacts associated with cumulative increases in solid waste generation would be potentially significant (Sections 4.19.7 and 4.19.8, pages 4-537 and 4-538). Augmentation of landfill capacity is listed as a mitigation measure, however, the responsibility for implementing this mitigation measure is left to State, County, and local solid waste planning authorities. This discussion should be revised to indicate what measures the City of Los Angeles will implement to provide for the disposal of residual solid waste generated by this project and future projects within the City of Los Angeles considering the City’s stated interest to close all landfills within the City’s boundaries by 2006.

## **5.0 CONCLUSIONS**

There is no doubt that Los Angeles International Airport is vitally important to the City of Los Angeles, to the County of Los Angeles, to the region, and to California generally. There is an obvious and pressing need for improvements at LAX, most particularly to ensure the safety and security of future air travel. However, the County of Los Angeles believes that LAWA is proposing to implement a flawed project and that the process is further compromised by an inadequate environmental review. As documented throughout this report our concerns include (a) an inadequate security planning effort, (b) misleading statements regarding growth potential, resulting in fundamentally flawed environmental analyses, (c) improper choice of a Supplement to propose and assess an entirely new preferred project, (d) use of an unwieldy and confusing document format, (e) continued reliance on a baseline that is outdated and serves to undermine rather than illuminate understanding of project impacts, (f) wholly inadequate consideration and disclosure of

Environmental Justice issues coupled with a scoping process that considered neither 2001 nor the 2003 preferred project options, (g) language suggestive of bias and advocacy and an absence of full disclosure, (h) incomplete analysis of noise and air quality and the absence of studies to establish baseline or impact-level toxic air emissions, (i) inadequate and misleading assessment of impacts on biological habitat, and (j) the failure to provide an alternative that meets stated goals and also avoids or minimizes significant impacts in the identification and assessment of Alternatives.

The problems with the 2001 and 2003 environmental documents are so serious, pervasive, and universal that the only practical remedy is to start the process over again and prepare a truly comprehensive revised EIS/EIR. The revised document would need to provide comprehensive scoping, an updated and consistent baseline, identify and assess a reasonable range of feasible alternatives, be free of internal inconsistencies, offer proper levels of analysis and explanation, and present an entirely new impact assessment that does not defer critical decisions. Only with these extensive modifications can the LAX Master Plan and associated EIS/EIR be rendered adequate.

### **Review of Biological Resources Analysis in LAX Master Plan Draft Environmental Impact Statement/Environmental Impact Report**

**August 8, 2001**

**Travis Longcore, Ph.D.  
Catherine Rich, J.D., M.A.**

## Review of Biological Resources Analysis in LAX Master Plan Draft Environmental Impact Statement/Environmental Impact Report

This review pertains to the Federal Aviation Administration and Los Angeles World Airports Joint Draft Environmental Impact Statement/Environmental Impact Report ("EIS/R"). It addresses Sections 4.10 (Biotic Communities), 4.11 (Endangered and Threatened Species of Flora and Fauna), 4.12 (Wetlands), 4.14 (Coastal Zone), and 4.18 (Light Emissions). The review was prepared by Dr. Travis Longcore and Catherine Rich, who are experts in the ecology and history of the natural communities that would be affected by the proposed airport expansion. Dr. Longcore has co-authored several peer-reviewed scientific articles on the El Segundo Dunes and the Los Angeles Coastal Prairie (including its vernal pools),<sup>1</sup> which both would be adversely affected by the proposed project.

The presentation of information in the EIS/R about biological resources is segmented into several sections. For the purpose of this review, however, all biological resource issues are treated together, because mitigation measures for biological impacts are largely the same.

### 1.0 Project Description

For the purpose of discussing the impacts to biological resources, the EIS/R does not provide a complete project description. Within the extent of the Master Plan boundaries, it is unclear what the disposition of certain areas of biologically significant property will be. In maps of the various project alternatives, the legend indicates useless designations such as "Airport Related."<sup>2</sup> There is no way to ascertain with certainty what the use of such land will be under the various alternatives.

### 1.1 Failure To Analyze Northside/Southside Project

The EIS/R describes the LAX Northside Project as "Collateral Development" that previously has been entitled through the CEQA process.<sup>3</sup> Reliance on old CEQA documentation is problematic, and development of this project would seem to require a reopening of the environmental review, especially given the changed conditions since the approval in 1983. However, the real difficulty is that the EIS/R replaces the LAX Northside Project with the Westchester Southside Project in each of the three build alternatives for the Master Plan. These projects are not the same, and even if the CEQA documentation for the Northside Project is deemed adequate, the Southside Project must be fully analyzed under CEQA. The EIS/R does not completely describe or analyze the biological impacts of the Southside Project.

  2. EIS/R, Figures 3-6, 3-11, 3-15.
  3. EIS/R, pp. 3-20, 3-29.

The Westchester Southside Project, as depicted in the EIS/R,<sup>4</sup> would include the conversion of 100 acres of the El Segundo Dunes to a golf course. (Several figures in the EIS/R appendices map this area at the northern portion of the dunes as “golf course/open space” and include “Resort Hotels” within the same color designation. At a minimum the maps indicate some level of development of the dunes as part of the Westchester Southside Project.) The dunes golf course/open space development was not included in the CEQA analysis for the LAX Northside Project, and remains unanalyzed for compliance with any environmental laws (CEQA, NEPA, California Coastal Act). It is inappropriate for the EIS/R to rely on the Westchester Southside Project — which is a site for relocation of displaced businesses<sup>5</sup> — for mitigation, and not to evaluate the full impacts of the development. While all of the El Segundo Dunes are within the Master Plan area, and the alternatives themselves show no development on the 100 acres at the northern end of the dunes, the result of adopting any of the three project alternatives is to develop 100 acres of dunes in association with “Resort Hotels” and “golf course/open space.”<sup>6</sup> The resource value of this area is discussed later, but the analysis of the Westchester Southside Project should not be piecemealed. Currently, the biological impacts of the Westchester Southside Project do not seem to be analyzed fully, nor are they included in the discussion of cumulative impacts for the project. Even if one accepts the premise of the EIS/R that the project will proceed absent approval of the Master Plan, the Westchester Southside Project is “reasonably foreseeable” — in fact relied upon for mitigation — and all of its impacts must be disclosed and mitigated as part of the Master Plan EIS/R.

The decision not to address the biological impacts of the Westchester Southside Project can be interpreted as a strategic choice to avoid disclosure of the full impacts of the airport expansion project. From a biological standpoint, the Westchester Southside Project, even though it would involve fewer square feet of built space than the LAX Northside Project (2.6 million square feet vs. 4.5 million square feet), it has a larger geographic footprint and greater biological impact. Any of the three build alternatives plus the Westchester Southside Project would be a catastrophe for the biological resources found at LAX.

## **1.2 Previous Failure To Disclose Impacts of Development on El Segundo Dunes**

Los Angeles World Airports (“LAWA”) has previously failed to disclose impacts of development on the El Segundo Dunes. In 1999, a newspaper story announced that LAWA was planning to install landscaping on the northern end of the El Segundo Dunes, along Waterview, Rindge, and Napoleon streets. The Urban Wildlands Group, a Los Angeles-based nonprofit whose board includes the authors of this letter, contacted LAWA to inform project managers of the sensitive resources present and request that the project not include invasive plants that would degrade the dunes. LAWA promised, but then failed to provide, the plant list for the project. LAWA proceeded to implement the project, but failed to secure the proper permits from the City of Los Angeles as required under the California Coastal Act. After installing a new walkway and over 90 mature, non-native palm trees in a sensitive habitat area,<sup>7</sup>

---

4. EIS/R, Appendix J1. Biological Assessment Technical Report, Figures 8, 11, 14.

5. EIS/R, pp. 3-33, 3-47, 3-56.

6. City of Los Angeles Ordinance 169,767 restricts use of the northern 100 acres of the El Segundo Dunes at LAX to “nature preserve and accessory uses only.” This ordinance was passed unanimously by the City Council on April 6, 1994 as part of the General Plan/Zoning Consistency Program. Given this unequivocal direction from the City, it is unclear why the Master Plan is ambiguous about the disposition of this area, unless the intention is to attempt to remove the development conditions from the property and seek another use as part of the Westchester Southside Project.

7. Installation of palm trees is damaging ecologically, and also provides sites for birds to perch, potentially increasing bird strikes with aircraft. Consultants for the airport report that “[t]he El Segundo Dunes provides relatively few attractants

(cont’d)

LAWA was instructed to stop work by the California Coastal Commission, told that it must obtain a permit, and subsequently applied for a permit from the City. The Urban Wildlands Group opposed the permit application for the partially implemented project because it would significantly disrupt habitat values of an environmentally sensitive habitat area ("ESHA"), as defined under the California Coastal Act.<sup>8</sup> The City analysis of the project also agreed that the site was an ESHA.<sup>9</sup> The appeal of the permit was denied by the City of Los Angeles Board of Public Works with the stipulation that LAWA resolve the issue in consultation with The Urban Wildlands Group and those residents opposed to the palm trees. This has not yet happened.

LAWA steadfastly maintains that the 100 acres outside of the El Segundo Blue Butterfly Preserve is not part of the El Segundo Dunes and that it will be developed as a golf course.<sup>10</sup> The area, however, is within the jurisdiction of the California Coastal Commission, and no approved Local Coastal Plan has been produced that would allow for a golf course. The EIS/R provides even more information to join previously published sources<sup>11</sup> showing that the area is an environmentally sensitive habitat area and therefore protected by Section 30240(a) of the California Coastal Act. For example, the EIS/R itself discloses that El Segundo blue butterflies (*Euphilotes bernardino allyni*) occupy one subsite,<sup>12</sup> sensitive Lewis' evening primrose (*Camissonia lewisii*) occupies seven subsites,<sup>13</sup> and the area is occupied by sensitive species such as silvery legless lizard (*Anniella pulchra*), San Diego horned lizard (*Phrynosoma coronatum blainvillei*),<sup>14</sup> loggerhead shrike (*Lanius ludovicianus*; breeding),<sup>15</sup> and Dorothy's sand dune weevil (*Trigonoscuta dorothea dorothea*).<sup>16</sup> The golf course or other development on the dunes should either be analyzed as part of the Master Plan EIS/R for conformance with applicable laws, including the California Coastal Act, or be explicitly deleted from the plans for the area. The EIS/R should offer some certainty about what development will take place within the Master Plan boundaries and disclose the impacts of that development.

---

to birds which may partially account for the significantly lower percentage of strikes occurring over this area than over the approach area. The El Segundo Dunes naturally supports very few trees — the only trees present are non-native trees that have been planted...." (EIS/R, Technical Report 7: Biological Resources Memoranda for the Record on Floral and Faunal Surveys, p. 341). Without complete environmental review, LAWA planted more attractants for birds in the form of palm trees. The EIS/R also reports that the native birds of the dunes are not involved in bird strikes, while species promoted by urban development, such as pigeons and gulls, are involved in the most strikes.

## 2.0 Current Conditions

The description of current conditions of the biological resources within the Master Plan boundaries is biased toward underestimating the value of the habitats that will be impacted.

### 2.1 Surveys

A great deal of effort was expended surveying the insects of the El Segundo Dunes, especially within the El Segundo Blue Butterfly Preserve, even though this area is not targeted for direct development. Surveys for areas that would be subject to significant direct impacts were inadequate. It appears that only one type of survey — sweep netting — was conducted east of Pershing Drive in the areas that would be most affected by development. This single method would not detect all of the sensitive species that might occur in the area. For example, the El Segundo Jerusalem cricket (*Stenopelmatus* sp.), a burrowing insect, would not be detected with sweep netting. Pitfall trapping would be required to ascertain its presence, and should be performed in the areas of project impacts east of Pershing Drive. Other survey methods, including black lighting and malaise trapping, were conducted only west of Pershing Drive on the El Segundo Dunes, not in the areas of direct project impacts.

While the extensive surveys conducted on the El Segundo Dunes may be useful for evaluating the impacts of the Westchester Southside Project, which the EIS/R does not do, they offer little information to understand the biological communities supported in the open spaces that would be developed under the three development alternatives. For example, the EIS/R provides no summary of the bird surveys conducted at the ephemeral wetlands and open spaces found in the western area of the airport, and provides only handwritten notes buried in the appendices.<sup>17</sup> A summary would be useful to understand the character of the biotic communities in these areas. Species of local conservation concern such as Costa's hummingbird (*Calypte costae*), western meadowlark (*Sturnella neglecta*), and common yellowthroat (*Geothlypis trichas*) were recorded in these areas, yet no complete description of the communities is provided in the text of the document. The biological consultants for the EIS/R report that the ephemeral wetland area at the west end of the airport "provides resting and foraging habitat for numerous resident and migratory bird species,"<sup>18</sup> but the EIS/R provides no summary of these observations or description of the impact of development on these species.

For the El Segundo Dunes, an extensive list of birds is found, complete with species that are almost certainly not present at all. The "Floral Compendium" and "Faunal Compendium" include "species observed or expected to occur on or in the immediate vicinity of the site."<sup>19</sup> On this list are found species that are highly unlikely to be present on the dunes or even near the dunes. For example, acorn woodpecker (*Melanerpes formicivorus*) is not likely to be found on the El Segundo Dunes now or in recent history. Acorn woodpeckers in Los Angeles would be associated with coast live oaks, which are found nowhere on the El Segundo Dunes or the Los Angeles Coastal Prairie. The rather excessive bird list in the Faunal Compendium is made ever more curious by the statement elsewhere by the biological

19. EIS/R, Appendix J1. Biological Assessment Technical Report, Appendix A, pp. 1-5.

consultants for the EIS/R that “the Dunes does not support a large resident bird population.”<sup>20</sup> It is odd to include these ambitious lists, because the biological analysis does not evaluate the impacts of the three alternatives on the species of wildlife in them.

## 2.2 “Determined Absent”

The summary table for sensitive species provided in Section 4.10 of the EIS/R is misleading. For many species, the table indicates that they have been “determined absent” from the Master Plan boundaries based on directed surveys. When dealing with small arthropods that are difficult to capture, persist at low numbers, and may have large annual variation in numbers, one cannot conclude that a species is “determined absent.” All that can be done is to state that the species was not found during a certain duration and intensity of searching. It is likely that the survey methodology did not possess sufficient statistical power to detect the species.<sup>21</sup> Presence may be determined conclusively, but absence cannot, especially for cryptic (i.e., small or camouflaged) species. Some degree of certainty about absence could be derived if one had knowledge of the population size, yearly variation in population size of the species, and the trapping efficiency of the survey methods. This information is not available, and therefore no statistically defensible declaration of absence can be made about the sensitive arthropod species.

In other instances, the declaration of absence is contradicted by the reports upon which the section is based. For example, Table 4.10-2 claims that the following species are absent from the Master Plan boundaries: Henne’s ecosman moth (*Eucosa hennei*), Rivers’ dune moth (*Euxoa riversii*), Ford’s sand dune moth (*Psammobotrys fordii*), El Segundo scythrid moth (*Scythris new sp.*), lesser dunes scythrid moth (*Scythris new sp.*), El Segundo goat moth (*Comadia intrusa*), and Santa Monica dunes moth (*Copeblepharon sanctamonicae*). However, in the underlying report, Frank Hovore, the surveyor, writes:

Sensitive moth species (general *Comadia*, *Copeblepharon*, *Euxoa*, *Psammobotrys* [sic], *Scythris*) — A wide variety of moth specimens, including some possibly representing all of these species except *Psammobotrys* [sic], were taken in light traps, but moths in the traps were rendered unidentifiable by the combination of alcohol and churning actions of other species. All of the moth species previously known to occur on the dunes probably persist, because all of the known larval hosts are present. For most moth species, focused light collecting would be necessary to determine presence and distribution, using dry traps or light sheets. Very large numbers of *Psammobotrys* [sic] were collected on the dunes historically (LACM collection), and it is assumed that this species is present, but is highly seasonal and difficult to collect without sustained and focused field efforts.<sup>22</sup>

The text presented in Table 4.10-2 of the EIS/R contradicts the surveys that were conducted. Far from being absent, as maintained in Table 4.10-2, a qualified surveyor determined that the methodology was insufficient to determine presence of these moth species, but that the species were indeed probably

present. Mischaracterization such as this undermines the credibility of the description of current conditions presented in the EIS/R.

### 2.3 Terminology

The EIS/R is inconsistent in its use of terminology describing the 100 acres north of the El Segundo Blue Butterfly Preserve. This area, along with the preserve, is part of the El Segundo Dunes.<sup>23</sup> It has been degraded through residential construction and intrusion of exotic plant species, but it remains of significant biological value and is itself a sensitive habitat (see above, Section 1.2). In various places in the EIS/R, this area is referred to as “dunes and adjacent landforms,” “non-restructured dunes,”<sup>24</sup> “100 acres north of Sandpiper Street,”<sup>25</sup> and “the 100-acre open space north of the preserve.”<sup>26</sup> Implicit in the choice of terminology for this area is perhaps the intention to construct a golf course upon it. The Los Angeles Airport/El Segundo Dunes Specific Plan, adopted in 1992, incorrectly claims that “approximately 100 acres of the Dunes ... do not contain significant habitat resources.”<sup>27</sup> The Specific Plan requires the proposed golf course to provide revenue for the upkeep of the dunes habitat preserve,<sup>28</sup> thereby lifting that burden from LAWA, which perhaps partially explains LAWA’s enthusiasm for the idea. However, existing zoning for the area — established more recently than the Specific Plan — is as a nature preserve. EIS/R maps should be consistent with the existing “nature preserve” zoning and should consistently acknowledge this area as part of the El Segundo Dunes.

The EIS/R also exhibits some difficulty with terminology to describe the habitat that formerly was found throughout the entire project area inland of the El Segundo Dunes. In a published article, Mattoni and Longcore describe this area as the Los Angeles Coastal Prairie, and document the historic plant diversity and the presence of extensive vernal pools.<sup>29</sup> The article has been commended as an exemplar of the practice of historical ecology in *The Historical Ecology Handbook: A Restorationist’s Guide to Reference Ecosystems*.<sup>30</sup> For some reason, the EIS/R avoids using the Mattoni and Longcore article where it could be useful. For example, Mattoni and Longcore provide documentation of many sensitive species historically present within the study area from herbarium label texts. This includes a full list of vernal pool species historically found in the area, as well as upland forbs, grasses, and shrubs. Instead, the EIS/R chooses to classify the site as Valley Needlegrass Grassland. The historic evidence does not support the assumption that this area was dominated by perennial grasses; rather it was dominated by forbs. This is an important conclusion of Mattoni and Longcore’s research that the EIS/R neither accepts nor attempts to dispute.

## 2.4 Disturbed Dune Scrub/Foredune

Concurrent with the changing terminology about the portion of the El Segundo Dunes not found within the habitat preserve is the decision to classify all dune scrub/foredune outside of the preserve area as disturbed dune scrub. While it is true that the dunes area outside the habitat preserve has a heavier exotic species load, and does not support coast buckwheat (*Eriogonum parvifolium*), it nevertheless has more biological value than is implied by the description. For example, this area supports sensitive plants (Lewis' evening primrose, *Camissonia lewisii*), birds (loggerhead shrike, *Lanius ludovicianus*), and arthropods (see above, Section 1.2). Mattoni et al. describe the ex-residential area in their 2000 article:

Removal of the residences in the 1970s was superficial, leaving some foundations, substantial rubble, foreign soil, roads, and other infrastructure. Vegetation regenerated without assistance, producing a cover of predominately iceplant (*Carpobrotus edulis*) and acacia (*Acacia cyclops*) with patches of a few highly dispersive dune shrub species.<sup>31</sup>

However, not all ex-residential sites supported the same arthropod communities. Some sites within the ex-residential area supported terrestrial arthropod communities (including rare and sensitive species) that were similar to those found on undisturbed foredune and undisturbed backdune sites.<sup>32</sup> This variation in the vegetation and associated wildlife across the 100 acres should be reflected in the EIS/R. The wholesale characterization of the area as "disturbed dune scrub/foredune" is misleading in terms of its value to the dune system and proper statutory designation as an ESHA.

## 2.5 El Segundo Blue Butterfly

Much ado is made over the population size of the El Segundo blue butterfly ("ESB"). However, the methodology used to calculate population size by LAWA is flawed and overestimates population size by at least 400%. While many methods to track trends in butterfly population size exist in the scientific literature,<sup>33</sup> when LAWA hired consultants in 1994 to prepare the EIS/R, they inexplicably used none of the established methods. While consultants continued walking a transect to count butterflies established by Mattoni in 1984, they stopped conducting surveys throughout the entire season. It is absolutely

essential to survey throughout the flight season of the butterfly to obtain an estimate of total population size. Furthermore, rather than using an established method to analyze transect counts, Dr. Andrew Huang, an engineer at LAWA, constructed his own method to estimate population size. This method is flawed, and these flaws were explained by Dr. Travis Longcore to Dr. Huang in an email earlier this year, portions of which bear repeating here. The message describes methods used to estimate population size of the ESB by Longcore and others in a scientific article that was at that time in review and has subsequently been accepted for publication in an international scientific journal, the *Journal of Insect Conservation*.

The first method [of calculating population size] was the Pollard Index, which is quite straightforward and about which there can be no argument. There is not a lot of latitude in summing the average weekly count over the course of the season.

The second method is essentially the same as your numerical approximation. This method is first used, albeit with different data sources, by Watt et al in 1977 (Watt, Ward B., Frances S. Chew, Lee R. G. Snyder, Alice G. Watt, and David E. Rothschild. 1977. Population structures of Pierid butterflies I. Numbers and movements of some montane *Colias* species. *Oecologia* 27:1-22.) Watt et al. estimated "total animals [butterflies] present in the brood" by estimating daily butterfly numbers through MRR and extrapolation, summing them to calculate total animal-days, and multiplying this number by the death rate (determined by MRR). Dividing by the longevity (or residence time) would yield the same result. This is what we did, using Arnold's 1979 residence time estimates (ave 6.1 days). Your model does not divide by average longevity, but rather another figure. This is what I don't understand. What is wrong with the logic (used by Watt et al. as well) that the total brood size is equal to the total number of butterfly-days divided by the average butterfly longevity?

$$\frac{\text{butterfly-days}}{\text{longevity (days)}} = \text{butterflies}$$

Your model does something similar, calculating total butterfly days by integrating under the curve (gaussian or not) and dividing by a figure. The question, and the crux of the differences in our results, is the number that you divide by, which is 1.59. You get your number by parameterizing based on the recapture rates. I think the difficulty with this is that you do not know the age of the butterflies that were initially captured. Your method would work if all of the butterflies captured by Arnold on the first day were freshly eclosed adults. However, they cannot be. Some of them will be one, two, or more days old. Failure to account for this will skew your estimate of longevity downwards, and your total population estimate upwards. Now, I am going to guess that you will say that 1.59 days is not the longevity. But if it is not, what is it? Can you see a flaw in the logic of the Watt et al. method or otherwise reconcile it with your method?

One last thing on this method. Our application of it gave a population estimate for 1984 at LAX of 432, while Arnold's MRR estimate was 664, and the Zonneveld model estimated 910. Application of your method would give an estimate of 1,658. (Note: in case you want to calculate these numbers, with the exception of Arnold's estimate, they include an adjustment for the number of flowerheads) (Arnold, R.A. (1986) Studies of the El Segundo blue butterfly - 1984. Inland Fisheries Administrative Report 86-4.)

The third method that we used was the Zonneveld model. What is interesting is that our estimates of death rate (3.3-5.9 days), which vary from year to year, are similar to those given by Arnold (2.3-7.3 days) from MRR. We followed the model as set out by Zonneveld in the 1991 paper. We did not doubt the magnitude of the results because of the correspondence with the Watt et al method, the Pollard index, and the reasonableness of the longevity estimates.<sup>34</sup>

34. Longcore, T. 6 March 2001. Email to Dr. A. Huang.

Dr. Huang did not defend his method, stating in a response to Dr. Longcore, "You have raised many outstanding issues. ... I am very busy with a number of projects. I won't be able to respond to your questions for awhile."<sup>35</sup> To date, he has not provided a substantive response. The EIS/R should therefore be adjusted to reflect El Segundo blue butterfly population numbers that are calculated using the best available scientific methods. Three methods of evaluating the transect counts are given in the *Journal of Insect Conservation* paper, the proofs of which are appended to this report.<sup>36</sup>

As is evident from the literature about butterfly population size estimation,<sup>37</sup> the block counts promoted in the EIS/R are useful only to determine presence of the butterfly, not to estimate population size. The most perplexing part of the discussion of ESB population size by LAWA, both in reports by its consultants and in the EIS/R, is that none of the relevant scientific literature is referenced. Butterflies are conspicuous organisms, and schemes were developed in the 1970s to track population size, yet these are ignored. Sometimes remaking the wheel can lead to innovation, but in this instance it has led to confusion and the propagation of the myth that there are 40,000–80,000 El Segundo blue butterflies on the LAWA property. For example, LAWA claims that in 1998 there were roughly 12,000 ESB along the transect,<sup>38</sup> while proper analysis of the data indicates a population of  $3,356 \pm 805$  s.d.<sup>39</sup> Similarly extravagant claims for the period 1996–2000<sup>40</sup> should be revised.

The EIS/R discussion of the ESB population size provides a diversion from the real issues at hand. Recovery of the species and downlisting from endangered to threatened status requires securing all of the El Segundo Dunes, including that area not currently in the habitat preserve.<sup>41</sup> The 200-acre preserve is still vulnerable to disease, adverse weather, fire, and other accidents. Long-term extinction risk for the butterfly can be minimized through increasing habitat area, not simply by relying on existing areas to provide spectacular numbers. Furthermore, concentration on the El Segundo blue butterfly draws attention away from the ten other endemic invertebrates found on the dunes whose continued persistence depends on habitat values beyond those needed to maintain the butterfly.<sup>42</sup>

LAWA's persistent strategy has been to focus on the butterfly and the 200-acre preserve to the exclusion of all else. For example, in the above-described Waterview Street Landscaping Project, LAWA's main claim in support of the project was that it did not affect the butterfly preserve or the butterfly. None of the appellants had argued that the project directly affected the butterfly, and pointed instead to the other sensitive species and habitats found on the project site. This notwithstanding, there are legitimate impacts to the El Segundo blue butterfly that would result from the alternatives in the EIS/R.

### 3.0 Assessment of Impacts

While the EIS/R identifies impacts to biological resources, its improper quantification of those impacts results in an underestimation of the actual biological consequences of the build alternatives and ultimately the incorrect conclusion that those impacts can be mitigated to a less than significant level.

#### 3.1 Direct Impacts

The EIS/R uses what it calls a “modified Habitat Evaluation Procedure” to determine impacts on sensitive vegetation types and to quantify impacts to habitats of sensitive species.<sup>43</sup> This procedure is supposedly based on “Habitat Evaluation Procedures” (“HEP”)<sup>44</sup> previously developed by the U.S. Fish and Wildlife Service that have some degree of scientific validity and history of usage.<sup>45</sup> However, the methodology employed in the EIS/R uses the name of this procedure without incorporating any of the essential elements of the analysis. By comparing existing habitat for sensitive species against an abstracted, ideal habitat type, the EIS/R argues that loss of up to 500 acres of habitat for sensitive species can be mitigated by “improving” 100 acres of land already in a nature preserve. This conclusion is not supported by any accepted methodology of impact assessment and seems to have been specifically designed to underestimate the actual impacts to sensitive species at LAX.

HEP was designed for use with target species by the U.S. Fish and Wildlife Service in the 1970s to provide a form of standardization and comparability for environmental analysis. In HEP implementation, the term “habitat” is defined as the biophysical requirements of an individual species (e.g., bald eagle habitat), not as a general term synonymous with vegetation type (e.g., grassland habitat). The U.S. Fish and Wildlife Service states this in the guiding policies for HEP implementation:

HEP is a species-habitat approach to impact assessment; and habitat quality for selected evaluation species is documented with an index, the Habitat Suitability Index (HSI). This value is derived from an evaluation of the ability of key habitat components to supply the life requisites of selected species of fish and wildlife.<sup>46</sup>

The explicit species-based approach of the HEP is apparent in the manual describing the procedure:

HEP is a species-based assessment methodology. It is applicable only for the species evaluated and does not directly relate that species with other ecosystem components. HEP conceptually addresses only the issues of species populations and habitats.<sup>47</sup>

The “modified” HEP in the EIS/R does not establish which species will be used to evaluate the value of the reference sites, nor does it create HSIs for them. Rather, it sets habitat evaluation standards based on an “optimal” site with “a multitude of floral and faunal species.”<sup>48</sup>

---

43. EIS/R, p. 4-615.

44. The EIS/R refers to a “Habitat Evaluation Procedure” in the singular form, while the U.S. Fish and Wildlife Service manual calls the method “Habitat Evaluation Procedures” in the plural form. We abbreviate both as “HEP” and treat the acronym as a singular noun indicating a methodology.

45. For example, see Johnson, T.L., and D.M. Swift. 2000. A test of a habitat evaluation procedure for Rocky Mountain bighorn sheep. *Restoration Ecology* 8(4S):47-56.

46. U.S. Fish and Wildlife Service. 1996. Fish and Wildlife Service manual, 870 FW 1, Habitat Evaluation Procedures. [online at <http://policy.fws.gov/870fw1.html>].

47. U.S. Fish and Wildlife Service. 1980. Habitat as the Basis for Environmental Assessment, 101 ESM.

The "modified" HEP does not provide information about the value of habitats within the subject site for several of the sensitive species found there. For example, it does not consider the habitat requirements of loggerhead shrike (*Lanius ludovicianus*) or black-tailed jackrabbit (*Lepus californicus bennettii*). It assigns values of 0.25 for vegetation types that are occupied by these species (Non-Native Grassland/Ruderal). By definition under a true HEP, occupied sites would score much higher. By "modifying" the HEP to address an abstract ideal habitat, actual habitat values to sensitive species are ignored (see below, Table 1).

In fact, the "modified" HEP resembles actual HEP implementation only superficially, in that values between 0 and 1 are assigned to certain arbitrary standards for vegetation types within the study area. None of the essential features of HEP are present in the modified method; the "modified" HEP therefore does not provide the basis for impact assessment in the project area.<sup>49</sup>

Not only is the "modified" HEP quite different from the actual procedure, the standards used to evaluate habitats do not reflect ecological value. This problem derives from the physical and biologic criteria used to evaluate habitat and the so-called "ecosystem functional integrity" components of the analysis. Rather than using target species and HSIs to characterize vegetation types as required in HEP, the EIS/R evaluates whether each of the vegetation types in the project area meets the characteristics found in a "reference site." The habitat type chosen for this standard is that of Valley Needlegrass Grassland/Vernal Pool complex<sup>50</sup> (i.e., Los Angeles Coastal Prairie). For some inexplicable reason, all habitats are measured against this standard, including Southern Foredune, Southern Dune Scrub, and Disturbed Dune Scrub/Foredune. Of course these dune habitats do not have features found in a needlegrass grassland/vernal pool complex. Therefore, because of their failure to have vernal pools and associated species, these vegetation classifications are assigned lower habitat values, 0.35 for both Southern Dune Scrub and Disturbed Dune Scrub/Foredune, and 0.45 for Southern Foredune. These values are ludicrous, first because habitat values and "Habitat Units" are supposed to be relevant to individual species, and second because one vegetation type is measured by the features of another. *The analysis succeeds only in illustrating that dune habitats are not the same as vernal pool/grassland complexes.*

The portion of habitat value deriving from "ecosystem functional integrity" is another wholesale creation of the EIS/R. These standards are not part of HEP, and the choice of standards is arbitrary, with little to do with the sensitive species and vegetation types under analysis. Whether a site is "under regulatory conservation" does not necessarily have anything do with the ecological value of its vegetation type to sensitive species. Similarly, "contiguity with state-designated habitat" is not an ecological criterion. "Variety of pollinator/dispersal mechanisms present" is oriented toward vernal pool habitats, and the choice of "contiguous native habitat >40 acres" is arbitrary. Throughout, the analysis avoids recognition that sensitive plants and wildlife utilize habitats that are not dominated by native species. Loggerhead shrikes forage in ruderal and non-native grasslands as well as in dune scrub. Jackrabbits are thriving in an area with little native plant component. A true HEP would calculate the value of the areas being utilized by carefully selected individual species and use those values to quantify impacts. The EIS/R's "modified" HEP is fatally flawed and must either be revised to follow established procedure, or be abandoned.

### 3.1.1 Sensitive Vegetation Types

With the exception of the ambiguous treatment of the 100 acres on the northern portion of the El Segundo Dunes, the EIS/R claims not to be proposing direct impacts to sensitive vegetation types. The vegetation types to be removed by the three build alternatives are 306–404 acres of Non-Native Grassland/Ruderal and 60–96 acres of Disturbed/Bare Ground. Although these are not sensitive vegetation types, they are used extensively by sensitive species. Whereas the impacts of removal are to sensitive species, the EIS/R proposes mitigation of abstract “Habitat Units” using the “modified” HEP. The result of the use of the “modified” HEP is to underestimate the effects on the species that use these habitats. The “modified” HEP does not evaluate the value of non-native grassland and disturbed areas to each of the species involved, but rather compares those habitats against an idealized habitat. This allows the EIS/R to state losses and to mitigate in “Habitat Units” instead of acres. *“Habitat Units” calculated in the HEP do not reflect the value of the habitats to the sensitive species.* The EIS/R considers these “Habitat Units” as fungible entities, and thereby proposes to mitigate effects to one vegetation type by enhancing another habitat type. Also, by ranking vegetation types on the dunes by comparing them with Valley Needlegrass Grassland/Vernal Pool complex, the EIS/R creates an artificial deficit of “Habitat Units” within the dunes area. The EIS/R then proposes to mitigate for the loss of Non-Native Grassland (occupied by sensitive species) by enhancing the habitat within the already-preserved and restored area of the El Segundo Dunes. If one accepts the logic of the EIS/R’s HEP and mitigation scheme, the loss of Non-Native Grassland can be mitigated by making the El Segundo Dunes more like a Valley Needlegrass Grassland/Vernal Pool complex. (The EIS/R actually claims to restore these areas to Southern Dune Scrub, but does not reconcile that the “deficit” in habitat values on the dunes was caused by the “failure” of dune scrub to have vernal pool/grassland characteristics.) So by the twisted logic of the “modified” HEP, the loss of 366–500 acres of vegetation types occupied by sensitive species putatively can be mitigated by “improving” roughly 100 acres already protected as a nature reserve or zoned as such.<sup>51</sup> Because the “modified” HEP does not measure habitat values for the sensitive species involved, the description of impacts in terms of “Habitat Units” will drastically underestimate the impacts to those vegetation types. Again, it must be noted that the procedure used in the EIS/R *has no basis in scientific literature* and resembles the actual HEP in name only.

All alternatives propose the removal of sensitive habitats within the El Segundo Dunes to allow construction of navigational aids. These impacts range from 640–1,344 square feet. While this does constitute a significant impact, it is dwarfed in comparison to the other direct and indirect impacts proposed under the three build alternatives.

The discussion of acreage and “Habitat Units” lost under each alternative is not clear with respect to the Westchester Southside Project. Some impacts from the Westchester Southside Project are included (e.g., loss of mature trees), but the effects of the “Resort Hotels” and golf course/open space development are not discussed. The No Action/No Project Alternative explicitly includes the loss of habitat from the LAX Northside and Continental City projects. As mentioned above, this improperly assumes completion of the LAX Northside Project even though changed conditions should result in reopening of the environmental analysis. Inclusion of these speculative developments as part of the No Project alternative serves only to make the impacts of the Master Plan alternatives appear smaller.

---

51. While there are certainly adequate opportunities to enhance the habitat on the El Segundo Dunes through road/infrastructure removal and revegetation, the area available is simply inadequate to compensate for the loss of sensitive species habitat under the three build alternatives.

The EIS/R mentions but does not discuss adequately one impact of the Westchester Southside development: the removal of 300 mature trees that are used as "nursery" sites for raptors.<sup>52</sup> The biological appendix contains no reference to this impact, or the abundance and species of raptors involved.<sup>53</sup> Neither is a description immediately apparent in the "Biological Resources Memoranda for the Record on Floral and Faunal Surveys."<sup>54</sup> The EIS/R should contain a full description of the species of raptors involved, their relative abundance, the location of the trees, and behaviors observed to allow a full evaluation of the impacts.

### 3.1.2 Sensitive Species

The faulty "modified" HEP results in the underestimation of impacts on sensitive species in the EIS/R. The statement of the impacts to populations are low, which results in improper conclusions about mitigation (see below, Section 4.0).

**Lewis' evening primrose (*Camissonia lewisii*).** All alternatives acknowledge direct impacts to Lewis' evening primrose. This is expressed in terms of the number of individuals that would be affected. While the number of individuals is important, the area that these individuals occupy is as important to the conservation of the species. However, the map showing the distribution of the species indicates locations only on the El Segundo Dunes west of Pershing Drive. No indication is given of the location of areas occupied east of Pershing Drive, which total 2.5 acres.<sup>55</sup> Populations separated from one another offer some degree of insurance against catastrophic losses at individual sites. The complete geographic distribution of the species at LAX should be provided in the EIS/R.

**Belkin's tabanid dune fly (*Brennania belkini*).** The EIS/R does not acknowledge the loss of habitat for the Belkin's tabanid dune fly, which is a sensitive species.<sup>56</sup> This species was recorded as present in the "north runway expansion area."<sup>57</sup> The report indicates that the species may disperse into suitable habitat areas. The presence of this dune-associated species and the sensitive Lewis' evening primrose in the north runway expansion area suggests that this area has a substrate suitable for dune obligate species. This may be the result of previous grading, but the value of this site to these and other sensitive species (e.g., potentially El Segundo crab spider, *Ebo* new sp.<sup>58</sup>) should be noted.

**San Diego black-tailed jackrabbit (*Lepus californicus bennettii*).** The EIS/R acknowledges direct impacts to the habitat of this species, west of the southern runway, east of Pershing Drive. Each of the alternatives would result in the loss of 118.75 acres of occupied area, consisting of the entire population at LAX. The EIS/R maintains that these 118.75 acres equal 14.91 "Habitat Units," or roughly 15 acres of ideal vernal pool/grassland complex. As discussed above, this conversion to "Habitat Units" is misguided and wrong. Only two of the sixteen standards for calculating "Habitat Units" are even remotely related to the value of these areas to black-tailed jackrabbit.

**Table 1. Relevance of “Modified” Habitat Evaluation Procedure Standards to Two Sensitive Species**

HEP Standards	Relevance to value of area as black-tailed jackrabbit habitat	Relevance to value of area as loggerhead shrike habitat
<b>TOPOGRAPHY</b>		
Mound-depression microrelief	None. Species occurs in a variety of topographic conditions.	None
Native soils w/ slope <10%	None	None
Areas w/ period of inundation ≥ 30 days	None. Can serve as vectors for seed dispersal between vernal pools, but not necessary for habitat. <sup>59</sup>	None
Summer desiccation	None	None
<b>FLORA</b>		
>10% vegetative cover	Some. Forage and cover must be present.	Some. Vegetation must support prey populations.
Native grasses >10%	None. Will forage on all manner of grasses, forbs, and shrubs. <sup>60</sup>	None
Vernal pool associated species	None	None
Listed vernal pool associated species	None	None
<b>FAUNA</b>		
Domination of native fauna (reproducing)	None	None
Grassland associated species (reproducing)	None	None
Sensitive vernal pool associated species	None	None
Listed vernal pool associated species	None	None
<b>ECOSYSTEM FUNCTIONAL INTEGRITY</b>		
Contiguity w/ wetland and State-designated sensitive terrestrial habitat	None	None
Designated sensitive terrestrial habitat	None	None
Under regulatory conservation	None	None
Variety of pollinator/dispersal mechanisms present (wind, wildlife)	None. Is itself a dispersal agent.	None
Contiguous native habitat > 40 acres	Potentially important. Size of habitat, whether native or not, is important.	Potentially important. Size of habitat, whether native or not, is important.

The conversion of occupied area to “Habitat Units,” based on the standards listed here, is a misapplication of HEP. The extent of habitat loss to the species is on the order of 119 acres. The use of improperly-defined “Habitat Units” to quantify this loss implies that 15 acres of ideal vernal pool/grassland could support as many black-tailed jackrabbits as 119 acres of non-native grassland.

59. Zedler, P.H., and C. Black. 1992. Seed dispersal by a generalized herbivore: rabbits as dispersal vectors in a semiarid California vernal pool landscape. *The American Midland Naturalist* 128(1):1–10. (Jackrabbits play a similar role in the vernal pool landscape.)  
 60. Johnson, R.D., and J.E. Anderson. 1984. Diets of black-tailed jack rabbits in relation to population density and vegetation. *Journal of Range Management* 37(1):79–83. MacCracken, J.G., and R.M. Hansen. 1982. Herbaceous vegetation of habitat used by blacktail jackrabbits and Nuttall cottontails in southeastern Idaho. *American Midland Naturalist* 107(1):180–184. Jameson, E.W., Jr., and H.J. Peeters. *California mammals*. Berkeley: University of California Press.

This is not possible; 15 acres is substantially smaller than the smallest recorded home range for the species (256 acres).<sup>61</sup>

Surveys determining the area occupied by black-tailed jackrabbit may underestimate the area currently occupied. Research indicates that jackrabbits may move from 2 to 10 miles during a day, from shrub cover where the species conceals itself during the day, to foraging habitat in the late afternoon and evening.<sup>62</sup> The EIS/R does not provide sufficient survey information to establish if the grasslands and disturbed areas to the west of the southern runways provide only foraging habitat, and whether other locations (e.g., El Segundo Dunes) are already occupied at different times of the day. This is also suggested by studies of home range. In a study of big sagebrush and black greasewood, black-tailed jackrabbit ranges were larger (256–768 acres)<sup>63</sup> than the presumed occupied area at LAX (119 acres). This raises the question whether the species actually occupies a greater area at LAX, especially during the night and crepuscular periods when no surveys were undertaken.

**Loggerhead shrike (*Lanius ludovicianus*).** The same difficulties found quantifying habitat of black-tailed jackrabbit are found with description of impacts to loggerhead shrike. According to the EIS/R, the species currently occupies 171.86 acres that would be unusable following implementation of any of the project alternatives. (Such precision in habitat quantification is illusory; the EIS/R extrapolates occupied area by vegetation type, providing an *estimate* of habitat area that may differ from the area actually utilized.) Similarly, the EIS/R claims that this impact equals 22.88 “Habitat Units,” suggesting that roughly 23 acres of optimum habitat could mitigate for the loss of 172 acres of occupied habitat. This is false, and grossly underestimates the impacts to the species. No data are provided that link vegetation type to shrike density, as would be necessary to support this claim. The HEP standards are no more relevant to loggerhead shrike than they are to black-tailed jackrabbit. Unless an actual Habitat Suitability Index is developed for loggerhead shrike, all discussion of direct impacts should refer to the area of occupied habitat destroyed, not to the hypothetical “Habitat Units.” It is furthermore unclear whether the area of the Westchester Southside Project was surveyed, and whether these impacts are included.

**Burrowing owl (*Athene cunicularia*).** Surveys located burrowing owls within the project boundaries, though found no direct evidence of breeding. The EIS/R claims that the species “was determined not to breed within the Master Plan boundaries.”<sup>64</sup> This contradicts the previous assessment made by EIS/R consultant Jim Jennings, who concluded that “there is the potential that they may still breed in the project area.”<sup>65</sup> Because burrowing owl densities fluctuate from year to year, burrowing owls were observed in the project area, and potential burrow sites were found, the conservative approach would be to implement measures to ensure the conservation of the species. This species has recently lost much of its local habitat and if extirpated from the project site will disappear from west Los Angeles as a whole.

- 
61. Smith, G.W. 1990. Home range and activity patterns of black-tailed jackrabbits. *Great Basin Naturalist* 50(3):249–256. This study found home ranges of 0.4–1.2 square miles for big sagebrush and black greasewood communities in northern Utah. Many factors may allow higher densities at LAX, such as more forage provided by dense non-native grasses and forbs, but there is no evidence that 15 acres of even the best habitats could compensate for the loss of 119 acres.
  62. Dunn, J.P., J.A. Chapman, and R.E. Marsh. 1982. Jackrabbits: *Lepus californicus* and allies. Pp. 124–125 in J.A. Chapman, and G.A. Feldhamer (eds.). *Wild mammals of North America: biology, management and economics*. Baltimore: The Johns Hopkins University Press.
  63. Smith, G.W. 1990. Home range and activity patterns of black-tailed jackrabbits. *Great Basin Naturalist* 50(3):249–256.
  64. EIS/R, Tables 4.10-2, 4-630.
  65. EIS/R, Technical Report 7. Biological Resources Memoranda for the Record on Floral and Faunal Surveys, p. 463.

**Western spadefoot toad (*Spea hammondi*).** The EIS/R reports that the proposed project alternatives will destroy four seasonal ponds occupied by western spadefoot toads on the south airfield.<sup>66</sup> These populations number at least several hundred adults and all would be destroyed by the various project alternatives. The EIS/R estimates occupied area as 8.97 acres of ephemerally wetted areas and adjacent upland habitats. Spadefoot toads require upland habitats surrounding their aquatic habitat.<sup>67</sup> It is unclear how this area was determined for the EIS/R. Critically important in the analysis is that the species is found in four separate areas. Even though the areas are close to each other, the existing configuration of habitat patches is important to reduce risk to the species from a catastrophic event (e.g., chemical spill, disease). Depending on the separation of the pools, there may still be genetic exchange among the populations in each. These risk dynamics should be considered when evaluating the impact on the species and potential mitigation measures. Loss of the LAX population of western spadefoot toad would cause a significant restriction of the range of the species.

**Riverside fairy shrimp (*Branchinecta sandiegoensis*).** LAX represents the only known coastal population of Riverside fairy shrimp in Los Angeles County. Loss of this population, which is spread among nine sites on the western portion of the property, would be a significant impact. The EIS/R asserts that because the sites where fairy shrimp cysts were found do not have characteristic vernal pool plants, no suitable habitat is found for the species. This conclusion is false — fairy shrimp require vernal pool hydrology, not vernal pool plants, for their existence. This condition would exist, were the management practices at LAX to remove standing water in these pools. It is indeed LAWA's own management scheme that prevents Riverside fairy shrimp from completing its life cycle; LAWA, therefore, should incur liability for "take" of the species under the Endangered Species Act. LAWA fails to recognize that once the presence of fairy shrimp cysts was detected in the vernal pools at LAX, the airport should have ceased its activities that inhibited the life cycle of the species. Instead, the proposal is to destroy all of the areas currently occupied.

The description of acreage for this species does not seem to include the size of the cachements necessary to fill the "ephemerally wetted areas." These areas are necessary to formulate appropriate mitigation measures and evaluate impacts.

The EIS/R is insistent that "there are no extant vernal pools within the [Airport Operations Area]."<sup>68</sup> This statement is meant within the definition of vernal pools as a vegetation type. However, the term "vernal pool" may be used to refer to pools with standing water during the winter and spring, regardless of the presence of certain plant species. As defined by the U.S. Fish and Wildlife Service, "a vernal pool is a natural habitat of the Mediterranean climate region of the Pacific coast covered by shallow water for extended periods during the cool season but completely dry for most of the warm season drought."<sup>69</sup> The definition of the term is hydrological, not botanical. The EIS/R should therefore explicitly disclose that the statement "no vernal pools" refers to a botanical definition. Given the near complete destruction of vernal pools in Los Angeles County,<sup>70</sup> even loss of sites with vernal pool

hydrology and any remnant species (plant or invertebrate) represents a significant impact. The EIS/R emphasizes that Riverside fairy shrimp habitat is degraded through the presence of exotic plant species, presumably to suggest how much better mitigation sites will be than current conditions. However, the degradation of the habitat by exotic plant species is irrelevant to the quality of the pool as habitat for Riverside fairy shrimp. Other degradation to the habitat results directly from LAWA's management,<sup>71</sup> this degradation is avoidable.

### 3.2 Indirect Impacts

As a whole, indirect impacts are not well described in the EIS/R. Those that are described are dismissed with little or no data offered in support, leaving the probability of much greater indirect impacts from the project alternatives than those disclosed.

#### 3.2.1 Light

Night lighting has an effect on bird species composition in an area. A study in Sacramento showed that American crows (*Corvus brachyrhynchos*) roost in areas with high nighttime lighting levels.<sup>72</sup> It is hypothesized that artificial lighting allows them to reduce predation from owls.<sup>73</sup> Crows are native, but they are also aggressive, and artificially increased population levels can be detrimental to other native bird species, including such sensitive species as loggerhead shrike. Artificial night lighting has also been shown to affect the behavior of nocturnal frogs, reducing their visual acuity and ability to consume prey, an impact that may befall those amphibians found within Master Plan boundaries.<sup>74</sup> Many larval forms of arthropods are positively phototactic (e.g., attracted to light, even artificial light), which poses a threat to the many sensitive insect species found on the El Segundo Dunes.<sup>75</sup> Artificial lighting results in increased mortality of moths and other nocturnal insects.<sup>76</sup> Night lighting can also affect kestrels as seen from observation of lesser kestrel (*Falco naumanni*), but also applicable to American kestrel (*Falco sparverius*), found on the El Segundo Dunes.<sup>77</sup> In fact, artificial night lighting affects singing and foraging time of many bird species.<sup>78</sup> Increased lighting even affects gastropods, which would include the sensitive Trask's snail (*Helminthoglypta traskii*).<sup>79</sup>

Nocturnal foraging by Scissor-Tailed Flycatchers under artificial light. *Western Birds*

These effects may seem to be relatively innocuous, except that species that extend their activity periods into nighttime are often exposed to drastically increased predation threats. In a study of butterfly larvae, a higher growth rate associated with longer photoperiod (as would be caused by artificial light) resulted in significantly higher predation on the butterfly larvae from the primary parasitoid species.<sup>80</sup> Similar tradeoffs will likely occur for the El Segundo blue butterfly with increased lighting on the El Segundo Dunes. While the increased light may increase larval development, the time of activity may also increase predation and parasitism.

The conclusion in the EIS/R that the increased levels of night lighting will have no effect on the El Segundo blue butterfly is completely unsupported by current scientific knowledge of the mechanisms of such effects on ecological systems. The EIS/R concentrates on the adult form of the El Segundo blue butterfly, which only constitutes a minute fraction of the lifecycle of the organism, and ignores published scientific literature documenting the tradeoffs of increased lighting on larval forms of butterflies. Furthermore, the EIS/R includes no discussion of bat species that may forage on the El Segundo Dunes. Many bat species found in Los Angeles County are considered sensitive species, and their foraging patterns are affected by lighting levels. Some faster-flying species congregate at streetlights, while slower-flying species avoid them.<sup>81</sup> The EIS/R should document the bat species foraging within the project site and evaluate the impacts of lighting and other development on them.

The increased nighttime light levels on the El Segundo Dunes constitute a significant adverse impact, and should be avoided. One method to decrease the impacts of nighttime lighting is to use low pressure sodium lamps in place of other lighting types. Yellow light from these sources has less ecological impact. Other possible mitigation measures include using full cut-off lighting fixtures and mandating operational controls.

### 3.2.2 Noise

The effects of airport noise on the fauna of the project area are not considered at all. Perhaps this results from the noise analysis, which improperly chooses 1996 — prior to the introduction of quieter airplanes — as the baseline for noise impacts, rather than what noise conditions would be in the absence of the proposed project. Through this careful choice of baseline, the EIS/R argues that there would be virtually no change in the noise levels on the El Segundo Dunes. However, this is not the case. Noise would be more constant under increased passenger capacity — more planes would be traveling in and out of the airport. Increased noise levels on the El Segundo Dunes will have significant adverse effects on the wildlife found there, effects that are evident from the available scientific literature.

The use of a weighted average to describe noise levels (CNEL) precludes and obfuscates analysis of actual noise impacts. From the standpoint of wildlife, and indeed human physiological responses, it is relevant to know what maximum noise levels are experienced, and at what duration. While the average noise levels described in the EIS/R offer some indication of which areas are louder than others,

81. Rydell, J., and H.J. Baagoe. 1996. Bats & streetlamps. *Bats* 14(4):10–13.

maximum noise levels are necessary to evaluate potential hearing loss, startle reactions in animals, barriers to vocal communication, and other significant impacts to the fauna of the El Segundo Dunes.

The body of research on the effects of noise on vertebrates shows that chronic noise, even at low levels, is associated with elevated stress hormone levels, higher blood pressure, faster heart rates, and other physiological effects.<sup>82</sup> As a result, birds, mammals and other vertebrates may show anatomical differences (smaller body size, enlarged adrenal glands) from prolonged exposure to noise. Species that use vocalizations to communicate may be excluded altogether from noisy areas. The effects of noise on birds and mammals in particular are relevant to the EIS/R.

**Birds.** Of 45 bird species investigated in woodlands in The Netherlands, 33 showed significantly depressed breeding density in response to increased noise levels near roads. All species in the small passerine families Sylviidae, Fringillidae, and Emberizidae were affected by noise.<sup>83</sup> This research also showed that noise effects followed a threshold model.<sup>84</sup> This means that up to a certain noise level, no decrease in density is observed. When noise increases beyond that threshold level, bird density decreases dramatically in the area between the location at which that threshold is met and the road. The decreased density over the area with noise greater than the threshold level ranges from 30% to 100% and is known as the "decrease factor."<sup>85</sup>

These two variables, the threshold value and the decrease factor, describe the impact of noise on breeding birds. Empirical measurement of the threshold value in woodlands shows that for all bird species combined the threshold value is 42–52 dB(A), with individual species exhibiting thresholds as low as 36 dB(A) and as high as 58 dB(A).<sup>86</sup> Furthermore, years with overall low population densities showed lower threshold levels.

Similar research has been conducted for grasslands. Overall, this research shows that breeding bird habitat is degraded at noise levels as low as 36 dB(A). Minimum noise levels on the El Segundo Dunes are 70 dB(A) CNEL,<sup>87</sup> a quantification that does not even provide maximum noise levels. There is no question therefore that noise from LAX operations affects breeding bird densities on the El Segundo Dunes.

U.S. Fish and Wildlife Service National Ecology Research Center, Ft. Collins, Colorado. NERC-88/29. 88 pp. Such effects are found in humans too; children exposed to chronic noise greater than 60 dB "experienced marginally higher resting systolic blood pressure, greater heart rate reactivity to test, and higher overnight cortisol levels, which are signs of modestly elevated physiological stress" (Environmental News Network. 24 May 2001. Noisy neighborhoods harmful to children's health).

87. EIS/R, Figures 4.2-15, 4.2-19, 4.2-23.

**Mammals.** Chronic noise is a problem for native mammals on the El Segundo Dunes, as it is for humans in surrounding neighborhoods. The description of one study on the effect of airport noise on a small mammal illustrates one example of this problem:

Only a few studies of the physiological effects of noise on rodents have involved wild animals. A field study by Chesser et al. (1975) involved two populations of house mice near the end of a runway at Memphis International Airport. Adult mice also were collected from a rural field 2.0 km from the airport field. Background noise levels at both fields were 80–85 dB. Noise levels of incoming and outgoing aircraft at the airport field averaged 110 dB, with the highest reading reaching 120 dB. Total body weights and adrenal gland weights of mice from the fields were measured. Additional mice were captured from the rural field, placed in the laboratory, and exposed to 1 minute of 105-dB recorded jet aircraft noise every 6 minutes to determine if noise was the causative factor. Control mice were not subjected to noise. After 2 weeks, the adrenals were removed and weighed. Adrenal gland weights of male and female mice from the airport field were significantly greater than those of mice from the rural field. The noise-exposed mice in the laboratory study had significantly greater adrenal gland weights than the control mice. After ruling out stress factors, such as population density, Chesser et al. (1975) concluded that noise was the dominant stressful factor causing the adrenal weight differences between the two feral populations.<sup>88</sup>

While house mice are of no regulatory concern, native mammals on the El Segundo Dunes include some native small mammals (harvest mouse, *Reithrodontomys megalotis*, desert wood rat, *Neotoma lepida*) which are locally significant. Impacts of noise to the habitat quality of the El Segundo Dunes for native mammals should be evaluated.

**Reptiles and Amphibians.** Spadefoot toads may be induced to emerge from their burrows in response to loud noises (95 dB(A) recordings of motorcycle noise in one experiment).<sup>89</sup> Fringe-toed lizards are rendered deaf after 9 minutes exposure to 95 dB(A) noise in the same study. Some snakes will show alert behavior in response to airplanes flying overhead.<sup>90</sup>

The EIS/R should evaluate the effects of noise on the biota of the El Segundo Dunes. It is likely that if the noise baseline were set at current conditions rather than before the implementation of quieter planes, this analysis would reveal significant impacts on the ability of the El Segundo Dunes to support populations of some species of birds, mammals, and other vertebrates. Such significant impacts should be identified and mitigated.

### 3.2.3 Pollution

The discussion in the EIS/R about pollution effects on the El Segundo blue butterfly deserves comment. The EIS/R makes the statement, "Monitoring results indicate that current levels of vanadium are not adversely affecting the El Segundo blue butterfly population at the Habitat Restoration Area since counts for the year 2000 showed a significant increase in the population when compared to 1999."<sup>91</sup> Many factors influence butterfly abundance from year to year; changes from 1999 to 2000 provide no information about the effect of pollution on the butterfly. This statement is indicative of a fundamental misunderstanding of the process of deductive reasoning. The reality is that we have no idea what effect pollution has on the populations of sensitive species on the El Segundo Dunes, including the El Segundo blue butterfly. Population trends cannot be derived from two years of data, and are even difficult with ten years of measurements.<sup>92</sup>

### 3.2.4 Landscaping

The EIS/R does not assess the detrimental impacts of landscaping adjacent to the El Segundo Dunes. LAWA has planted invasive exotic species as landscape plants in the past, resulting in a greater load of exotic seed rain on the El Segundo Dunes.<sup>93</sup> Exotic landscaping material, and associated irrigation, can cause significant adverse effects on the biological resources of the El Segundo Dunes.

Installation of permanent irrigation in new areas along Pershing Drive would result in an expansion of the invasive exotic arthropod community on the El Segundo Dunes. Water sources promote population increases of non-native Argentine ants (*Linepithema humile*), European earwigs (*Forficula auricularia*), and other exotic species, which displace native insect species, an effect that has recently been documented to extend 200 m into native habitats.<sup>94</sup> Argentine ants are found on the El Segundo Dunes already, but the explosion in numbers associated with permanent irrigation will wreak havoc on native arthropod communities. This is shown by consistent decreases in native arthropod diversity in response to increased Argentine ant abundance.<sup>95</sup> Argentine ants would displace native ants surrounding the project site. This extirpation reverberates up the food chain, as some native reptiles (e.g., coast horned

lizard, *Phrynosoma coronatum*, found on the El Segundo Dunes) preferentially feed on native ants and decline in their absence.<sup>96</sup>

The EIS/R should require as a mitigation measure that in areas adjacent to the El Segundo Dunes, all landscaping plants be limited to locally native species, and that irrigation be limited to winter only.

### 3.3 Cumulative Impacts

The analysis of cumulative impacts is woefully inadequate and is inconsistent with previous conclusions reached by the City of Los Angeles in environmental impact reports. The discussion of cumulative impacts in Sections 4.10 and 4.11 of the EIS/R consists of a description of the Master Plan area and the following statement:

Areas surrounding the study area consist largely of developed areas with little or no habitat value. However, two biologically significant open spaces, the Ballona Wetlands and the Ballona Bluffs, remain extant within the vicinity of the study area.<sup>97</sup>

However, in the Final Environmental Impact Report for the West Bluffs Project — a project to build residences on the last open space on the Ballona Bluffs — the City of Los Angeles found:

The contribution of the proposed project to impacts on plant and animal life from ongoing development in the region is not considered to be significant, due to the disturbed nature and correspondingly low resource value of the project site.<sup>98</sup>

The current EIS/R is inconsistent with the above statement. To the contrary, the current EIS/R states that:

The cumulative impacts on biotic communities from development of the LAX Master Plan Improvements, and other proposed projects in the area, most notably the Playa Vista Master Plan Project and the Catellus residential proposal on the Ballona Bluffs, are considered significant due to the limited amount of extant natural habitat in the vicinity of the study area, particularly wetlands.<sup>99</sup>

The EIS/R then argues that implementation of the LAX Master Plan will not contribute to these cumulative impacts. The City of Los Angeles seems to claim that whichever project is under review does not contribute to cumulative impacts, yet once approved, the City's subsequent environmental review documents acknowledge that projects did contribute to cumulative impacts. The reality is that both the Catellus West Bluffs Project and the LAX Master Plan will contribute to significant cumulative impacts on natural resources.

Upland foraging habitat for grassland songbirds and raptors will be nearly eliminated by the combination of the LAX Master Plan, the West Bluffs Project, Playa Vista Phase I, and the potential

99. EIS/R, p. 4-664.

Playa Vista Phase II. The Ballona Creek watershed (with the exception of the Baldwin Hills) will no longer support many bird species as a result of the cumulative impacts of these developments. Western meadowlark, white-tailed kite, California horned lark, loggerhead shrike, sharp-shinned hawk, northern harrier, Cooper's hawk, and American kestrel will experience significant declines in suitable habitat as a result of these cumulative impacts. Peregrine falcon will experience significant losses of foraging habitat. Many birds associated with the Ballona Wetlands forage in upland habitats, especially during the winter and spring rains. For example, great blue heron and snowy egret forage in the ephemeral wetlands at LAX and the West Bluffs site. If all of these projects are completed, all remnants of vernal pools in the northern portion of the former Los Angeles Coastal Prairie will be obliterated. Vernal pool hydrology at the West Bluffs site and at LAX would be destroyed, yet the EIS/R claims that no significant cumulative impacts will result from the project.

This is the end of the line for open space in west Los Angeles. The City of Los Angeles must recognize that the current project, plus the others previously approved by the City, have significant, irreversible, cumulative impacts on biological resources.

#### **4.0 Mitigation Measures**

The mitigation measures that rely on the "modified Habitat Evaluation Procedure" are insufficient to offset the significant impacts that would result from the build alternatives. The use of "Habitat Units" in mitigation measures MM-BC-2, MM-BC-4, MM-BC-5, MM-BC-6, and MM-BC-7 is fundamentally flawed.

The all-purpose mitigation measure "Conservation of Faunal Resources" (MM-BC-4) is completely inadequate to address impacts to sensitive species from the project alternatives. The conversion to "Habitat Units" is spurious; all mitigation must replace lost habitat with an equal or greater area.

##### **4.1 Lewis' Evening Primrose**

Mitigation for Lewis' evening primrose does not ensure that a replacement population of the species will be created, only that more individuals will be grown on the El Segundo Dunes, where the species is already found. In addition to establishing a numerical goal for the number of individuals to be replaced, mitigation should ensure the area occupied by the species will increase by at least the 2.5 acres that would be lost. Because there is a risk-spreading benefit in the disjunct configuration of the impacted population, the mitigation site should be geographically distinct from currently occupied sites.

##### **4.2 Western Spadefoot Toad**

Mitigation for the western spadefoot toad ignores the geographic configuration of the impacted population(s). These toads are found in four distinct ephemeral wet areas on the LAX property, all of which would be destroyed by the build alternatives. Division of the population into separate, hydrologically distinct pools with different cachements is a benefit to the population. Mitigation for these losses cannot be achieved through creation of 1.24 acres of ideal habitat (the "Habitat Units"), but rather must consist of four separate pools and associated cachements of at least 9 acres.

The choice of mitigation location is important as well. The top choice would be on the areas of the former Los Angeles Coastal Prairie west of Pershing Drive. However, the EIS/R claims that allowing a vernal pool in this area would encourage bird life as well, and would therefore pose a hazard to aircraft.

If off-site mitigation is necessary, the first choice should be the West Bluffs property, currently subject to development by the Catellus Corporation. The West Bluffs site has vernal pool hydrology and is the only candidate site within a reasonable distance of LAX. Distant sites such as Madrona Marsh and potentially California State University Dominguez Hills (where spadefoot toads possibly persist in a vernal pool but are subject to imminent extirpation from construction), should be utilized only in addition to a more proximate site. If no proximate sites are secured (e.g., the West Bluffs property is unobtainable), then the conclusion of the EIS/R must be that the impacts to the species cannot be mitigated to a less than significant level. Without the LAX population, or a possible West Bluffs replacement, the range of the species in the region will be significantly diminished, even with more distant offsite mitigation.

#### 4.3 Riverside Fairy Shrimp

A similar analysis applies to the proposed mitigation for the loss of habitat for the Riverside fairy shrimp. The species is currently found in at least nine areas affected by the build alternatives. The proposed mitigation is for "no more" than 1.3 acres of replacement habitat.<sup>100</sup> To the contrary, loss of this occupied habitat should be mitigated by provision of nine pools with associated upland cachement areas to support vernal pool hydrology. While the mitigation measure suggests one location with 0.75 habitat value (i.e. restoration of vernal pool plants and other vernal pool characteristics), it is more important to the fairy shrimp that multiple locations be acquired. Population models for species found in habitat patches (e.g., metapopulations) show that persistence is enhanced not by density at a single site — although patch size is important — but by maximizing the number of occupied patches.<sup>101</sup> To trade occupied sites for other biological values such as presence of sensitive plant species decreases the long-term persistence possibilities for the fairy shrimp. Certainly full vernal pool restoration would be a noble conservation goal, but it does not mitigate the impacts to the Riverside fairy shrimp. The potential mitigation sites should be chosen by proximity to LAX. The West Bluffs site could provide one, possibly two pools. Additional pools should be identified to mitigate fully the impacts to the species.

#### 4.4 San Diego Black-tailed Jackrabbit

As discussed above, the proposed mitigation for the San Diego black-tailed jackrabbit is insufficient to offset the losses to the species. The loss of 119 acres of occupied habitat must be offset by the provision of at least 119 acres of additional habitat. The EIS/R provides no evidence to show that the species can be supported at similar densities in the Habitat Restoration Area on the dunes, nor that the "Habitat Units" of restoration on the dunes will make the area more suitable for jackrabbits. Black-tailed jackrabbits require mixed grasses, forbs, and shrubs for food; dune scrub may provide less preferred forage than exotic grassland. The Habitat Restoration Area therefore may support lower densities of the species than currently occupy the 119 acres of exotic grassland. Furthermore, the EIS/R provides no estimate of the size of the population to be impacted, or the diel<sup>102</sup> patterns of movement exhibited by the species, information that is necessary to formulate an effective mitigation measure. Any release program on the El Segundo Dunes must be accompanied by a humane control program for the exotic red fox (*Vulpes vulpes*).

---

100. EIS/R, p. 4-708.

101. Hanski, I. 2000. *Metapopulation ecology*. London: Oxford University Press.

102. "Diel" refers to a 24-hour period, a full day and night.

#### 4.5 Loggerhead Shrike

The EIS/R proposes to mitigate for loss of occupied loggerhead shrike habitat (172 acres) with restoration on the El Segundo Dunes in the form of 22.88 "Habitat Units." Implicit in this proposal is the assumption that the density of loggerhead shrikes on the El Segundo Dunes can be increased to accommodate those displaced by the loss of 172 acres of occupied habitat. The EIS/R provides no information about densities of loggerhead shrike to support this implicit assumption. To the contrary, because the El Segundo Dunes are already occupied with breeding loggerhead shrikes, and the shrike's use of habitat is not tied to whether the vegetation is native or not (or to the arbitrary habitat standards of the HEP), restoration on the El Segundo Dunes is not likely to appreciably increase the density of shrikes found there. Mitigation for this impact must be found elsewhere, in the form of 172 acres of shrike habitat. Loggerhead shrike are found at the West Bluffs site, but the site is only 44 acres and so could only offer partial mitigation for impacts at LAX. Other additional mitigation sites include properties covered under the Playa Vista master plan, or in the Baldwin Hills. However, if 172 acres of shrike habitat in addition to the El Segundo Dunes cannot be identified and acquired as mitigation, then the significant impact to this species cannot be mitigated to a less than significant level. The impacts are certainly not mitigated by the proposal to provide 23 extra "Habitat Units" in currently occupied habitat.

#### 4.6 Los Angeles Coastal Prairie

Prescriptions for restoration of Valley Needlegrass Grassland described in MM-BC-5, MM-BC-6, and MM-BC-7 are not consistent with evidence of the historic vegetation in the area, which Mattoni and Longcore have described as Los Angeles Coastal Prairie. The prescription is for a needlegrass dominated habitat, with four common subshrubs. First, five plant species are insufficient to restore this habitat type; the actual plant diversity of the habitat was significantly higher. Second, the relative abundance of species is nothing approaching historical conditions. A transect along a historic photograph of the Coastal Prairie (or "meadow" as described by Pierce<sup>103</sup>), shows the following coverage: *Lupinus bicolor* (39%), *Camissonia bistorta* (18%), *Phacelia stellaris* (14%), *Lotus strigosus* (8%), *Festuca megalura* (4%), *Cryptantha intermedia* (1%), and open (16%).<sup>104</sup> A mitigation measure should bear at least some resemblance to the vegetation type that it proposes to emulate. Furthermore, the standard of 10% native cover for successful restoration is outrageous. The claim that this is defensible because 10% is deemed significant for the identification of a native grassland by the California Department of Fish and Game is equally stunning. Ten percent cover represents the most degraded grasslands, not a standard to achieve in restoration. If the success criterion for grassland mitigation were followed, the vegetation created would score very low on the "modified" HEP touted in the EIS/R.

#### 4.7 Restoration Performance Criteria

The performance criteria for the restoration efforts are all exceedingly weak. The only quantifiable standard for revegetation performance is attainment of native cover, the highest of which is 45%. Ecologists have developed many measures of habitat quality that are available to define performance

standards for revegetation, including many measures of plant diversity and plant structure.<sup>105</sup> Wetland mitigation must meet stringent standards quantifying wetland functions and values.<sup>106</sup> Terrestrial arthropods have been used to assess the performance of revegetation in re-creating native habitats.<sup>107</sup> The performance criteria for restoration should provide more ecological information than simply percent native cover, especially when so many measures are readily available. Without true ecological assessment of restored areas, the success of the mitigation will be forever unknown.

#### 4.8 Raptor “Nursery Sites”

Insufficient information about the impact to raptors using mature trees is provided to allow assessment of whether the mitigation measure (MM-BC-3) would be effective for replacement of mature trees. The location of this mitigation would be important, and the destruction of nearly all of the open space used for foraging by raptors may render “nursery sites” extraneous, with no raptors to use them.

#### 5.0 California Coastal Act

None of the build alternatives in the Master Plan would be consistent with the California Coastal Act. First, there would be many impacts to the environmentally sensitive habitat area on the El Segundo Dunes through the indirect effects of increased construction, light, landscaping, pollution, and road construction. The mitigation measures proposed are insufficient to mitigate for these significant disruptions of habitat values. Even though the development is designed to occur outside the coastal zone boundary, Section 30240(b) of the Coastal Act provides that:

Development in areas adjacent to environmentally sensitive habitat areas and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade those areas, and shall be compatible with the continuance of those habitat and recreation areas.<sup>108</sup>

Second, the EIS/R does not discuss impacts to marine biological resources, which could occur as a result of runoff into and jet fuel dumping over the ocean. Impacts to marine biological resources should be described and appropriate changes implemented before preparation of a final EIS/R.

## **6.0 Conclusion**

The EIS/R treatment of biological resources represents the result of significant effort and expenditure on the part of the preparers. Unfortunately, the resulting analysis is deeply flawed, unscientific, and improperly reaches the conclusion that the mitigation measures would reduce impacts to a less than significant level. To the contrary, implementation of any of the three build alternatives would be catastrophic for the biological resources on the project site and result in a significant local and cumulative impact on sensitive species. If approved and implemented, the Master Plan will permanently degrade the diversity and abundance of native wildlife in west Los Angeles. The last refuges of birds and mammals depending on large open spaces will be erased from the landscape.

Dear Mr. Kessler:

**COUNTY OF LOS ANGELES BOARD OF SUPERVISORS  
FINAL COMMENTS ON LAX MASTER PLAN DRAFT SUPPLEMENTAL EIS/EIR**

On behalf of the Los Angeles County Board of Supervisors, I am submitting final comments on the Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (Supplemental Draft EIS/EIR) for the Los Angeles International Airport Master Plan. The Board of Supervisors approved these comments for submission at their meeting of October 28, 2003.

The Board of Supervisors looks forward to receiving a written response to the comments.

Sincerely,

## Review of Biological Resources Analysis in Supplement to Draft Environmental Impact Statement/Environmental Impact Report for LAX Master Plan

This review pertains to the Federal Aviation Administration/Los Angeles World Airports Supplement to Draft Environmental Impact Statement/Environmental Impact Report ("SDEIS/EIR") for the LAX Master Plan. The scope of this review is limited to biological resources, and consequently addresses Sections 4.10 (Biotic Communities), 4.11 (Endangered and Threatened Species of Flora and Fauna), 4.12 (Wetlands), 4.14 (Coastal Zone Management and Coastal Barriers), and 4.18 (Light Emissions). The review was prepared by Dr. Travis Longcore and Catherine Rich, who are experts in the ecology and history of the natural communities that would be affected by the proposed airport expansion and in the assessment of environmental impacts under the California Environmental Quality Act, National Environmental Policy Act, and California Coastal Act. Dr. Longcore has co-authored several peer-reviewed scientific articles on the El Segundo dunes and the Los Angeles coastal prairie (including its vernal pools),<sup>1</sup> which both would be adversely affected by the proposed project.

The SDEIS/EIR complements, but does not replace, the original Draft Environmental Impact Statement/Environmental Impact Report ("DEIS/EIR") for the LAX Master Plan. The SDEIS/EIR does nothing to improve the fatally flawed assessment methodology for direct impacts to sensitive biological resources that was presented in the DEIS/EIR. Rather, the SDEIS/EIR provides only a trivial and meaningless change in the name of the methodology from "modified Habitat Evaluation Procedure" to "Mitigation Land Evaluation Procedure" ("MLEP"). The SDEIS/EIR attempts to improve the analysis of indirect impacts on biological resources, including the effects of light, noise, and air pollution, but the analysis is illogical and unsupported by the literature. Finally, the SDEIS/EIR presents impact analysis for the newly-formulated Alternative D.

With the exception of the analysis of Alternative D, which triggered the preparation of a Supplement, the new biological resources analysis appears to consist primarily of responses to comments on the DEIS/EIR, including those of the resources agencies and perhaps our own.<sup>2</sup> In our 2001 review, we noted the failure of the DEIS/EIR to provide an adequate assessment of the effects of light and noise on biological resources, illustrated the gross inadequacy of the "modified Habitat Evaluation Procedure," and identified contradictions in the project description. Because many of the problems that we identified in our 2001 review have not been addressed in the SDEIS/EIR, we incorporate our earlier comments by reference (see attached without appendices). This review evaluates the updated analysis of biological impacts and associated mitigation measures presented in the SDEIS/EIR.

## 1.0 Project Description

The maps of land use for the airport properties are updated in the Supplement to depict the four Alternatives. These maps are somewhat clearer than those in the DEIS/EIR about the land use of the ~100 acres of El Segundo dunes not included in the Habitat Restoration Area. While the DEIS/EIR included maps depicting this area as a golf course or resort hotels,<sup>3</sup> the SDEIS/EIR identifies that area as "Airfield/Airport Open Space."<sup>4</sup> The description of Alternatives does not, however, provide conclusive details about the long-term disposition of this biologically important area.<sup>5</sup> The long-term plans for this property are important to the analysis of mitigation measures because the SDEIS/EIR contemplates that some habitat mitigation activities will occur in this area, outside of the ~200-acre Habitat Restoration Area.<sup>6</sup>

We note that the depiction of the 100 acres of El Segundo dunes north of the Habitat Restoration Area as "Airfield/Airport Open Space" diverges from the previous positions articulated by the City of Los Angeles. In the staff report for issuance of a Coastal Development Permit for landscaping along Waterview Street at the northern end of this area, the City in 2001 wrote, "The Project, a narrow, landscaped area along the streets, would provide a buffer between the golf course and residential areas...."<sup>7</sup> As we noted in our previous comments, the zoning for the parcels in the dunes was set at [QJOS-1-XL in 1994, which disallows development in the dunes habitat preserve and restricts use of the remainder of the property to "a nature preserve and accessory uses only."<sup>8</sup> In the Land Use section of the SDEIS/EIR, while the entire 300 acres of the El Segundo dunes are designated as "Open Space," the map refers to the "Los Angeles Airport/El Segundo Dunes Specific Plan" as the descriptor.<sup>9</sup> This Specific Plan has been superseded by the 1994 zoning update, but this fact is not reflected in the various maps in the SDEIS/EIR. The restriction of the northern 100 acres of the dunes to "nature preserve and accessory uses" should be clarified in the Final EIS/EIR.

## 2.0 Direct Impacts

### 2.1 Mitigation Land Evaluation Procedure (formerly "modified Habitat Evaluation Procedure")

The modified Habitat Evaluation Procedure presented in the DEIS/EIR has been renamed the Mitigation Land Evaluation Procedure in the SDEIS/EIR.<sup>10</sup> This methodology was rejected outright by the U.S. Fish and Wildlife Service ("USFWS") and the California Department of Fish and Game ("CDFG") in comments on the DEIS/EIR, but the SDEIS/EIR retains the methodology while simply changing the name, "to eliminate confusion associated with a similarity in the designation to an unrelated methodology developed by the USFWS."<sup>11</sup> This change in terminology does not correct the faulty

11. *Id.*

assumptions of the underlying method, and does nothing to correct the deficiencies in this method that were identified by the USFWS, CDFG, and our previous review.

The SDEIS/EIR uses the Mitigation Land Evaluation Procedure to determine impacts to sensitive vegetation types and to quantify impacts to habitats of sensitive species.<sup>12</sup> The name change is a *de facto* confirmation that the “methodology” is not based on an accepted technique, the “Habitat Evaluation Procedures” (“HEP”)<sup>13</sup> developed by the U.S. Fish and Wildlife Service, but rather was invented for this analysis. While the HEP is an established method with a history of usage,<sup>14</sup> the MLEP is not a recognized method for the evaluation of impacts to sensitive species or vegetation types, or the determination of mitigation ratios for such impacts. Because the SDEIS/EIR does not reprint the methodology it has renamed MLEP, further discussion of the MLEP must refer to the DEIS/EIR.

The MLEP sets habitat evaluation standards based on an “optimal” site with “a multitude of floral and faunal species.”<sup>15</sup> One would expect that each vegetation type would be compared against an optimal site of that same vegetation type, but this is not the case. Rather, the MLEP inexplicably compares all vegetation types against a valley needlegrass grassland/vernal pool complex. One might also expect that the habitat evaluation for each species would incorporate features relevant to that species’ survival. This is not true either, because the habitat evaluation standards bear no relation to species requirements. For example, we compared the habitat evaluation standards in the MLEP to the habitat requirements of loggethead shrike (*Lanius ludovicianus*) and black-tailed jackrabbit (*Lepus californicus bennettii*) (Table 1),<sup>16</sup> and found no nexus. The MLEP assigns low values of 0.25 for vegetation types that are occupied by these species (non-native grassland/ruderal), even though this vegetation is quite good habitat for both species. Furthermore, because the MLEP compares all vegetation types against one vegetation type, the MLEP results in the false conclusion that habitat values lost by destruction of one vegetation type can be mitigated by enhancing a completely different vegetation type.

This critical failure bears repeating. The single set of standards used to evaluate all vegetation types does not reflect ecological value, either to sensitive species or as vegetation communities. This problem derives from the physical and biological criteria used to evaluate habitat and the so-called “ecosystem functional integrity” components of the analysis. Rather than developing criteria for each vegetation type, the MLEP evaluates all vegetation types against the characteristics found in a “reference site.” The vegetation type chosen for this standard is that of valley needlegrass grassland/vernal pool complex.<sup>17</sup> For some inexplicable reason, all vegetation types are measured against this standard, including southern foredune, southern dune scrub, and disturbed dune scrub/foredune. Dune vegetation does not exhibit many features found in a valley needlegrass grassland/vernal pool complex. Because dune vegetation does not have vernal pools and associated species, these vegetation dune types are assigned lower

16. Because the MLEP is the “modified HEP” with a different name, our analysis is the same as provided in our 2001 comments.

17. DEIS/EIR, p. 4-615.

“habitat” values — 0.35 for both southern dune scrub and disturbed dune scrub/foredune, and 0.45 for southern foredune. This ranking merely illustrates that dune scrub is not good valley needlegrass grassland/vernal pool complex, but it says nothing about whether it is good dune scrub.

**Table 1. Relevance of Mitigation Land Evaluation Procedure Standards to Two Sensitive Species**

MLEP Standards	Relevance to value of area as black-tailed jackrabbit habitat	Relevance to value of area as loggerhead shrike habitat
<b>TOPOGRAPHY</b>		
Mound-depression microrelief	None. Species occurs in a variety of topographic conditions.	None
Native soils w/ slope <10%	None	None
Areas w/ period of inundation ≥ 30 days	None. Can serve as vectors for seed dispersal between vernal pools, but not necessary for habitat. <sup>18</sup>	None
Summer desiccation	None	None
<b>FLORA</b>		
>10% vegetative cover	Some. Forage and cover must be present.	Some. Vegetation must support prey populations.
Native grasses >10%	None. Will forage on all manner of grasses, forbs, and shrubs. <sup>19</sup>	None
Vernal pool associated species	None	None
Listed vernal pool associated species	None	None
<b>FAUNA</b>		
Domination of native fauna (reproducing)	None	None
Grassland associated species (reproducing)	None	None
Sensitive vernal pool associated species	None	None
Listed vernal pool associated species	None	None
<b>ECOSYSTEM FUNCTIONAL INTEGRITY</b>		
Contiguity w/ wetland and State-designated sensitive terrestrial habitat	None	None
Designated sensitive terrestrial habitat	None	None
Under regulatory conservation	None	None
Variety of pollinator/dispersal mechanisms present (wind, wildlife)	None. Is itself a dispersal agent.	None
Contiguous native habitat > 40 acres	Potentially important. Size of habitat, whether native or not, is important.	Potentially important. Size of habitat, whether native or not, is important.

18. Zedler, P.H., and C. Black. 1992. Seed dispersal by a generalized herbivore: rabbits as dispersal vectors in a semiarid California vernal pool landscape. *The American Midland Naturalist* 128(1):1–10. (Jackrabbits play a similar role in the vernal pool landscape.)

19. Johnson, R.D., and J.E. Anderson. 1984. Diets of black-tailed jack rabbits in relation to population density and vegetation. *Journal of Range Management* 37(1):79–83. MacCracken, J.G., and R.M. Hansen. 1982. Herbaceous vegetation of habitat used by blacktail jackrabbits and Nuttall cottontails in southeastern Idaho. *American Midland Naturalist* 107(1):180–184. Jameson, E.W., Jr., and H.J. Peeters. 1988. *California mammals*. University of California Press, Berkeley.

The portion of habitat value deriving from “ecosystem functional integrity” is another wholesale creation of the DEIS/EIR, and by extension the SDEIS/EIR. The choice of standards is arbitrary, with little to do with the sensitive species and vegetation types under analysis. Whether a site is “under regulatory conservation” does not necessarily have anything do with the ecological value of its vegetation type for sensitive species. Similarly, “contiguity with state-designated habitat” is not an ecological criterion. “Variety of pollinator/dispersal mechanisms present” is oriented toward vernal pool vegetation, and the choice of “contiguous native habitat >40 acres” is arbitrary.

The MLEP fundamentally obscures the reality that sensitive plants and wildlife utilize vegetation that is not dominated by native species. Loggerhead shrikes forage in ruderal and non-native grasslands as well as in dune scrub. Jackrabbits are thriving in an area with little native plant component. Furthermore, the MLEP asserts that landscaped areas within the airport grounds contain “habitat units,” even though these areas support neither sensitive vegetation communities nor sensitive species. The MLEP is therefore of no use in evaluating the impacts to native wildlife, or in devising mitigation schemes for those impacts. The MLEP is so flawed that it completely fails to establish the nexus for mitigation of impacts.

We are not saying that it would be impossible to develop a scheme to assess vegetation communities that assigns lower area equivalence to degraded vegetation. Indeed, the suggestion by CDFG that non-native grasslands be mitigated at a 0.5:1 ratio is implicit recognition of such an approach. A preliminary effort to develop a “habitat hectares” scheme has been published in the scientific literature, but it is fundamentally different from the MLEP.<sup>20</sup> A valid “habitat area” approach should include the following features: 1) incremental values of habitat areas are assigned strictly on biological criteria, 2) these criteria are developed separately for each vegetation type, and 3) the results are not applied as proxies for the habitat requirements of individual wildlife species.<sup>21</sup> The MLEP violates all three of these conditions. (Technically, this type of approach should not be called a “habitat area” approach, because “habitat” is a specific term that is defined relative to an individual species.<sup>22</sup>)

## 2.2 Alternative D

The SDEIS/EIR discloses that the new, preferred Alternative D would result in direct destruction of 1.53 acres of sensitive habitat for the construction of navigational aids and associated service roads within the El Segundo dunes, both inside and outside the Habitat Restoration Area. This would include removal of 0.8 acres of disturbed foredune, 0.5 acres of disturbed grassland, and 0.2 acres of foredune.<sup>23</sup> The acreage may sound minimal to the casual reader, but the raw acreage does not reveal the true extent of project impacts because it conceals the spatial configuration of the development. The Biotic Communities analysis fails to reveal the geographic arrangement of the proposed construction, and does not consider this critical information in the assessment of impacts. This information about configuration is important because if the navigational aids are scattered, a greater area will be subjected to “edge effects” from adjacency to the new infrastructure and the construction. If they are clustered, then

---

20. Parkes, D., G. Newell, and D. Cheal. 2003. Assessing the quality of native vegetation: the “habitat hectares” approach. *Ecological Management and Restoration* 4:S29–S38.

21. *Id.*

22. Hall, L.S., P.R. Krausman, and M.L. Morrison. 1997. The habitat concept and a plea for standard terminology. *Wildlife Society Bulletin* 25:173–182.

23. SDEIS/EIR, Table S4.10-4.

impacts will be lessened. Clustering of development is one of the basic tenets of conservation planning. Every site of disturbance within the dunes habitat is an area that is more easily invaded by exotic plants and arthropods. It is therefore troubling that the SDEIS/EIR contains no assessment of the configuration of this development footprint.

Configuration of the navigational aids on the dunes is found only in the Coastal Zone Management and Coastal Barriers section. A figure in that section reveals that the navigational aids will be installed at no fewer than 23 separate locations in two lines extending two thirds of the way across the dunes from east to west.<sup>24</sup> In addition, existing navigational aids will be removed from 12 other locations both in and out of the Habitat Restoration Area. Each new navigational aid will be 9 feet square, within a 15-foot service buffer. The total area of the new navigational aids is 0.2 acres, so the remaining 1.4 acres of identified disruption must be from new roads or other construction impacts. Therefore, from the new navigational aids alone, nearly 1,300 feet of new habitat edges will be introduced into the El Segundo dunes. It is furthermore unclear if habitat disruption from removal of existing navigational aids has been evaluated.

The impact analysis for Alternative D uses the flawed MLEP to calculate "habitat units" that will be lost for various sensitive species. These habitat units are essentially meaningless; the actual acres of lost habitat should be the basis for impact assessment. According to the SDEIS/EIR the following sensitive species will experience habitat loss in the following amounts: black-tailed jackrabbit, 23.76 acres; western spadefoot toad (*Spea hammondi*), 8.97 acres; loggerhead shrike, 83.25 acres.

The area of impacts to black-tailed jackrabbit is actually much larger than 23.76 acres. The area currently occupied by this species will be used as a construction staging area, which will eliminate far more habitat than the parking garage.<sup>25</sup> In addition, the mitigation measure for this species proposes relocating all of the jackrabbits to the El Segundo dunes. The resulting total loss of habitat is therefore closer to the 118.75 acres described for the other Alternatives.

Loss of habitat for jackrabbits, loggerhead shrikes, and western spadefoot toads constitutes a significant impact because the losses would appreciably diminish the ranges of these rare species. LAX supports the only population of jackrabbits in west Los Angeles and indeed, in most of the Los Angeles basin. LAX also supports one of the last western spadefoot toad populations in the Los Angeles basin. Surveys in 2003 for breeding loggerhead shrikes recorded fewer than six pairs within the Los Angeles basin (Kimball Garrett, Los Angeles County Museum of Natural History, pers. comm.), and the species has disappeared in recent years from regularly surveyed sites at Holy Cross Cemetery, Madroña Marsh, and other Los Angeles locations (Professor Hartmut Walter, UCLA Department of Geography, pers. comm.). All three of these species are on the verge of extirpation within a large cismontane geographic area, making any impacts to the populations at LAX highly significant. Cumulative impacts to these species, from the proposed project and other projects in the area, including the Catellus West Bluffs development, are highly significant.

The impact analysis for Alternative D (and the other Alternatives) does not address the "bomb disposal site" located within the Habitat Restoration Area. Consultants to LAX previously recommended that

---

24. SDEIS/EIR, Figure S4.14-1.

25. SDEIS/EIR, Figure S4.20-1.

this site be moved as part of the Master Plan process so that the ongoing adverse impacts to sensitive habitats (including scraping of restored areas, and disposal of debris within restored areas) could be avoided.<sup>26</sup>

The impact analysis does not provide a sufficient discussion of chemicals that would be used for dust suppression. The SDEIS/EIR suggests the use of "nontoxic" soil binders to reduce dust, but the compatibility of these chemicals with habitat restoration and biological communities is unknown or not reported, and so cannot be evaluated.

### 3.0 Indirect Impacts

The SDEIS/EIR provides additional discussion of the effects of light and noise on biological resources. While presenting marginally more information, the analysis and conclusions on both these topics are lacking in logic and scientific support.

#### 3.1 Artificial Night Lighting and Wildlife

Discussion of the impacts of artificial night lighting on wildlife is hampered by the confusing use of terminology in the SDEIS/EIR. The issue is routinely described as an analysis of "light emissions," and the magnitude of lighting is described in foot-candles ("fc"). The difficulty with this is that foot-candles (or the SI equivalent lux) are measures of illumination within an area, not the emission of light from a source. Light emissions should be described in terms of luminance. Both illumination and luminance are relevant to assessment of the biological impacts of artificial lighting. Luminance is primarily associated with attraction and repulsion of animals, while illumination primarily results in orientation and disorientation.<sup>27</sup> Analysis of lighting should therefore clearly distinguish between illumination and luminance in considering impacts to wildlife.

The analysis of lighting impacts from all Alternatives lacks relevant spatial information to reach meaningful conclusions. For example, the baseline conditions within the dunes Habitat Restoration Area are described as ranging from 0.004 fc to 0.26 fc.<sup>28</sup> For all build scenarios, the SDEIS/EIR predicts that illumination will increase by 0.34 fc. The spatial distribution of this increase is not described, which makes it difficult to discern how large an area will be subjected to increased lighting from the project.

The SDEIS/EIR tries to reach the conclusion that current lighting levels have no adverse influence on wildlife. This conclusion is not supported by the facts. First, all lighting levels within the dunes were recorded during a night with a clear sky. Light reflected by clouds or fog is at a minimum on clear nights; ambient illumination may increase substantially on overcast or foggy nights.<sup>29</sup> The

characterization of the baseline conditions does not therefore adequately represent lighting impacts, given the frequency of these meteorological conditions along the coast.

Second, the biological analysis asserts that only nocturnal and crepuscular species could be affected by artificial night lighting. This conclusion reveals a failure to understand basic ecology and an ignorance of the scientific literature. One of the common effects of artificial night lighting is to extend the activity period of a diurnal species into the nighttime hours. This has been well documented for birds,<sup>30</sup> and is so notable in reptiles that animals exhibiting such behavior have been characterized as using the "night light niche."<sup>31</sup> In another example, seals extended foraging time on salmon by using the lights from a bridge overhead.<sup>32</sup> Extended activity times for diurnal species results in disruption of interactions with other species. Species with extended activity periods may 1) subject other species to increased predation, 2) increase competition with nocturnal and crepuscular species, and 3) be subject to additional predation. The outcome of these altered species interactions will be positive, neutral, and negative for different members of the community, be they diurnal, crepuscular, or nocturnal. One experimental investigation reports the outcome of increased foraging time allowed by artificial lighting for butterfly larvae. The higher growth rate associated with longer photoperiod was offset by significantly higher predation on the butterfly larvae from the primary parasitoid species.<sup>33</sup> The SDEIS/EIR errs dramatically in claiming that diurnal species would not be affected by artificial night lighting.

Third, the SDEIS/EIR does not discuss the relevant literature to develop thresholds to determine adverse impacts from lighting. Rather, it draws on the rather illogical statement that because sensitive species are present in the dunes area with existing light levels, the light does not adversely affect these species.<sup>34</sup> Presence of a species in a degraded habitat does not mean that the habitat is not degraded. The conclusion of no impact from existing lighting cannot be drawn without knowing the density of sensitive species in the absence of artificial night lighting. Even using the measurements taken on a clear night for the SDEIS/EIR, artificial illumination on the dunes reaches 0.26 fc (2.8 lux), which is an order of magnitude greater than that provided by a full moon (~0.1 lux). The claim that illumination of this magnitude does not affect wildlife is untenable, given the known influences of lunar cycles on wildlife behavior. For example, scorpions stay closer to their burrows during the full moon.<sup>35</sup> Other animals,

including snakes,<sup>36</sup> small mammals,<sup>37</sup> lagomorphs,<sup>38</sup> and bats,<sup>39</sup> similarly avoid foraging during the full moon to avoid the increased predation risk. With areas of the dunes subjected permanently to illumination brighter than that of a full moon, the conclusion that this baseline condition causes no impacts is not supported by scientific evidence. Even the dimmest illumination found in the baseline conditions at the dunes (0.004 fc = 0.043 lux) is still greater than the light of a quarter moon (0.01 lux), let alone a moonless clear night (i.e., starlight only with no light pollution; 0.001 lux), or a moonless overcast night (i.e., no starlight with no light pollution; 0.0001 lux).

With these natural illumination levels in mind, it becomes evident that impacts from additional light created by the project will be significant to wildlife: All project Alternatives would increase illumination within the Habitat Restoration Area so that illumination would range from 0.344–0.6 fc (3.7–6.5 lux). This illumination is 37 to 65 times brighter than that of a full moon. Given that the wildlife species of the dunes evolved for hundreds of thousands of years with, and are adapted to, a natural light regime with a maximum illumination of the full moon, and some wildlife species may detect and respond to illuminations below 0.01 or even 0.0001 lux,<sup>40</sup> an increase of 0.34 fc (3.6 lux) constitutes a significant adverse impact.

### 3.2 Noise and Wildlife

In our 2001 comments on the DEIS/EIR, we requested that the impact of noise on wildlife be analyzed. The SDEIS/EIR presents an analysis, but it is lacking in scope and logic.

The scope of the analysis of noise impacts is limited in the SDEIS/EIR to sensitive species only. While these impacts are important, this scope is unduly narrow, because it ignores impacts to wildlife species not designated as “sensitive” that are found in rare natural communities (also called “sensitive habitats”). Rare natural communities, such as southern foredune, dune scrub, and valley needlegrass grassland, are important for both their flora and fauna. It would defeat the purpose of protecting such sensitive habitats if impacts to the wildlife in those habitats are not analyzed. The noise analysis should therefore be expanded to consider impacts to the wide range of wildlife found in the sensitive habitats at LAX, and not limited to only those individual species designated as sensitive.

The logic of the noise analysis is also flawed. This is exemplified by the conclusion that, “Based on the analysis of existing noise levels at locations occupied by sensitive species, and the presence of sensitive species within these areas, it appears that current noise conditions do not adversely affect sensitive species at LAX.”<sup>41</sup> Again, as is the case with the analysis of artificial night lighting, insufficient information is available in the SDEIS/EIR to draw this conclusion. If the density of sensitive species

  41. SDEIS/EIR, p. 4-453.

without elevated noise levels were known, and those densities remained the same with elevated noise, then perhaps a conclusion of no impact could be reached. But the SDEIS/EIR does not report density of occupation by any sensitive species (except El Segundo blue butterfly, *Euphilotes bernardino allyni*) and presents no comparison to suggest that densities would be the same in the absence of the noise associated with the fourth largest airport in the United States. Without these critical parts of a logical argument, the conclusion that existing noise does not affect sensitive species at LAX is unfounded.

Beyond the faulty conclusion that *current* noise levels do not affect sensitive species at LAX, the SDEIS/EIR also asserts that *increased* noise would not affect sensitive species. This conclusion is a result of the inappropriately narrow scope of the analysis and a failure to consider reasonable thresholds for noise effects. A rather exhaustive body of literature is referenced, but glossed over by the SDEIS/EIR, that illustrates the adverse impacts of airport noise on vertebrates, even at levels far below the thresholds in the SDEIS/EIR. Chronic noise, even at low levels, is associated with elevated stress hormone levels, higher blood pressure, faster heart rates, and other physiological effects.<sup>42</sup> As a result, birds, mammals, and other vertebrates may show anatomical differences (smaller body size, enlarged adrenal glands) from prolonged exposure to noise.

A study of the influence of aircraft overflights on birds is cited in the SDEIS/EIR, noting that "there were no major differences in the nesting productivity of the most abundant species, and the nesting success was high and similar for both the control site and the test site."<sup>43</sup> This reference is rather disingenuous, because it neglects to inform the reader that the Alaska study site experienced  $L_{max}$  below 70 dB(A) while the  $L_{max}$  at LAX ranges 90–140 dB(A) under the various Alternatives. This represents a considerable difference, because decibels are measured on a logarithmic scale.

Road noise, which is several orders of magnitude quieter than aircraft noise, has been documented to exert an adverse impact on breeding birds. Of 45 bird species investigated in woodlands in The Netherlands, 33 showed significantly depressed breeding density in response to increased noise levels near roads. All species in the small passerine families Sylviidae, Fringillidae, and Emberizidae were affected by noise.<sup>44</sup> Empirical measurement of the threshold value triggering decreased density in woodlands shows that for all bird species combined the threshold value is 42–52 dB(A), with individual species exhibiting thresholds as low as 36 dB(A) and as high as 58 dB(A).<sup>45</sup> Furthermore, years with overall low population densities showed lower threshold levels. Similar research has been conducted for

grasslands. Overall, this research shows that breeding bird habitat is degraded at noise levels as low as 36 dB(A).<sup>46</sup>

Mammals are likewise vulnerable to impacts from chronic airport noise:

Only a few studies of the physiological effects of noise on rodents have involved wild animals. A field study by Chesser et al. (1975) involved two populations of house mice near the end of a runway at Memphis International Airport. Adult mice also were collected from a rural field 2.0 km from the airport field. Background noise levels at both fields were 80–85 dB. Noise levels of incoming and outgoing aircraft at the airport field averaged 110 dB, with the highest reading reaching 120 dB. Total body weights and adrenal gland weights of mice from the fields were measured. Additional mice were captured from the rural field, placed in the laboratory, and exposed to 1 minute of 105-dB recorded jet aircraft noise every 6 minutes to determine if noise was the causative factor. Control mice were not subjected to noise. After 2 weeks, the adrenals were removed and weighed. Adrenal gland weights of male and female mice from the airport field were significantly greater than those of mice from the rural field. The noise-exposed mice in the laboratory study had significantly greater adrenal gland weights than the control mice. After ruling out stress factors, such as population density, Chesser et al. (1975) concluded that noise was the dominant stressful factor causing the adrenal weight differences between the two feral populations.<sup>47</sup>

While house mice are of no regulatory concern, native small mammals on the El Segundo dunes include harvest mouse, *Reithrodontomys megalotis*, and desert wood rat, *Neotoma lepida*, which are locally significant. But again, the SDEIS/EIR does not analyze these impacts because it concentrates only on sensitive species, and not on the full range of wildlife species in sensitive habitats.

The scientific literature provides ample evidence to conclude that the sensitive habitats at LAX are degraded by noise from airport operations and that increased noise would constitute a significant adverse impact.

#### 4.0 Mitigation Measures

The SDEIS/EIR, because it relies on the MLEP to formulate mitigation measures for impacts to sensitive species and biotic communities, contains deeply flawed mitigation measures.

The SDEIS/EIR reports that all of the proposed project Alternatives will destroy four seasonal ponds occupied by western spadefoot toads on the south airfield. These populations number at least several hundred adults and all sites would be destroyed by the various project Alternatives. The SDEIS/EIR estimates occupied area as 8.97 acres of ephemeral wetted areas and adjacent upland habitats. Spadefoot toads require upland habitats surrounding their aquatic habitat.<sup>48</sup> It is unclear how upland habitats were measured for the SDEIS/EIR. Critically important in the analysis is that the species is found in four separate areas. Even though the areas are close to each other, the existing configuration of

Foppen, and G. Veenbaas. 1997. Disturbance by traffic of breeding birds: evaluation of the effect and considerations in planning and managing road corridors. *Biodiversity and Conservation* 6(4):567–581.

47. Mancini, K.M., D.N. Gladwin, R. Villella, and M.G. Cavendish. 1988. Effects of aircraft noise and sonic booms on domestic animals and wildlife: a literature synthesis. U.S. Fish and Wildlife Service National Ecology Research Center, Ft. Collins, Colorado. NERC-88/29. 88 pp.

48. Ruibal, R., L. Trevis, and V. Roig. 1969. The terrestrial ecology of the spadefoot toad *Scaphiopus hammondi*. *Copeia* 572–584.

habitat patches is important to reduce risk to the species from a catastrophic event (e.g., chemical spill). Depending on the separation of the pools, there may still be genetic exchange among the populations in each. These risk dynamics should be considered when evaluating the impact on the species and potential mitigation measures.

Loss of the LAX population of western spadefoot toads would cause a significant restriction of the range of the species. Because of the significance of the LAX population to the range of the species, mitigation areas should be as close as possible to the existing sites. The first choice should be within the 100 acres north of the Habitat Restoration Area where vernal pools were found historically.<sup>49</sup> This site would not require land acquisition and would be consistent with achieving other mitigation goals within this area. Furthermore, the biological consultants for the LAX Master Plan recommend that this site be restored with vernal pools.<sup>50</sup> The second priority for creation of habitat and reintroduction of western spadefoot toad is the West Bluffs site. While this site is currently graded for development, the owner is willing to sell the property, which historically supported appropriate vernal pool habitat. The area of the reintroduction site must at least equal the area occupied at LAX. Given the difficulty of restoring habitat and establishing rare species, a 3:1 mitigation ratio for pool surface area would be more appropriate. This surface area must be accompanied by surrounding upland habitat at a ratio of 10 to 15 acres for each acre of pool surface area. Ideally the mitigation pool surface area would be divided among at least three pools to minimize the effects from a possible catastrophic event.

Mitigation for impacts to Riverside fairy shrimp (*Branchinecta sandiegoensis*) should use the same pool system as developed for the western spadefoot toad.

The SDEIS/EIR suggests that the impact of destroying at least 83 acres of habitat for loggerhead shrike can be mitigated by enhancing habitat within the El Segundo dunes. As proposed, this mitigation measure will not be successful. It suggests that the loss of 83 acres of habitat can be offset by enhancing habitat within 300 acres of existing, occupied habitat. The SDEIS/EIR presents no evidence that the 300 acres of the El Segundo dunes could support a greater density of shrikes. Surveys of the El Segundo dunes in 1995 and 1998 showed this area to be occupied by breeding shrikes.<sup>51</sup> An average of six individuals per survey were seen within the Habitat Restoration Area in 1995.<sup>52</sup> Territory size for loggerhead shrikes on the Channel Islands is large, 34 ha (~84 acres),<sup>53</sup> while mainland territories are somewhat smaller, 4.4–16.0 ha (~10.9–39.5 acres).<sup>54</sup> Assuming the Habitat Restoration Area supports three pairs of breeding shrikes, the territory size would be ~27 ha (~66.7 acres). Experts familiar with shrikes and the El Segundo dunes doubt that the mitigation measure would be successful in increasing shrike density in this occupied habitat (Professor Hartmut Walter, UCLA Department of Geography, pers. comm.).

54. Miller, A.H. 1931. Systematic revision and natural history of the American shrikes (*Lanius*). *University of California Publications in Zoology* 38:11–242.

Only one of the three proposed enhancement activities (removal of roads) could be conducted within the Habitat Restoration Area. The other enhancement activities would be conducted outside the Habitat Restoration Area. If enhancement will occur outside the Habitat Restoration Area, then the mitigation measure must establish that restored areas will be protected permanently as natural habitat. The SDEIS/EIR fails to state that mitigation areas outside of the Habitat Restoration Area will be permanently protected.

Enhancement to improve habitat for loggerhead shrikes might also have adverse consequences on other species. Shrikes are fond of Jerusalem crickets as forage.<sup>55</sup> The Jerusalem cricket found at the El Segundo dunes is a sensitive endemic species.<sup>56</sup> This is meant only to illustrate that artificially increasing the density of one species is not necessarily consistent with management for other species or for maximum biological diversity. Similarly, as discussed below, enhancement to support a large population of jackrabbits would conflict with the provision of habitat for El Segundo blue butterflies.

The proposed mitigation for impacts to black-tailed jackrabbits involves relocation from a ruderal grassland to the Habitat Restoration Area, which contains southern dune scrub and foredune scrub vegetation. It is likely that this mitigation measure will not succeed. First, the 200 acres (81 ha) of the Habitat Restoration Area will support a lower density of jackrabbits than the open grassland they now inhabit. Black-tailed jackrabbits are generalist herbivores, and therefore can survive in a range of vegetation types. The density of jackrabbits differs, however, with the composition of the vegetation. Sites that have very high grass cover relative to shrubs and forbs support far greater densities. For example, a steppe habitat with 59% grass, 10% forb, and 31% shrub cover supported 18.4 jackrabbits per ha, and density decreased with increasing shrub cover to 1.4 individuals per ha at 91.0% shrub cover.<sup>57</sup> Because the Habitat Restoration Area is intended to support scrub habitats, jackrabbits could only persist at a far lower density than they do in their current habitat at the Airport Operations Area, meaning a much larger area would be required to support the population. Furthermore, the SDEIS/EIR does not consider the possible reasons that black-tailed jackrabbits are no longer present on the dunes, even though they were present historically. For some reason the population was extirpated, and unless the forces that caused the extirpation are removed, the mitigation will fail. We see two possible explanations. First, the small population size within the Habitat Restoration Area was vulnerable to random events simply because it was small. If this is true, then the relocation will eventually fail unless the dunes are managed to maintain a larger population size to the detriment of other sensitive species on the dunes, including El Segundo blue butterfly. A second possible explanation for the disappearance of jackrabbits from the dunes can be deduced from the timing of their extirpation. According to surveys in the DEIS/EIR, jackrabbits died out (or were killed) sometime between surveys in 1978 and 1988.<sup>58</sup> The other major change in the mammal fauna between 1978 and 1988 was the appearance of the non-native red fox as a breeding resident on the dunes. Red fox are recorded predators of black-tailed jackrabbits, so the invasion and success of this predator may have resulted in the elimination of jackrabbits. If this is true, any jackrabbit relocation program must be accompanied by a humane red fox (and feral cat/dog) control program.

58. DEIS/EIR, Technical Report 7. *Biological Resources Memoranda for the Record on Floral and Faunal Surveys*, p. 493.

Mitigation for Lewis' evening primrose (*Camissonia lewisii*) does not ensure that a replacement population of the species will be created, only that more individuals will be grown on the El Segundo dunes, where the species is already found. In addition to establishing a numerical goal for the number of individuals to be replaced, mitigation should ensure that the area occupied by the species will increase by at least the 2.5 acres that would be lost. Because there is a risk-spreading benefit in the disjunct configuration of the impacted population, the mitigation site should be geographically distinct from currently occupied sites.

Mitigation Measure MM-ET-4 describes actions to mitigate impacts to El Segundo blue butterfly from Alternative D. It contains the following provisions, summarized and quoted from here, that deserve comment based on our previous experience<sup>59</sup> with such mitigation efforts: 1) avoid flight season for construction, such that construction occurs between October 1st and May 31st, 2) mitigate the number of plants of coast buckwheat at 1:1 ratio, 3) "salvage existing coast buckwheat plants and any larvae on the plant or in the soil below the plant that would be removed," and 4) salvage any El Segundo blue butterfly larvae from plants that are not salvaged.<sup>60</sup> While it may seem intuitive to avoid construction during the adult flight season, the species may indeed be more vulnerable at other times because individuals are in diapause as pupae in the sand beneath the plants. While flying adults can escape physical disturbance in the environment, pupae cannot move to avoid being crushed. If the Section 7 consultation with USFWS results in a "no jeopardy" determination, the following strategy would reduce impacts to the butterfly. Plants that will be impacted should be carefully removed in the late Spring before adult butterflies eclose by cutting them at the surface of the sand. This minimizes disturbance to pupae in the duff and sand below. Then construction should be delayed until after the ensuing flight season. Butterflies that emerge to find their plants gone will be forced to emigrate to nearby habitat. If desired, the affected areas can be searched for pupae after the flight season to locate any pupae in multiple-year diapause. Relocation of mature coast buckwheat plants is not a cost efficient means of mitigation. Most plants will die, and the butterfly would be better served by restoring more habitat with container plants. Given the timing of the construction phase, the existing measure incorrectly refers to salvage of larvae at a time when only pupae would be found. Finally, mitigation at a 1:1 ratio for plants is insufficient. The mitigation ratio for direct impacts to this rare natural community should be at a 5:1 ratio on an area basis rather than a per plant basis. The impacts to 0.24 acres of occupied El Segundo blue butterfly habitat (which will be scattered across the Habitat Restoration Area) should be mitigated by restoration of 1.25 acres of the vegetation type in similar topoclimatic configuration. Impacts to backdune areas should be mitigated by restoring backdune vegetation, not by planting a remote foredune area as contemplated by the mitigation measure.

## 5.0 Conclusion

The full DEIS/EIR, including the new Supplement, fails to provide a realistic assessment of the impacts of the proposed project on biological resources, including sensitive species and rare natural communities. The centerpiece of the analysis of direct impacts is a fatally flawed methodology. This methodology confuses the distinction between habitat and vegetation type, and even fails to account for

---

60. DSEIS/EIR, p. 4-494.

differences between vegetation types. The assessment of indirect impacts relies on illogical assertions (e.g., if a habitat is degraded for a species then further degradation will have no adverse impact), and fails to consider the scientific literature and its application to the impact analysis.

The magnitude of the LAX Master Plan development and its impacts to wildlife habitat for all four Alternatives, combined with the regional setting and cumulative impacts from development in the City of Los Angeles, lead to the conclusion that implementation of the Master Plan will have significant adverse impacts on biological resources. The mitigation measures proposed to offset these impacts are wholly insufficient to reduce these impacts to a less than significant level.

## Review of Biological Resources Analysis in LAX Master Plan Draft Environmental Impact Statement/Environmental Impact Report

This review pertains to the Federal Aviation Administration and Los Angeles World Airports Joint Draft Environmental Impact Statement/Environmental Impact Report ("EIS/R"). It addresses Sections 4.10 (Biotic Communities), 4.11 (Endangered and Threatened Species of Flora and Fauna), 4.12 (Wetlands), 4.14 (Coastal Zone), and 4.18 (Light Emissions). The review was prepared by Dr. Travis Longcore and Catherine Rich, who are experts in the ecology and history of the natural communities that would be affected by the proposed airport expansion. Dr. Longcore has co-authored several peer-reviewed scientific articles on the El Segundo Dunes and the Los Angeles Coastal Prairie (including its vernal pools),<sup>1</sup> which both would be adversely affected by the proposed project.

The presentation of information in the EIS/R about biological resources is segmented into several sections. For the purpose of this review, however, all biological resource issues are treated together, because mitigation measures for biological impacts are largely the same.

### 1.0 Project Description

For the purpose of discussing the impacts to biological resources, the EIS/R does not provide a complete project description. Within the extent of the Master Plan boundaries, it is unclear what the disposition of certain areas of biologically significant property will be. In maps of the various project alternatives, the legend indicates useless designations such as "Airport Related."<sup>2</sup> There is no way to ascertain with certainty what the use of such land will be under the various alternatives.

#### 1.1 Failure To Analyze Northside/Southside Project

The EIS/R describes the LAX Northside Project as "Collateral Development" that previously has been entitled through the CEQA process.<sup>3</sup> Reliance on old CEQA documentation is problematic, and development of this project would seem to require a reopening of the environmental review, especially given the changed conditions since the approval in 1983. However, the real difficulty is that the EIS/R replaces the LAX Northside Project with the Westchester Southside Project in each of the three build alternatives for the Master Plan. These projects are not the same, and even if the CEQA documentation for the Northside Project is deemed adequate, the Southside Project must be fully analyzed under CEQA. The EIS/R does not completely describe or analyze the biological impacts of the Southside Project.

The Westchester Southside Project, as depicted in the EIS/R,<sup>4</sup> would include the conversion of 100 acres of the El Segundo Dunes to a golf course. (Several figures in the EIS/R appendices map this area at the northern portion of the dunes as "golf course/open space" and include "Resort Hotels" within the same color designation. At a minimum the maps indicate some level of development of the dunes as part of the Westchester Southside Project.) The dunes golf course/open space development was not included in the CEQA analysis for the LAX Northside Project, and remains unanalyzed for compliance with any environmental laws (CEQA, NEPA, California Coastal Act). It is inappropriate for the EIS/R to rely on the Westchester Southside Project — which is a site for relocation of displaced businesses<sup>5</sup> — for mitigation, and not to evaluate the full impacts of the development. While all of the El Segundo Dunes are within the Master Plan area, and the alternatives themselves show no development on the 100 acres at the northern end of the dunes, the result of adopting any of the three project alternatives is to develop 100 acres of dunes in association with "Resort Hotels" and "golf course/open space."<sup>6</sup> The resource value of this area is discussed later, but the analysis of the Westchester Southside Project should not be piecemealed. Currently, the biological impacts of the Westchester Southside Project do not seem to be analyzed fully, nor are they included in the discussion of cumulative impacts for the project. Even if one accepts the premise of the EIS/R that the project will proceed absent approval of the Master Plan, the Westchester Southside Project is "reasonably foreseeable" — in fact relied upon for mitigation — and all of its impacts must be disclosed and mitigated as part of the Master Plan EIS/R.

The decision not to address the biological impacts of the Westchester Southside Project can be interpreted as a strategic choice to avoid disclosure of the full impacts of the airport expansion project. From a biological standpoint, the Westchester Southside Project, even though it would involve fewer square feet of built space than the LAX Northside Project (2.6 million square feet vs. 4.5 million square feet), it has a larger geographic footprint and greater biological impact. Any of the three build alternatives plus the Westchester Southside Project would be a catastrophe for the biological resources found at LAX.

## 1.2 Previous Failure To Disclose Impacts of Development on El Segundo Dunes

Los Angeles World Airports ("LAWA") has previously failed to disclose impacts of development on the El Segundo Dunes. In 1999, a newspaper story announced that LAWA was planning to install landscaping on the northern end of the El Segundo Dunes, along Waterview, Rindge, and Napoleon streets. The Urban Wildlands Group, a Los Angeles-based nonprofit whose board includes the authors of this letter, contacted LAWA to inform project managers of the sensitive resources present and request that the project not include invasive plants that would degrade the dunes. LAWA promised, but then failed to provide, the plant list for the project. LAWA proceeded to implement the project, but failed to secure the proper permits from the City of Los Angeles as required under the California Coastal Act. After installing a new walkway and over 90 mature, non-native palm trees in a sensitive habitat area,<sup>7</sup>

4. EIS/R, Appendix J1. Biological Assessment Technical Report, Figures 8, 11, 14.

5. EIS/R, pp. 3-33, 3-47, 3-56.

6. City of Los Angeles Ordinance 169,767 restricts use of the northern 100 acres of the El Segundo Dunes at LAX to "nature preserve and accessory uses only." This ordinance was passed unanimously by the City Council on April 6, 1994 as part of the General Plan/Zoning Consistency Program. Given this unequivocal direction from the City, it is unclear why the Master Plan is ambiguous about the disposition of this area, unless the intention is to attempt to remove the development conditions from the property and seek another use as part of the Westchester Southside Project.

7. Installation of palm trees is damaging ecologically, and also provides sites for birds to perch, potentially increasing bird strikes with aircraft. Consultants for the airport report that "[t]he El Segundo Dunes provides relatively few attractants

(cont'd)

LAWA was instructed to stop work by the California Coastal Commission, told that it must obtain a permit, and subsequently applied for a permit from the City. The Urban Wildlands Group opposed the permit application for the partially implemented project because it would significantly disrupt habitat values of an environmentally sensitive habitat area ("ESHA"), as defined under the California Coastal Act.<sup>8</sup> The City analysis of the project also agreed that the site was an ESHA.<sup>9</sup> The appeal of the permit was denied by the City of Los Angeles Board of Public Works with the stipulation that LAWA resolve the issue in consultation with The Urban Wildlands Group and those residents opposed to the palm trees. This has not yet happened.

LAWA steadfastly maintains that the 100 acres outside of the El Segundo Blue Butterfly Preserve is not part of the El Segundo Dunes and that it will be developed as a golf course.<sup>10</sup> The area, however, is within the jurisdiction of the California Coastal Commission, and no approved Local Coastal Plan has been produced that would allow for a golf course. The EIS/R provides even more information to join previously published sources<sup>11</sup> showing that the area is an environmentally sensitive habitat area and therefore protected by Section 30240(a) of the California Coastal Act. For example, the EIS/R itself discloses that El Segundo blue butterflies (*Euphilotes bernardino allyni*) occupy one subsite,<sup>12</sup> sensitive Lewis' evening primrose (*Camissonia lewisii*) occupies seven subsites,<sup>13</sup> and the area is occupied by sensitive species such as silvery legless lizard (*Anniella pulchra*), San Diego horned lizard (*Phrynosoma coronatum blainvillei*),<sup>14</sup> loggerhead shrike (*Lanius ludovicianus*; breeding),<sup>15</sup> and Dorothy's sand dune weevil (*Trigonoscuta dorothea dorothea*).<sup>16</sup> The golf course or other development on the dunes should either be analyzed as part of the Master Plan EIS/R for conformance with applicable laws, including the California Coastal Act, or be explicitly deleted from the plans for the area. The EIS/R should offer some certainty about what development will take place within the Master Plan boundaries and disclose the impacts of that development.

---

to birds which may partially account for the significantly lower percentage of strikes occurring over this area than over the approach area. The El Segundo Dunes naturally supports very few trees — the only trees present are non-native trees that have been planted...." (EIS/R, Technical Report 7. Biological Resources Memoranda for the Record on Floral and Faunal Surveys, p. 341). Without complete environmental review, LAWA planted more attractants for birds in the form of palm trees. The EIS/R also reports that the native birds of the dunes are not involved in bird strikes, while species promoted by urban development, such as pigeons and gulls, are involved in the most strikes.

## 2.0 Current Conditions

The description of current conditions of the biological resources within the Master Plan boundaries is biased toward underestimating the value of the habitats that will be impacted.

### 2.1 Surveys

A great deal of effort was expended surveying the insects of the El Segundo Dunes, especially within the El Segundo Blue Butterfly Preserve, even though this area is not targeted for direct development. Surveys for areas that would be subject to significant direct impacts were inadequate. It appears that only one type of survey — sweep netting — was conducted east of Pershing Drive in the areas that would be most affected by development. This single method would not detect all of the sensitive species that might occur in the area. For example, the El Segundo Jerusalem cricket (*Stenopelmatus* sp.), a burrowing insect, would not be detected with sweep netting. Pitfall trapping would be required to ascertain its presence, and should be performed in the areas of project impacts east of Pershing Drive. Other survey methods, including black lighting and malaise trapping, were conducted only west of Pershing Drive on the El Segundo Dunes, not in the areas of direct project impacts.

While the extensive surveys conducted on the El Segundo Dunes may be useful for evaluating the impacts of the Westchester Southside Project, which the EIS/R does not do, they offer little information to understand the biological communities supported in the open spaces that would be developed under the three development alternatives. For example, the EIS/R provides no summary of the bird surveys conducted at the ephemeral wetlands and open spaces found in the western area of the airport, and provides only handwritten notes buried in the appendices.<sup>17</sup> A summary would be useful to understand the character of the biotic communities in these areas. Species of local conservation concern such as Costa's hummingbird (*Calypte costae*), western meadowlark (*Sturnella neglecta*), and common yellowthroat (*Geothlypis trichas*) were recorded in these areas, yet no complete description of the communities is provided in the text of the document. The biological consultants for the EIS/R report that the ephemeral wetland area at the west end of the airport "provides resting and foraging habitat for numerous resident and migratory bird species,"<sup>18</sup> but the EIS/R provides no summary of these observations or description of the impact of development on these species.

For the El Segundo Dunes, an extensive list of birds is found, complete with species that are almost certainly not present at all. The "Floral Compendium" and "Faunal Compendium" include "species observed or expected to occur on or in the immediate vicinity of the site."<sup>19</sup> On this list are found species that are highly unlikely to be present on the dunes or even near the dunes. For example, acorn woodpecker (*Melanerpes formicivorus*) is not likely to be found on the El Segundo Dunes now or in recent history. Acorn woodpeckers in Los Angeles would be associated with coast live oaks, which are found nowhere on the El Segundo Dunes or the Los Angeles Coastal Prairie. The rather excessive bird list in the Faunal Compendium is made ever more curious by the statement elsewhere by the biological

consultants for the EIS/R that "the Dunes does not support a large resident bird population."<sup>20</sup> It is odd to include these ambitious lists, because the biological analysis does not evaluate the impacts of the three alternatives on the species of wildlife in them.

## 2.2 "Determined Absent"

The summary table for sensitive species provided in Section 4.10 of the EIS/R is misleading. For many species, the table indicates that they have been "determined absent" from the Master Plan boundaries based on directed surveys. When dealing with small arthropods that are difficult to capture, persist at low numbers, and may have large annual variation in numbers, one cannot conclude that a species is "determined absent." All that can be done is to state that the species was not found during a certain duration and intensity of searching. It is likely that the survey methodology did not possess sufficient statistical power to detect the species.<sup>21</sup> Presence may be determined conclusively, but absence cannot, especially for cryptic (i.e., small or camouflaged) species. Some degree of certainty about absence could be derived if one had knowledge of the population size, yearly variation in population size of the species, and the trapping efficiency of the survey methods. This information is not available, and therefore no statistically defensible declaration of absence can be made about the sensitive arthropod species.

In other instances, the declaration of absence is contradicted by the reports upon which the section is based. For example, Table 4.10-2 claims that the following species are absent from the Master Plan boundaries: Henne's ecospin moth (*Eucosa hennei*), Rivers' dune moth (*Euxoa riversii*), Ford's sand dune moth (*Psammobotrys fordii*), El Segundo scythrid moth (*Scythris* new sp.), lesser dunes scythrid moth (*Scythris* new sp.), El Segundo goat moth (*Comadia intrusa*), and Santa Monica dunes moth (*Copeblepharon sanctamonicae*). However, in the underlying report, Frank Hovore, the surveyor, writes:

Sensitive moth species (general *Comadia*, *Copeblepharon*, *Euxoa*, *Psammobotrys* [sic], *Scythris*) — A wide variety of moth specimens, including some possibly representing all of these species except *Psammobotrys* [sic], were taken in light traps, but moths in the traps were rendered unidentifiable by the combination of alcohol and churning actions of other species. All of the moth species previously known to occur on the dunes probably persist, because all of the known larval hosts are present. For most moth species, focused light collecting would be necessary to determine presence and distribution, using dry traps or light sheets. Very large numbers of *Psammobotrys* [sic] were collected on the dunes historically (LACM collection), and it is assumed that this species is present, but is highly seasonal and difficult to collect without sustained and focused field efforts.<sup>22</sup>

The text presented in Table 4.10-2 of the EIS/R contradicts the surveys that were conducted. Far from being absent, as maintained in Table 4.10-2, a qualified surveyor determined that the methodology was insufficient to determine presence of these moth species, but that the species were indeed probably

present. Mischaracterization such as this undermines the credibility of the description of current conditions presented in the EIS/R.

### 2.3 Terminology

The EIS/R is inconsistent in its use of terminology describing the 100 acres north of the El Segundo Blue Butterfly Preserve. This area, along with the preserve, is part of the El Segundo Dunes.<sup>23</sup> It has been degraded through residential construction and intrusion of exotic plant species, but it remains of significant biological value and is itself a sensitive habitat (see above, Section 1.2). In various places in the EIS/R, this area is referred to as "dunes and adjacent landforms," "non-restructured dunes,"<sup>24</sup> "100 acres north of Sandpiper Street,"<sup>25</sup> and "the 100-acre open space north of the preserve."<sup>26</sup> Implicit in the choice of terminology for this area is perhaps the intention to construct a golf course upon it. The Los Angeles Airport/El Segundo Dunes Specific Plan, adopted in 1992, incorrectly claims that "approximately 100 acres of the Dunes ... do not contain significant habitat resources."<sup>27</sup> The Specific Plan requires the proposed golf course to provide revenue for the upkeep of the dunes habitat preserve,<sup>28</sup> thereby lifting that burden from LAWA, which perhaps partially explains LAWA's enthusiasm for the idea. However, existing zoning for the area — established more recently than the Specific Plan — is as a nature preserve. EIS/R maps should be consistent with the existing "nature preserve" zoning and should consistently acknowledge this area as part of the El Segundo Dunes.

The EIS/R also exhibits some difficulty with terminology to describe the habitat that formerly was found throughout the entire project area inland of the El Segundo Dunes. In a published article, Mattoni and Longcore describe this area as the Los Angeles Coastal Prairie, and document the historic plant diversity and the presence of extensive vernal pools.<sup>29</sup> The article has been commended as an exemplar of the practice of historical ecology in *The Historical Ecology Handbook: A Restorationist's Guide to Reference Ecosystems*.<sup>30</sup> For some reason, the EIS/R avoids using the Mattoni and Longcore article where it could be useful. For example, Mattoni and Longcore provide documentation of many sensitive species historically present within the study area from herbarium label texts. This includes a full list of vernal pool species historically found in the area, as well as upland forbs, grasses, and shrubs. Instead, the EIS/R chooses to classify the site as Valley Needlegrass Grassland. The historic evidence does not support the assumption that this area was dominated by perennial grasses; rather it was dominated by forbs. This is an important conclusion of Mattoni and Longcore's research that the EIS/R neither accepts nor attempts to dispute.

## 2.4 Disturbed Dune Scrub/Foredune

Concurrent with the changing terminology about the portion of the El Segundo Dunes not found within the habitat preserve is the decision to classify all dune scrub/foredune outside of the preserve area as disturbed dune scrub. While it is true that the dunes area outside the habitat preserve has a heavier exotic species load, and does not support coast buckwheat (*Eriogonum parvifolium*), it nevertheless has more biological value than is implied by the description. For example, this area supports sensitive plants (Lewis' evening primrose, *Camissonia lewisii*), birds (loggerhead shrike, *Lanius ludovicianus*), and arthropods (see above, Section 1.2). Mattoni et al. describe the ex-residential area in their 2000 article:

Removal of the residences in the 1970s was superficial, leaving some foundations, substantial rubble, foreign soil, roads, and other infrastructure. Vegetation regenerated without assistance, producing a cover of predominately iceplant (*Carpobrotus edulis*) and acacia (*Acacia cyclopsis*) with patches of a few highly dispersive dune shrub species.<sup>31</sup>

However, not all ex-residential sites supported the same arthropod communities. Some sites within the ex-residential area supported terrestrial arthropod communities (including rare and sensitive species) that were similar to those found on undisturbed foredune and undisturbed backdune sites.<sup>32</sup> This variation in the vegetation and associated wildlife across the 100 acres should be reflected in the EIS/R. The wholesale characterization of the area as "disturbed dune scrub/foredune" is misleading in terms of its value to the dune system and proper statutory designation as an ESHA.

## 2.5 El Segundo Blue Butterfly

Much ado is made over the population size of the El Segundo blue butterfly ("ESB"). However, the methodology used to calculate population size by LAWA is flawed and overestimates population size by at least 400%. While many methods to track trends in butterfly population size exist in the scientific literature,<sup>33</sup> when LAWA hired consultants in 1994 to prepare the EIS/R, they inexplicably used none of the established methods. While consultants continued walking a transect to count butterflies established by Mattoni in 1984, they stopped conducting surveys throughout the entire season. It is absolutely

essential to survey throughout the flight season of the butterfly to obtain an estimate of total population size. Furthermore, rather than using an established method to analyze transect counts, Dr. Andrew Huang, an engineer at LAWA, constructed his own method to estimate population size. This method is flawed, and these flaws were explained by Dr. Travis Longcore to Dr. Huang in an email earlier this year, portions of which bear repeating here. The message describes methods used to estimate population size of the ESB by Longcore and others in a scientific article that was at that time in review and has subsequently been accepted for publication in an international scientific journal, the *Journal of Insect Conservation*.

The first method [of calculating population size] was the Pollard Index, which is quite straightforward and about which there can be no argument. There is not a lot of latitude in summing the average weekly count over the course of the season.

The second method is essentially the same as your numerical approximation. This method is first used, albeit with different data sources, by Watt et al in 1977 (Watt, Ward B., Frances S. Chew, Lee R. G. Snyder, Alice G. Watt, and David E. Rothschild. 1977. Population structures of Pierid butterflies I. Numbers and movements of some montane *Colias* species. *Oecologia* 27:1-22.) Watt et al. estimated "total animals [butterflies] present in the brood" by estimating daily butterfly numbers through MRR and extrapolation, summing them to calculate total animal-days, and multiplying this number by the death rate (determined by MRR). Dividing by the longevity (or residence time) would yield the same result. This is what we did, using Arnold's 1979 residence time estimates (ave 6.1 days). Your model does not divide by average longevity, but rather another figure. This is what I don't understand. What is wrong with the logic (used by Watt et al. as well) that the total brood size is equal to the total number of butterfly-days divided by the average butterfly longevity?

$$\frac{\text{butterfly-days}}{\text{longevity (days)}} = \text{butterflies}$$

Your model does something similar, calculating total butterfly days by integrating under the curve (gaussian or not) and dividing by a figure. The question, and the crux of the differences in our results, is the number that you divide by, which is 1.59. You get your number by parameterizing based on the recapture rates. I think the difficulty with this is that you do not know the age of the butterflies that were initially captured. Your method would work if all of the butterflies captured by Arnold on the first day were freshly eclosed adults. However, they cannot be. Some of them will be one, two, or more days old. Failure to account for this will skew your estimate of longevity downwards, and your total population estimate upwards. Now, I am going to guess that you will say that 1.59 days is not the longevity. But if it is not, what is it? Can you see a flaw in the logic of the Watt et al. method or otherwise reconcile it with your method?

One last thing on this method. Our application of it gave a population estimate for 1984 at LAX of 432, while Arnold's MRR estimate was 664, and the Zonneveld model estimated 910. Application of your method would give an estimate of 1,658. (Note: in case you want to calculate these numbers, with the exception of Arnold's estimate, they include an adjustment for the number of flowerheads) (Arnold, R.A. (1986) Studies of the El Segundo blue butterfly - 1984. Inland Fisheries Administrative Report 86-4.)

The third method that we used was the Zonneveld model. What is interesting is that our estimates of death rate (3.3-5.9 days), which vary from year to year, are similar to those given by Arnold (2.3-7.3 days) from MRR. We followed the model as set out by Zonneveld in the 1991 paper. We did not doubt the magnitude of the results because of the correspondence with the Watt et al method, the Pollard index, and the reasonableness of the longevity estimates.<sup>34</sup>

34. Longcore, T. 6 March 2001. Email to Dr. A. Huang.

Dr. Huang did not defend his method, stating in a response to Dr. Longcore, "You have raised many outstanding issues. ... I am very busy with a number of projects. I won't be able to respond to your questions for awhile."<sup>35</sup> To date, he has not provided a substantive response. The EIS/R should therefore be adjusted to reflect El Segundo blue butterfly population numbers that are calculated using the best available scientific methods. Three methods of evaluating the transect counts are given in the *Journal of Insect Conservation* paper, the proofs of which are appended to this report.<sup>36</sup>

As is evident from the literature about butterfly population size estimation,<sup>37</sup> the block counts promoted in the EIS/R are useful only to determine presence of the butterfly, not to estimate population size. The most perplexing part of the discussion of ESB population size by LAWA, both in reports by its consultants and in the EIS/R, is that none of the relevant scientific literature is referenced. Butterflies are conspicuous organisms, and schemes were developed in the 1970s to track population size, yet these are ignored. Sometimes remaking the wheel can lead to innovation, but in this instance it has led to confusion and the propagation of the myth that there are 40,000–80,000 El Segundo blue butterflies on the LAWA property. For example, LAWA claims that in 1998 there were roughly 12,000 ESB along the transect,<sup>38</sup> while proper analysis of the data indicates a population of  $3,356 \pm 805$  S.D.<sup>39</sup> Similarly extravagant claims for the period 1996–2000<sup>40</sup> should be revised.

The EIS/R discussion of the ESB population size provides a diversion from the real issues at hand. Recovery of the species and downlisting from endangered to threatened status requires securing all of the El Segundo Dunes, including that area not currently in the habitat preserve.<sup>41</sup> The 200-acre preserve is still vulnerable to disease, adverse weather, fire, and other accidents. Long-term extinction risk for the butterfly can be minimized through increasing habitat area, not simply by relying on existing areas to provide spectacular numbers. Furthermore, concentration on the El Segundo blue butterfly draws attention away from the ten other endemic invertebrates found on the dunes whose continued persistence depends on habitat values beyond those needed to maintain the butterfly.<sup>42</sup>

LAWA's persistent strategy has been to focus on the butterfly and the 200-acre preserve to the exclusion of all else. For example, in the above-described Waterview Street Landscaping Project, LAWA's main claim in support of the project was that it did not affect the butterfly preserve or the butterfly. None of the appellants had argued that the project directly affected the butterfly, and pointed instead to the other sensitive species and habitats found on the project site. This notwithstanding, there are legitimate impacts to the El Segundo blue butterfly that would result from the alternatives in the EIS/R.

### 3.0 Assessment of Impacts

While the EIS/R identifies impacts to biological resources, its improper quantification of those impacts results in an underestimation of the actual biological consequences of the build alternatives and ultimately the incorrect conclusion that those impacts can be mitigated to a less than significant level.

#### 3.1 Direct Impacts

The EIS/R uses what it calls a "modified Habitat Evaluation Procedure" to determine impacts on sensitive vegetation types and to quantify impacts to habitats of sensitive species.<sup>43</sup> This procedure is supposedly based on "Habitat Evaluation Procedures" ("HEP")<sup>44</sup> previously developed by the U.S. Fish and Wildlife Service that have some degree of scientific validity and history of usage.<sup>45</sup> However, the methodology employed in the EIS/R uses the name of this procedure without incorporating any of the essential elements of the analysis. By comparing existing habitat for sensitive species against an abstracted, ideal habitat type, the EIS/R argues that loss of up to 500 acres of habitat for sensitive species can be mitigated by "improving" 100 acres of land already in a nature preserve. This conclusion is not supported by any accepted methodology of impact assessment and seems to have been specifically designed to underestimate the actual impacts to sensitive species at LAX.

HEP was designed for use with target species by the U.S. Fish and Wildlife Service in the 1970s to provide a form of standardization and comparability for environmental analysis. In HEP implementation, the term "habitat" is defined as the biophysical requirements of an individual species (e.g., bald eagle habitat), not as a general term synonymous with vegetation type (e.g., grassland habitat). The U.S. Fish and Wildlife Service states this in the guiding policies for HEP implementation:

HEP is a species-habitat approach to impact assessment; and habitat quality for selected evaluation species is documented with an index, the Habitat Suitability Index (HSI). This value is derived from an evaluation of the ability of key habitat components to supply the life requisites of selected species of fish and wildlife.<sup>46</sup>

The explicit species-based approach of the HEP is apparent in the manual describing the procedure:

HEP is a species-based assessment methodology. It is applicable only for the species evaluated and does not directly relate that species with other ecosystem components. HEP conceptually addresses only the issues of species populations and habitats.<sup>47</sup>

The "modified" HEP in the EIS/R does not establish which species will be used to evaluate the value of the reference sites, nor does it create HSIs for them. Rather, it sets habitat evaluation standards based on an "optimal" site with "a multitude of floral and faunal species."<sup>48</sup>

---

43. EIS/R, p. 4-615.

44. The EIS/R refers to a "Habitat Evaluation Procedure" in the singular form, while the U.S. Fish and Wildlife Service manual calls the method "Habitat Evaluation Procedures" in the plural form. We abbreviate both as "HEP" and treat the acronym as a singular noun indicating a methodology.

45. For example, see Johnson, T.L., and D.M. Swift. 2000. A test of a habitat evaluation procedure for Rocky Mountain bighorn sheep. *Restoration Ecology* 8(4S):47-56.

46. U.S. Fish and Wildlife Service. 1996. Fish and Wildlife Service manual, 870 FW 1, Habitat Evaluation Procedures. [online at <http://policy.fws.gov/870fw1.html>].

47. U.S. Fish and Wildlife Service. 1980. Habitat as the Basis for Environmental Assessment, 101 ESM.

The "modified" HEP does not provide information about the value of habitats within the subject site for several of the sensitive species found there. For example, it does not consider the habitat requirements of loggerhead shrike (*Lanius ludovicianus*) or black-tailed jackrabbit (*Lepus californicus bennettii*). It assigns values of 0.25 for vegetation types that are occupied by these species (Non-Native Grassland/Ruderal). By definition under a true HEP, occupied sites would score much higher. By "modifying" the HEP to address an abstract ideal habitat, actual habitat values to sensitive species are ignored (see below, Table 1).

In fact, the "modified" HEP resembles actual HEP implementation only superficially, in that values between 0 and 1 are assigned to certain arbitrary standards for vegetation types within the study area. None of the essential features of HEP are present in the modified method; the "modified" HEP therefore does not provide the basis for impact assessment in the project area.<sup>49</sup>

Not only is the "modified" HEP quite different from the actual procedure, the standards used to evaluate habitats do not reflect ecological value. This problem derives from the physical and biologic criteria used to evaluate habitat and the so-called "ecosystem functional integrity" components of the analysis. Rather than using target species and HSIs to characterize vegetation types as required in HEP, the EIS/R evaluates whether each of the vegetation types in the project area meets the characteristics found in a "reference site." The habitat type chosen for this standard is that of Valley Needlegrass Grassland/Vernal Pool complex<sup>50</sup> (i.e., Los Angeles Coastal Prairie). For some inexplicable reason, all habitats are measured against this standard, including Southern Foredune, Southern Dune Scrub, and Disturbed Dune Scrub/Foredune. Of course these dune habitats do not have features found in a needlegrass grassland/vernal pool complex. Therefore, because of their failure to have vernal pools and associated species, these vegetation classifications are assigned lower habitat values, 0.35 for both Southern Dune Scrub and Disturbed Dune Scrub/Foredune, and 0.45 for Southern Foredune. These values are ludicrous, first because habitat values and "Habitat Units" are supposed to be relevant to individual species, and second because one vegetation type is measured by the features of another. *The analysis succeeds only in illustrating that dune habitats are not the same as vernal pool/grassland complexes.*

The portion of habitat value deriving from "ecosystem functional integrity" is another wholesale creation of the EIS/R. These standards are not part of HEP, and the choice of standards is arbitrary, with little to do with the sensitive species and vegetation types under analysis. Whether a site is "under regulatory conservation" does not necessarily have anything to do with the ecological value of its vegetation type to sensitive species. Similarly, "contiguity with state-designated habitat" is not an ecological criterion. "Variety of pollinator/dispersal mechanisms present" is oriented toward vernal pool habitats, and the choice of "contiguous native habitat >40 acres" is arbitrary. Throughout, the analysis avoids recognition that sensitive plants and wildlife utilize habitats that are not dominated by native species. Loggerhead shrikes forage in ruderal and non-native grasslands as well as in dune scrub. Jackrabbits are thriving in an area with little native plant component. A true HEP would calculate the value of the areas being utilized by carefully selected individual species and use those values to quantify impacts. The EIS/R's "modified" HEP is fatally flawed and must either be revised to follow established procedure, or be abandoned.

### 3.1.1 Sensitive Vegetation Types

With the exception of the ambiguous treatment of the 100 acres on the northern portion of the El Segundo Dunes, the EIS/R claims not to be proposing direct impacts to sensitive vegetation types. The vegetation types to be removed by the three build alternatives are 306–404 acres of Non-Native Grassland/Ruderal and 60–96 acres of Disturbed/Bare Ground. Although these are not sensitive vegetation types, they are used extensively by sensitive species. Whereas the impacts of removal are to sensitive species, the EIS/R proposes mitigation of abstract “Habitat Units” using the “modified” HEP. The result of the use of the “modified” HEP is to underestimate the effects on the species that use these habitats. The “modified” HEP does not evaluate the value of non-native grassland and disturbed areas to each of the species involved, but rather compares those habitats against an idealized habitat. This allows the EIS/R to state losses and to mitigate in “Habitat Units” instead of acres. *“Habitat Units” calculated in the HEP do not reflect the value of the habitats to the sensitive species.* The EIS/R considers these “Habitat Units” as fungible entities, and thereby proposes to mitigate effects to one vegetation type by enhancing another habitat type. Also, by ranking vegetation types on the dunes by comparing them with Valley Needlegrass Grassland/Vernal Pool complex, the EIS/R creates an artificial deficit of “Habitat Units” within the dunes area. The EIS/R then proposes to mitigate for the loss of Non-Native Grassland (occupied by sensitive species) by enhancing the habitat within the already-preserved and restored area of the El Segundo Dunes. If one accepts the logic of the EIS/R’s HEP and mitigation scheme, the loss of Non-Native Grassland can be mitigated by making the El Segundo Dunes more like a Valley Needlegrass Grassland/Vernal Pool complex. (The EIS/R actually claims to restore these areas to Southern Dune Scrub, but does not reconcile that the “deficit” in habitat values on the dunes was caused by the “failure” of dune scrub to have vernal pool/grassland characteristics.) So by the twisted logic of the “modified” HEP, the loss of 366–500 acres of vegetation types occupied by sensitive species putatively can be mitigated by “improving” roughly 100 acres already protected as a nature reserve or zoned as such.<sup>51</sup> Because the “modified” HEP does not measure habitat values for the sensitive species involved, the description of impacts in terms of “Habitat Units” will drastically underestimate the impacts to those vegetation types. Again, it must be noted that the procedure used in the EIS/R *has no basis in scientific literature* and resembles the actual HEP in name only.

All alternatives propose the removal of sensitive habitats within the El Segundo Dunes to allow construction of navigational aids. These impacts range from 640–1,344 square feet. While this does constitute a significant impact, it is dwarfed in comparison to the other direct and indirect impacts proposed under the three build alternatives.

The discussion of acreage and “Habitat Units” lost under each alternative is not clear with respect to the Westchester Southside Project. Some impacts from the Westchester Southside Project are included (e.g., loss of mature trees), but the effects of the “Resort Hotels” and golf course/open space development are not discussed. The No Action/No Project Alternative explicitly includes the loss of habitat from the LAX Northside and Continental City projects. As mentioned above, this improperly assumes completion of the LAX Northside Project even though changed conditions should result in reopening of the environmental analysis. Inclusion of these speculative developments as part of the No Project alternative serves only to make the impacts of the Master Plan alternatives appear smaller.

---

51. While there are certainly adequate opportunities to enhance the habitat on the El Segundo Dunes through road/infrastructure removal and revegetation, the area available is simply inadequate to compensate for the loss of sensitive species habitat under the three build alternatives.

The EIS/R mentions but does not discuss adequately one impact of the Westchester Southside development: the removal of 300 mature trees that are used as "nursery" sites for raptors.<sup>52</sup> The biological appendix contains no reference to this impact, or the abundance and species of raptors involved.<sup>53</sup> Neither is a description immediately apparent in the "Biological Resources Memoranda for the Record on Floral and Faunal Surveys."<sup>54</sup> The EIS/R should contain a full description of the species of raptors involved, their relative abundance, the location of the trees, and behaviors observed to allow a full evaluation of the impacts.

### 3.1.2 Sensitive Species

The faulty "modified" HEP results in the underestimation of impacts on sensitive species in the EIS/R. The statement of the impacts to populations are low, which results in improper conclusions about mitigation (see below, Section 4.0).

**Lewis' evening primrose (*Camissonia lewisii*).** All alternatives acknowledge direct impacts to Lewis' evening primrose. This is expressed in terms of the number of individuals that would be affected. While the number of individuals is important, the area that these individuals occupy is as important to the conservation of the species. However, the map showing the distribution of the species indicates locations only on the El Segundo Dunes west of Pershing Drive. No indication is given of the location of areas occupied east of Pershing Drive, which total 2.5 acres.<sup>55</sup> Populations separated from one another offer some degree of insurance against catastrophic losses at individual sites. The complete geographic distribution of the species at LAX should be provided in the EIS/R.

**Belkin's tabanid dune fly (*Brennania belkini*).** The EIS/R does not acknowledge the loss of habitat for the Belkin's tabanid dune fly, which is a sensitive species.<sup>56</sup> This species was recorded as present in the "north runway expansion area."<sup>57</sup> The report indicates that the species may disperse into suitable habitat areas. The presence of this dune-associated species and the sensitive Lewis' evening primrose in the north runway expansion area suggests that this area has a substrate suitable for dune obligate species. This may be the result of previous grading, but the value of this site to these and other sensitive species (e.g., potentially El Segundo crab spider, *Ebo* new sp.<sup>58</sup>) should be noted.

**San Diego black-tailed jackrabbit (*Lepus californicus bennettii*).** The EIS/R acknowledges direct impacts to the habitat of this species, west of the southern runway, east of Pershing Drive. Each of the alternatives would result in the loss of 118.75 acres of occupied area, consisting of the entire population at LAX. The EIS/R maintains that these 118.75 acres equal 14.91 "Habitat Units," or roughly 15 acres of ideal vernal pool/grassland complex. As discussed above, this conversion to "Habitat Units" is misguided and wrong. Only two of the sixteen standards for calculating "Habitat Units" are even remotely related to the value of these areas to black-tailed jackrabbit.

**Table 1. Relevance of "Modified" Habitat Evaluation Procedure Standards to Two Sensitive Species.**

HEP Standards	Relevance to value of area as black-tailed jackrabbit habitat	Relevance to value of area as loggerhead shrike habitat
<b>TOPOGRAPHY</b>		
Mound-depression microrelief	None. Species occurs in a variety of topographic conditions.	None
Native soils w/ slope <10%	None	None
Areas w/ period of inundation ≥ 30 days	None. Can serve as vectors for seed dispersal between vernal pools, but not necessary for habitat. <sup>59</sup>	None
Summer desiccation	None	None
<b>FLORA</b>		
>10% vegetative cover	Some. Forage and cover must be present.	Some. Vegetation must support prey populations.
Native grasses >10%	None. Will forage on all manner of grasses, forbs, and shrubs. <sup>60</sup>	None
Vernal pool associated species	None	None
Listed vernal pool associated species	None	None
<b>FAUNA</b>		
Domination of native fauna (reproducing)	None	None
Grassland associated species (reproducing)	None	None
Sensitive vernal pool associated species	None	None
Listed vernal pool associated species	None	None
<b>ECOSYSTEM FUNCTIONAL INTEGRITY</b>		
Contiguity w/ wetland and State-designated sensitive terrestrial habitat	None	None
Designated sensitive terrestrial habitat	None	None
Under regulatory conservation	None	None
Variety of pollinator/dispersal mechanisms present (wind, wildlife)	None. Is itself a dispersal agent.	None
Contiguous native habitat > 40 acres	Potentially important. Size of habitat, whether native or not, is important.	Potentially important. Size of habitat, whether native or not, is important.

The conversion of occupied area to "Habitat Units," based on the standards listed here, is a misapplication of HEP. The extent of habitat loss to the species is on the order of 119 acres. The use of improperly-defined "Habitat Units" to quantify this loss implies that 15 acres of ideal vernal pool/grassland could support as many black-tailed jackrabbits as 119 acres of non-native grassland.

59. Zedler, P.H., and C. Black. 1992. Seed dispersal by a generalized herbivore: rabbits as dispersal vectors in a semiarid California vernal pool landscape. *The American Midland Naturalist* 128(1):1-10. (Jackrabbits play a similar role in the vernal pool landscape.)

60. Johnson, R.D., and J.E. Anderson. 1984. Diets of black-tailed jack rabbits in relation to population density and vegetation. *Journal of Range Management* 37(1):79-83. MacCracken, J.G., and R.M. Hansen. 1982. Herbaceous vegetation of habitat used by blacktail jackrabbits and Nuttall cottontails in southeastern Idaho. *American Midland Naturalist* 107(1):180-184. Jameson, E.W., Jr., and H.J. Peeters. *California mammals*. Berkeley: University of California Press.

This is not possible; 15 acres is substantially smaller than the smallest recorded home range for the species (256 acres).<sup>61</sup>

Surveys determining the area occupied by black-tailed jackrabbit may underestimate the area currently occupied. Research indicates that jackrabbits may move from 2 to 10 miles during a day, from shrub cover where the species conceals itself during the day, to foraging habitat in the late afternoon and evening.<sup>62</sup> The EIS/R does not provide sufficient survey information to establish if the grasslands and disturbed areas to the west of the southern runways provide only foraging habitat, and whether other locations (e.g., El Segundo Dunes) are already occupied at different times of the day. This is also suggested by studies of home range. In a study of big sagebrush and black greasewood, black-tailed jackrabbit ranges were larger (256–768 acres)<sup>63</sup> than the presumed occupied area at LAX (119 acres). This raises the question whether the species actually occupies a greater area at LAX, especially during the night and crepuscular periods when no surveys were undertaken.

**Loggerhead shrike (*Lanius ludovicianus*).** The same difficulties found quantifying habitat of black-tailed jackrabbit are found with description of impacts to loggerhead shrike. According to the EIS/R, the species currently occupies 171.86 acres that would be unusable following implementation of any of the project alternatives. (Such precision in habitat quantification is illusory; the EIS/R extrapolates occupied area by vegetation type, providing an *estimate* of habitat area that may differ from the area actually utilized.) Similarly, the EIS/R claims that this impact equals 22.88 "Habitat Units," suggesting that roughly 23 acres of optimum habitat could mitigate for the loss of 172 acres of occupied habitat. This is false, and grossly underestimates the impacts to the species. No data are provided that link vegetation type to shrike density, as would be necessary to support this claim. The HEP standards are no more relevant to loggerhead shrike than they are to black-tailed jackrabbit. Unless an actual Habitat Suitability Index is developed for loggerhead shrike, all discussion of direct impacts should refer to the area of occupied habitat destroyed, not to the hypothetical "Habitat Units." It is furthermore unclear whether the area of the Westchester Southside Project was surveyed, and whether these impacts are included.

**Burrowing owl (*Athene cunicularia*).** Surveys located burrowing owls within the project boundaries, though found no direct evidence of breeding. The EIS/R claims that the species "was determined not to breed within the Master Plan boundaries."<sup>64</sup> This contradicts the previous assessment made by EIS/R consultant Jim Jennings, who concluded that "there is the potential that they may still breed in the project area."<sup>65</sup> Because burrowing owl densities fluctuate from year to year, burrowing owls were observed in the project area, and potential burrow sites were found, the conservative approach would be to implement measures to ensure the conservation of the species. This species has recently lost much of its local habitat and if extirpated from the project site will disappear from west Los Angeles as a whole.

- 
61. Smith, G.W. 1990. Home range and activity patterns of black-tailed jackrabbits. *Great Basin Naturalist* 50(3):249–256. This study found home ranges of 0.4–1.2 square miles for big sagebrush and black greasewood communities in northern Utah. Many factors may allow higher densities at LAX, such as more forage provided by dense non-native grasses and forbs, but there is no evidence that 15 acres of even the best habitats could compensate for the loss of 119 acres.
  62. Dunn, J.P., J.A. Chapman, and R.E. Marsh. 1982. Jackrabbits: *Lepus californicus* and allies. Pp. 124–125 in J.A. Chapman, and G.A. Feldhamer (eds.). *Wild mammals of North America: biology, management and economics*. Baltimore: The Johns Hopkins University Press.
  63. Smith, G.W. 1990. Home range and activity patterns of black-tailed jackrabbits. *Great Basin Naturalist* 50(3):249–256.
  64. EIS/R, Tables 4.10-2, 4-630.
  65. EIS/R, Technical Report 7. Biological Resources Memoranda for the Record on Floral and Faunal Surveys, p. 463.

**Western spadefoot toad (*Spea hammondi*).** The EIS/R reports that the proposed project alternatives will destroy four seasonal ponds occupied by western spadefoot toads on the south airfield.<sup>66</sup> These populations number at least several hundred adults and all would be destroyed by the various project alternatives. The EIS/R estimates occupied area as 8.97 acres of ephemerally wetted areas and adjacent upland habitats. Spadefoot toads require upland habitats surrounding their aquatic habitat.<sup>67</sup> It is unclear how this area was determined for the EIS/R. Critically important in the analysis is that the species is found in four separate areas. Even though the areas are close to each other, the existing configuration of habitat patches is important to reduce risk to the species from a catastrophic event (e.g., chemical spill, disease). Depending on the separation of the pools, there may still be genetic exchange among the populations in each. These risk dynamics should be considered when evaluating the impact on the species and potential mitigation measures. Loss of the LAX population of western spadefoot toad would cause a significant restriction of the range of the species.

**Riverside fairy shrimp (*Branchinecta sandiegoensis*).** LAX represents the only known coastal population of Riverside fairy shrimp in Los Angeles County. Loss of this population, which is spread among nine sites on the western portion of the property, would be a significant impact. The EIS/R asserts that because the sites where fairy shrimp cysts were found do not have characteristic vernal pool plants, no suitable habitat is found for the species. This conclusion is false — fairy shrimp require vernal pool hydrology, not vernal pool plants, for their existence. This condition would exist, were the management practices at LAX to remove standing water in these pools. It is indeed LAWA's own management scheme that prevents Riverside fairy shrimp from completing its life cycle; LAWA, therefore, should incur liability for "take" of the species under the Endangered Species Act. LAWA fails to recognize that once the presence of fairy shrimp cysts was detected in the vernal pools at LAX, the airport should have ceased its activities that inhibited the life cycle of the species. Instead, the proposal is to destroy all of the areas currently occupied.

The description of acreage for this species does not seem to include the size of the cachements necessary to fill the "ephemerally wetted areas." These areas are necessary to formulate appropriate mitigation measures and evaluate impacts.

The EIS/R is insistent that "there are no extant vernal pools within the [Airport Operations Area]."<sup>68</sup> This statement is meant within the definition of vernal pools as a vegetation type. However, the term "vernal pool" may be used to refer to pools with standing water during the winter and spring, regardless of the presence of certain plant species. As defined by the U.S. Fish and Wildlife Service, "a vernal pool is a natural habitat of the Mediterranean climate region of the Pacific coast covered by shallow water for extended periods during the cool season but completely dry for most of the warm season drought."<sup>69</sup> The definition of the term is hydrological, not botanical. The EIS/R should therefore explicitly disclose that the statement "no vernal pools" refers to a botanical definition. Given the near complete destruction of vernal pools in Los Angeles County,<sup>70</sup> even loss of sites with vernal pool

hydrology and any remnant species (plant or invertebrate) represents a significant impact. The EIS/R emphasizes that Riverside fairy shrimp habitat is degraded through the presence of exotic plant species, presumably to suggest how much better mitigation sites will be than current conditions. However, the degradation of the habitat by exotic plant species is irrelevant to the quality of the pool as habitat for Riverside fairy shrimp. Other degradation to the habitat results directly from LAWA's management,<sup>71</sup> this degradation is avoidable.

### 3.2 Indirect Impacts

As a whole, indirect impacts are not well described in the EIS/R. Those that are described are dismissed with little or no data offered in support, leaving the probability of much greater indirect impacts from the project alternatives than those disclosed.

#### 3.2.1 Light

Night lighting has an effect on bird species composition in an area. A study in Sacramento showed that American crows (*Corvus brachyrhynchos*) roost in areas with high nighttime lighting levels.<sup>72</sup> It is hypothesized that artificial lighting allows them to reduce predation from owls.<sup>73</sup> Crows are native, but they are also aggressive, and artificially increased population levels can be detrimental to other native bird species, including such sensitive species as loggerhead shrike. Artificial night lighting has also been shown to affect the behavior of nocturnal frogs, reducing their visual acuity and ability to consume prey, an impact that may befall those amphibians found within Master Plan boundaries.<sup>74</sup> Many larval forms of arthropods are positively phototactic (e.g., attracted to light, even artificial light), which poses a threat to the many sensitive insect species found on the El Segundo Dunes.<sup>75</sup> Artificial lighting results in increased mortality of moths and other nocturnal insects.<sup>76</sup> Night lighting can also affect kestrels as seen from observation of lesser kestrel (*Falco naumanni*), but also applicable to American kestrel (*Falco sparverius*), found on the El Segundo Dunes.<sup>77</sup> In fact, artificial night lighting affects singing and foraging time of many bird species.<sup>78</sup> Increased lighting even affects gastropods, which would include the sensitive Trask's snail (*Helminthoglypta traskii*).<sup>79</sup>

(cont'd)

These effects may seem to be relatively innocuous, except that species that extend their activity periods into nighttime are often exposed to drastically increased predation threats. In a study of butterfly larvae, a higher growth rate associated with longer photoperiod (as would be caused by artificial light) resulted in significantly higher predation on the butterfly larvae from the primary parasitoid species.<sup>80</sup> Similar tradeoffs will likely occur for the El Segundo blue butterfly with increased lighting on the El Segundo Dunes. While the increased light may increase larval development, the time of activity may also increase predation and parasitism.

The conclusion in the EIS/R that the increased levels of night lighting will have no effect on the El Segundo blue butterfly is completely unsupported by current scientific knowledge of the mechanisms of such effects on ecological systems. The EIS/R concentrates on the adult form of the El Segundo blue butterfly, which only constitutes a minute fraction of the lifecycle of the organism, and ignores published scientific literature documenting the tradeoffs of increased lighting on larval forms of butterflies. Furthermore, the EIS/R includes no discussion of bat species that may forage on the El Segundo Dunes. Many bat species found in Los Angeles County are considered sensitive species, and their foraging patterns are affected by lighting levels. Some faster-flying species congregate at streetlights, while slower-flying species avoid them.<sup>81</sup> The EIS/R should document the bat species foraging within the project site and evaluate the impacts of lighting and other development on them.

The increased nighttime light levels on the El Segundo Dunes constitute a significant adverse impact, and should be avoided. One method to decrease the impacts of nighttime lighting is to use low pressure sodium lamps in place of other lighting types. Yellow light from these sources has less ecological impact. Other possible mitigation measures include using full cut-off lighting fixtures and mandating operational controls.

### 3.2.2 Noise

The effects of airport noise on the fauna of the project area are not considered at all. Perhaps this results from the noise analysis, which improperly chooses 1996 — prior to the introduction of quieter airplanes — as the baseline for noise impacts, rather than what noise conditions would be in the absence of the proposed project. Through this careful choice of baseline, the EIS/R argues that there would be virtually no change in the noise levels on the El Segundo Dunes. However, this is not the case. Noise would be more constant under increased passenger capacity — more planes would be traveling in and out of the airport. Increased noise levels on the El Segundo Dunes will have significant adverse effects on the wildlife found there, effects that are evident from the available scientific literature.

The use of a weighted average to describe noise levels (CNEL) precludes and obfuscates analysis of actual noise impacts. From the standpoint of wildlife, and indeed human physiological responses, it is relevant to know what maximum noise levels are experienced, and at what duration. While the average noise levels described in the EIS/R offer some indication of which areas are louder than others,

maximum noise levels are necessary to evaluate potential hearing loss, startle reactions in animals, barriers to vocal communication, and other significant impacts to the fauna of the El Segundo Dunes.

The body of research on the effects of noise on vertebrates shows that chronic noise, even at low levels, is associated with elevated stress hormone levels, higher blood pressure, faster heart rates, and other physiological effects.<sup>82</sup> As a result, birds, mammals and other vertebrates may show anatomical differences (smaller body size, enlarged adrenal glands) from prolonged exposure to noise. Species that use vocalizations to communicate may be excluded altogether from noisy areas. The effects of noise on birds and mammals in particular are relevant to the EIS/R.

**Birds.** Of 45 bird species investigated in woodlands in The Netherlands, 33 showed significantly depressed breeding density in response to increased noise levels near roads. All species in the small passerine families Sylviidae, Fringillidae, and Emberizidae were affected by noise.<sup>83</sup> This research also showed that noise effects followed a threshold model.<sup>84</sup> This means that up to a certain noise level, no decrease in density is observed. When noise increases beyond that threshold level, bird density decreases dramatically in the area between the location at which that threshold is met and the road. The decreased density over the area with noise greater than the threshold level ranges from 30% to 100% and is known as the "decrease factor."<sup>85</sup>

These two variables, the threshold value and the decrease factor, describe the impact of noise on breeding birds. Empirical measurement of the threshold value in woodlands shows that for all bird species combined the threshold value is 42–52 dB(A), with individual species exhibiting thresholds as low as 36 dB(A) and as high as 58 dB(A).<sup>86</sup> Furthermore, years with overall low population densities showed lower threshold levels.

Similar research has been conducted for grasslands. Overall, this research shows that breeding bird habitat is degraded at noise levels as low as 36 dB(A). Minimum noise levels on the El Segundo Dunes are 70 dB(A) CNEL,<sup>87</sup> a quantification that does not even provide maximum noise levels. There is no question therefore that noise from LAX operations affects breeding bird densities on the El Segundo Dunes.

U.S. Fish and Wildlife Service National Ecology Research Center, Ft. Collins, Colorado. NERC-88/29. 88 pp. Such effects are found in humans too; children exposed to chronic noise greater than 60 dB "experienced marginally higher resting systolic blood pressure, greater heart rate reactivity to test, and higher overnight cortisol levels, which are signs of modestly elevated physiological stress" (Environmental News Network. 24 May 2001. Noisy neighborhoods harmful to childrens' health).

87. EIS/R, Figures 4.2-15, 4.2-19, 4.2-23.

**Mammals.** Chronic noise is a problem for native mammals on the El Segundo Dunes, as it is for humans in surrounding neighborhoods. The description of one study on the effect of airport noise on a small mammal illustrates one example of this problem:

Only a few studies of the physiological effects of noise on rodents have involved wild animals. A field study by Chesser et al. (1975) involved two populations of house mice near the end of a runway at Memphis International Airport. Adult mice also were collected from a rural field 2.0 km from the airport field. Background noise levels at both fields were 80–85 dB. Noise levels of incoming and outgoing aircraft at the airport field averaged 110 dB, with the highest reading reaching 120 dB. Total body weights and adrenal gland weights of mice from the fields were measured. Additional mice were captured from the rural field, placed in the laboratory, and exposed to 1 minute of 105-dB recorded jet aircraft noise every 6 minutes to determine if noise was the causative factor. Control mice were not subjected to noise. After 2 weeks, the adrenals were removed and weighed. Adrenal gland weights of male and female mice from the airport field were significantly greater than those of mice from the rural field. The noise-exposed mice in the laboratory study had significantly greater adrenal gland weights than the control mice. After ruling out stress factors, such as population density, Chesser et al. (1975) concluded that noise was the dominant stressful factor causing the adrenal weight differences between the two feral populations.<sup>88</sup>

While house mice are of no regulatory concern, native mammals on the El Segundo Dunes include some native small mammals (harvest mouse, *Reithrodontomys megalotis*, desert wood rat, *Neotoma lepida*) which are locally significant. Impacts of noise to the habitat quality of the El Segundo Dunes for native mammals should be evaluated.

**Reptiles and Amphibians.** Spadefoot toads may be induced to emerge from their burrows in response to loud noises (95 dB(A) recordings of motorcycle noise in one experiment).<sup>89</sup> Fringe-toed lizards are rendered deaf after 9 minutes exposure to 95 dB(A) noise in the same study. Some snakes will show alert behavior in response to airplanes flying overhead.<sup>90</sup>

The EIS/R should evaluate the effects of noise on the biota of the El Segundo Dunes. It is likely that if the noise baseline were set at current conditions rather than before the implementation of quieter planes, this analysis would reveal significant impacts on the ability of the El Segundo Dunes to support populations of some species of birds, mammals, and other vertebrates. Such significant impacts should be identified and mitigated.

### 3.2.3 Pollution

The discussion in the EIS/R about pollution effects on the El Segundo blue butterfly deserves comment. The EIS/R makes the statement, "Monitoring results indicate that current levels of vanadium are not adversely affecting the El Segundo blue butterfly population at the Habitat Restoration Area since counts for the year 2000 showed a significant increase in the population when compared to 1999."<sup>91</sup> Many factors influence butterfly abundance from year to year; changes from 1999 to 2000 provide no information about the effect of pollution on the butterfly. This statement is indicative of a fundamental misunderstanding of the process of deductive reasoning. The reality is that we have no idea what effect pollution has on the populations of sensitive species on the El Segundo Dunes, including the El Segundo blue butterfly. Population trends cannot be derived from two years of data, and are even difficult with ten years of measurements.<sup>92</sup>

### 3.2.4 Landscaping

The EIS/R does not assess the detrimental impacts of landscaping adjacent to the El Segundo Dunes. LAWA has planted invasive exotic species as landscape plants in the past, resulting in a greater load of exotic seed rain on the El Segundo Dunes.<sup>93</sup> Exotic landscaping material, and associated irrigation, can cause significant adverse effects on the biological resources of the El Segundo Dunes.

Installation of permanent irrigation in new areas along Pershing Drive would result in an expansion of the invasive exotic arthropod community on the El Segundo Dunes. Water sources promote population increases of non-native Argentine ants (*Linepithema humile*), European earwigs (*Forficula auricularia*), and other exotic species, which displace native insect species, an effect that has recently been documented to extend 200 m into native habitats.<sup>94</sup> Argentine ants are found on the El Segundo Dunes already, but the explosion in numbers associated with permanent irrigation will wreak havoc on native arthropod communities. This is shown by consistent decreases in native arthropod diversity in response to increased Argentine ant abundance.<sup>95</sup> Argentine ants would displace native ants surrounding the project site. This extirpation reverberates up the food chain, as some native reptiles (e.g., coast horned

lizard, *Phrynosoma coronatum*, found on the El Segundo Dunes) preferentially feed on native ants and decline in their absence.<sup>96</sup>

The EIS/R should require as a mitigation measure that in areas adjacent to the El Segundo Dunes, all landscaping plants be limited to locally native species, and that irrigation be limited to winter only.

### 3.3 Cumulative Impacts

The analysis of cumulative impacts is woefully inadequate and is inconsistent with previous conclusions reached by the City of Los Angeles in environmental impact reports. The discussion of cumulative impacts in Sections 4.10 and 4.11 of the EIS/R consists of a description of the Master Plan area and the following statement:

Areas surrounding the study area consist largely of developed areas with little or no habitat value. However, two biologically significant open spaces, the Ballona Wetlands and the Ballona Bluffs, remain extant within the vicinity of the study area.<sup>97</sup>

However, in the Final Environmental Impact Report for the West Bluffs Project — a project to build residences on the last open space on the Ballona Bluffs — the City of Los Angeles found:

The contribution of the proposed project to impacts on plant and animal life from ongoing development in the region is not considered to be significant, due to the disturbed nature and correspondingly low resource value of the project site.<sup>98</sup>

The current EIS/R is inconsistent with the above statement. To the contrary, the current EIS/R states that:

The cumulative impacts on biotic communities from development of the LAX Master Plan Improvements, and other proposed projects in the area, most notably the Playa Vista Master Plan Project and the Catellus residential proposal on the Ballona Bluffs, are considered significant due to the limited amount of extant natural habitat in the vicinity of the study area, particularly wetlands.<sup>99</sup>

The EIS/R then argues that implementation of the LAX Master Plan will not contribute to these cumulative impacts. The City of Los Angeles seems to claim that whichever project is under review does not contribute to cumulative impacts, yet once approved, the City's subsequent environmental review documents acknowledge that projects did contribute to cumulative impacts. The reality is that both the Catellus West Bluffs Project and the LAX Master Plan will contribute to significant cumulative impacts on natural resources.

Upland foraging habitat for grassland songbirds and raptors will be nearly eliminated by the combination of the LAX Master Plan, the West Bluffs Project, Playa Vista Phase I, and the potential

98. City of Los Angeles. October 1998. EIR No. 91-0675. West Bluffs Project Section IV.D.3.

99. EIS/R, p. 4-664.

Playa Vista Phase II. The Ballona Creek watershed (with the exception of the Baldwin Hills) will no longer support many bird species as a result of the cumulative impacts of these developments. Western meadowlark, white-tailed kite, California horned lark, loggerhead shrike, sharp-shinned hawk, northern harrier, Cooper's hawk, and American kestrel will experience significant declines in suitable habitat as a result of these cumulative impacts. Peregrine falcon will experience significant losses of foraging habitat. Many birds associated with the Ballona Wetlands forage in upland habitats, especially during the winter and spring rains. For example, great blue heron and snowy egret forage in the ephemeral wetlands at LAX and the West Bluffs site. If all of these projects are completed, all remnants of vernal pools in the northern portion of the former Los Angeles Coastal Prairie will be obliterated. Vernal pool hydrology at the West Bluffs site and at LAX would be destroyed, yet the EIS/R claims that no significant cumulative impacts will result from the project.

This is the end of the line for open space in west Los Angeles. The City of Los Angeles must recognize that the current project, plus the others previously approved by the City, have significant, irreversible, cumulative impacts on biological resources.

#### **4.0 Mitigation Measures**

The mitigation measures that rely on the "modified Habitat Evaluation Procedure" are insufficient to offset the significant impacts that would result from the build alternatives. The use of "Habitat Units" in mitigation measures MM-BC-2, MM-BC-4, MM-BC-5, MM-BC-6, and MM-BC-7 is fundamentally flawed.

The all-purpose mitigation measure "Conservation of Faunal Resources" (MM-BC-4) is completely inadequate to address impacts to sensitive species from the project alternatives. The conversion to "Habitat Units" is spurious; all mitigation must replace lost habitat with an equal or greater area.

##### **4.1 Lewis' Evening Primrose**

Mitigation for Lewis' evening primrose does not ensure that a replacement population of the species will be created, only that more individuals will be grown on the El Segundo Dunes, where the species is already found. In addition to establishing a numerical goal for the number of individuals to be replaced, mitigation should ensure the area occupied by the species will increase by at least the 2.5 acres that would be lost. Because there is a risk-spreading benefit in the disjunct configuration of the impacted population, the mitigation site should be geographically distinct from currently occupied sites.

##### **4.2 Western Spadefoot Toad**

Mitigation for the western spadefoot toad ignores the geographic configuration of the impacted population(s). These toads are found in four distinct ephemerally wet areas on the LAX property, all of which would be destroyed by the build alternatives. Division of the population into separate, hydrologically distinct pools with different cachmentments is a benefit to the population. Mitigation for these losses cannot be achieved through creation of 1.24 acres of ideal habitat (the "Habitat Units"), but rather must consist of four separate pools and associated cachmentments of at least 9 acres.

The choice of mitigation location is important as well. The top choice would be on the areas of the former Los Angeles Coastal Prairie west of Pershing Drive. However, the EIS/R claims that allowing a vernal pool in this area would encourage bird life as well, and would therefore pose a hazard to aircraft.

If off-site mitigation is necessary, the first choice should be the West Bluffs property, currently subject to development by the Catellus Corporation. The West Bluffs site has vernal pool hydrology and is the only candidate site within a reasonable distance of LAX. Distant sites such as Madrona Marsh and potentially California State University Dominguez Hills (where spadefoot toads possibly persist in a vernal pool but are subject to imminent extirpation from construction), should be utilized only in addition to a more proximate site. If no proximate sites are secured (e.g., the West Bluffs property is unobtainable), then the conclusion of the EIS/R must be that the impacts to the species cannot be mitigated to a less than significant level. Without the LAX population, or a possible West Bluffs replacement, the range of the species in the region will be significantly diminished, even with more distant offsite mitigation.

#### 4.3 Riverside Fairy Shrimp

A similar analysis applies to the proposed mitigation for the loss of habitat for the Riverside fairy shrimp. The species is currently found in at least nine areas affected by the build alternatives. The proposed mitigation is for "no more" than 1.3 acres of replacement habitat.<sup>100</sup> To the contrary, loss of this occupied habitat should be mitigated by provision of nine pools with associated upland cachement areas to support vernal pool hydrology. While the mitigation measure suggests one location with 0.75 habitat value (i.e. restoration of vernal pool plants and other vernal pool characteristics), it is more important to the fairy shrimp that multiple locations be acquired. Population models for species found in habitat patches (e.g., metapopulations) show that persistence is enhanced not by density at a single site — although patch size is important — but by maximizing the number of occupied patches.<sup>101</sup> To trade occupied sites for other biological values such as presence of sensitive plant species decreases the long-term persistence possibilities for the fairy shrimp. Certainly full vernal pool restoration would be a noble conservation goal, but it does not mitigate the impacts to the Riverside fairy shrimp. The potential mitigation sites should be chosen by proximity to LAX. The West Bluffs site could provide one, possibly two pools. Additional pools should be identified to mitigate fully the impacts to the species.

#### 4.4 San Diego Black-tailed Jackrabbit

As discussed above, the proposed mitigation for the San Diego black-tailed jackrabbit is insufficient to offset the losses to the species. The loss of 119 acres of occupied habitat must be offset by the provision of at least 119 acres of additional habitat. The EIS/R provides no evidence to show that the species can be supported at similar densities in the Habitat Restoration Area on the dunes, nor that the "Habitat Units" of restoration on the dunes will make the area more suitable for jackrabbits. Black-tailed jackrabbits require mixed grasses, forbs, and shrubs for food; dune scrub may provide less preferred forage than exotic grassland. The Habitat Restoration Area therefore may support lower densities of the species than currently occupy the 119 acres of exotic grassland. Furthermore, the EIS/R provides no estimate of the size of the population to be impacted, or the diel<sup>102</sup> patterns of movement exhibited by the species, information that is necessary to formulate an effective mitigation measure. Any release program on the El Segundo Dunes must be accompanied by a humane control program for the exotic red fox (*Vulpes vulpes*).

100. EIS/R, p. 4-708.

101. Hanski, I. 2000. *Metapopulation ecology*. London: Oxford University Press.

102. "Diel" refers to a 24-hour period, a full day and night.

#### 4.5 Loggerhead Shrike

The EIS/R proposes to mitigate for loss of occupied loggerhead shrike habitat (172 acres) with restoration on the El Segundo Dunes in the form of 22.88 "Habitat Units." Implicit in this proposal is the assumption that the density of loggerhead shrikes on the El Segundo Dunes can be increased to accommodate those displaced by the loss of 172 acres of occupied habitat. The EIS/R provides no information about densities of loggerhead shrike to support this implicit assumption. To the contrary, because the El Segundo Dunes are already occupied with breeding loggerhead shrikes, and the shrike's use of habitat is not tied to whether the vegetation is native or not (or to the arbitrary habitat standards of the HEP), restoration on the El Segundo Dunes is not likely to appreciably increase the density of shrikes found there. Mitigation for this impact must be found elsewhere, in the form of 172 acres of shrike habitat. Loggerhead shrike are found at the West Bluffs site, but the site is only 44 acres and so could only offer partial mitigation for impacts at LAX. Other additional mitigation sites include properties covered under the Playa Vista master plan, or in the Baldwin Hills. However, if 172 acres of shrike habitat in addition to the El Segundo Dunes cannot be identified and acquired as mitigation, then the significant impact to this species cannot be mitigated to a less than significant level. The impacts are certainly not mitigated by the proposal to provide 23 extra "Habitat Units" in currently occupied habitat.

#### 4.6 Los Angeles Coastal Prairie

Prescriptions for restoration of Valley Needlegrass Grassland described in MM-BC-5, MM-BC-6, and MM-BC-7 are not consistent with evidence of the historic vegetation in the area, which Mattoni and Longcore have described as Los Angeles Coastal Prairie. The prescription is for a needlegrass dominated habitat, with four common subshrubs. First, five plant species are insufficient to restore this habitat type; the actual plant diversity of the habitat was significantly higher. Second, the relative abundance of species is nothing approaching historical conditions. A transect along a historic photograph of the Coastal Prairie (or "meadow" as described by Pierce<sup>103</sup>), shows the following coverage: *Lupinus bicolor* (39%), *Camissonia bistorta* (18%), *Phacelia stellaris* (14%), *Lotus strigosus* (8%), *Festuca megalura* (4%), *Cryptantha intermedia* (1%), and open (16%).<sup>104</sup> A mitigation measure should bear at least some resemblance to the vegetation type that it proposes to emulate. Furthermore, the standard of 10% native cover for successful restoration is outrageous. The claim that this is defensible because 10% is deemed significant for the identification of a native grassland by the California Department of Fish and Game is equally stunning. Ten percent cover represents the most degraded grasslands, not a standard to achieve in restoration. If the success criterion for grassland mitigation were followed, the vegetation created would score very low on the "modified" HEP touted in the EIS/R.

#### 4.7 Restoration Performance Criteria

The performance criteria for the restoration efforts are all exceedingly weak. The only quantifiable standard for revegetation performance is attainment of native cover, the highest of which is 45%. Ecologists have developed many measures of habitat quality that are available to define performance

103. Pierce, W.D. 1938. The fauna and flora of the El Segundo sand dunes: 1. General ecology of the dunes. *Bulletin of the Southern California Academy of Sciences* 37(3):93-97.

104. Mattoni, R., and T.R. Longcore. 1997. The Los Angeles Coastal Prairie, a vanished community. *Crossosoma* 26(2):71-102, at 87.

standards for revegetation, including many measures of plant diversity and plant structure.<sup>105</sup> Wetland mitigation must meet stringent standards quantifying wetland functions and values.<sup>106</sup> Terrestrial arthropods have been used to assess the performance of revegetation in re-creating native habitats.<sup>107</sup> The performance criteria for restoration should provide more ecological information than simply percent native cover, especially when so many measures are readily available. Without true ecological assessment of restored areas, the success of the mitigation will be forever unknown.

#### 4.8 Raptor "Nursery Sites"

Insufficient information about the impact to raptors using mature trees is provided to allow assessment of whether the mitigation measure (MM-BC-3) would be effective for replacement of mature trees. The location of this mitigation would be important, and the destruction of nearly all of the open space used for foraging by raptors may render "nursery sites" extraneous, with no raptors to use them.

#### 5.0 California Coastal Act

None of the build alternatives in the Master Plan would be consistent with the California Coastal Act. First, there would be many impacts to the environmentally sensitive habitat area on the El Segundo Dunes through the indirect effects of increased construction, light, landscaping, pollution, and road construction. The mitigation measures proposed are insufficient to mitigate for these significant disruptions of habitat values. Even though the development is designed to occur outside the coastal zone boundary, Section 30240(b) of the Coastal Act provides that:

Development in areas adjacent to environmentally sensitive habitat areas and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade those areas, and shall be compatible with the continuance of those habitat and recreation areas.<sup>108</sup>

Second, the EIS/R does not discuss impacts to marine biological resources, which could occur as a result of runoff into and jet fuel dumping over the ocean. Impacts to marine biological resources should be described and appropriate changes implemented before preparation of a final EIS/R.

108. California Public Resources Code § 30240(b).

## 6.0 Conclusion

The EIS/R treatment of biological resources represents the result of significant effort and expenditure on the part of the preparers. Unfortunately, the resulting analysis is deeply flawed, unscientific, and improperly reaches the conclusion that the mitigation measures would reduce impacts to a less than significant level. To the contrary, implementation of any of the three build alternatives would be catastrophic for the biological resources on the project site and result in a significant local and cumulative impact on sensitive species. If approved and implemented, the Master Plan will permanently degrade the diversity and abundance of native wildlife in west Los Angeles. The last refuges of birds and mammals depending on large open spaces will be erased from the landscape.

- M. A., Geography, University of California, Los Angeles 1993–1995  
Thesis Title: *Risk, Technology, and Place: Siting a Radioactive Waste Dump in California's Ward Valley*
- Honors B. A., Geography *summa cum laude*, University of Delaware 1989–1993  
Thesis Title: *Information Technology and World City Restructuring: The Case of New York City's Financial District*

### PROFESSIONAL EXPERIENCE

- Research Assistant Professor, Center for Sustainable Cities, Department of Geography,  
University of Southern California 2001–present
- Lecturer, UCLA Department of Geography, UCLA Department of Organismic Biology,  
Ecology and Evolution, UCLA Institute of the Environment 2000–present  
Lower division: Biogeography, People and the Earth's Ecosystems, Ecology and Conservation of California Oaks. Upper division: World Vegetation, Forest Ecosystems, Ecology, Environmental Impact Analysis.
- Co-founder and Science Director, The Urban Wildlands Group 1996–present  
Organization studies and works to protect species, habitats, and ecological processes within urban and urbanizing areas. Projects include restoration and management of habitat supporting endangered butterfly species, education of policymakers on impacts of artificial light and noise on wildlife, research on minimizing ecological effects of fuel modification.
- Principal, Land Protection Partners 1998–present  
Consultant to attorneys in land protection actions (primarily California Environmental Quality Act, California Coastal Act, and federal Endangered Species Act). Services include issue identification, preparation of biological analysis with supporting scientific literature review, and communication with resource agency personnel.
- Research Associate, Sustainable Cities Program, University of Southern California 1999–2001
- Summer Instructor, UCLA Graduate School of Education and Information Studies 1997–1999
- Staff Researcher, UCLA Department of Geography 1996–1999
- Teaching Assistant, UCLA Department of Geography 1995–1996
- Geographic Information System Technician, Water Resources Agency, New Castle  
County, Delaware 1992–1993

## GRANTS, HONORS, AND AWARDS

### Professional

- Santa Monica Bay Restoration Commission 2003  
Grant of \$131,000 to Los Angeles Conservation Corps and The Urban Wildlands Group to restore coastal dune and bluff vegetation and develop a master plan for restoration of El Segundo dune and bluff habitat.
- Defense Logistics Agency 2003  
Contract for \$43,779 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly.
- James C. Zumberge Fund for Innovation, University of Southern California 2003  
Grant of \$50,000 for interdisciplinary investigation of phytoremediation with native plants.
- Conservation and Research Foundation 2003  
Grant of \$5,000 to The Urban Wildlands Group to support preparation of book, *Ecological Consequences of Artificial Night Lighting*.
- California ReLeaf 2003  
Grant of \$7,500 to The Urban Wildlands Group for project, "Urban Forest Assessment and Outreach at UCLA."
- U.S. Department of the Navy 2002  
Contract for \$12,000 to The Urban Wildlands Group to salvage Palos Verdes blue butterfly pupae from Navy property to be disposed and developed.
- U.S. Fish and Wildlife Service 2002  
Contract for \$10,000 to The Urban Wildlands Group to draft management plan for endangered Kern primrose sphinx moth.
- U.S. Fish and Wildlife Service 2002  
Contract for \$24,000 to The Urban Wildlands Group to draft species recovery plan for endangered Calippe silverspot butterfly.
- International Dark-Sky Association Executive Director's Award 2002
- National Fish and Wildlife Foundation 2002  
Grant of \$5,000 to The Urban Wildlands Group to support conference *Ecological Consequences of Artificial Night Lighting*.
- Electric Power Research Institute 2002  
Grant of \$2,000 to The Urban Wildlands Group to support conference *Ecological Consequences of Artificial Night Lighting*.
- Defense Logistics Agency 2002  
Contract for \$42,665 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly.
- U.S. Fish and Wildlife Service Landowner Incentive Program 2001  
Grant of \$37,300 to The Urban Wildlands Group to restore habitat for endangered El Segundo

blue butterfly on private property in Torrance, California.

John Randolph Haynes and Dora Haynes Foundation 2000

Co-author of \$398,000 grant to USC Sustainable Cities Program to assess benefits of urban greening in a dense inner-city neighborhood.

Los Angeles Department of Water and Power 2000

USC Sustainable Cities Program awarded \$9,000 contract to assess "Cool Schools" tree planting program.

New Research Design Award for a More Sustainable Los Angeles Region, John Randolph Haynes and Dora Haynes Foundation 2000

Awarded \$5,000 to develop a research design for the use of native plants in phytoremediation.

#### Graduate

Conference Travel Grant, UCLA Department of Geography 1999

Dissertation Improvement Grant, National Science Foundation (\$8,000) 1998

Distinguished Doctoral Scholar Fellowship, UCLA Alumni Association (\$17,500) 1998

Portable Fellowship, UCLA Graduate Division (\$18,500) 1997

Graduate Research Fellowship, National Science Foundation (\$64,400) 1993

Chancellor's Fellowship, UCLA Graduate Division (declined) 1993

#### Undergraduate

Alexander J. Taylor Award ("Outstanding Senior Man"), University of Delaware 1993

Geography Faculty Award, University of Delaware 1993

Mid-Atlantic Region Finalist, Rhodes Scholarship 1992

Fellow, Arizona Honors Academy, Northern Arizona University 1992

Marie Donaghay Award for Excellence in Geography, University of Delaware 1992

Phi Beta Kappa 1992

Phi Beta Kappa Clift and DeArmond Award, University of Delaware 1991

George and Margaret Collins Seitz Award, University of Delaware 1991

Eugene duPont Memorial Distinguished Scholar Award, University of Delaware (\$44,500) 1989

#### PUBLICATIONS AND PRESENTATIONS

##### In Preparation

1. Rich, Catherine, and Travis Longcore (eds.). *Ecological consequences of artificial night lighting*. Island Press (scheduled 2004).
2. Longcore, Travis. Christina Li, and John P. Wilson. Nature's services in a dense urban neighborhood. *Environmental Management*.

### In Review

4. Longcore, Travis and Catherine Rich. Ecological light pollution. *Frontiers in Ecology and Environment*.
3. Longcore, Travis, Catherine Rich, and Dietland Müller-Schwarze. Management by assertion: beavers and vireos at Lake Skinner (Riverside County, California). *Ecological Restoration*.
2. Longcore, Travis, Christina Li, and John P. Wilson. Applicability of CITYgreen urban ecosystem analysis software to a dense urban neighborhood. *Urban Geography*.
1. Longcore, Travis. Ecological effects of fuel management practices around residential development. Sidebar for chapter by Kevin Shafer in text on California fire ecology.

### Peer Reviewed Publications

11. Longcore, Travis. Arthropods as indicators of restoration success in coastal sage scrub (California, U.S.A.). *Restoration Ecology* 11(4):00-00 (2003).
10. Mattoni, Rudi, Travis Longcore, Zdenka Krenova, and Alison Lipman. Mass rearing the endangered Palos Verdes blue butterfly (*Glaucopsyche lygdamus palosverdesensis*: Lycaenidae). *Journal of Research on the Lepidoptera* 37:55-67 (2003).
9. Longcore, Travis, Rudi Mattoni, Cor Zonneveld, and Jorn Bruggeman. INsect Count Analyzer: a tool to assess responses of butterflies to habitat restoration. *Ecological Restoration* 21(1):60-61 (2003).
8. Zonneveld, Cor, Travis Longcore, and Claudia Mulder. Optimal schemes to detect presence of insect species. *Conservation Biology* 14(2):476-487 (2003).
7. Longcore, Travis. Ecological effects of fuel modification on arthropods and other wildlife in an urbanizing wildland. Pp. 000-000 in Galley, Krista E.M., Robert C. Klinger, and Neil G. Sugihara (eds.). *Proceedings of Fire Conference 2000: The First National Congress on Fire Ecology, Prevention, and Management*. Miscellaneous Publication No. 13, Tall Timbers Research Station, Tallahassee, Florida (2003).
6. Mattoni, Rudi, Travis Longcore, Cor Zonneveld, and Vojtech Novotny. Analysis of transect counts to monitor population size in endangered insects: the case of the El Segundo blue butterfly, *Euphilotes bernardino allyni*. *Journal of Insect Conservation* 5(3):197-206 (2001).
5. Longcore, Travis, Rudi Mattoni, Gordon Pratt, and Catherine Rich. On the perils of ecological restoration: lessons from the El Segundo blue butterfly. Pp. 281-286 in Keeley, Jon, Melanie Baer-Keeley, and C. J. Fotheringham, eds. *2nd Interface Between Ecology and Land Development in California*, U.S. Geological Survey Open-File Report 00-62, Sacramento, CA (2000). (Abstracted in *Ecological Restoration* 19(2):125 (2001).)
4. Mattoni, Rudi, Vojtech Novotny, and Travis Longcore. Arthropod monitoring for fine scale habitat analysis: A case study of the El Segundo sand dunes. *Environmental Management* 25(4):445-452 (2000).
3. Mattoni, Rudi and Travis R. Longcore. The Los Angeles coastal prairie, a vanished community. *Crossosoma* 23(2):71-102 (1997).

2. Mattoni, Rudi, Gordon F. Pratt, Travis R. Longcore, John F. Emmel and Jeremiah N. George. The endangered Quino checkerspot butterfly, *Euphydryas editha quino* (Lepidoptera: Nymphalidae). *Journal of Research on the Lepidoptera* 34:99–118 (1997).
1. Longcore, Travis R. and Peter W. Rees. Information technology and downtown restructuring: the case of New York City's financial district. *Urban Geography* 17(4):354–372 (1996).

### Book Reviews

2. Longcore, Travis. Review of *From Coastal Wilderness to Fruited Plain: A History of Environmental Change in Temperate North America from 1500 to Present*, by Gordon G. Whitney. *Ethics, Place and Environment* 4(3):278–279 (2001).
1. Longcore, Travis. Review of *Butterflies on British and Irish Offshore Islands: Ecology and Biogeography*, by Roger Dennis and Tim Shreeve. *Journal of Research on the Lepidoptera* 35:139–140 (2000).

### Scientific Reports and Publications

31. U.S. Fish and Wildlife Service [Anderson, Alison, with Edith Allen, Mark Dodero, Travis Longcore, Dennis Murphy, Camille Parmesan, Gordon Pratt, and Michael Singer]. Recovery plan for the Quino checkerspot butterfly (*Euphydryas editha quino*). Portland, Oregon, U.S. Fish and Wildlife Service, x + 179 pp. (August 11, 2003)
30. Longcore, Travis, and Catherine Rich. Review of biological impact analysis in Initial Study and Mitigated Negative Declaration (PD-S-942/TT5411), City of Simi Valley. Los Angeles, Land Protection Partners, 15 pp. (July 24, 2003).
29. Longcore, Travis, and Catherine Rich. Conservation value of Catellus West Bluffs property justifies purchase with public funds, Los Angeles, Land Protection Partners, 11 pp. (May 2, 2003).
28. Pincetl, Stephanie, Jennifer Wolch, John Wilson, and Travis Longcore. Toward a sustainable Los Angeles: a "nature's services" approach. Los Angeles, USC Center for Sustainable Cities, 47 pp. (report to John Randolph Haynes and Dora Haynes Foundation, February 2003).
27. Longcore, Travis, Catherine Rich, John Marzluff, and Barbara Nightingale. Peer review of artificial light and noise impact analysis in *Sand Point Magnuson Park Drainage, Wetland/Habitat Complex and Sports Fields/Courts Project Final Environmental Impact Statement [Seattle, Washington]*. Los Angeles, Land Protection Partners, 15 pp. (January 16, 2003).
26. Longcore, Travis, and Catherine Rich. Review of biological resources analysis in Malibu Bay Company Development Agreement Draft Environmental Impact Report. Los Angeles, Land Protection Partners, 28 pp. (November 11, 2002).
25. Longcore, Travis, and Catherine Rich. Action plan for Kern primrose sphinx moth (*Euproserpinus euterpe*) at Carrizo Plain National Monument. Los Angeles, The Urban Wildlands Group. 15 pp. (report to U.S. Fish and Wildlife Service, November 1, 2002).
24. Longcore, Travis, Rudi Mattoni, Alison Lipman, Zdenka Krenova, and Catherine Rich. Final report for Palos Verdes blue butterfly year 2002 captive rearing on Defense Fuel Support Point, San Pedro, California. Los Angeles, The Urban Wildlands Group (Defense Logistics Agency Agreement # N68711-02-LT-00010). 18 pp. (October 1, 2002).
23. Longcore, Travis, and Catherine Rich. Effects of light and noise from a proposed Wal-Mart

- "Supercenter" on the wildlife of Penjajawoc Marsh (Bangor, Maine). Los Angeles, Land Protection Partners. 18 pp. (June 7, 2002).

#### INVITED PRESENTATIONS

South Coast Wildlands Project Missing Linkages Workshop, August 2002

University of Southern California, Department of Geography, February 2002

Santa Monica Mountains Conservancy, September 2001

California Native Plant Society, South Coast Chapter, August 2001

California State University, Northridge, Olivatt Library, April 2001

University of California Natural Resources Continuing Conference, Wrigley Institute for Environmental Studies, April 2001

Society for Ecological Restoration, California Chapter Annual Conference, October 2000

University of Stockholm, Department of Zoology, September 2000

University of Gothenberg, Department of Applied Environmental Science, September 2000

Lorquin Entomological Society, Los Angeles, California, June 2000

University of California, Los Angeles, Department of Geography, May 2000

Southern California Institute of Architecture, June 1998

Los Angeles Unified School District Target Science, "Butterflies in the City" Workshop Series, South Central Los Angeles Leadership Team, October 1998

#### PROFESSIONAL SERVICE

Referee, *Restoration Ecology, Journal of Research on the Lepidoptera, Environmental Management, Transactions in GIS*

Independent Scientific Advisor (Quino checkerspot butterfly), County of San Bernardino, 2002  
Baldwin Hills Park Citizens Advisory Committee, 2002  
Conference Co-Chair, The Urban Wildlands Group and UCLA Institute of the Environmental Consequences of Artificial Night Lighting, 2001–2002  
Member, Advisory Council, Yosemite Restoration Trust, 1999–present  
Member, Recovery Team (Technical Subteam), Quino Checkerspot Butterfly, U.S. Fish and Wildlife Service, 1999–present  
Newsletter Layout, Endangered Habitats League, 1998–2002  
Member, Conference Steering Committee, UCLA Institute of the Environment, *California's Biodiversity Crisis: The Loss of Nature in an Urbanizing World*, 1998  
Managing Editor, *Journal of Research on the Lepidoptera*, 1997–1999  
Member, Recovery Team, El Segundo Blue Butterfly, U.S. Fish and Wildlife Service, 1997–1998  
Member, Environmental Review Board, County of Los Angeles (appointed by Los Angeles County Board of Supervisors), 1997–present  
Editor, *Western Tanager*, newsletter of the Los Angeles Audubon Society, 1997  
Vice President, Los Angeles Audubon Society, 1995–1997  
Coordinator, Los Angeles Audubon Society Birdathon, 1996 (recognized by National Audubon Society, "Most Money Raised by a Rookie," September–October issue of *Audubon* magazine)  
Graduate Student Association Representative, UCLA Academic Senate Council on Planning and Budget, 1996–1999  
Member, Graduate Affairs Committee, UCLA Department of Geography, 1995–1997  
Member, Instructional Technology Committee, UCLA Department of Geography, 1993–1995

#### PROFESSIONAL AFFILIATIONS

Member, Ecological Society of America  
Member, Association of American Geographers

### Education

UCLA Department of Geography, M.A. June 1997. Emphasis in biogeography, urban wildlife, environmental philosophy. Thesis: *Poliophilophilia? Toward an Understanding of the Role of Human Emotion in Nature Preservation*. Teaching Assistant: Biogeography, Physical Geography, People and the Earth's Ecosystems.

UCLA School of Law, J.D. June 1981. Member, State Bar of California. Co-founder and Associate Editor, *UCLA Journal of Environmental Law and Policy*. Co-founder and officer (faculty liaison), UCLA Environmental Law Society.

University of California, Berkeley, A.B. March 1978 (with Distinction). Pre-medical course, psychology major. Member, Board of Directors, U.C. Berkeley CalPIRG (1976-1977). Co-founder, U.C. Berkeley CalPIRG (1976).

### Professional Experience

Co-founder and Executive Officer, The Urban Wildlands Group (1996-present). Organization studies and works to protect species, habitats, and ecological processes within urban and urbanizing areas. Projects include restoration and management of habitat supporting endangered butterfly species, public education about effects of noise and artificial night lighting on wildlife, promotion of humane approaches to wildlife management, research on minimizing ecological effects of fuel modification.

Principal, Land Protection Partners (1998-present). Consultant to attorneys in land protection actions (primarily California Environmental Quality Act, California Coastal Act, federal Endangered Species Act). Services include issue identification, preparation of biological analysis with supporting scientific literature review, communication with resource agency personnel.

Contract Attorney, Law Offices of Jonathan Kirsch (1999-present). Trademark and publishing law.

Copy Editor, *Journal of Research on the Lepidoptera* (1997-1999).

Legal/Policy Consultant (1989-1992). Projects included assisting in the preparation of lawsuit (*Nordlinger v. Lynch*) challenging property tax assessment scheme mandated by Proposition 13 (for Center for Law in the Public Interest).

Deputy, Los Angeles City Councilman Marvin Braude (1987-1988). Formulated and developed environmental policies and programs. Represented councilman before city boards,

commissions, and committees, and at community meetings. Coordinated reelection campaign for seat on AQMD Board.

Community Representative (1985–1986). Directed successful effort to prevent demolishing five contiguous apartment buildings in an unredeveloped Westwood neighborhood. Persuaded Los Angeles City Council to enact a local building moratorium, then represented local community before Planning and Environment Committee of the City in a hardship exemption hearing requested by developer. Prepared architectural and historical documentation for Historic Preservation Overlay Zone application.

Staff Attorney, California Commission on Campaign Financing (1984–1985). Contributed to two-volume report on legislative campaign financing (*The New Gold Rush: Financing California's Legislative Campaigns*).

Full-time staff member, Gary Hart presidential campaign (1984). Field desk contact for Northern California; Los Angeles regional co-coordinator. Appointed to Credentials Committee of the 1984 Democratic National Convention.

Attorney, Paul, Hastings, Janofsky & Walker (1983). General civil litigation.

Editor/Assistant, Professor Charles M. Firestone (1982–1983). Edited Firestone and Johnson's *Cases and materials on communications law and policy*; assisted in preparations for conference, UCLA Communications Law Program/International Bar Association Symposium on International Satellite Television.

Research Assistant, Professor Richard Abel (Summer 1980). Compiled information on workplace exposure to toxic substances.

Intern, Hollywood Revitalization Committee (funded by National Trust for Historic Preservation) (Summer 1979). Evaluated feasibility of establishing a façade easement program for Hollywood's historic buildings.

Research Assistant, Professor Laura Nader (funded by National Highway Traffic Safety Administration) (Spring 1978). Research on social costs of automobile accidents.

Research Assistant, Professor Laura Nader (Summer 1977). Participated in study funded by Energy Research & Development Administration evaluating feasibility of alternative energy systems in California. Interviewed officials involved with the implementation of Energy Conservation Standards for New Residential Buildings.

Longcore, Travis, Rudi Mattoni, Gordon Pratt, and Catherine Rich. *On the perils of ecological restoration: lessons from the El Segundo blue butterfly*. Paper presented at 2nd Interface Between Ecology and Land Development in California (Occidental College, Los Angeles, California, April 18-19, 1997).

Mattoni, Rudi, Travis Longcore, Jeremiah George, and Catherine Rich. *Down memory lane: the Los Angeles coastal prairie and its vernal pools*. Poster presented at 2nd Interface Between Ecology and Land Development in California (Occidental College, Los Angeles, California, April 18-19, 1997).

#### Grants and Awards

Santa Monica Bay Restoration Commission. Grant of \$131,000 to Los Angeles Conservation Corps and The Urban Wildlands Group to restore coastal dune and bluff vegetation and develop a master plan for restoration of El Segundo dune and bluff habitat (2003).

Defense Logistics Agency. Contract for \$43,779 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly (2003).

Conservation and Research Foundation. Grant of \$5,000 to The Urban Wildlands Group to support preparation of book, *Ecological Consequences of Artificial Night Lighting* (2003).

California ReLeaf. Grant of \$7,500 to The Urban Wildlands Group for project, "Urban Forest Assessment and Outreach at UCLA" (2003).

U.S. Department of the Navy. Contract for \$12,000 to The Urban Wildlands Group to salvage Palos Verdes blue butterfly pupae from Navy property to be disposed and developed (2002).

U.S. Fish and Wildlife Service. Contract for \$24,000 to The Urban Wildlands Group to develop Recovery Plan for endangered Callippe silverspot butterfly in San Francisco area, California (2002).

U.S. Fish and Wildlife Service. Contract for \$10,000 to The Urban Wildlands Group to develop Action Plan for endangered Kern primrose sphinx moth on BLM land in the Carrizo Plain National Monument, California (2002).

National Fish and Wildlife Foundation. Grant of \$5,000 to The Urban Wildlands Group to support conference, *Ecological Consequences of Artificial Night Lighting* (2002).

Electric Power Research Institute. Grant of \$2,000 to The Urban Wildlands Group to support conference, *Ecological Consequences of Artificial Night Lighting* (2002).

Defense Logistics Agency. Contract for \$42,665 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly (2002).

U.S. Fish and Wildlife Service Landowner Incentive Program. Grant of \$37,300 to The Urban Wildlands Group to restore habitat for endangered El Segundo blue butterfly on private property in Torrance, California (2001).

International Dark-Sky Association Executive Director's Award, "In recognition of her enthusiastic efforts in the pursuit of the promotion of Dark Skies" (2002).

International Dark-Sky Association Executive Director's Award, "For outstanding service in protecting our nighttime environment" (2001).

### **Selected Activities and Memberships**

Conference Co-Chair, The Urban Wildlands Group/UCLA Institute of the Environment, *Ecological Consequences of Artificial Night Lighting* (2002)

Advisor, California Wildlife Foundation (2002-present)

Member, Advisory Council, California Oak Foundation (1999-present)

Member, Conference Steering Committee, UCLA Institute of the Environment, *California's Biodiversity Crisis: The Loss of Nature in an Urbanizing World* (1998)

President, Los Angeles Audubon Society (1996-1997)

Conservation Co-Chair, Los Angeles Audubon Society (1995-1996)

Second Vice President, Los Angeles Audubon Society (1994-1995)

Member, Advisory Committee, Los Angeles County 1996 Proposition A. Successfully lobbied for inclusion of, and wrote, statement in Proposition A's preamble pertaining to the importance of maintaining biological diversity within the County, and successfully lobbied for creation of a competitive grant category for habitat acquisition and/or restoration.

Member, Society for Conservation Biology

Member, Cooper Ornithological Society

County of Los Angeles

Final Comments on the E/A Master Plan  
Supplement to the Draft EIS/EIR

## **1.0 BACKGROUND AND EXECUTIVE SUMMARY**

### **1.1 BACKGROUND**

During 2001, A.C. Lazzaretto & Associates was retained by the Los Angeles County Chief Administrative Office to review and comment on the Draft Environmental Impact Statement/Environmental Impact Report (DEIS/EIR) prepared for Los Angeles World Airport's (LAWA) Proposed Los Angeles International Airport (LAX) Master Plan. The 2001 Draft EIS/EIR addressed three build alternatives, a no-build alternative, and the existing setting for the Los Angeles International Airport (LAX) Master Plan.

A.C. Lazzaretto & Associates assembled a team of environmental review experts to review the document for consistency and accuracy. Working in collaboration with County staff, a detailed comment letter was prepared and submitted to LAWA on 28 June 2001. Thereafter, in response to considerable public comment and the terrorist attacks that occurred on September 11, 2001, LAWA suspended work on the earlier EIS/EIR to develop a fourth alternative -- Alternative D, the Enhanced Safety and Security Plan. LAWA made a Supplement to the Draft EIS/EIR (SDEIS/EIR) available for public comment in July of 2003 to update information presented in the Draft EIS/EIR and to integrate Alternative D into the environmental review process. The Supplement offered no response to comments submitted on the 2001 DEIS/EIR.

Alternative D includes a number of airfield facility modifications. Although LAX would continue to operate with 4 runways, 2 of the existing runways would be moved, two would be lengthened, and all would be further separated from one another. New centralized passenger terminals would replace the existing parking structures. The existing Terminals 1 through 7 would be reconfigured, including a new north/south linear concourse at the Tom Bradley International Terminal, flanked on the west by a new satellite concourse. A new ground transportation center and intermodal transportation center to be built east of Aviation Blvd. would serve as the primary access for all passenger drop-off and pick-up and vehicle parking. Some cargo facilities would be modified, although overall square footage would be equivalent to the No Action/No Project Alternative.

Following publication of the SDEIS/EIR, the Los Angeles County Chief Administrative Office again retained A.C. Lazzaretto & Associates to review and comment on the revised document. A.C. Lazzaretto & Associates in turn assembled the team of environmental review experts that had reviewed the 2001 document, in order to assess the 2003 Supplement for consistency, accuracy, and changes since the original Draft EIS/EIR was prepared. The information has been evaluated using the following criteria: reasonableness of input data and assumptions, appropriateness and accuracy of analyses and mitigation measures, and conformity with requirements of the California Environmental Quality Act (CEQA) and the National Environmental Policy Act (NEPA).

Results of the current review indicate that many of the concerns expressed in our earlier comment letter still remain, including one that was central to County comments on the earlier LAX Master Plan review: although LAWA indicates that its goal is to limit growth, improvements proposed as part of Alternative D would in reality serve to reinforce LAX as the preeminent airport of the southern California region, and may undermine attempts to strengthen the role of outlying airports. There are a number of points, in addition to this thematic concern, that merit further consideration and discussion before LAWA considers certification of the Supplement to the EIS/EIR and approval of the preferred alternative.

To facilitate LAWA's review and response, the County has revised and updated the comment letter originally submitted in June of 2001. The current comment letter incorporates all issues for which a response is sought from LAWA. As before, the review team has paid special attention to the major issues of noise, traffic, environmental justice, and air quality, and the team has again made every attempt to offer objective, constructive comments concerning the major elements of the Supplement to the DEIS/EIR.

## 1.2 EXECUTIVE SUMMARY

A.C. Lazzaretto & Associates has been retained by the Los Angeles County Chief Administrative Office to review and update comments on the 2001 Draft DEIS/EIR prepared for LAWA's Proposed LAX Master Plan, consistent with changes in the current 2003 Supplement to the Draft EIS/EIR. The 2001 Draft EIS/EIR addressed three build alternatives, a no-build alternative, and the existing setting for the Los Angeles International Airport (LAX) Master Plan. The 2003 Supplement incorporates a new Alternative D (the "enhanced safety and security plan") that LAWA has designated as the preferred project option. To address safety issues, the review team has been expanded to include participation by BoydForbes, Inc., a renowned airport safety consulting firm based in Denver.

The County has a special responsibility in this process, since it represents the unincorporated communities that are most directly impacted by LAX operations. It is for this reason that the County has taken a highly active stance during 2001 and 2003, and in both instances we have focused on issues of greatest concern to our constituents. During 2001, we submitted comments to LAWA in which we expressed a number of serious concerns. With publication of the 2003 Supplement we find that most of our earlier concerns remain unaddressed and new issues have been identified that are of even greater potential concern for Los Angeles County constituents. The County has twice sought to meet with LAWA's consulting team to discuss these issues, and on both occasions has been rebuffed. In so doing, LAWA has bypassed an opportunity for identification of joint solutions that could facilitate improvements at LAX while minimizing impacts on LAX's neighbors living in Manchester Square, Lennox, Westchester and other adjoining communities. Manchester Square is that area bounded by La Cienega Blvd. on the east, Century Blvd. on the south, Aviation Blvd. on the west, and Arbor Vitae Street on the north.

Fundamentally, the County of Los Angeles believes that LAWA is proposing to implement a flawed project, and that LAWA has developed an inadequate environmental document to review the project. The following report covers a wide range of issues, many in considerable detail. While all of these issues are important, we would like to call special attention to the following key points:

- ▶ Contrary to statements made throughout the SDEIS/EIR, our review clearly shows that Alternative D will not constrain growth at LAX. LAWA has misrepresented this alternative, to the jeopardy of the environmental analysis.
- ▶ Alternative D will also not serve the security goals for which it was formulated. The Plan focuses on hardening security for the east-side entry to LAX but largely ignores the perimeter, maintenance/fuel farm, and cargo areas -- leaving the back door wide open.
- ▶ The separation concept is diminished in value by the expensive and vulnerable mass transit link proposed between the Central Terminal Area and remote landside ground facilities. It is further diminished by the lack of Flow Process Mapping data; the consequential risk of task

- overload and failure to achieve target reduction; and by the potential alienation of a public that may perceive screening requirements as excessive.
- ▶ The Security plan relies heavily on technologies, some of which have been discredited (e.g., facial recognition surveillance). Additionally, greater thought must be given to the risk of data saturation. Over-dependence on security technology may lead to higher risk of error and, ironically, diminished protection.
  - ▶ There are a number of existing, unexplained security exposures at LAX, including several areas characterized by extreme weakness in access control, that should be remedied as soon as possible; it is recommended that LAWA take steps to close Pershing Drive to public traffic as soon as practicable.
  - ▶ Use of a Supplement to the 2001 Draft EIS/EIR was improper under guidelines for CEQA. LAWA should have addressed Alternative D in a comprehensive revised draft EIS/EIR in which the full record of information was available for public review and agency decision-making.
  - ▶ The Purpose & Need statement emphasizes LAX's role in meeting regional growth, investment return, and international trade, and claims that Alternative D will fill these objectives. Yet the EIS/EIR asserts that Alternative D has the same socioeconomic characteristics as No Action, but for construction jobs, and finds that No Action would fail to meet project purpose and need. Either Alternative D fails to meet the stated goals, or Alternative D has not been described in accordance with full disclosure requirements.
  - ▶ The environmental assessment does not offer a reasonable range of Alternatives that would feasibly meet most objectives, but would avoid or lessen significant effects of the project, and thus the SDEIS/EIR fails to fulfill the "Rule of Reason."
  - ▶ Scoping Outreach did not include input from Los Angeles County Government or the public at large regarding either Alternative C (the 2001 preferred project) or Alternative D (the 2003 preferred project) and thus fails to meet basic NEPA requirements.
  - ▶ The SDEIS/EIR offers a baseline now 7 years old: conditions in 1996 do not represent the baseline of 2003. The events of 9/11 changed the baseline so fundamentally that LAWA withdrew its 2001 documents to formulate an entirely new preferred project. The 1996 baseline does not offer a reasonable yardstick against which to measure the impacts of Alternative D or any other project alternative (including No Action).
  - ▶ Piecemeal efforts to remedy the outdated baseline have further obscured understanding. The frequent shifting from one baseline nomenclature and timeframe to another is, at best, confusing. At worst, it conceals the underlying impacts that this 2003 Supplemental Draft EIS/EIR is intended to illuminate.
  - ▶ The most pressing problems at LAX are lack of adequate runway length on the north complex, the security threat of private autos near the terminals, and lack of international gates. Yet the Phase One construction plan addresses none of these for many years and instead concentrates on the airport fringes (the GTC and ITC) and on demolishing and rebuilding perfectly useable terminals to accommodate New Large Aircraft. This sequence does not match the environmental and congestion priorities evident at LAX.
  - ▶ The SDEIS/EIR contains numerous comments and statements that create an appearance of project advocacy. Even the appearance of advocacy is inappropriate given the policy guidelines contained in CEQA and NEPA and it seriously undermines confidence in the objectivity of the Draft EIS/EIR and its commitment to full disclosure.
  - ▶ The 2001 DEIS/EIR was found to lack even the most elementary NEPA requirements for Environmental Justice; many deficiencies remain in the 2003 SDEIS/EIR. In particular, Alternative D shifts many impacts toward the more economically disadvantaged

communities east and northeast of LAX, and appears to protect biological resources at the expense of residents in Lennox, Inglewood & Manchester Square.

- ▶ The document fails to disclose issues and concerns raised in Environmental Justice (EJ) workshops, defers evaluation of critical environmental justice impacts (including Air Quality and Health Effects) due to lack of data, offers ill-defined mitigations, and offers a preferred project that protects butterflies at the expense of residents and schoolchildren.
- ▶ The noise assessment contains significant discrepancies in the number of dwelling units and population impacted between the baseline year and the data published by LAWA. Additionally, there is an unexplained discrepancy in the year 2000 noise contours shown in the 2001 and the 2003 documents.
- ▶ The 2001 EIS/EIR acknowledged that it omitted quantitative assessment of toxic air pollutant exposure due to lack of time; the 2003 document also omitted this assessment, but did not so note. Completion of such studies independent of the environmental review, as proposed, would preclude establishment of baseline conditions. LAWA decision-makers will be unable to make an informed project determination until this data is developed and disclosed. The noise modeling results were based on inadequate flight track data.
- ▶ Nitrogen oxides were determined to have significant impacts before and after mitigation, but would be reduced the least under the proposed mitigation measures. The proposed mitigation measures do not appear to successfully address nitrogen oxides.
- ▶ The 'ratioing' technique used to update the analyses of airport pollutant sources for Alternatives A, B and C, and No Action, makes it difficult to fairly compare the alternatives.
- ▶ LAWA Decision-Makers will not be adequately informed until the environmental documentation provides thorough review of the following alternatives:
  - Relocation of New Large Aircraft Facilities to Another Airport
  - Major Shift of Airport Facility Improvements from East (Human Habitat) to West (Butterfly Habitat)
  - Development of a Minimum Airport Improvement Plan incorporating only High Priority elements

The County looks forward to reviewing LAWA's responses, particularly with respect to the additional commitments requested throughout this comment letter. At the same time, the County believes that LAWA's interests would be best served through preparation of a *comprehensive revised Draft EIS/EIR* in which *the full record* of information is consolidated in a manner that facilitates public review and agency decision-making.

## **2.0 INTRODUCTION TO THE COMMENT LETTER AND REPORT ORGANIZATION**

A.C. Lazzaretto & Associates has again been retained by the Los Angeles County Chief Administrative Office to review and comment on a Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (SDEIS/EIR) prepared by Los Angeles World Airport (LAWA) to address the impacts of a proposed Master Plan for Los Angeles International Airport (LAX). The SDEIS/EIS was issued in response to considerable public comment on the Draft EIS/EIR and Master Plan presented during 2001 and in response to the terrorist attacks that occurred on September 11<sup>th</sup> of that year. The SDEIS/EIR introduces a new preferred alternative -- Alternative D, the Enhanced Safety and Security Plan. In reviewing the Supplement, we have again noted the high quality of writing, and the thoughtful organization and presentation of materials that is evident in many of the technical reports. We again conclude, however, that the documents are substantially compromised by significant errors, omissions, and biases. We submit

that LAWA has used improper procedures -- under CEQA and NEPA -- to introduce the new preferred Alternative D, and we conclude that LAWA has offered misleading statements concerning the potential for further growth at LAX.

The review team assembled by A.C. Lazzaretto & Associates includes all firms who contributed to the 2001 review, as well as a new firm -- BoydForbes, Inc. -- that was brought in to review the highly technical, and critically important issues pertaining to airport safety and security. Based in Colorado, BoydForbes, Inc. is one of a handful of firms that specialize in airport security and have the ability to critically review the environmental documentation pertaining to this topical issue. Team members who also participated in the earlier effort include Michael Brandman Associates, Bauer Environmental Services, Austin-Foust Associates, and Mestre Greve Associates. Each of these firms is a leader in the field of environmental review and key members have extensive experience working with the environmental review of airport projects.

In performing the task of reviewing the Draft EIS/EIR, the County has made every attempt to offer objective, constructive comments concerning the major elements of the Draft EIS/EIR. We have made note as appropriate where issues may involve diverse views among experts.

The following report is organized to facilitate LAWA's review and response to the issues raised. As such, the general flow of this review document follows the topic pattern of the Supplement to the DEIS/EIR; however, there are many sections that have been rearranged in order to emphasize a particular point or to clarify the issue at hand. This is particularly true in the following discussion (§3.0 below) which deals with general issues that are evident throughout the SDEIS/EIR document and are not specific to any single section.

This document focuses only on issues of concern to the County from a legal standpoint, and does not attempt to identify or discuss those sections in the SDEIS/EIR that appear to meet State or Federal guidelines. This is not to say that sections not mentioned in this document can be assumed adequate; rather, the sections are omitted from this document in order to focus on areas of greatest concern to the Los Angeles County Board of Supervisors.

### **3.0 GENERAL ISSUES**

This section identifies issues that are evident throughout the entire Supplement to the DEIS/EIR document. Typically, the issues raised in this section deal with the backbone of the SDEIS/EIR and, therefore, the errors, omissions, and faulty conclusions identified herein are those that compromise the validity of the Supplement to the Draft EIS/EIR as a whole.

#### **3.1 ALTERNATIVE "D" DOES NOT CONSTRAIN GROWTH AT LAX**

##### **3.1.1 Airside Gate Frontage Far Exceeds Stated Levels**

The SDEIS/EIR claims that Alternative D would serve, in the year 2015, no more passengers than would be expected with current airport facilities (approximately 78 Million Annual Passengers [MAP]). Despite massive improvements to the capacity of the runways and terminals, the SDEIS/EIR also claims that passenger limits will be assured by limiting "airside gate frontage." These assertions do not hold up to scrutiny. In fact, Alternative D increases "airside gate frontage",

increases the number of aircraft gates, and increases aircraft gate efficiency beyond the levels contained in the No Project Alternative. The Master Plan states that:

*“Alternative D is described as constrained because...facilities would not be designed to accommodate the unconstrained aviation demand forecast profile. Specifically, the terminal frontage available in Alternative D to park aircraft side-by-side is less than the equivalent terminal frontage available in the No Action/No Project Alternative.”* (emphasis added)

Further, the Supplement to the EIS/EIR states:

*“The net effect of these terminal changes would be a reduction in the total airside gate frontage available for aircraft gates and in the number of available aircraft gates to match the peak gate requirements identified in the Alternative D design day schedule.”*

Neither the Supplement to the Master Plan nor the Supplement to the Draft EIS/EIR provides any further explanation, data or calculations to substantiate those statements. On the contrary, as shown on the attached table, Aircraft Gate Comparison, various graphics in the Master Plan provide evidence directly contravening those statements.

**Table 1**  
**AIRCRAFT GATE COMPARISON**  
**EXISTING, NO PROJECT & ALTERNATIVE “D”<sup>1</sup>**

Terminal	1996 Existing			2015 No Project		Alternative D		
	Air Carrier Contact Gates	Commuter Parking	Frontage Length (ft.)	Air Carrier Contact Gates	Commuter Parking	Air Carrier Contact Gates	Commuter Parking	Frontage Length (ft.)
1	14	6	1,740	16	0	0	0	0
2	10	0	1,201	10	0	0	0	0
3	12	3	2,104	12	0	0	0	0
4	10	10	n/a	13	0	16	0	n/a
5	16	0	n/a	16	0	16	0	n/a
6	10	14	n/a	13	0	13	0	n/a
7	12	0	n/a	12	0	15	0	n/a
8	8	0	n/a	8	0	0	19	n/a
TBIT	12	0	2,111	12	0	19	0	3,184
Remote	0	0	0	19	33	0	0	0
New West	0	0	0	0	0	27	13	4,148
New North	0	0	0	0	0	15	0	3,416
<b>TOTAL</b>	<b>104</b>	<b>33</b>	<b>7,156</b>	<b>131</b>	<b>33</b>	<b>121</b>	<b>32</b>	<b>10,748</b>

The amount of “airside gate frontage available for aircraft gates” is easily calculated using scaled drawings contained in the Master Plan. As shown on the attached Table 1, Alternative D includes an increase of nearly 3,600 linear feet of terminal frontage: Terminals 1, 2 and 3 will be replaced by the New North Terminal; Tom Bradley International Terminal will be reconfigured; and a New West Terminal will be built. No changes will be made to Terminals 4 thru 8. The total *existing*

<sup>1</sup>‘1996 Existing’ data obtained from Master Plan Figure II-3.2; ‘2015 No Project’ data obtained from Figure ES-1; ‘Alternative D’ data obtained from Figure 2.2-4.

frontage of the terminals being modified is thus 7,156 feet; following proposed modifications, the terminals will encompass 10,748 feet — an increase of 3,592 feet. To substantiate its claim concerning existing conditions, the Master Plan must be including the “remote gates” that are little more than apron area where aircraft are parked. These areas with their low efficiency are not a suitable comparison to actual aircraft gates with jetways linked to a terminal. To suggest differently is to ignore well-established planning factors for passenger processing.

The number of aircraft gates also increases with Alternative D. The Master Plan Supplement uses figures in its summary tables to indicate that the No Project Alternative has 163 gates and that Alternative D has 153 gates — indicating a reduction. However, these figures do not correspond to other figures in the Master Plan. For example, Table ES-2 in the Master Plan Supplement indicates 115 contact gates<sup>2</sup> and 48 remote gates for an existing total of 163. However, Figure II-3.2 of the Existing Conditions Working Paper (Chapter 2 of the Draft Master Plan), provides a detailed accounting of all existing gates and aircraft parking spaces, and it shows quite clearly that there are only 104 contact air carrier gates at present. Additionally, it shows 33 parking places for commuter aircraft located adjacent to terminals 1, 3, 4 and 6 and accessed via stairways. Except for one passing reference to 36 Narrow Body Equivalent Gates with access to the Bradley Terminal, Chapter Two makes no mention of the 19 remote gates in the northwest corner.

In the No Project Alternative, some of the parking spaces used for commuter flights have been converted to parking spaces for air carriers, and those spaces are now counted among the air carrier gates in the No Project Alternative. Furthermore, the 19 remote aircraft parking spaces have become prominent in the SDEIS/EIR No Project Alternative, implying that there are now 131 “gates” for air carriers and 32 “gates” for commuters. In reality, there are no more true contact gates today than there were in 1997. It is only that some existing concrete apron space formerly used for maintenance and other uses is now being used on a regular basis to park scheduled aircraft. This practice requires that passengers are bussed to the terminals, in a manner that the Master Plan admits is costly and inefficient. In simpler terms, there are now 112 air carrier parking spaces adjacent to the terminals, 19 remote air carrier parking spaces in the northwest corner, and areas for parking approximately 32 commuter aircraft at two remote locations.

Aircraft gates for Alternative D are depicted very clearly on Figure 2.2-4 Gate Layout and Utilization in the Supplement to the Master Plan. This Figure shows 121 air carrier contact gates and 32 parking spaces for commuter aircraft and/or regional jets. Alternative D also includes the conversion of 8 existing air carrier contact gates in Terminal 8 to spaces to park 19 commuter turbo props/regional jets.

The evidence is quite clear that Alternative D provides 8 more air carrier contact gates than the No Project Alternative, and in a configuration that is more efficient.<sup>3</sup> Additionally, under Alternative D LAWA retains the flexibility to create remote gates on available apron space. As the historical evidence shows, LAWA has not prepared environmental documentation for similar operational modifications at LAX in past years. Furthermore, LAWA could easily retain the eight contact gates in Terminal 8, thereby boosting the total for Alternative D to 129 contact gates — 15% more than the existing LAX layout. Accordingly, under Alternative D LAWA has the potential to

---

<sup>2</sup> A “contact gate” includes traditional numbered gates in the terminal and a jet way to a waiting aircraft.

<sup>3</sup> Linear configurations offer more flexibility than the current cul-de-sac design; the Construction Phasing Plan notes that the reconstruction of terminals 1, 2, & 3 into a linear configuration will create a “continuous Group VI flightline.”

increase the number aircraft gates, increase airside terminal front footage, replace inefficient aircraft gates with more efficient ones and create additional remote gates.

### **3.1.2 Runway Design Capacity is Understated**

The preferred alternative will also serve future growth through the proposed runway design: the runway configuration for Alternative D has the same or higher capacity as Alternative C -- 90 MAP. Alternative D, in the same manner as Alternative C, addresses existing runway constraints by lengthening both of the north complex runways and by increasing the separation distance between them. The fact that the new four runway system can handle more than 78 MAP is stated very clearly in the Master Plan addendum on page 3-4: *“Alternative C’s projected annual passenger activity level served is limited by the capacity of the four-runway system and is forecast to be approximately 89.6 million (air passengers.)”* Given that Alternative D uses the same 4-runway configuration as Alternative C, and Alternative D extends RW 6L/24R an additional 1,000 feet farther than does Alternative C, it can be concluded that the capacity of the runways under Alternative D is the same or more than Alternative C -- approximately 90 MAP.

### **3.1.3 Passenger Levels will be Much Higher than Forecast for Alternative D**

Alternative D will allow unconstrained growth through the year 2015. Unlike the most recent FAA forecasts, the “unconstrained forecast” of 98 MAP in the Master Plan has not been updated to reflect changes in the air industry that have occurred following the events of 9/11. The most recent FAA Terminal Area Forecasts for LAX indicate that service levels at LAX will not reach the year 2000 levels (64 MAP) until the year 2008 and that service levels in 2015 will be approximately 81.6 MAP. Using those figures, Alternative D provides little if any constraint on growth.

Alternative D understates the passengers per operation. Alternative D accommodates the new Super Jumbo A380 (referred to in the Master Plan as the New Large Aircraft by creating a separation of 1040 feet between the two northern runways and by demolishing terminals 1, 2 and 3 and reconstructing a “continuous Group VI flightline.”<sup>4</sup> The arrival of the New Large Aircraft, with almost 600 seats, will increase the passenger handling capacity of the runways and airspace by increasing the number of passengers per aircraft operation. Nevertheless, the Master Plan forecasts that Alternative D will have a lower number of passengers per operation than Alternative C and in fact forecasts a lower number than currently exists. As indicated on Table 3.3-1 of the Master Plan Addendum, Alternative D is forecast to have only 121.06 passengers per air carrier operation, while Alternative C is forecast to have 124.95. The table fails to include the actual numbers for the years 1996 and 2000. However, information from the LAWA web site indicates that passengers per air carrier operation totaled 109.5 in 1996, 119.65 in 2000, 116.62 in 2001, 123.18 in 2002, and 125.4 thru July of 2003. The number of passengers per operation is expected to continue to increase as airlines increase the size of aircraft and increase their load factors (percentage of sold seats.) Furthermore, there is a large and unexplained increase in the number of commuter flights (from 109,000 in Alternative C to 183,000 in Alternative D). Commuter flights average only about 20 passengers per aircraft. If some of the capacity used for commuter operations was used instead for air carrier operations, the number of passengers would again increase. There is thus abundant evidence that the runway capacity proposed under Alternative D is much greater than 78 MAP.

<sup>4</sup> In contrast, the south runways will be separated only by 795 feet which is sufficient for aircraft such as the B747.

### 3.1.4 Terminal Space in Alternative D is Equivalent to Alternative C

Alternative D increases terminal space by 70%. The proposed increase in terminal space from 4 million square feet (msf) to 6.8 msf represents a considerable increase -- 70% higher than existing. The resulting capacity is only 8% less than Alternative C, again indicating an ability to handle many more than 78 MAP.

### 3.1.5 The No Project Alternative Cannot be used to Evaluate Alternative D.

Comparison with the No Project Alternative does not provide a reasonable basis to conclude there will be no additional growth. As discussed below in §3.4.2, the origins of the service levels used in the No Project Alternative are obscure and undocumented, thus casting some doubt upon their validity. If the No Project service levels are inflated, as we anticipate, then Alternative D would surely be promoting growth as the service levels increased from the current 55 MAP to 78 MAP.

## 3.2 IMPROPER USE OF A SUPPLEMENT TO THE DRAFT EIS/EIR

The CEQA Guidelines state that a Supplement to an EIR may be prepared if changes to a project are not considered major (§15162(a)). Where the changes necessitate major revision to a previous EIR, CEQA requires preparation of a Subsequent EIR. Both types of documents must receive the same notice and public review requirements as the original EIR. However, in a Subsequent EIR, *all information* must be presented, whereas in a Supplemental EIR only *new or revised information* need be presented. Discussion provided in Public Resources Code §21166 (and CEQA Guidelines §15162 and §15163) indicate that both types of review are intended for use in connection with *previously certified or approved* environmental documents. For documents that have not yet been certified, CEQA outlines a procedure for recirculation. Discussion provided with the CEQA Guidelines states specifically that, "*Circulating a subsequent EIR or supplement to an EIR is not "recirculation" as described under §15088.5.*"

In the present case, there is no previously certified or approved document. Furthermore, review of the Supplement to the Draft EIS/EIR provides incontrovertible evidence that changes to the proposed project are major and affect the entire environmental assessment: LAWA has presented an *entirely new alternative* as the preferred project, and the alternative was *created to meet safety and security challenges that did not exist in 2001*. In effect, the entire framework for this project -- from the baseline conditions, to the project purpose and need, to the very project itself -- changed following September of 2001, and yet LAWA used a CEQA format intended for minor changes to a certified EIR.

Finally, the format used by LAWA serves to obfuscate rather than facilitate understanding of this complex project.<sup>5</sup> Every reasonable interpretation of CEQA would indicate that LAWA should have addressed the project through preparation of a comprehensive revised Draft EIS/EIR, in which

---

<sup>5</sup> At a minimum, the SDEIS/EIR Index (§7.7) could have provided the reader with a more listing of topical issues and where they can be found, along with a cross reference to text discussions in the 2001 and 2001 documents. Instead, the Index offers only a cursory guide to topical discussions (for example, the Index contains no references for "cumulative impacts") and provides no useful tools for locating or accessing analyses from the 2001 Draft EIS/EIR.

the *full record* of information was consolidated in an effort to facilitate public review and agency decision-making.

Public review and lead agency decision-making would also have been far better served by providing copies of the comment letters submitted during public review of the original EIS/EIR. During 2001, the County of Los Angeles devoted considerable time, public funds and staff effort to review and submit comments on the extensive Draft EIS/EIR and Master Plan documentation released by LAWA at that time. Surely a similar effort was spent by many other agencies, organizations and individuals, and it is probable that the collective comments contained a wide range of information that would have been relevant to the current review. Despite this fact, the Supplement to the Draft EIS/EIR makes no effort to present *or even summarize* the earlier comment letters. This approach creates a process that is confusing and cumbersome for reviewing agencies and organizations, and thwarts an opportunity to advance public participation. A response to the earlier comments would have served to advance public discourse, strengthen the opportunity for environmental protection, and facilitate an understanding of the Lead Agency's thinking on a wide range of key issues. We acknowledge that LAWA was under no obligation to respond or acknowledge the earlier comment letters. However, the failure to have done so belies a continuing pattern of disinterest in public views that was established in 2001.

### 3.3 INCONSISTENT PURPOSE & NEED STATEMENT

The apparent contradiction between SDEIS/EIR statements and actual intent is also evident in the discussion of project purpose and need. The SDEIS/EIR states, on page ES-1, that the purpose and need for the project have not changed:

*"The purpose and need for the LAX Master Plan has not changed since the publication of the Draft EIS/EIR...In particular, the Master Plan project objectives are to:*

- ▶ *Respond to local and regional demand for air transportation during the period 2000-2015, taking into consideration the amount, type, location, and timing of such demand.*
- ▶ *Ensure that new investments in airport capacity are efficient and cost-effective, maximizing the return on existing infrastructure capital.*
- ▶ *Sustain and advance the international trade component of the regional economy and the international commercial gateway role of the City of Los Angeles."*

In a number of text discussions, the SDEIS/EIR affirms that Alternative D responds to the stated purpose and need for this Master Plan, as shown in the excerpts below from pages 2-1 and 3-25:

*"Alternative D, the "Enhanced Safety and Security" alternative, offers a well-planned and rational 'regional approach' alternative for improvement of LAX. Alternative D would respond to future demand for air transportation by encouraging, but not requiring, other airports in the Los Angeles area to increase capacity to make up for the limitations of LAX. It would allow airlines to accommodate the demand for international aviation at LAX to the greatest extent possible without otherwise increasing capacity of the airport generally. It would also maintain the return on existing capital investments at LAX. Thus, Alternative D would allow the Los Angeles region to realize some of the important economic benefits outlined in the Draft EIS/EIR, while at the same time enhancing security and safety at the airport and significantly reducing environmental impacts from airport operations to the surrounding communities."*

*“Alternative D, as stated previously in § 3.1, Formulation and Refinement of Alternatives, of this document, is a direct response to the strongly expressed desire of many citizens, as indicated in comments received on the Draft EIS/EIR, for a regional approach to airport planning in Southern California that is more aggressive than demonstrated by the previously considered Master Plan build alternatives. The Mayor of Los Angeles, noting the need to fully examine a regional approach to satisfy air transportation demand, directed LAWA to develop a new Master Plan alternative for the improvement of LAX. Responding to the Mayor’s direction, the new alternative is designed to:*

- ▶ *Enhance safety and security at LAX for users and to protect the airport infrastructure*
- ▶ *Encourage the development and use of regional airports to serve local demand by constraining the facility capacity at LAX to approximately the same aviation activity levels identified in the No Action/No Project Alternative;*
- ▶ *Maintain LAX as the International Gateway to Southern California; and*
- ▶ *Mitigate the impacts of LAX’s continued operation.”*

At the same time, the SDEIS/EIR emphasizes that Alternative D is equivalent in many ways to the No Action /No Project Alternative. For example, SDEIS/EIR page ES-17 includes the following statement:

*“Alternative D would encourage a long-term regional approach to serving air traffic demand in the Los Angeles basin by designing facilities at LAX to accommodate passenger and cargo activity levels equivalent to the No Action/No Project Alternative activity level, but would be designed to allow air carriers to emphasize international routes at LAX.”*

The Project Description (page 3-25) expands on this theme, including the statement below:

*“LAWA determined that constraining the aircraft gate frontage at the terminals is a component of the airport system that is fully within its control. LAWA can constrain the development of this frontage and believes that this will, in turn, place an effective constraint on total passenger activity at LAX. LAWA can also control the amount of available cargo warehouse and processing space at LAX. By constraining the development of these cargo facilities, total cargo activity at LAX would be constrained.”*

Further, the SDEIS/EIR provides quantitative data to support these statements, as shown below with information excerpted from SDEIS/EIR Tables ES-1 and ES-2.

**Table 2  
COMPARISON OF NO PROJECT WITH ALTERNATIVES ‘C’ AND ‘D’<sup>6</sup>**

Facility	No Action/No Project Alternative	Previously-Preferred Alternative C	Currently Preferred Alternative D
Cargo-Annual Tons	3,120,000	4,172,000	3,120,000
Total # Nominal Gates	163	168	153
Million Air Passengers	78.7	89.6	78.9

<sup>6</sup> Note again that the 163 gates shown for the No Project alternative includes 52 remote parking spaces.

And yet the SDEIS/EIR claims that the No Action/No Project Alternative is seriously deficient. For example, discussion on page ES-7 states that the No Action/No Project Alternative “*would fall far short of meeting the projected demand for aviation services at LAX by accommodating approximately 78.7 million passengers (a shortfall of approximately 19.2 million) and 3.1 million tons of cargo (a shortfall of approximately 1 million tons) in 2015.*”

The SDEIS/EIR also portrays the No Action alternative as *de minimis* in the scope of its improvements, but allowing for increased passenger and cargo volumes, as shown in discussion from page 3-6:

*“This [No Project] alternative includes only minor airport improvements approved as of the publication of the Draft EIS/EIR in January 2001 or that were in the planning stages at that time. The improvements include minor taxiway improvements, new cargo building space, construction of at least one off-airport parking structure, and reconstruction of an on-airport parking structure. Passenger and cargo volumes would continue to increase in response to projected demand, reaching activity levels in 2015 of approximately 78.7 MAP and 3.12 MAT, respectively.”*

In essence, the Supplement to the DEIS/EIR offers the following unsupportable syllogism: Alternative D meets project goals, Alternative D is substantially the same as No Action, and No Action fails to meet project goals. As discussed more fully below (and in previous sections), we believe that this inconsistency arises from the fact that the EIS/EIR is misleading in its description of alternatives.

### 3.4 INADEQUATE ASSESSMENT OF ALTERNATIVES

#### 3.4.1 Inadequate Definition and Evaluation of Project Alternatives

The SDEIS/EIR fails to comply with two cornerstone elements of CEQA – that an EIR must describe a reasonable range of Alternatives that would feasibly meet most objectives, but would avoid or lessen significant effects of the project,<sup>7</sup> and that preparation of an EIR should be guided by a good faith effort at full disclosure.

The Supplement to the Draft EIS/EIR carries forward the project goals that were previously established in the 2001 DEIS/EIR. These goals included: (a) to respond to local and regional demand for air transportation during the period 2000-2015; (b) to ensure that the investment in airport capacity maximizes the return on existing infrastructure capital; and (c) to advance the role of LAX as the international commercial gateway to the region. Alternative D is presented as an option that would fulfill key aspects of the project purpose and need.

The SDEIS/EIR also emphasizes, repeatedly, that Alternative D is substantially the same as the No Action Alternative in terms of meeting transportation demand -- as measured by number of gates, number of passengers, number of aircraft operations, and cargo tonnage. Yet the No Action Alternative as presented is clearly deficient in terms of meeting demand for aviation and cargo services.

---

<sup>7</sup> CEQA §15126.6(f) states, “Alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project.”

If this inconsistency has a sound explanation, it is the job of the SDEIS/EIR to provide that explanation. Instead, the SDEIS/EIR is permeated with unexplained inconsistencies. Similar incongruities were apparent in the 2001 document. The 2001 Draft EIS/EIR presented Alternative C as the preferred action, yet concluded that Alternative C would have more significant unavoidable adverse effects than either of the other two build Alternatives (25 for C; 23 for A; 22 for B), and would fail to meet projected demand.

In this regard, both the Draft and the Supplement to the Draft EIS/EIR fall short of the requirement that environmental documents must provide a *clear definition of project goals* in association with the selected range of alternatives. As now presented, the data suggest either that Alternative D fails to meet essential aspects of the stated goals, or that Alternative D has not been described in accordance with full disclosure requirements.

### **3.4.2 Alternatives are Inconsistent with Baseline Data**

On close review, the numbers provided in the Tables entitled “Summary of Activity, Comparison of Alternatives and Summary of Features, Comparison of Alternatives”<sup>8</sup> do not present a cohesive picture. When compared with data provided throughout the baseline and impact analyses, information contained in this summary statement appears to be fundamentally lacking in logical internal consistency. For example, in describing assumptions made for the No Project Alternative, the Socioeconomic Technical Report<sup>9</sup> indicates, “The schedule of operations would still show variations throughout the day but the peak period would be at or exceed the airfield’s capacity. Congestion, delays and passenger inconvenience would be common all year, not just during peak holiday periods.” However, the “Summary of Features, Comparison of Alternatives” contradicts these claims. The Summary indicates that the No Project Alternative would have: (a) fewer all-weather delays than Alternative C (13.2 vs.13.6); (b) fewer annual cancellations than Alternatives A and C (9,969 vs. 15,477 and 15,814); (c) more public parking stalls than Alternative B; and (d) the same number of all-weather peak operations and 3-hour average operations.

Similar inconsistencies occur with the addition of Alternative D. Most notably, the Design Day activity levels should approximate those for Alternative C given that the runway improvements are nearly identical. Further, public parking stalls and employee parking stalls are equal to or greater than other build alternatives, and rental car acreage is doubled over other alternatives. Passenger terminal square footage is 93% of Alternative C, but the passengers are 88%. This indicates faulty project design without consistent use of planning factors.

### **3.4.3 Alternative D may Exceed the Stated Growth Levels**

The SDEIS/EIR states that Alternative D evolved from a decision on the part of LAWA and the City of Los Angeles to limit growth. Alternative D does limit growth below that of Alternative A and B. However, as discussed in § 3.1, this alternative would not limit LAX to 78.7 MAP as claimed. Considering the extensive improvements to the airfield, passenger terminals, roadways and other facilities, it is more reasonable to assume that Alternative D will achieve service levels equaling or exceeding those of Alternative C (90 MAP). Furthermore, many elements of Alternative D resemble the Phase I construction of other alternatives: in future years, land area in

<sup>8</sup> Pages ES-9 through ES-11.

<sup>9</sup> Section 5.1.1.

the western part of the airport can be used for additional terminal space, and available apron space can be readily converted to remote terminal space. These possibilities merit evaluation in the SDEIS/EIR.

The SDEIS/EIR makes certain assumptions that require further explanation or verification. Why for example do commuter flights increase from 109,000 in Alternative C to 183,000 in Alternative D? If commuters fail to materialize, will the excess capacity be used for air carrier aircraft? Similarly, as discussed earlier in regard to the No Project Alternative, air cargo growth may also not be constrained.

Many of the more capital-intensive improvements in Alternative D seem to contravene the intended purposes. For example, Alternative D would require that significant resources be devoted to separating runways and demolishing existing terminals to provide for the New Large Aircraft. In fact, many major airports in the USA have already taken a position that they will not underwrite these costs. Yet easing the way for the New Large Aircraft at LAX will surely enhance the concentration of air service at LAX to the detriment of the other regional airports. If provisions for the new 600-seat New Large Aircraft were instead placed at Ontario International Airport, it would provide a powerful incentive for the airlines to increase service there. It takes many connecting flights to fill a 600 seat aircraft; if LAX is designed to accommodate these aircraft, one outcome will be to strongly reinforce the ability of LAX to attract the bulk of the region's air service.

The stated security enhancement goals can be achieved without the expense and vulnerabilities of an Automated People Mover by building the three principal ground processing landside facilities in a strategic configuration closer to the Central Terminal Area.

#### **3.4.4 Regional Alternatives would be Best Served by Relocating New Large Aircraft Inland**

The Master Plan is at odds with itself in regards to constraining or expanding LAX. As set forth in the Draft Master Plan and SDEIS/EIR, serious economic consequences will befall the region if LAX is not expanded to accommodate the unconstrained demand, and then the Supplement presents a Preferred Alternative that purports to do just that. The recent growth spurts at Long Beach and John Wayne will soon peak out. LAX will continue to attract cargo and international flights because the carriers continue to resist using other regional airports, particularly those in the inland empire. The proposed expansion of LAX and particularly the provisions for the New Large Aircraft are simply another chapter in the long history of incremental growth. As soon as these improvements are completed in twenty years or so, there is every indication that there will be another round of master planning to continue that pattern. As stated above, this master plan claims to support a regional approach to air transportation, but does not incorporate the one feature that would most secure it – i.e., relocation of the New Large Aircraft improvements to Ontario or Palmdale International Airports.

#### **3.4.5 Additional Alternatives to Evaluate**

Under CEQA, the range of alternatives addressed in an EIR should be governed by the 'Rule of Reason' which states that an EIR need only address those alternatives necessary to provide decision makers with a reasoned choice. Under this Rule, the selection of alternatives is guided by feasibility, efficacy in reducing or avoiding impacts, and ability to foster public participation and informed decision-making. 'Feasibility' includes site suitability, economic viability, availability of

infrastructure, compatibility with relevant planning documents and jurisdictional controls, and proponent access in cases where the alternative involves another location. In considering alternate locations, the “key question” to be asked is whether any of the significant project impacts could be lessened or avoided by relocating the project to another site.

**Relocation of New Large Aircraft Facilities to another Airport:** The Rule of Reason applies to the LAX Master Plan SDEIS/EIR, and this document will not meet the standards of adequacy until it evaluates relocation of all or part of the project to another site. The County of Los Angeles requests that LAWA provide such analysis for the following alternative: relocation of facilities oriented to the New Larger Aircraft to Ontario International and/or Palmdale International, both of which *were designed to accommodate international travel, are underutilized, and are owned and operated by LAWA.* Such an alternative would almost certainly enable LAWA to reduce project impacts around LAX substantially, without concomitant impacts at the relocation sites.

**Shift Airport Improvements from the East to the West:** The County also requests that LAWA evaluate an alternative in which improvements are shifted away from human habitat on the north and east and into the butterfly habitat on the west. We understand why LAWA may have wished to avoid this assessment in light of the complex background and history surrounding the El Segundo Blue Butterfly Habitat Restoration Area and the Los Angeles/El Segundo Dunes. However, the path of omission forecloses an important opportunity for informed decision-making. In this case, *the proposed Master Plan improvements will cause new, significant and unavoidable adverse new impacts to thousands of human beings (i.e. elevated noise levels, increased single-event exposures, increased school disruption, loss of industrial jobs and historical resources, elevated pollutant levels, etc.).* Due to omission *decision makers will not know* whether it may have been possible to lessen or avoid these impacts by shifting the improvements westward and instead imposing the significant unavoidable adverse impacts on a population of 7,000-87,000 endangered El Segundo Blue Butterflies. *Decision makers will not know* how the mitigation costs for the human impacts would compare with the mitigation costs for relocating butterfly habitat. Due to omission, *decision-makers will be unable fulfill their statutory obligation* to weigh, balance and consider the trade-offs, costs and opportunities associated with environmental justice and resource protection. To avoid this outcome, the County of Los Angeles asks that LAWA provide the public and LAWA decision-maker with a full and complete assessment of this alternative.

**Redesign and Reprioritize Proposed Airport Improvements:** Finally, in furtherance of finding an environmentally superior alternative that fulfills the basic objectives of the project, the County asks that LAWA develop, consider and comment on a new Alternative that would solve the urgent needs LAX in a timely manner and also eliminates costly, time consuming and controversial items. The following elements should be addressed:

- ▶ Fast track the addition of international gates on the west side of Tom Bradley International Terminal.
- ▶ Fast track the lengthening of RW 6R/24L in its present position.
- ▶ Widen the north complex runways by moving RW6L/24R to the north as proposed in Alternative C.
- ▶ Eliminate the Ground Transportation Center and the Automated People Mover. Prohibit private vehicles on World Way in the Central Terminal Area, and provide security screening for a fleet of zero emission vans that would serve the many airport and privately owned garages around the airport. (Note that this trend is already evident.)

- ▶ Eliminate all provisions for the New Large Aircraft including the Design Category VI spacing of the north complex runways and provision of larger aircraft gates.
- ▶ Provide additional space in the Central Terminal Area as proposed in Alternative D.
- ▶ Close Pershing Drive to all public access.

### **3.4.6 Scoping Outreach did not Include Alternative D**

LAWA made the 2003 SDEIS/EIR available for public comment in July of 2003 to update information presented in the 2001 Draft EIS/EIR and to integrate Alternative "D" into the environmental review process. Alternative D, the "Enhanced Safety and Security Plan," introduces numerous infrastructure and concept changes into the alternatives analysis including a reprioritization of project goals to emphasize safety. In turn, the shift in project objectives changes the manner in which alternatives must be assessed in the environmental analysis. The objectives of the CEQA process include fostering interagency coordination early in the review of projects and encourage public participation in the planning process.<sup>10</sup> Similarly, the purpose of the scoping process required by NEPA is to identify and disclose all of the potential Alternatives under consideration by the lead agency. This provides the public with the greatest ability to understand project issues and thus contribute useful information, suggestions and comment for consideration by the lead agency decision-makers.<sup>11</sup>

In the present case, the scoping outreach and early consultation with Responsible and Trustee Agencies did not include Alternative D, which became the preferred project. This denies the public of the opportunity to comment, and it also raises questions as to the validity of the process by which "D" became the preferred Alternative -- between the 1996 circulation of the Notice of Preparation (NOP), and scoping outreach, and the circulation of the 2003 SDEIS/EIR. If the objectives and scope of the project changed sufficiently between initial outreach and circulation of the Supplement to the Draft to warrant incorporation of a preferred Alternative that was not even included in the original Draft EIS/EIR, then the NEPA scoping process should have started again. CEQA also requires, at minimum, circulation of a comprehensive Subsequent Draft EIR that includes full disclosure of the alternatives analysis and process used to select the preferred Alternative.<sup>12</sup>

## **3.5 INADEQUATE AND OUTDATED BASELINE SETTING**

### **3.5.1 The 1996 Baseline is not Applicable to Existing Conditions in 2003**

The Draft and Supplement to the Draft EIS/EIR both comply with the CEQA requirement that the baseline be defined by conditions extant at the time the Notice of Preparation was released. However, because the baseline was already five years old at the time of the 2001 Draft EIS/EIR release, and is now 7 years old for analyses contained in the Supplement, the review fails to comply with the intent of CEQA to facilitate an understanding of changes in the environment associated with the proposed project. Use of the five-year old baseline, coupled with the document's frequent assumption that mitigative actions addressing air quality, noise, traffic, water quality, and other topical issues will occur primarily (or only) through project-related activities, tends to consistently overstate the impacts of the No Project Alternative relative to other Alternatives. Although the

<sup>10</sup> CEQA Guidelines § 15002, § 15086, and § 1587

<sup>11</sup> NEPA Guidelines: 40 C.F.R. § 1508.25

<sup>12</sup> CEQA Guidelines §15162(a)

2003 SDEIS/EIR provides the “normally” accepted “baseline” of conditions extant at the time the NOP was released, CEQA Guidelines by implication allow the Lead Agency to use a baseline different than the NOP released date when “non-normal” circumstances occur.<sup>13</sup>

In the present case, several “non-normal” circumstances have occurred that necessitate an updated baseline. In particular, the NOP is now seven years old and conditions extant in 1996 do not represent existing conditions at the project site. More significantly, the extraordinary events of September 11, 2001 significantly altered baseline conditions – physical and social -- from what existed when the NOP was released. So fundamental were these changes that LAWA withdrew the then-pending Draft EIS/EIR and Master Plan, and proceeded to formulate an entirely new alternative, which it then identified as its preferred project. Clearly, the 1996 baseline material provides an inadequate yardstick against which to measure and understand the impacts of Alternative D or any other project alternative (especially including the No Action Alternative).

It is generally understood that air travel will not soon return to pre-9/11 conditions. After 9/11, LAX implemented new operational procedures that in turn changed (1) the location and distribution of passengers and visitors, (2) the length of time passengers are at the airport, (3) the number of passengers arriving, and (4) the number of aircraft taking off and landing.

For all of these reasons the 2003 Supplemental Draft EIS/EIR fails to comply with the intent and judicial interpretation of CEQA relative to the Baseline Analysis – i.e., to facilitate an understanding of changes in the environment associated with the proposed project and project Alternatives. Furthermore, use of this 7-year old baseline tends to consistently overstate the impacts of the No Project Alternative relative to other Alternatives. When coupled with the Draft EIS/EIRs frequent assumption that mitigative actions addressing air quality, noise, traffic, water quality, and other topical issues will occur primarily (or only) through project-related activities, the error is even more apparent. CEQA clearly intends that the baseline should reflect the existing level of actual development to the maximum extent possible; since the Draft EIS/EIR baseline is set at 58 MAP (vs. 67+ MAP at present – a 15%+ discrepancy), this intent is clearly unmet.

In order to achieve an adequate document, LAWA needs to provide an updated baseline for all topical sections where current data is available. Doing so will minimize the risk of an unfavorable ruling such as the situation encountered by Logan Airport in Boston. The United States Environmental Protection Agency rated the 1999 Logan Airport EIS as “Environmental Objection, Insufficient Information” for, among other concerns, the use of the outdated baseline year of 1993.

### **3.5.2 Baseline Terminology is Inconsistent and Confusing**

The baseline data is also inconsistent. This problem extends not only to the many different years used as the “baseline”, but also to incorrect identification of the base year for given data sets. For example, the 4<sup>th</sup> quarter 1996 database cited for the noise calibration does not match actual 4<sup>th</sup> quarter data according to published noise contours.

---

<sup>13</sup> CEQA Guidelines § 15125

**Table 3**  
**DIFFERENCES BETWEEN EIS/EIR NOISE IMPACT**  
**& LAWA 1996 QUARTERLY REPORT**

	Dwellings Inside 65 CNEL	Population Inside 65 CNEL
LAWA 1996 4 <sup>th</sup> Quarter Report	31,968	85,907
EIS/EIR Table 4.1-2 For 1996	16,900	49,000
Difference	<b>15,068</b>	<b>36,907</b>

The question therefore arises as to how LAWA actually defines the “Environmental Baseline.” Is the Environmental Baseline the same as the “Adjusted Environmental Baseline?” Or the “Future Without Project Scenario” (i.e., cumulative without project)? Or the “No Action/No Project Alternative?” Or none of these? Although each of these scenarios may serve a useful purpose, such gains can be realized only when the scenarios are properly defined, adequately differentiated, and consistently employed – none of which is true for the LAX Master Plan SDEIS/EIR. Does the environmental baseline include the phase-out of older, noisier Stage 2 jets, as assumed with the build Alternatives? The forecast reduction in noise exposure for Alternatives A, C and D, as compared with the No Action/No Project Alternative,<sup>14</sup> appears to conflict with the numbers cited in the penultimate paragraph on page ES-21. It is not clear which of the congestion relief package features are scheduled for completion in Phase 1 and which will be deferred to Phase 2.

The Summary of Alternatives<sup>15</sup> notes, in discussing baseline conditions, that “physical conditions are represented as they existed in 1997 and in more current years when possible to provide the most up-to-date information available.” It is not clear why “up-to-date” information is possible in some categories but not others. LAWA has had five years to update the information and is anticipating spending significant funds to implement the project; there is in truth no justifiable reason for denying the public and LAWA decision-makers access to current information.

LAWA must clearly define each of the baseline and future condition scenarios used in the 2003 Supplemental Draft EIS/EIR, with an explicit statement of the rationale for its use. Perhaps LAWA should delete one or more of these scenarios from discussion. Referenced scenarios include “environmental baseline,” “environmental baseline (1996),” “environmental baseline (2000),” “adjusted environmental baseline,” “environmental baseline (2015),” “non-LAX development having cumulative impact,” “future without project scenario” (i.e., cumulative without project), and “No Action/No Project”. Incredibly, the Glossary defines none of these terms. The analysis constantly shifts the baseline timeframe to manipulate the comparative assessment of project impacts -- using 1996 baseline data for traffic, air and aircraft noise, while using 2000 through 2002 for biology, earth, and water resources. The frequent shifting from one baseline nomenclature and timeframe to another is, at best, confusing. At worst, it conceals the underlying impacts that this 2003 Supplemental Draft EIS/EIR is intended to illuminate.

<sup>14</sup> First bar chart on Page ES-22 titled, “Population Exposed to Noise Above 65 CNEL in 2015.”

<sup>15</sup> 2001 Draft EIS/EIR, Section 3.2.1, Pages 3-8 through 3-18.

### 3.5.3 Baseline Terms are Not Defined

There is no clear definition of the term “Unconstrained Forecast” anywhere in the Environmental Summary or in Sections 1, 2 or 3. The reader is left to guess what the term is intended to portray, where it fits into the long-range forecasts for LAX and other regional airports<sup>16</sup> and the estimates of rising aviation demand.<sup>17</sup>

This lack of definition and intent extends to the term “Adjusted Baseline.” This condition has never existed, and will never exist (i.e., 1996/97 airport activity and physical facilities plus 2005 and 2015 land use activity and regional traffic). There is no basis in CEQA and/or NEPA for use of this term and it therefore requires either clarification or removal from the document in favor of more traditional and more clearly defined comparative data.

### 3.6 PROJECT PHASING DOES NOT REFLECT STATED PRIORITIES

The proposed project phasing illustrates the Master Plan’s embrace of an environmentally inferior alternative. The most pressing problems on the airport are the lack of adequate runway length on the north complex, the security threat of private autos near the terminals, and the lack of international gates. Taxiing of loaded B747 aircraft to the south runway complex and the bussing of international passengers across the airfield creates air quality impacts, congestion, delay, and general lack of capacity. Yet the Phase 1 construction plan addresses none of these issues for many years and instead concentrates initially on the fringes of the airport preparing for the Ground Transportation Center and Intermodal Transportation Center, and on demolishing and rebuilding perfectly useable terminals in preparation for moving a runway to accommodate the New Large Aircraft. This sequence does not match the urgent environmental and congestion priorities evident on the airport.

### 3.7 APPEARANCE OF ADVOCACY

Both the Draft EIS/EIR and the Supplement to the Draft EIS/EIR contain numerous comments and conclusive statements that create an appearance of project advocacy. This is inappropriate given the policy guidelines contained in CEQA and NEPA. It undermines confidence in the objectivity of the analyses and casts doubt on the Lead Agency commitment to full disclosure. We are particularly concerned about technical assumptions that understate the growth potential and overstate the benefits of Alternative D, as paired with assumptions that overstate the adverse impacts of the No Project Alternative (please see §3.5.2 above for further elaboration of this concern).

### 3.8 INADEQUATE SCOPING OUTREACH

Both the 2001 Draft EIS/EIR and the 2003 Supplemental Draft EIS/EIR make frequent mention of the regional significance of LAX and of the Master Plan process. This emphasis on regional context is evident in discussions and analyses provided throughout the text, but more significantly is an integral part of the Purpose and Objectives statement. As stated, *“The purpose and objectives of the Master Plan are to provide...sufficient airport capacity for passengers and freight in the Los*

<sup>16</sup> 2001 Draft EIS/EIR, Table 1-13.

<sup>17</sup> 2001 Draft EIS/EIR, Depicted in the Exhibit on Page ES-3.

*Angeles region to sustain and advance the economic growth and vitality of the Los Angeles region...*<sup>18</sup>

Nevertheless, the original scoping outreach effort did not include a single agency within the county governments of San Bernardino County, Orange County, Riverside County, or Ventura County.<sup>19</sup> Nor did the scoping outreach include any municipal agencies, airport officials, businesses, or services within any of these four counties, although many such entities would have an interest in the regional issues addressed and in the development and analysis of project Alternatives. This is a serious omission, particularly in light of the NEPA mandate to establish close nexus between project goals and project Alternatives. It may also explain why none of the project Alternatives incorporates even minimal regional elements.

Furthermore, the scoping process is intended to identify and disclose all of the potential Alternatives under consideration by the lead agency. This provides the public with the greatest ability for input and understanding into the potential project and offers an opportunity to comment. In fact, it is common for lead agencies to remove Alternatives from further consideration between the scoping process and the distribution of the Draft EIS/EIR. In this case, the scoping outreach did not include Alternative C (the 2001 preferred alternative) or Alternative D (the 2003 preferred alternative). As noted previously, this approach forecloses the opportunity for public comment and casts doubt on the adequacy of the process by which LAWA screened and selected the alternatives. In any case, the SDEIS/EIR fails to meet CEQA and NEPA standards because LAWA did not disclose the preferred Alternative D to the public prior to document release.

Furthermore, although LAWA presented the original 2001 draft master plan at a number of public meetings held specifically for minority citizens, it is unfortunate that the same level of outreach has not occurred for the Supplement to the Master Plan. The minority segment of the population will experience the greatest exposure to the effects of changes at LAX. In particular, the County's interest in this issue is again with the unincorporated Lennox community. LAWA should develop a more thorough outreach program for Alternative D that fully informs the citizens in this area of the complete range of options and how the proposed master plan would specifically affect them. LAWA should fully disclose the decision to extend runways to the east and avoid the endangered species habitat to the west along the beaches.

### **3.9 PROGRAM ASSESSMENT OF BASELINE, IMPACTS, MITIGATIONS**

The analytic framework of the 2001 Draft EIS/EIR was described as one in which the document was meant to set the basis for "tiered" environmental review pursuant to both NEPA and CEQA.<sup>20</sup> The tiered concept assumes that subsequent environmental documents will be required to focus the analysis on site-specific, project-level issues, impacts, and mitigation measures. The 2003 Supplemental Draft EIS/EIR does describe many concepts in more detail, but continues to keep the analysis at a program level. The program-level analyses and vague mitigation commitments may not provide the Federal Aviation Administration (FAA) with an adequate basis on which to issue an "unconditional approval" of the airport layout plan (ALP). An unconditional approval assumes that

<sup>18</sup> 2001 Draft and 2003 Supplemental Draft EIS/EIR, Section 2.1, Page 2-1.

<sup>19</sup> Based on review of EIS Agency Scoping Coordination Letter Mailing List and other materials provided in Appx. A.

<sup>20</sup> Section 4, Pages 4-5 and 4-6.

LAWA has completed appropriate analyses for all development actions, and the circulated document does not fulfill this requirement.

### **3.10 GROWTH & CUMULATIVE IMPACTS MAY BE UNDERSTATED**

The Supplement to the Draft EIS/EIR bases its analysis of growth inducement on projected cargo and passenger activity. It concludes that by 2015, Alternative D would yield a direct economic output of \$63.7 billion and 350,500 jobs, plus an indirect economic output of \$93.8 billion and 629,000 jobs through a multiplier effect of 1.5. The EIS/EIR assumes that all of the jobs would be within the 5-County SCAG region, 78% of the jobs would be within a 20-mile radius, and 40% within a 10-mile radius of LAX. Finally, it concludes that Alternative D would be similar in terms of job formation to the No Action/No Project Alternative, differing by an increase of about 1%. With respect to collateral development, the EIS/EIR finds Alternative D impacts equivalent to the No Project Alternative for LAX Northside<sup>21</sup>, Westchester Southside and Belford, and less than the No Project Alternative for Continental City and Manchester South.

In taking this approach, the document ignores the cumulative synergistic effects that would result if LAX Northside is constructed in tandem with the LAX improvements, as proposed under Alternative D (but not Alternatives A, B or C). The increase in cargo will create corresponding increases in off-airport services and place extraordinary pressures on commercial and residential land uses in the immediate neighborhood. Apart from a discussion of the proposed cap on peak hour traffic from the LAX Northside project, the Growth-Inducing Impact Analysis (which is also the Cumulative Impact Analysis for Alternative D) does not address these more localized impacts at all, even though the history of LAX shows them to be potentially significant.

## **4.0 COMMENTS SPECIFIC TO THE SUPPLEMENT TO THE DRAFT EIS/EIR**

### **4.1 AIRPORT SECURITY ASSESSMENT IS INCOMPLETE**

#### **4.1.1 Summary of Findings Concerning the Analysis of LAX Master Plan Security**

As detailed at length in the discussion that follows, the security content of Alternative D documentation is inconsistent and contradictory, leaving important questions unanswered and an urgent need for definitive clarification of the true policy and planning direction. The security analysis has been treated in an aloof and disconnected manner, is preoccupied with the public approaches and the eastern half of the infrastructure; and fails to address total airport security vulnerabilities and risk management planning. These inconsistencies imply an absence of coordination in the planning process. Of greater concern is the possibility that the professed emphasis on security enhancement is not the true priority in terms of planning and phased implementation.

There is a strong case for the separate ground processing facilities and for dispersal of target populations by reducing density, controlling and limiting vehicular access and proximity. Access

---

<sup>21</sup>LAX Northside is approximately 330-acres of land located on the north side of LAX (bisected by Westchester Parkway) and owned by LAWA. Tentative Map #34836, approved for this site during the mid-1980s, would allow development of about 4.5 million square feet of office, hotel, restaurant, retail, research and airport-related land uses.

roadways merit greater emphasis on security design, demonstrating a clearer commitment to specific contingencies while anticipating traffic impacts.

The separation concept is diminished in value by the expensive and vulnerable mass transit link between the Central Terminal Area and remote landside ground facilities. It is further diminished by the lack of Flow Process Mapping data, the risk of task overload and failure to achieve target reduction, and by potential alienation if the public perceives screening requirements as excessive.

For reasons discussed in this report, we believe that the Automated People Mover is a weak link in the overall security plan. Security enhancement goals can be achieved without the Automated People Mover by moving the 3 main ground processing facilities closer to the Central Terminal Area. The western half of the airport should be drawn into the Plan with all subcomponents receiving 'substantial treatment' as required of federal regulators and stated early in the analysis. In the course of addressing the western end of the airport, *and as a matter of urgency*, LAWA should conduct a detailed assessment of the vulnerability to terrorist attack. LAWA should give serious consideration to the permanent closure of Pershing Drive as a public thoroughfare.

LAWA should provide an illustration that shows anticipated concentric ring security applications along with an explanation of the capabilities for surveillance of adjoining commercial and residential neighborhoods. Finally, the analysis should offer a quantitative projection of the demands on security and law enforcement personnel, and the intended ratio of manpower to technological devices.

#### **4.1.2 Introduction to the Analysis of the LAX Master Plan Security Component**

The LAX Master Plan Security Component addresses known and implied security issues, with a focus on Alternative D (the Enhanced Safety and Security Alternative), while also referencing the more limited discussions found in the Master Plan and SDEIS/EIR documents as a whole. The events of September 11, 2001 are commonly referenced in the Alternative D documentation, and security issues predictably appear in documentation released by the City of Los Angeles on July 9, 2003. However, it has been more difficult to obtain security plan elements for earlier plan options, namely Alternatives A, B and C, and also the No Project Alternative.

Fundamental to the integrity of the exercise is simulation of the process by which an ordinary member of the public would gain access to this public documentation. Although airport security is a relevant topical in the context of environmental review, it did not receive any attention in the pre-9/11 public deliberations for the 2001 LAX Master Plan. This is an extraordinary fact considering the status of LAX as a world-class destination and departure airport. The public documentation search process is therefore discussed here because the security content, its location within the Master Plan and the priority afforded to it, bears directly on the credibility of the stated title of Alternative D, 'The Enhanced Safety and Security Initiative' and therefore upon the worth of the security planning component.

The documentation is voluminous and consequently electronic key word searches were employed to locate security related sections in the earlier documentation, i.e. up to June of 2001. Key words used included 'security', 'threat' and 'terrorism;' Master Plan documentation published during 2003 was

also searched using electronic means. The major portions of the documentation subjected to analysis from the security perspective, after search and filtering are:

- ▶ The LAX Master Plan SDEIS/EIR: Chapter 3 Alternatives (Including Proposed Action).
- ▶ LAX Master Plan Addendum Draft dated June 2003.
- ▶ Appendix I to the LAX Master Plan Addendum Draft: Comparative Security Analysis of Alternative D and the No Action/No Project.

#### 4.1.3 Review of the LAX Master Plan Supplement to the Draft EIS/EIR

**Chapter 3, Alternatives:** The Introduction notes that Council on Environmental Quality (CEQ) regulations for NEPA require federal regulators to “*Devote substantial treatment to each alternative considered in detail...*” The SDEIS/EIR offers an historical explanation of the Draft Master Plan and the context in which Alternative D was developed. An excerpt from page 3-1 illustrates some of the extraordinary circumstances applicable to long-term security planning:

*“Alternative D is designed to protect airport users and critical airport infrastructure in response to the increased risk of terrorism aimed at aviation and commercial assets. The Plan is designed with the flexibility to incorporate evolving federal airport security requirements. Alternative D is also designed to enhance the on-airport presence of law enforcement and emergency response teams.”*

The words ‘flexibility’ and ‘evolving’ effectively equate at the time of public deliberation to ‘unknown’. The discussion of baseline conditions (Ch. 3.2) does not address security planning in terms of existing conditions, and, the discussion of airport security (Ch. 3.3.1) provides no explanation for the failure to address security planning in the pre-9/11 options. A vague attempt is made to reassure the reader that security plans are available for Alternatives A, B, and C should these be chosen (as opposed to Alternative D), yet the discussion is wholly inadequate. Noting that ‘these alternatives would provide on-airport space for the Transportation Security Administration to conduct its mission,’ the report goes on to state:

- ▶ *“At the time this supplement to the Draft EIS/EIR was published, the federal government’s security requirements were continuing to evolve and LAWA officials were working with TSA to determine and accommodate its needs to the greatest extent possible,”* and
- ▶ *“...it is anticipated that an extensive array of security features and operational practices if/as required could be accommodated by any of the build alternatives.”*

These statements suggest that the public disclosure of security plans is unnecessarily vague, and that security planning has been overly deferred to federal regulators.

The SDEIS/EIR summarizes conceptual points making up the new approach to airport security on page 3-27 under Alternative D: “*The end goal of this design concept is to achieve a new balance between the needs of both passenger security and passenger convenience.*” Besides claiming public safety and security benefits in very sweeping terms, it also refers to the physical layout of Alternative D and mentions the Master Plan boundaries. But it does not provide any detail concerning the features of the security plan that will deliver these benefits.

The description of Alternative D Facilities (p. 3-43) repeats the message that "*Alternative D is designed to be flexible in accommodating new federal security requirements.*" There follows brief mention of 'important security features' referring to elimination of private vehicles from the Central Terminal Area roadways and elimination of the public parking structures within the Central Terminal Area. This and subsequent statements are not so much 'security features' as 'security objectives' or 'security outcomes'. The difference is important, because it is the details that impart greater understanding and thereby enable the public to judge and offer comment. For example, when the text states that passengers and employees will access the Central Terminal Area via the Automated People Mover, there is no explanation of the methodologies that would be used to secure the safety of that journey. It is thus unclear that the APM would be safer than the Central Terminal Area public parking facility. The document also declares that "*The presence of law enforcement and emergency response teams would be enhanced with Alternative D.*" Although it then goes on to speak of two new Aircraft Rescue and Fire Fighting facilities, a new police headquarters and Terminal police posts, again it resorts to generalized claims of the advantages without supportive detail. In fact, the planned police headquarter (at Westchester Parkway and Emerson Avenue), is located outside of the operating boundary of the airport.

In subsequent pages (3-47 to 3-56), the following topics are listed and discussed without reference to any specific security component: Terminal Facilities; Traffic/Parking/Circulation Facilities; Automated People Mover; Cargo Facilities; Ancillary Facilities; Land Acquisition and Relocation; Collateral Development; and Proposed Phasing. The text states that publicly available data show that airport facilities have to be upgraded to improve security. However, the Transportation Security Administration is not the only arbiter of security issues. Security is becoming an integrated component across all airport functions. Given the size of the LAX Master Plan project, it is reasonable to expect discussion of the security plan for each listed action, each function and each facility. Cargo and Phasing offer good illustrations of this need: Cargo security is currently the focus of attention by TSA and others. It is unarguable that cargo security processes will affect airport operations, logistics and facilities access over the next 2 years, but the Supplement does not appear to anticipate this. Moreover, the 3-part Phasing Plan does not even acknowledge advance security preparation for a protracted construction project during which exceptional and extraordinary vulnerabilities will apply to the airport and its environs. The new police headquarter is not listed in the phasing, nor is there any apparent recognition of the significant perimeter and core security demands. All of these elements should be addressed before project commencement.

Discussion of the Preferred Alternative (Ch. 3.5) and the CEQA Environmentally Superior Alternative (Ch. 3.6) does not elaborate on the security benefits from traffic and incident management. Security plan elements discussed in other parts of the Master Plan suggest that the security surveillance and detection system will extend well beyond the airport infrastructure into the wider public environs, but there is no detail to confirm this. We request that LAWA provide further discussion, in keeping with full public accountability, so that long-term impacts can be considered.

The role of the Transportation Security Administration is briefly discussed in Chapter 4 (p. 4-698). The remainder of this subsection describes post 9/11 security measures, including government-mandated deadlines on baggage screening that LAWA states it has met, together with current and long term plans for deployment of 'inline' screening systems. A statement in this discussion indicates that: "...TSA is in the process of developing additional recommendations and requirements to increase security at the nation's airports" but provides no details. We request

discussion of the additional TSA recommendations and requirements and how they may be applied to the LAX Master Plan.

#### 4.1.4 Review of the LAX Master Plan Addendum Draft June 2003

The Executive Summary to the Draft Addendum speaks of Alternative D as 'a new design approach to securing airports for the future' (page i-1). It states that "*The alternative would incorporate, to the greatest extent possible, [TSA] recommendations as they are developed as well as the latest passenger and baggage screening technologies;*" and "*...would also enhance the on-airport presence of law enforcement, surveillance, security, and response teams.*" These statements merit further explanation as to how this would be accomplished, and with what impact. The following page (i-2) describes conceptual goals for deterrence and prevention of terrorist attacks. In shorter form the goals stated are:

1. Reduced concentrations of people in the public areas of the airport;
2. Relatively rapid movement of departing passengers and baggage through the necessary processes to the secure (sterile) parts of the airport; and
3. Reducing vehicular access to the Central Terminal Area and avoiding concentrations of people and vehicles in other ground processing areas.

On the same page, it is stated that, "*Alternative D would utilize an expanded LAWA-operated FlyAway Program throughout the region to disperse passenger processing. This service would include remote check-in of passengers and baggage, and provide direct access into the Central Terminal Area. Refer to Appendix I for a detailed assessment of the security and safety features of Alternative D.*" Although the foregoing suggests that an explanation will be forthcoming from Appendix I, our analysis has shown that Appendix I *does not present a detailed assessment* as promised, especially when compared with other parts of the documentation. Accordingly, some comment is due concerning the generalizations stated in the Executive Summary.

As noted above, the third goal is to permit only known, screened and controlled vehicles into the Central Terminal Area; this means that some vehicles will still have access. Expansion of the FlyAway program throughout the region would also offer access to the Central Terminal Area. These two factors may compromise the intent to prevent vehicle bombs imposing heavy casualties in and around the Central Terminal Area. Terrorists seeking weak links in the protective systems would have the opportunity to exploit both approaches, e.g. by hijacking, stealing or attaching bombs to vehicles that they know have privileged access. The County requests further review and comment on this issue.

Furthermore, a number of questions arise about the modes of permit, identification (vehicle and driver) and screening of so-called 'controlled vehicles.' Access and special egress road design, emergency diversion contingencies, fully equipped road vehicle inspection checkpoints, chokepoints, and barriers -- all away from the concentrations of people -- come into play here. An efficient system should impose structural constraints on all roadways, with special allowance for those passengers and foreign drivers who will make mistakes or misinterpret airport road signs. This need appears to have been underestimated (in contrast, Appendix I does enter into speculative possibilities on roadway security controls) and we ask for a reassessment of this issue.

It is extremely doubtful that regional expansion of the FlyAway service can satisfactorily and consistently secure a fully screened passenger and baggage load to justify a bus being brought close to the Central Terminal Area, especially given the threat of suicide attack. The description of the proposed passenger screening systems for those passing through the Ground Transportation Center, Intermodal Transportation Center and Rental Car facilities will be discussed later, as there are some contradictions to address. But it is necessary to point out here that a 'level one' screening will not be adequate for passengers at the FlyAway bus stations. The TSA 'level two' screening would be essential, but would have to be repeated in the Central Terminal Area because of the mixing of people from different modes of access at that location. It is unlikely that LAWA can consistently operate fully equipped remote resources (and sterile station-to-bus areas) to accomplish full screening prior to embarking on the FlyAway bus, and then keep that bus closed and secure for its entire journey. Such a system is prone to error and penetration. Moreover, the 'hassle factor' from lengthy duplication of screening operations would to some extent defeat the initial reason for using this service. We request further review of the screening operations, including assessment of the feasibility of operating the remote resource to complete screening in advance of the FlyAway bus.

Still on page i-2, the document briefly describes the Ground Transportation Center as the primary pick-up and drop off for LAX passengers. It states "*The facility would combine a controlled and monitored roadway access system with first level passenger security screening and profiling to further enhance the safety and security of all passengers using LAX.*" The interested observer might wonder what this actually means. Parts of the Draft Addendum on this topic contradict other parts of the same document, creating confusion if not doubt about the ultimate intention for security risk management of the various facilities. LAWA has made an effort in the right direction, but the analysis below shows that the documentation for Alternative D must be significantly expanded before its title as the enhanced safety and security alternative can be justified.

Discussion of the Terminal/Passenger Processing Facilities for Alternative D (Ch. 2.2) includes a statement that, "*The Central Terminal Area reconfiguration would prohibit private and commercial vehicle access to the area, eliminating the threat of vehicular blast at the curb front, which exists today in the Central Terminal Area.*" What vehicles would LAWA permit to enter the area? Would FlyAway buses and 'screened, controlled vehicles' be allowed, as mentioned in the Executive Summary?

Text on page 2-20 mentions a baggage tunnel that connects the new airport terminals with the Ground Transportation Center, and notes that this tunnel would allow passengers to check their baggage at the Ground Transportation Center, with arriving passengers using the system to re-check their baggage back to the Ground Transportation Center from the Central Terminal Area. This statement is somewhat confusing -- does this refer to Skycap check-in service only? What security process would LAWA use for departing passengers? Is the baggage tunnel available for use by departing passengers who will check in at the Central Terminal Area? If so, is there a plan to screen 100% of this baggage? Further, what are the implications for synchronizing transit of passengers and their baggage to the Central Terminal Area?

Ch. 2.2.5 describes an airside secure underground Automated People Mover linking the West Satellite Concourse with the reconfigured Central Terminal Area. Given that a geological fault exists in or close to the area, we request discussion concerning the resulting safety implications as well as contingency plans for emergencies including Automated People Mover breakdown.

**The Ground Transportation Center:** Discussion in Ch. 2.2.8 notes the theoretical role of the Ground Transportation Center in drawing concentrations of people away from the check-in queues by separating curbside pick up, drop off, and parking. Some of the statements in this discussion require further clarification:

*“...limiting large congregations of passengers by moving ticketing, security screening, and baggage claim to the Central Terminal Area would improve passenger safety and security. Passengers would be subjected to a first level security screening process at the Ground Transportation Center. It is anticipated that the process would include a random checking of baggage and passengers using sniffing dogs, video surveillance systems, and other security devices. Second level screening would occur at the Central Terminal Area; however the Ground Transportation Center would be designed to accommodate second level screening at any time.”* (Underlined words relate to later comment in this review).

Eight major functions are proposed to be included in the Ground Transportation Center, including E-Kiosk check in, Skycap baggage check-in and first level ‘passenger security screening.’ We assume that the passenger screening would also apply to visitors and employees (not just passengers), but it is unclear what is meant by ‘random checking.’ The deployment of explosive detection canine units, given their limitations, suggests that far less than 100% of people and bags would be screened at the Ground Transportation Center. Please provide further clarification for this part of the plan.

Discussion of the baggage tunnel (p. 2-36) tends to reinforce the assumption that the baggage transit system between the Ground Transportation Center and the Central Terminal Area will not incorporate EDS screening or, if some check is applied, it will not be to the standard required for aircraft loading. The discussion leaves open the question as to whether passengers not using the Skycap service would be able to send baggage through the tunnel to the Central Terminal Area, but it does say ‘*Passengers that do not use Skycap baggage check-in may carry [note, not ‘must carry’] baggage on the Automated People Mover*’. There are two important qualifying statements about the process: “*Bags carried by passengers on the Automated People Mover would need to be checked by the appropriate airline in the Central Terminal Area. No airline agents are initially anticipated to be located in the Ground Transportation Area.*” The foregoing suggests a confused and difficult process, particularly for passengers who do not use the Skycap service (potentially 60% of all LAX traffic).

There is also risk of a terrorist attack via baggage used to carry a device for detonation on the APM. The terrorist objective in this case would be 3-fold: (1) killing and maiming a maximum number of Automated People Mover passengers; (2) closing a critical part of the system down; and (3) terrorizing the public so that they will not use LAX. In logistical terms an APM journey that involves loading, mixing and unloading of passenger baggage would reduce the potential frequency of Automated People Mover arrivals and departures and the subsequent loop journey time. Please comment on this issue.

**Intermodal Transportation Center (ITC):** The description of random screening in the ITC section (page 2-45) is almost identical to that describing the processes at the Ground Transportation Center. Also mentioned is the intent to monitor all approaching vehicles using video surveillance systems. Please see the discussion of Appendix I for further comment on this subject.

**Consolidated Rental Car Facility (RAC):** This section does not address security issues, and so the review process defers to Appendix I for explanation.

**Ground Access and Parking:** Discussion in Chapter 2.3 emphasizes means to reduce terrorist target density and the County does not dispute the validity of this approach. However, the document lacks data to show that the projected dispersal pattern would justify the expense and disruption of reconfiguration. For example, if an improvised explosive device was detonated at the Ground Transportation Center, curbside, on or near the Automated People Mover, or at the reconfigured Central Terminal Area, what casualty rate would LAWA anticipate at, say, peak travel time? Are the projected measurements of time, distance, people dispersal, response capabilities and resources proportionate to the desired gain? Part of the improved protection evidently comes from proposed blast mitigation measures that combine structural design with open space, but we request more data on the flow of people and vehicles in order to evaluate the plan. For example, if the needed dispersal percentages are achieved by adding 3 outlying facilities, is it necessary to operate an automated train system for a distance of 1.5 miles away from the Central Terminal Area? Could LAWA achieve the same goals closer in, with resultant savings and safety mitigations on Automated People Mover operations? If LAWA holds that there is a logistical and dispersal advantage by having the Automated People Mover further out, thereby staggering the flow of people, we request that an explanation of the basis for this advantage.

In discussion of the Central Terminal (Ch. 2.3.2.1) the document says that *“access points to the Central Terminal Area road system would be controlled to enhance security in the areas immediately surrounding the airport’s infrastructure.”* It then mentions FlyAway buses and vehicles cleared to drive on the secure airside. This appears to open a security loophole. Would it not be better to provide FlyAway passengers with a dedicated lane or fast track, using the public entrance to the Central Terminal Area while having their baggage processed through the level two TSA screening checkpoint? It appears feasible to screen all FlyAway buses, passengers and baggage with a unit contracted or employed by LAWA with TSA approval. Sufficient user numbers within the FlyAway expansion plan would justify this investment. Moreover, this additional service feature, once given the security planning attention it requires, may offer a more cost effective use of reconfiguration, in addition to its target dispersal contribution. Please comment on this proposal.

Discussion of the Ground Transportation Center (p. 2-60) mentions use of video surveillance to monitor activity, and cites the ability to pre-screen vehicles before they approach the Ground Transportation Center as an integral part of security. Some very simple calculations show this to be an extremely optimistic expectation in terms of prevention. Current, developing and anticipated surveillance technology may offer improved detection and interception, but the distances covered by vehicles at various speeds (whether at normal or excessive traffic flow rates) significantly limit the ability of responding security or law enforcement officers to prevent a determined attack. A number of examples of the speed of attack execution exist, such as terrorist bombings of military installations overseas. A vehicle traveling a linear mile at 20 mph would cover the ground, if unhindered, in 3 minutes; at 40 mph, in 1.5 minutes. Some type of substantial physical obstacle, such as a hydraulic arrest barrier built into a choke point, should therefore be part of the roadway design. Such equipment does need some visibility for deterrent value; in a multi-lane setting, the barrier could be used to moderate traffic volume for other goals. We request that LAWA comment on roadway design from a security perspective, including the concept outlined above.

Security features for access to/from the Intermodal Transportation Center and the Rental Car Facility are not discussed in Chapters 2.3.2.3 and 2.3.2.4. We thus repeat our previous comments on controlled choke points, and request that LAWA provide discussion of security design. The reduction of people and vehicle density is but one layer in the defensive design that will allow the 'protection, detection, assessment, and response' concept to become reality. The fact that a target density at one location is reduced from say, 1000 to 100 people will not in itself deter an attacker. The possibility remains that a back up of people could be orchestrated to deliberately increase congestion, density and target volume. This possibility must be addressed at every airport ground processing facility in order to eliminate weakness in the overall security plan and avoid the need to later retrofit the roadways. The suggested control would also apply to design of exit roads, to prevent reverse flow access by an attacking vehicle. The intermodal and rental car facilities would probably not benefit from as much close-in law enforcement and security personnel coverage as the Ground Transportation Center and Central Terminal Area. This compounds the need for optimum security design features on roadways and building access. Please comment on these points.

Discussion of the Air Cargo Roadway (§2.3.2.5) offers no discussion about security planning, conveying the assumption that there are no security considerations. Is this a correct assumption? Similarly, there is no discussion of security planning for Off-Airport Public Road Access (§ 2.3.3), conveying the assumption that there are no security considerations. Is this a correct assumption?

In §2.3.6 it is noted that the proposed 12,400-stall employee garage (accessed via Pershing Drive) would "*be designed to help diffuse blast impacts from surrounding vehicles. It would be designed with a security-screening checkpoint for all employees using the garage.*" Why does LAWA emphasize this point for the employee parking facility but not for public parking facilities at the Ground Transportation Center, the Intermodal Transportation Center, or the rental car facility?

Discussion of the Automated People Mover (§ 2.4 et seq.) touches briefly on security in a reference to video surveillance. We have indicated previously our concern about the vulnerability of the Automated People Mover, but would add that the expected security issues and management plans for the Automated People Mover deserve more public disclosure. Please provide an assessment of this risk and the steps proposed to address it.

In discussing Cargo Facilities, Chapter 2.5 acknowledges that new security requirements are being developed by the TSA and advises that "*LAWA would incorporate any new requirements into the cargo facilities as those standards are developed.*" This section does not adequately address LAWA's own 'industry capability' -- i.e. using its own initiative to offer options. The future direction of air cargo security management may not be fully known from a regulatory perspective, but in terms of public safety we believe that it would be responsible for LAWA to pioneer its own air cargo security standard. Alternative D by virtue of its title claims to answer security concerns and to offer innovation in the process. Yet innovation is decidedly absent from the cargo aspect of the plan. The ultimate test may come from an attack on commercial aircraft via air cargo: adequate warnings exist in industry circles to justify a stronger effort in this regard. We request that the SDEIS/EIR provide more detailed discussion of air cargo security measures, and respond to the suggestion that LAWA pioneer its own standards.

Among the measures that could be considered for air cargo facilities is a plan that would allow airline operators to provide, at short notice, an integrated roadway and security system to screen and clear inbound vehicles, and a 'cold' or 'hot' operational facility for dual technology screening of

outbound cargo. In combination, these facilities could routinely earn additional airport revenue and facilitate business continuity during periods of high alert. Please comment on this suggestion.

**Addendum Illustrations:** The various plan drawings and artists impressions found in the Master Plan Alternative D documentation are helpful and informative. There are, however, several considerations for improving public articulation. Residents of the surrounding environs are a valuable part of airport protection. The eyes, ears and voices of local residents can provide superior protection of community assets. This holds true even when compared with trained law enforcement personnel who have access to advanced technologies. Citizens and local residents who perceive that they have a stake in the future of their airport, and who are consulted in the security planning aspects, are most likely to participate constructively. What efforts have been or will be taken by LAWA to provide public education sufficient to harness this resource?

#### **4.1.5 Review of Appendix I: Comparative Security Analysis**

The Master Plan Draft Addendum refers to Appendix I as “*a detailed assessment of the security and safety features of Alternative D.*” This statement, combined with the lack of detail in other Master Plan documents, creates high expectations as to the quality of its articulation. In practice, our review has found the experience to be disappointing. The discussion is inconsistent with other documentation and falls short of the detail that should be available for public scrutiny. We are in a new era of risk management. Traditional or conventional thinking will not successfully address future vulnerabilities unless there is a respectful treatment of the public debate. The physical and operational reach of the defensive concept will extend beyond the footprint of the airport infrastructure. In fact, the security component will have environmental effects that are unprecedented in American commercial airport planning, particularly in urban and suburban settings. The Master Plan Alternative D must offer detailed projection, measurement and quantification of these impacts.

**Discussion of the Concept:** The document states, on page I-2 of the Executive Summary, “*The first level (Level 1) entails screening of all persons and bags prior to entering the Central Terminal Area. Level 1 screening is focused on preventing attacks on the ground and ensuring a safe passenger environment. This level of screening will occur prior to entering the Automated People Mover system or FlyAway shuttle buses and focuses on weapons and explosive.*” This directly contradicts the ‘random screening, sniffing dogs’ explanation in the main Draft Addendum document; clarification is requested.

On page I-4 of the Appendix, under Methodology, reference is made to the Department of Homeland Security and General Accounting Office validation of “concentric rings of security” to bring protection, detection, assessment, and response” capability ‘*to the extended airport perimeter*’. The following statements from that Chapter appears to contradict the approach offered in the prior two documents:

*‘Anyone entering the airport property whether to visit or travel will undergo security inspections. There are at least two levels of personnel and baggage inspection that will take place. Level 1 inspection requires screening for explosives and weapons prior to transport by the Automated People Mover or FlyAway shuttle bus to the Central Terminal Area. Using current technology, Level 1 inspection would include screening of persons and bags similar to checks made upon entering federal buildings today. These checks should be*

*designed to be as unobtrusive and not impede the flow of transportation to the Central Terminal Area and should take advantage of the emerging technology. Level 2 inspections will consist of current security screening criteria as mandated by TSA for departing passengers and baggage which is more intrusive and detailed than level 1'.*

We offer the following observations on the above excerpt, and request that LAWA provide comment and clarification for each point:

- ▶ Level 1 inspection as described here does not match the 'random selection, sniffing dogs' explanation offered in the Draft Addendum.
- ▶ There is no mention of profiling people and baggage for selective screening.
- ▶ The stated similarity to 'checks made upon entering federal buildings today' is meaningless to people who have never seen or experienced the federal security screening process.
- ▶ At federal buildings 100% of those who enter are screened, but these systems rarely (if ever) encounter baggage in size and volume such as will be common to an airport.
- ▶ The statement above contradicts itself: the process for federal buildings is obtrusive and would impede flow if applied literally as a Level 1 screening protocol.
- ▶ The possibility of 2 levels of screening that are both obtrusive, even with Level 1 proving to be selective, implies a need to estimate consequential density effects that might in some circumstances defeat the desire to disperse people rapidly into the airport controlled areas.
- ▶ The reader is left wondering whether there is agreement and/or coordination between the planning entities on security policy and practice.

The same page refers to Figures 4-1 & 4-2 as illustrations of the concentric rings of security and deterrence strategy respectively. These very simplistic figures are of no value in helping the public to understand what the strategies mean for LAX, and no other drawings are included in Appendix I. Why is this not done, given the proliferation of site drawings and artists' impressions in the other parts of the Alternative D documentation? We ask that LAWA superimpose the concentric rings over the airport plan and explain the resulting figure. The following statement from the same page is offered for its relevance to further comment:

*"PDAR facilitates the detection of possible malevolent acts prior to the hostile force coming within range of the target. By increasing the distance between critical areas and the point of detection, law enforcement officers and security personnel have additional time to assess the act as benign, dangerous, or overtly hostile, and respond appropriately."*

We offer the following observations on the above excerpt, and request that LAWA provide comment and clarification for each point:

- ▶ Is it correct to assume from the statements about bomb threat dispersal that 'critical areas' include public areas where concentrations of people can be expected (e.g. the Ground Transportation and Intermodal Transportation Centers, the Central Terminal and perhaps to a lesser extent, the Rental Car Facility)?
- ▶ A rough calculation of available response times (using existing travel distances and transit times) indicates that Alternative D roadway configurations will not significantly increase response time 'prior to the hostile force coming within range of the target.' What does LAWA anticipate in terms of this issue?

- › By inference, the ‘protection, detection, assessment, and response’ system would prove of value only if the outer concentric circles encompass more distant roadways and areas including commercial and residential areas, beyond the immediate airport environs. Is LAWA contemplating an expansion of the concentric circles to include these areas?
- › Implementation of a multiple concentric ring system defies imagination in its practical application to LAX. The airport has an irregular property boundary that may be poorly suited to this system. There is no logical center point for the concentric rings, apart from the large Air Operations Area, and the critical areas at LAX are disparate and scattered. In this setting, what is the feasibility of developing the concept with a series of overlapping concentric rings?

Discussion in Ch. 5 (Threat) evaluates LAX as a target. This is a complex topic; we understand that evolving trends in terrorist tactics may unexpectedly shift some of the security emphasis and strategy over time. However, we believe that the threat may have been understated and ask for further discussion and comment on this issue.

The discussion of Potential Mitigations (pp. I-12, I-13) describes security measures that will be applied to MTA Green Line connections with the proposed Intermodal Transportation Center. The discussion refers to use of Closed Circuit Television surveillance and related intelligent devices (as yet unidentified), and specifically mentions facial recognition technology. Several security industry reports in 2002 and 2003 have discredited the so-called ‘face in the crowd’ facial recognition applications. Original hopes for this technology were overly optimistic, and recent experience has shown this application to be flawed. In a number of cases (for example, Ybor City, Tampa, FL) the systems have been withdrawn from use.<sup>22</sup> Further comment will be made later in regard to use of an array of technology and the finite value of detection data inflow.

The final paragraph discussing the MTA Green Line states that “*The Green Line connection enhancements in Alternative D provide for a better security solution because no unscreened people or luggage would be permitted to enter the Central Terminal Area.*” This suggests 100% screening of people and bags, yet there is no reference elsewhere in the Addendum or Supplement to confirm this. Please comment on whether 100% screening will be provided.

There is also no discussion of the planned accommodation for and type of screening equipment, other than a vague mention: “*The MTA Green Line connection facilitates the future employment of security technology allowing a level of initial screening to occur prior to entering the Intermodal Transportation Center or Central Terminal Area.*” What form of screening will actually take place there initially, and to what extent? What increase in screening activity is planned or accommodated in the contingencies for change?

Chapter 6.2 offers a more comprehensive description of the Intermodal Transportation Center. The Comparative Analysis acknowledges that the Intermodal Transportation Center is an integral part of the concentric rings of security and ‘protection, detection, assessment, and response’ concept. The concentric rings processes are described, with the final stage described thus: “*Prior to boarding the APM, all people and bags will be screened using appropriate technology to identify weapons and explosives.*” Two benefits are cited: one is that it would permit initial screening of passengers and

---

<sup>22</sup> Note that biometric facial identification systems, which are used to match individuals on a one-on-one basis, are a different form of this technology and continue to show successful results.

vehicles that without the reconfiguration would not occur; and the other is that it adds a measure of protection to passengers using the APM as they move to the Central Terminal Area. This appears to contradict other elements of the Master Plan documentation, raising questions about the consistency between security components. LAWA should define the word 'screening' and use the classification 'Level 1' more consistently. Otherwise this suggests the emergence of different security standards for access to the Automated People Mover and Central Terminal Area.

Pages I-16 and I-17 cover general security matters pertaining to the reconfigured roadways. Again we note that security technology is a valuable adjunct to trained security patrols but it is not a panacea; it is instead a management tool. Please articulate the contingency plan for interception and management of roadway incidents with minimal disruption to airport operations. This is particularly important at the policy setting stage, as large projects are notorious for paring back security expenditures and thereby compromising protection standards. Will LAWA policy identify agreed-upon security standards so that this does not occur?

In practice, the performance of Closed Circuit TV will depend on the ratio of trained personnel to monitoring devices. Although the stated benefits of roadway monitoring are attractive, the increased data will require monitoring, interpretation and action. How much thought has LAWA given to the risk of data saturation? Over-dependence on security technology may lead to higher risk of error and, ironically, diminished protection. Occupied space is projected under this plan to increase from 3.9 to 6.8 msf. In combination with increased separation distances, this increase will impose substantial new constraints and demands on emergency and enforcement response, and also upon patrol/deterrent services.

Mitchell Gray, in a University of British Columbia paper title *Urban Surveillance and Panopticism* (<http://www.surveillance-and-society.org>) explores many of the more complex issues associated with surveillance in the community. It is worthy reading for any elected official attempting to understand the implications and potential unintended consequences of surveillance systems. The basic message to be gained from Gray's treatise is contained in the following extract: "*It is rapidly becoming an urban instinct to grasp at security through surveillance and knowledge, but this, paradoxically, may add to urban insecurity in a fundamental way: by transforming society in unforeseen directions. There is a threshold point in urban surveillance beyond which quantitative change – the addition of devices used and areas watched – becomes qualitative change.*" Please comment on how LAWA has addressed the potential for over-dependence on security technology at LAX as part of the proposed Master Plan improvements.

A review of the Ground Transportation Center in Appendix I (Ch. 6.4) restates the threat and target dispersal philosophy along with the 'protection, detection, assessment, and response' protocols. According to discussion on page I-19, passengers will go through a well-organized Level 1 screening point at the Ground Transportation Center before transport on the Automated People Mover to the Central Terminal Area. The Level 1 screening serves to insure the integrity of the Automated People Mover and common areas of the Central Terminal Area, and represents the first opportunity to check passengers and employees for concealed weapons and explosive devices. Yet again there is a clear contradiction with the main part of the Draft Addendum, reinforced by a listing of measures that makes reference to design and installation of passenger and baggage screening devices; please clarify. Additional comment and questions are provided below:

- Is it the planned intention to have two levels of screening, to include 100% of pedestrians accessing the APM and Central Terminal Area?
- How would 100% screening of Level 1 people and baggage affect the risk of congestion and increased people density at the Ground Transportation Center and other remote locations? Has LAWA analyzed this risk? If so, where are the results?
- What ergonomic design factors will optimize rapid movement of people and bags? Has LAWA considered the impact of Level 1 screening on the elderly, infirm, and people traveling with small children?
- Has any field market research been conducted to assess the tolerance for earlier arrivals to negotiate two levels of screening and transportation of baggage between those two levels?

Discussion of the Rental Car Facility (Appendix I Ch. 6.5) repeats the intention to screen all personnel from the Rental Car area to the Automated People Mover. However, the same discussion notes: *'should the current Central Terminal Area roadway need to be secured' inspection of an estimated 1 million shuttle bus trips annually would be time consuming and subject to human error even if state-of-the-art security inspection equipment was employed*. If Alternative D removes vehicular traffic, and thereby mitigates vehicle bomb risk, then would not the passenger and baggage security factor shift to the Automated People Mover? The APM system could become an attractive and vulnerable target. We are therefore concerned about the potential need to police and manage a much larger area (including an occupied mix of separate facilities), that may from the outset require equal standards of screening at Levels 1 and 2. Please comment on this concern.

The Rental Car Facility mitigation measures offer a blend of logical and speculative measures, including the discredited facial recognition system. We again raise earlier comments about discredited systems, data saturation and over-dependence on technology. This is particularly pertinent since the assessment does not refer to an equivalent demand for the increased training and numbers of security operatives (ranging from technicians through guards to airport dedicated law enforcement personnel). Please comment on LAWA's plans with respect to the presence and role of security personnel at the Rental Car Facility.

We request that LAWA provide a security deployment projection for Alternative D, together with a security technology and equipment schedule. Please illustrate how 'protection, detection, assessment, and response' can be accomplished using only technology available today, and describe any credible security equipment advances that can be expected over the next 5 years that might justify an investment in this program. It may be unwise to count on as-yet undeveloped technologies, particularly since reliable and proven technology is with us today, sufficient for planning purposes. More problematic may be the use of human resources, including appropriate numbers, competence and strategic locations.

The comparative analysis in Chapter 6.6 indicates that the Automated People Mover will be a key component for dispersal of vehicular traffic from the Central Terminal Area roadway network. This may be true, but could LAWA accomplish the same dispersal by reducing the distance between the remote ground processing points and the Central Terminal Area? Please provide a vulnerability analysis to address this issue. Further comment and questions are provided below:

- Please provide additional discussion about screening for weapons and explosives at the inbound remote Automated People Mover station access points

- ▶ Please discuss the security logistics and practical challenges of handling heavy baggage, multiple bags, and elderly and disabled passengers and children when loading and unloading the Automated People Mover. It is extremely difficult to imagine how screening, loading and offloading of passengers and baggage could be accommodated at the Ground Transportation and Intermodal Transportation Centers and the Rental Car Facility, with sufficient frequency to achieve the level of service promised in the Plan -- especially with the reconfiguration objective of rapid dispersal of people.
- ▶ The Draft Addendum states (p.2-37) "*It is also assumed that luggage carts would be allowed on the Automated People Mover and highly utilized in the transfer of people and baggage.*" This chaotic image invites questions about safety factors and load capabilities, neither of which is discussed in the Appendix I security assessment. Please address this issue.
- ▶ Please provide an exhibit showing street-to-departure ergonomics, flow and density patterns, and screening equipment layout of the remote people mover access points. Although security screening equipment is implied, space utilization is at odds with this statement from page 2-37: "*it is anticipated that passenger assembly would be limited to the passenger platform.*"
- ▶ The prevention of unscreened vehicular and bomb access to the Central Terminal Area could be offset by the APM: the train could actually carry the device to its target if Level 1 does not screen for explosives carried on the person (as in suicide attacks in Israel). Magnetometers do not detect explosives. Please address this potential security threat.
- ▶ The APM could be attacked via vehicles using Century Blvd. and 98<sup>th</sup> Street, and/or from commercial buildings and hotels overlooking the Automated People Mover guide way system. Please address this potential security threat.
- ▶ The primary vulnerability appears to come from the track distance and elevated nature of the Automated People Mover, and its target worth (i.e., elimination of a critical airport transit link, serious disruption to operations, high casualties, public terror and a prestigious but discredited security program). In effect, the Automated People Mover may serve to reintroduce the target potential that Alternative D was purportedly designed to reduce.
- ▶ If the Automated People Mover concept is to be pursued, we ask that LAWA consider the possibility of building a grade level (surface) operation, with blast diffusion techniques and materials applied to a protective wall and an armored one-way-transparent canopy for the length of the track
- ▶ Overall this part of the Plan is conceptual and idealistic. It lacks data that is essential to show how and when the processes interconnect and will be successfully negotiated while achieving safe dispersal objectives. If the main part of the Addendum (Page 2-35) is correct in its description of the intended screening activity (i.e., "*random checking of baggage and passengers using sniffing dogs, video surveillance systems and other security devices*") then the Automated People Mover will be vulnerable. Acceptance of that risk is a matter for public policy debate, but moving walkway bridges would obviate need for the Automated People Mover. We request comment and discussion on each of the points raised in this item.

Discussion of the Expanded FlyAway (Ch. 6.7.1) attempts to instill confidence in a speculative system to protect buses from becoming unwitting vehicles for terrorist attack. We have already expressed our doubts on this topic, including the considerable physical spread of the security requirement, the attendant cost, and serious questions as to the ability to control bus security within remote stations and in transit. The FlyAway bus operations would come inside the concentric circles, and it is unclear how the protection would be achieved. The technology to address these

concerns (such as under-vehicle inspections) is simplistic and conceptual. Please provide more detail concerning this system, with discussion of the attendant human resource requirements.

In the Chapter 8 Summary, Appendix I uses a subtitle 'Alternative D Advantages and Disadvantages.' It then lists five primary advantages followed immediately by three 'potential enhancements'. We request that LAWA provide more explanation of each, as we believe they merit greater priority. Note that the first suggests the provision of a Vehicle Inspection Center. We have already made reference to the need for this in roadway planning.

We believe that the Remote Delivery Facility will become a reality for many critical government facilities in the United States over the next 5 years, closely followed by other critical infrastructure sectors including commercial airports. It is already operating policy for a variety of private and public sector facilities in different parts of the world, and has seen an increase since the Anthrax mail attacks of late 2001. Accordingly, we ask that LAWA give serious consideration to an extension of this prospective facility to include an Identification and Authorization Processing Center, including some discussion in the response to this comment.

During this review we have established an unquantifiable but extensive (potentially massive) future demand for data input, retrieval, analysis, interpretation and sharing. The data will be diverse, covering audio & visual, electronic signaling, text, numerical, pictorial, computer code, identification systems, people, vehicles, transactions etc. etc. Our understanding of the transactional volume and complexities for a busy international airport shows that a dedicated Identification and Authorization Processing Center is justified to monitor the demand for access to different parts of the airport. This security-controlled service provides identification and clearance for individuals and vehicles, engaging electronic tagging, biometrics, and the administration of airport asset and airside vehicle tracking. Variables allow for individual issue of identification and access control media whether the subject is escorted or unescorted, permanent or temporary, urgent or routine. This facility should be off-airport, based on long established methods employed overseas. The processes will relate directly to the interests of law enforcement agencies and the security resource. This facility should be located close to the planned new police headquarters. Please comment on the possibility of incorporating these suggestions into the Master Plan.

The third enhancement described in Appendix I relates to the Automated People Mover, previously discussed in this review. There is, however, *a distinct and in fact total, absence of listed disadvantages relating to Alternative D security.* Our concerns are deepened by the fact that Appendix I lists 5 disadvantages of the No Action/No Project Alternative and then proceeds to mix conceded points with counter argument on 5 other points, thereby maintaining absolute opposition to the No Action/No Project Alternative. A similarly critical eye needs to be cast upon all alternatives. The current approach significantly weakens the value and integrity of the discussion as a comparative analysis, and echoes the concerns for bias and lack of full disclosure that we have stated elsewhere. We request that LAWA provide a full discussion of the disadvantages associated with the proposed security plans for each of the project Alternatives.

#### **4.1.6 Other Security Considerations**

In a project of this size, with a title of the Safety and Security Alternative, the County of Los Angeles would expect the LAX Master Plan Alternative D to embrace a total security concept. It is

therefore notable that the documentation does not elaborate on plans to secure areas that are known to have major security implications, such as cargo, maintenance hangars and facilities, fuel farm operations, and the perimeter fence lines. During an airport environs tour, the review team saw many security exposures at the west end of LAX and witnessed extreme weaknesses in access control allowing commercial delivery vehicles to enter facilities unchecked (in one instance by simple tailgating). This unauthorized access provided close quarter observation and potential access to parked wide body passenger aircraft in the vicinity. Please comment on this apparent lack of existing security at the west end, and any plans to remedy the situation.

We are aware that in a September 2002 press release, Mayor Hahn announced installation of more than 1,200 video cameras throughout the airport complex. We are unsure whether the word 'complex' refers to all LAWA managed airports, or just LAX; please clarify. We also request discussion of the current status of this project; is it correct that bids have been invited for installation of surveillance technology on the LAX perimeter? With respect to perimeter areas, we offer the following comments, along with a request that LAWA respond to each:

- ▶ The Alternative D Plan provides a substantial, expensive (albeit imperfect) protection system for the 'front door' to LAX. But it leaves the back door wide open.
- ▶ LAWA should give much more effort to security planning for the individual cargo area, the maintenance and fuel farm complex and roadways, and for the entire perimeter. Otherwise there is a danger that the environmental impact will not receive public scrutiny or will consume unacceptable time when that becomes urgent and essential.
- ▶ It is evident that LAX is vulnerable and that security improvements are relatively urgent. LAWA should prioritize the work so that the new security enhancements, when selected, come on stream as early as practicable. Special need exists for a thoughtful security risk management program during construction.
- ▶ Serious consideration should be given to the permanent closure of Pershing Drive to public access, and to introduction of a controlled, partially-automated access and egress system for vehicles with legitimate business in the maintenance, fuel farm and employee parking areas.
- ▶ In 1994 the Irish Republican Army fired four mortar bombs onto the runway at London Heathrow from a pick-up truck parked outside the perimeter fence. Two bombs hit the runway but failed to detonate. Two more recent attempts to attack aircraft with rocket-propelled grenade have occurred in Africa and at a military air base in the Middle East. The vulnerability arising from use of surface-to-air missiles is acute at the western end of the LAX airport environs. The location of the Segundo Blue Butterfly Habitat/Reserve, the topography and rough shrub cover, is almost perfect for the launch of shoulder-fired missiles and offers target range proximity to ascending and descending aircraft. As disturbing as it may be to be so candid, it is necessary to point out that a passenger, cargo and fuel laden wide-body passenger aircraft heading out for a long haul trans-Pacific flight could be attacked without sufficient time to implement successful counter measures. The suicidal nature of modern day terrorist attack reduces the notional response time even further. We recommend that an urgent and intensive review be undertaken to address this vulnerability and to proffer solutions that meet both public safety and environmental review requirements.
- ▶ Security and law enforcement personnel requirements merit discussion, as the number and need for specialized training would increase under Alternative D. For the sake of efficiency and public safety, this review should consider ways to reduce potential for jurisdictional and operational law enforcement conflict. It is our understanding that senior officers of the Los

Angeles Police Dept. in 1991 proposed a merger of policing entities for the airport, but without progress at that time. This may be a good opportunity to revisit that proposal.

#### 4.2 THE ENVIRONMENTAL JUSTICE ASSESSMENT IS DEFICIENT

Presidential Executive Order 12898, issued in February 1994, requires all federal agencies to analyze environmental justice impacts when proposing public projects. The analysis is intended to determine whether minority and low-income communities are unfairly burdened by project impacts, with the goal of using mitigation measures to create a level playing field. In 1999, Senate Bill 115 was passed making environmental justice a requirement of CEQA as well (PRC §.72000-72001).

Despite the importance of this subject, the original Draft EIS/EIR was found to lack even the most elementary NEPA requirements for this topical issue. Review of the Supplement to the Draft EIS/EIR indicates that many of the same deficiencies in the analysis remain. The impacts associated with Environmental Justice demand a far more rigorous analysis than has been provided in the 2001 and 2003 environmental reviews. As discussed below, NEPA requires that information be included in the EIS if costs of obtaining the information are not exorbitant. Where such costs are exorbitant, NEPA requires that the EIS: (1) state that the information is complete or unavailable; (2) state the relevance of the information to the analysis; (3) summarize credible scientific information about the impacts; and/or (4) use other methods of assessing impacts that are generally accepted by the scientific community. CEQA also addresses the issue of analytic detail, requiring that an EIR provide information and analyses with a sufficient level of detail to permit informed decision-making and public participation. LAWA must apply these very basic NEPA and CEQA requirements to the SDEIS/EIR assessment of Environmental Justice.

We are also concerned about the method used to compare alternatives in the environmental justice analysis. In both the 2001 and the 2003 documents, the No Project Alternative incorporates future planned improvements that were not actually being built, and overstates the capacity of existing facilities. Consequently, the No Project Alternative appears to have far more environmental impacts than any of the proposed Build Alternatives.

Further, the 2003 Supplemental Draft EIS/EIR describes Alternative "D" as an option that would limit growth to 78 MAP. However, as described previously in § 3.1, Alternative D provides 153 fully functional, high capacity gates and does not remove concrete areas that can be used for aircraft parking. By parking aircraft, Alternative "D" can function as though it has over 200 gates. In overstating the capacity of the No Project Alternative and minimizing the capacity of the build alternatives, the impacts relating to air emissions, air toxics, noise, and traffic are all underestimated for the build alternatives. *Underestimating these impacts skews the environmental justice assessment.* This is particularly true for Alternative "D," which shifts many of the impacts toward the more economically disadvantaged communities east and northeast of LAX.

Finally, in designing runway extensions and facilities to the east under Alternative D, this plan appears to protect biological resources (especially the El Segundo Blue Butterfly) at the expense of residents in Lennox, Inglewood & Manchester Square. As part of the Environmental Justice assessment, a revision to the 2003 Supplemental Draft EIS/EIR needs to be made that compares the disproportionately high and adverse human health and environmental effects that will be incurred by

minority and/or low-income communities in order to protect a limited habitat area on the coast (see also our discussion under § 3.4.5). Our concerns are discussed further in the sections below.

#### **4.2.1 Results of Scoping Outreach Must Be Discussed**

Scoping is a public process, required by NEPA, that should be conducted as early as possible after a Lead Agency decides to prepare an EIS. The scoping process is designed to determine the scope of issues to be addressed in an EIS, and should be conducted as early as possible after a Lead Agency decides to prepare an EIS. It is intended to be an open process, incorporating the views of other agencies and the public regarding the scope of an EIS.

Environmental Justice issues are usually a major component of the scoping process, and the 2001 Draft EIS/EIR does list 126 outreach efforts with low-income and minority communities and Appendix S-D of the 2003 Supplemental Draft EIS/EIR includes copies of the material (in both Spanish and English) handed out during these outreach efforts. The 2003 SDEIS/EIR also lists four additional Environmental Justice Workshops conducted in 2001. However, neither the 2001 DEIS/EIR nor the 2003 SDEIS/EIR provides an indication of concerns or issues raised by those that were contacted, or details of what transpired during these meetings. The public is thus unable to assess whether or how LAWA may have used the information developed through these efforts. The County of Los Angeles hereby requests that the 2003 SDEIS/EIR be expanded to include specific descriptions of the efforts made to gather information from low-income and minority communities, with a table that identifies the specific concerns raised by each of these groups and discusses LAWA's steps to address those concerns.

#### **4.2.2 The Level of Analytic Detail is Inadequate<sup>23</sup>**

Many potential Environmental Justice impacts were not fully evaluated, reportedly because LAWA was unable to quantify the impacts. NEPA states that when information is incomplete or unavailable, the Lead Agency must obtain that information unless costs are exorbitant.<sup>24</sup> According to CEQA, the analysis must be specific enough to permit informed decision-making and public participation. The following subsections include some of the impact discussions considered inadequate.

In discussing Air Quality and Health Effects, the 2001 Draft EIS/EIR and the 2003 Supplement both state: "Due to the lack of available background data and limited information on the cumulative effect of multiple air pollutants, the effect of the Master Plan on cumulative health risks among minority and low-income population cannot be quantified or fully analyzed." NEPA regulations do not permit such a deferral of obligation. All available data must be included, consistent with the mandate of NEPA, and the report must document the efforts made to obtain needed data. Where data is found to be unavailable or limited, the report should identify the cost associated with developing original data and indicate why such cost was determined to be exorbitant in the context of overall project costs.

The 2001 Draft EIS/EIR further asserts, "*Due to the lack of available background data, the cumulative or synergistic health effects of [toxic air pollutants (TAP)] emissions associated with the*

<sup>23</sup> 2001 Draft EIS/EIR, Section 4.4.3.

<sup>24</sup> NEPA Guidelines ; 40 C.F.R. § 15022.22.

*build Alternatives and other environmental hazards could not be quantitatively analyzed within the scope and timeframe of this Draft EIS/EIR.*" The 2003 SDEIS/EIR dropped this discussion and did not provide new information related to cumulative or synergistic health effects. The 2003 Supplemental Draft EIS/EIR could and should have made assumptions in order to determine such impacts. The County asks that LAWA develop and apply these assumptions to a quantitative analysis of the cumulative and synergistic health effects of TAP emissions associated with the build Alternatives and other hazards.

#### **4.2.3 The Relocation Plan and Requirements are Unsubstantiated<sup>25</sup>**

The 2001 Draft EIS/EIR stated that, "*Minority-owned businesses or businesses with a high proportion of minority employees or minority/low-income customers may face special challenges that need to be considered in developing a Business Relocation Plan*" but provided no explanation or definition of "special challenges." LAWA needs to clarify this term and indicate how these challenges would be considered in developing a business relocation plan.

The 2001 Draft EIS/EIR further stated that, "*Data is currently not available regarding the number of minority owned businesses or minority employees that might be affected by proposed acquisition.*" In fact, the referenced data is generally available and can be obtained with reasonable effort. LAWA must obtain and analyze this data in the SDEIS/EIR.

The 2003 assessment of Alternative D relocation impacts includes this statement: "*While it is possible that certain of these businesses may be minority owned, they are mostly airport related uses or uses that serve the largely non-minority/non-low-income community of Westchester-Playa del Rey.*" This statement is unsubstantiated by any facts presented in the 2001 Draft EIS/EIR or the 2003 SDEIS/EIR. Neither of these documents presents data showing how many businesses are minority owned or serve minority communities. The County requests that LAWA present such information in the SDEIS/EIR.

#### **4.2.4 Noise Impact Mitigations Require Further Discussion**

Both the 2001 and 2003 environmental documents assert that "*Certain areas affected by noise would still be faced with significant impacts due to constraints that apply most directly to minority and/or low-income communities. These include residential areas ineligible for mitigation due to inconsistent zoning or land use designations and substandard housing that may be infeasible to insulate.*"<sup>26</sup> At the very least, the 2003 Supplemental Draft EIS/EIR needs to clearly delineate the location of these impacted areas. A more appropriate solution would be to identify and implement specific mitigation measures to reduce impacts on minority neighborhoods; the document did not contain any noise mitigation measures, as discussed in detail later in this report.

#### **4.2.5 LAWA Must Develop a Build Alternative Based on Community Input**

Scoping is intended to be an open process, incorporating the views of other agencies and the public regarding the scope and focus of the EIS. CEQ regulations require Federal Agencies to identify an environmentally preferable alternative in the record of decision.<sup>27</sup> When the agency has identified a

<sup>25</sup> Discussion in this section is based on 2001 Draft EIS/EIR, §4.4.3 and SDEIS/EIR §4.4.3.

<sup>26</sup> 2001 Draft EIS/EIR, Section 4.4.3, Page 4-423; Supplemental Draft EIS/EIR, Section 4.4.3, Page 4-323.

<sup>27</sup> NEPA Guidelines: 40 C.F.R. § 1505.2(b)

disproportionately high and adverse human health or environmental effect on minority and/or low-income populations, as occurs in the 2001 and 2003 EIS/EIR documents, NEPA requires that the distribution as well as the magnitude of the disproportionate impacts should be a factor in determining the environmentally preferable alternative. This mandate is evidence in the following excerpt from the CEQ Environmental Justice Guidance document:<sup>28</sup>

*“Agencies should encourage the members of the communities that may suffer a disproportionately high and adverse human health or environmental effect from a proposed agency action to help develop and comment on possible alternatives to the proposed agency actions as early as possible in the process.”*

To conform to these requirements, LAWA and FHWA must develop an environmentally superior alternative based in part on input from members of minority and/or low-income communities that may suffer a disproportionately high and adverse human health or environmental effect. The 2001 Draft EIS/EIR and the 2003 Supplemental Draft EIS/EIR are void of any evidence indicating that comments or input offered by impacted members of minority or low-income communities were considered in developing an environmentally superior alternative. LAWA must revise the 2003 SDEIS/EIR to incorporate an environmentally superior alternative.

#### **4.2.6 The Area of Analysis is Arbitrarily Limited**

The Environmental Justice analysis of existing conditions and impacts focuses only on census tracts surrounding LAX. LAWA completed no regional analyses, although it was stated that the area of included the region as a whole. The analysis needs to be expanded to incorporate the region that is referenced in § 2 titled the Purpose and Need for the Proposed Action in both the 2001 Draft EIS/EIR and the 2003 Supplemental Draft EIS/EIR.

#### **4.2.7 Environmental Justice Mitigation Measures are Vague and/or Deferred<sup>29</sup>**

The 2003 Supplemental Draft EIS/EIR describes Environmental Justice mitigation in vague terms, deferring some of the mitigation to future studies. For example, aircraft noise mitigation measure MM-LU-1 (2003 SDEIS/EIR) states that LAWA will revise the Aircraft Noise Mitigation Program (ANMP) to include:

*“Aspects that are particularly relevant to addressing the unique issues and conditions in minority and low-income areas include provision by LAWA of additional technical assistance to local jurisdictions to support more rapid and efficient mitigation, and the reduction and elimination of structural and building code compliance constraints to mitigation of substandard housing.”*

Although the language suggests that LAWA has addressed this problem, the measure does not in fact commit LAWA to any definable actions that would reduce impacts. The 2003 SDEIS/EIR also describes future studies as mitigation. Of particular concern is mitigation measure MM-LU-3 calling for a study of the relationship between aircraft noise levels and the ability of children to learn:

---

<sup>28</sup> Environmental Justice Guidance Under NEPA, Section 5, page 15.

<sup>29</sup> Discussion is based on review of 2003 Supplemental Draft EIS/EIR Section 4.2.8.

*“This measure requires that LAWA conduct a comprehensive study to determine the relationship between learning and the disruptions caused by aircraft noise with the intent to set a threshold of significance for classroom disruption due to aircraft noise”*

This description suggests that the children of disadvantaged communities may be subjected to harmful noise levels in order to define thresholds of significance. A more responsible and conservative approach is needed that does not have the potential to do additional harm.

While the 2003 Supplemental Draft EIS/EIR elaborates on mitigation concepts more fully than the 2001 document, in many cases the mitigations still do not commit LAWA to definable actions that meet the CEQA and NEPA requirement to avoid, minimize, rectify, reduce, or compensate for adverse project impacts. All identified adverse impacts need to be accompanied by specific and defined mitigation measures. LAWA must evaluate the efficacy of the proposed measures in reducing identified primary and secondary impacts. The EIS/EIR should clearly identify impacts for which no measures are proposed, and should provide an indication of their severity. LAWA should then offer the amended analysis for public review and comment as part of a revised (or entirely new) Draft EIS/EIR. Only by these means can the EIS/EIR achieve adequacy with respect to the analysis of Environmental Justice.

#### **4.3 TRAFFIC ASSESSMENT**

##### **4.3.1 The LAX Interchange at Lennox Boulevard**

If Alternative D is chosen for the LAX Master Plan, the County of Los Angeles recommends the LAX Interchange be constructed on the 405 Freeway at Lennox Boulevard. The LAX Interchange would provide direct access between the 405 Freeway and LAX and significantly reduce the traffic impact of LAX on the unincorporated Lennox community and surrounding area. The name “LAX Interchange” is recommended, rather than Lennox Interchange, is to avoid the impression that motorists on the 405 Freeway can exit the freeway and travel to Lennox. Additionally, some form of interchange at Lennox Boulevard is recommended regardless of the plan chosen for LAX. Traffic demand at LAX is expected to increase steadily to the 78.9 MAP, even under the no-build scenario. Therefore, intersection or interchange improvements will be needed to mitigate LAX’s traffic impact on the Lennox community and nearby area.

County staff has met with Mr. Bruce McDaniel, Superintendent of the Lennox School District, and his staff to consider the School District’s input about the LAX Interchange. In response to their concerns, County staff informed the School District that the EIR/EIS for the LAX Interchange would include a noise study of the proposed interchange ramps. County staff also informed Mr. McDaniel the study would consider Lennox School District’s new pre-school recently constructed at the west end of 106<sup>th</sup> Street. Mr. McDaniel also expressed concern that the LAX Interchange may affect the visibility of signs to be installed on Lennox School District property adjacent to the LAX Interchange. Public Works referred the School District’s concern about the signs to LAWA’s representatives for their review and response.

### 4.3.2 Traffic Model Questions

A. C. Lazzaretto retained Mr. Terry Austin of Austin Foust and Associates to review the traffic model used in the LAX traffic study. Public Works staff coordinated its traffic review with Mr. Austin, and agrees with the questions and concerns raised by Mr. Austin in the discussion below.

**Trip Generation:** The trip generation table (Attachment A in Technical Report S2B) gives information by activity component but is hard to follow for the “Airport Miscellaneous” category. For example, what items represent the trip generation for the 12,400 space west employee parking structure and the 1,300 east employee parking structure? With respect to the employee trips, why are 54 percent assigned to the east parking structure with 1,300 spaces and only 46 percent to the 12,400-space west parking structure? (See Page 22 of the Supplemental On-Airport Surface Transportation Technical Report).

**Trip Distribution:** The trip distribution diagram (Figure B-1) is difficult to follow (while not labeled, it appears to be airport peak hour trips). Is there information that can more clearly show the trip distribution? The methodology discussion suggests that employee/other trips have a different trip distribution than air passenger trips. This would certainly be appropriate, but there does not appear to be any elaboration on this or any quantitative description.

**General:** There does not appear to be a reference for a description of the traffic model. There presumably is such a report which describes the model and provides a peak hour intersection level validation. Other questions that are also presumably addressed in that document pertain to the intersection forecasting process. For example, does the traffic model use post-processing for year 2015, and if so, is it 2000-2015 or some other interval? If there is no post-processing, then considerable reliance is being placed on the raw modeled data for 2015. This is particularly critical for peak hour intersection turn movement volumes.

## 4.4 NOISE ASSESSMENT

The County previously submitted to LAWA a lengthy set of comments on the noise analysis contained in the 2001 Draft EIR/EIS for the LAX Master Plan. The prior comments addressed noise impacts associated with the project Alternatives (A, B and C) under review at that time. The 2003 SDEIS/EIR expands on analyses contained in the original EIR/EIS to cover the new preferred project, Alternative D. The SDEIS/EIR also contains an analysis of single event noise impacts on sleep disturbance as well as an expanded analysis of noise impacts on schools. The sleep disturbance and school noise impacts analyses were prepared in response to CEQA litigation on the Oakland International Airport Master Plan commonly known as “Berkeley Jets.” The SDEIR/EIS presents Year 2000 noise data for comparison in addition to the Base Year 1996 data.

The comments presented here are ones made specific to the analysis of Alternative D and the sleep and school analyses that are presented in the supplemental EIR/EIS. The comments submitted in 2001 concerning Alternatives A, B and C also apply to Alternative D. Accordingly, we have organized the following review to include all of the comments originally submitted in 2001, as well as the new comments appropriate to Alternative D as described in the SDEIS/EIR.

#### **4.4.1 Restatement of Critical Review Submitted in 2001**

It is important to note that the findings of the Draft EIS/EIR include a finding of significant noise impact that cannot be mitigated to a point of insignificance. The issues raised in our analysis do not change this finding of significance. The comments presented here address whether or not the Draft EIS/EIR adequately discloses the extent and magnitude of the impact and whether or not mitigation issues are addressed adequately.

**Determination of Potentially Significant Impacts:** CEQA requires that the Draft EIR identify all impacts that could arise to significant levels and must employ the proper “thresholds of significance” to make that identification. CEQA also requires that the document “challenge” and “update” thresholds that may not be current or protective of the public interest. This notion includes the idea of setting thresholds that will improve the quality of life of residents. As it relates to the impacts identified below, LAWA should seize this opportunity to push the SDEIS/EIR beyond mere minimum standards or code compliance, and assert a more conservative approach to identifying significant impacts. The following identified impacts relate to the use of minimum standards.

CEQA does not mandate, require or endorse a specific decibel standard or noise metric to determine if a project engenders a significant adverse environmental impact with respect to aircraft noise. However, a significant aircraft noise impact is said to have occurred if one or both of the following conditions exist:<sup>30</sup> (a) noise sensitive areas (such as residences, churches, and hospitals) are newly exposed to 65 CNEL or greater; and/or (b) noise sensitive uses in the 65 CNEL contour of a “build” alternative experience an increase of 1.5 CNEL or greater compared with the environmental baseline conditions.

The Airport Noise Compatibility Planning guideline<sup>31</sup> is the primary Federal regulation guiding and controlling planning for aviation noise compatibility on and around airports. It establishes, for most land uses and noise sensitive uses, the standard of < 65 day-night average noise level (DNL or Ldn) as “acceptable,” although it recognizes that local communities may choose to mitigate impacts below the Ldn of 65 dB.

The Federal Interagency Commission of Noise has identified 65 Ldn as the 24-hour day-night average sound level at which most people become highly annoyed by noise. However, FICON has acknowledged that people may and do become highly annoyed by noise levels well below 65 Ldn. Indeed, many commentators and acoustic researchers are seriously questioning the validity of the 65 dB Ldn criteria for planning purposes: research has shown that at this level about 15% of the population remains “highly annoyed” and that the standard is an average sound level, not a measurement of individual sound events that tend to affect people more than average levels.

The SDEIS/EIR should have employed these conservative criteria to allow a survey of a larger area and reveal the true pervasiveness of sound that was not identified in the Draft EIS/EIR. This would be important in the discussion of impacts and mitigation of noise to show that “average” threshold levels were not sufficient to show the chronic and long-term effects within the LAX flight path. It is likely that there will be exacerbated and disproportionate levels of impacts on unincorporated neighborhoods under the flight path approaches to LAX.

<sup>30</sup> California Aircraft Noise Standards, Title 21 of the California Code of Regulations.

<sup>31</sup> Title 14 of the Code of Federal Regulations, Part 150.

**Number of People Impacted by Noise:** There is a significant discrepancy in the number of dwelling units and population impacted between the EIS/EIR baseline year impacts and data published by LAWA. Under California law, the airport must publish a quarterly report that describes the noise impact of the airport. This law has been in effect since the early 1970s and LAWA has published the Quarterly Reports as required. Appendix D of the EIS/EIR states that the base year noise impact is based on data published by LAWA in the 1996 Fourth Quarter Report.<sup>32</sup> Chapter 4, § 4.1.3.1.2 states that the EIS/EIR relies on the Fourth Quarter 1996 operational data but does adjust the EIS/EIR contours to reflect the noise monitoring data that are collected by the airport. The difference between the impacts as defined by the EIS/EIR and the impacts as identified by LAWA in its Quarterly Report is dramatic and significant. The following data compare the number of dwellings and population impacted as defined by LAWA in the 1996 Fourth Quarter Report and as defined in the EIS/EIR for baseline year 1996.

**Table 4**  
**Difference Between Draft EIS/EIR Noise Impact and LAWA 1996 Quarterly Report**

	Dwellings Inside 65 CNEL	Population Inside 65 CNEL
LAWA 1996 Fourth Quarter Report	31,968	85,907
EIS/EIR Table 4.1-2 For 1996	16,900	49,000
<b>Difference</b>	<b>15,068</b>	<b>36,907</b>

The differences shown in Table 4 are not presented, reconciled, or explained in the SDEIS/EIR. The population and dwelling data shown in the LAWA 1996 Quarterly Report are not mentioned in the Supplement to the Draft EIS/EIR even though the Quarterly Report shows noise impacts nearly twice as large as those reported in the SDEIS/EIR. Section 4.1.3.1.2 and Appendix D § 2.2 discuss the LAWA Quarterly Reports and the fact that noise contours in the Quarterly Reports are adjusted to reflect noise monitoring data. Appendix D presents the difference between the noise monitoring results and the EIS/EIR noise model results in the terms of dB CNEL in Table 5. The average difference between the two is presented as an under-prediction in the model of approximately 1.1 dB. Examination of the data shows that the noise monitor sites east of the airport, primarily in Inglewood, consistently show noise levels nearly 3 dB greater than the EIS/EIR noise modeling predicts. While the differences are smaller in other communities, the bulk of the population impacted is in the area where monitors show that the noise model has under-predicted the impact.

LAWA operates a permanent noise monitoring system as required by the California Airport Noise Regulations that has been approved by the State of California Division of Aeronautics. LAWA has been monitoring noise on a continuous basis and submitting Quarterly Reports since the early 1970's and every Quarterly Report includes noise impact data based on noise contours that have been adjusted to match noise monitoring data. Nevertheless, the Draft EIS/EIR relies on a noise computer model output that has not been adjusted to reflect the noise monitoring data even though the noise monitoring data show a consistent 3 dB bias in the east approach corridor to LAX.

<sup>32</sup> Appendix D Section 2.1, Appendix D Section 2.2.

There is no doubt that there is a consistent bias in modeling data in the Inglewood approach corridor; the size of the difference in the Inglewood area compared to the system accuracy is significant. Appendix D, in the paragraph just below Table 6 makes the misleading and inaccurate statement that the SDEIS/EIR noise contours “were generally confirmed by the actual noise measurements.” This statement is based on the overall average difference at all sites, and fails to recognize the bias in the Inglewood approach corridor. The Draft EIS/EIR contours under-predict the noise impact as measured by the number of dwellings and population within the 65 CNEL contour by an amount that makes it difficult to establish a credible disclosure statement to the general public.

The SDEIS/EIR does not attempt to examine the reason for the under-prediction of aircraft noise by this noise model. Instead, the SDEIS/EIR rationalizes the lack of contour adjustment by stating, “draft FAA Order 1050.E indicates that measurements should not be used to calibrate noise contours;”<sup>33</sup> the cause of the discrepancy is not identified. The difference may be due to errors in input data to the noise model, not a calibration issue. Failure to adequately account for flight track dispersion could cause the kind of discrepancies the data shows. The model has the capability to report noise levels by aircraft type at each location. Such data should be compared to measurement data for those aircraft and a rational and detailed explanation of the model/measurement differences should be made. At the least, the source of the difference would then be identified (i.e., input data errors, model database differences, or model algorithm shortcomings).

The FAA has a history of being reluctant to adjust noise contours based on measurement data. This policy was based on historical attempts to use short term monitoring data to make adjustments that are not statistically justified. Such a policy is justified, in particular when attempts are made to use a few hours of monitoring data as a basis for moving noise contours. In this case, however, LAWA operates noise-monitoring sites 24 hours a day, measuring every aircraft, and has been doing so for over 20 years. These data do warrant adjustment to the noise contours; either by correcting input errors or modifying model databases (such as noise curves and aircraft profiles). FAA does not prohibit these changes and, in fact, FAA provides a mechanism for user changes to the database. The “INM Users Guide,”<sup>34</sup> contains Appendix B, “FAA Profile Review Checklist.” The first paragraph of that appendix contains the following statement,

*“The Office of Environment and Energy (AEE) requires prior written approval for all user changes to the Integrated Noise Model (INM) standard profiles for FAR Part 150 studies. A similar requirement under National Environmental Policy Act (NEPA) will take effect pending FAA Order 1050.1E”.*

Following that paragraph is a detailed list of information required for the FAA review of user made changes. It is not known if any attempt was made to seek FAA approval of changes needed to make the model better match measurement data. If there was no attempt, the decision should be explained. This last comment is especially appropriate if input errors have already been eliminated as a possible source of the difference.

**Change in Number of People Impacted by Noise:** The Draft EIS/EIR relies on the noise model to identify relative changes between baseline and future Alternative conditions. The Draft states, “*the*

---

<sup>33</sup> Appendix D, Page 17.

<sup>34</sup> For INM Version 6, dated September 1999.

*modeled noise levels associated with environmental baseline conditions will have consistent relative relationships to future noise patterns prepared with the INM.*"<sup>35</sup> This statement, while possibly true for changes in noise level, is not accurate with respect to the area of noise impact, the number of dwelling units, and the population within the noise contours. The implication of the statement quoted above is that the increased number of people identified as impacted will be the same whether or not the noise contours are adjusted to reflect results of noise monitoring. This is not true and fails to reflect that area, dwelling units, and population are second order functions of the size of the contour. The change in the number of people residing inside the 65 CNEL contour will be much larger than reported in the Draft EIS/EIR. The percent change may remain nearly constant, but the absolute magnitude will be larger.

If LAWA does not adjust the Draft EIS/EIR contours to reflect monitoring data then the document should attempt to estimate the correct number of dwellings and people inside the contours by using an adjustment factor based on the differences identified for the baseline conditions. While this is far less satisfactory than adjusting the contours, the impacts identified would be a far better disclosure of the magnitude of the impact than is now included in the document.

**Use of 1996 as Base Year:** There is reason to question the validity of 1996 as the baseline year. Use of the 1996 baseline appears to underestimate the impact of the project (in addition to the contour adjustment issue identified above). To demonstrate this concern, the following table compares 1996, 1999, and Year 2000 noise impacts at LAX:

**Table 5  
LAWA 1996, 1999 and 2000 Quarterly Report Noise Impacts**

	Dwellings Inside 65 CNEL	Population Inside 65 CNEL
1996 Fourth Quarter Report	31,968	85,907
1999 Fourth Quarter Report	26,422	78,026
2000 Fourth Quarter Report	27,312	80,211

The above data show that the use of the 1996 baseline, with its larger impact area, would result in underestimating impacts compared to using 1999 or 2000. The difference in the number of people impacted for the year 1996 and the year 2000 is potentially large enough to change the conclusions as to whether future year contours impact a larger or smaller number of people than baseline conditions. As a result, LAWA should update the noise study to a more current year.

**Project Description/Operational Assumptions:** The noise analysis is a comprehensive analysis that attempts to identify cumulative and single event noise impacts as well as detailed tables of time above specific thresholds. However, in addition to failing to adjust the contours to reflect noise monitoring data, there is substantial uncertainty associated with the future operational assumptions. The operational assumptions are in many cases counterintuitive and lack justification. This makes any analysis of the noise impacts speculative, and potentially under-predicts the impact. The following are examples of areas of concern and point to a need to do a "worst case" analysis in the

<sup>35</sup> Appendix D, Page 17.

event that these assumptions cannot be assured or justified. The following data were taken from the Executive Summary, Pages ES-9 and ES-10.

**Passengers Per Departure:** The baseline passengers per departure are 90.76 while Alternative C assumes 145.09. It is not explained how LAWA expects the project to result in a relocation of short haul operations to some other airport and an increase in average aircraft size. There is no component of Alternative C that results in a nearly 60% increase in passengers per departure. This increase is extraordinarily large given that no part of the project forces commuter or short haul aircraft to move or even includes a design feature that discourages these aircraft. In light of this, the Draft EIS/EIR should contemplate the noise impacts if this assumption proves to be false and commuter and short haul carriers do not move to some other airport. Further, the extent to which the passenger per departure increase is due to increased load factors needs to be addressed and a discussion of whether or not this increase in load factor (expressed as an increase in aircraft weight) was included in the INM input for the future case scenarios needs to be explored.

**Cargo Activity/Cargo Building Space:** The baseline cargo activity is 1.9 million tons of cargo using 1.9 million square feet of space. Alternative C activity is 4.1 million tons using 5 million square feet. The future ratio assumes that new cargo facilities are no more efficient than the old LAX facilities and fails to recognize that modern facilities may handle twice the amount of cargo per square foot. LAWA does not provide the basis for this assumption. The noise analysis should be based on the potential impact of far more cargo traffic than is currently estimated.

**Maximum Airside Capacity:** The Draft EIS/EIR nearly doubles the terminal space but assumes a very modest increase in passengers and operations. This is based on the assumption that future technology will not increase the capacity of existing runways. However, LAWA should also explore the opposite: what would result if improved technology results in increased airside capacity? Given the increase in terminal space, how much air traffic could those terminals handle? LAWA should disclose noise impacts for air traffic estimates based on maximum terminal capacity for the proposed project.

**Peak Hour Operations/Delay:** The All Weather Peak Hour Operations are identified as 150 for the baseline condition and 145 for Alternative C. The All Weather Average Delay is identified as 8.69 minutes while the Alternative C delay is identified as 13.59 minutes. This statement is counterintuitive and, at the very least, challenges the credibility of the aviation forecasts upon which the noise analyses are based. Please explain the basis for these findings.

**Terminal Space/Number of Gates:** Alternative C increases terminal space from 4 to 7.3 msf while gates increase from 165 to 172 (186 to 228 narrow body equivalents). The narrow body equivalent ratio increases from 21,500 sq. ft. per narrow body equivalent gate (baseline) to 32,000 square feet per gate, which is nearly a 50% increase. It appears that the project will have a larger gate capacity than is being reported and, if so, this needs to be accounted for in the noise analysis.

**Regional Issues:** The project is primarily a landside development project (terminals and roads) with no new runways. A major assumption in the document is that some other airport in the region will absorb the unmet aviation demand. The Draft EIS/EIR does not identify which airports will meet this demand or any mechanism to ensure that this assumption is valid. LAWA, as proprietor of multiple airports is lead agency for the EIR and the FAA is a lead agency for the EIS. Both agencies have the ability to commit to or fund airport projects outside of LAX. The document

needs to address the noise issues in the event that future airport capacity is not developed elsewhere in the region. The SDEIS/EIR should include an Alternative that meets aviation demand for the region – either through committing to a regional solution or anticipating additional runways in Alternative C – and discloses the noise impact of that Alternative.

**Health Effects of Noise Technical Report:** Technical Report 14b contains a general discussion of the effects of noise on people. In the last paragraph of §1 the report concludes with the statement, “It is, therefore, assumed that compliance with the compatibility criteria is sufficient to protect human health.” The statement in itself is correct, but is misleading in its implication that LAX complies with the compatibility criteria. The report fails to make a most important conclusion related to health effects of noise: LAX does not comply with the compatibility criteria. Based on this factor, it can then be concluded that noise levels associated with aircraft operations at LAX have adverse health effects on people. This should be addressed in the Technical Report and the DEIS/EIR should identify the health effects associated with high noise levels including the fact that in 1996 over 85,000 people resided in areas that exceeded the compatibility criteria.

**Mitigation of Noise Impacts:** The proposed project includes no noise mitigation recommendations for the proposed project. It should be noted and clearly recognized that LAWA has for many years conducted an ongoing noise mitigation program and has periodically introduced new programs as appropriate. What is not clear is why the proposed project does not address any new noise mitigation programs. Several mitigations are discussed in detail in Appendix D but not recommended for adoption by LAWA. Appendix D includes the following measures that LAWA should consider for inclusion as recommended programs for the proposed project:

- ▶ Shorten the downwind leg approach to reduce the number of overflights to communities well east of the airport.<sup>36</sup>
- ▶ Eliminate early turns over El Segundo.
- ▶ Reevaluate the benefit of restricting outboard runways to arrivals only in terms of number of people and dwellings inside the 65 CNEL contour.

The analysis in Appendix D describes benefits and impacts in only general terms of change in noise level but not in area impacted. Further, the analysis appears to rely on questionable economic data to estimate mitigation costs. Specifically, the analysis assumes that the delay of 2-4 minutes associated with the measure would apply to all flights independent of time of day. It would be more logical to assume that the delay would be longer during peak periods and shorter during off peaks.

An important aspect of the existing LAX noise mitigation program is the preference for west flow departure operations. The project assumptions presented in Appendix D appear to assume some degradation in the amount of time that the airport is in west flow for departures. Figure 10 of Appendix D shows 5.71% of operations in east flow for the proposed project. Table 3 of Appendix D indicates that less than 1% of departures are to the east for baseline conditions. Figure 10 and Table 3 are in different formats, so the above comparison may not be fair; however, the SDEIS/EIR does not provide assurance that the project will not result in an increase in east flow departures.

A final mitigation that should be given consideration is expansion of the sound insulation program to homes within the 60 CNEL contour. Such a program may not qualify for traditional Federal

---

<sup>36</sup> Exhibit 29 of Appendix D.

funding but there may be an opportunity to use passenger facility charge (PFC) funding for such a program. Because community concerns about the impact of aircraft noise goes so far beyond the boundary of the 65 CNEL contour (particularly when the contour is not adjusted to match noise measurement data), consideration of expanding the program should be given a thorough evaluation in the Draft EIS/EIR. Figure 4.2-5 shows the 1992 65 CNEL contour upon which the insulation program is based. The Draft EIS/EIR should compare this contour with the project 60 CNEL contour and evaluate the cost of expanding the program to include the 60 CNEL contour.

#### **Miscellaneous Noise Comments:**

Data Sources and Assumptions: In §2.1, the third from last sentence, 2<sup>nd</sup> paragraph states, “this EIS/EIR will rely on the results of the Noise Management Bureau’s system in the definition of environmental baseline noise levels (per the 4<sup>th</sup> Quarter 1996 Report).” This statement is categorically wrong and misleading. It implies that the report relies on the calibrated noise contours produced by LAWA. The report relies on uncalibrated noise contours generated by the noise model that are considerably smaller than the contours presented in the 4<sup>th</sup> Quarter 1996 Report.

Environmental Baseline vs. Quarterly Noise Report: Discussion in §2.2 attempts to downplay differences between the Quarterly Report contours and the baseline contours in the SDEIS/EIR. The first paragraph cites a Figure<sup>37</sup> that would help the reader understand that the Draft EIS/EIR baseline is considerably smaller than the Quarterly Report contours, but the figure is missing from the report. The statistical analysis of the noise measurement data and noise model results from Table 6 is completely inadequate and fails to identify the bias in the noise model to under-predict noise levels in the approach corridor over Inglewood. Please address this concern.

Impact on Schools: §3.3 of Technical Report 14b (Health Effects of Noise) has a footnote explaining the 1980 lawsuit settlement with the school district. The analysis appears to assume that because of this settlement there is no impact on schools. Please identify which schools have been insulated, which schools remain to be insulated, and how many more schools will need to be insulated as a result of the project.

Federal Standards: § 4.1.4.1.2 in the last sentence states that the “...FAA has adopted standards and guidance governing airport noise compatibility.” The FAA has only published land use compatibility guidelines and has not adopted noise standards. It is up to the local authorities to adopt noise/land use compatibility standards.

Construction Noise: § 4.1.4.3.1 should reference the City of Los Angeles and the County of Los Angeles Noise Ordinances which contain noise limits and limits on the hours of activity. The County requests that LAWA identify noise limits in the ordinance as a threshold of significance, and provide analyses in accordance with that threshold.

Operations Data: In the discussion on noise patterns,<sup>38</sup> the first bullet point outlines an increase in heavy aircraft and a decrease in small aircraft. There is no explanation as to how Alternative C accomplishes this transition and there are no explicit features of Alternative C that would appear to

---

<sup>37</sup> Figure 2.3.

<sup>38</sup> Section 4.1.6.1.2.2, Alternative C, Aircraft Noise Pattern at 2015.

encourage it. If the assumption cannot be justified, the noise analysis should be revised to reflect the trend toward a fleet mix that does not rely on heavy aircraft for achieving the passenger demand.

Construction Scheduling: The City and County of Los Angeles have ordinances that limit the hours of construction activity. § 4.1.8.3, MM-N-9, should reference those ordinances and identify the hours that construction is permitted.

Location Impact Analysis: The last sentence of the last paragraph on Page 87 states that only CNEL and DNL have a regulatory function. This is a very limiting assumption and fails to recognize that for some types of impacts, these metrics may be inadequate. Specifically, FICON identifies these metrics as potentially inadequate for assessing noise impacts on sleep or noise impacts on the classroom environment. FICON recommends use of supplement metrics for analysis of these impacts; the County requests that LAWA use the metrics to analyze these impacts. While the document does present some Sound Exposure Level (SEL) contours and tables of time above data at specific points, the Draft EIS/EIR fails to use these data to assess sleep disturbance or school impacts.

No-Action/No Project Comparisons: The first sentence of § 5.1.3 identifies that 11 grid points will be exposed to increases of 1.5 dB. This comparison of the number of grid points is used throughout the analysis. This type of analysis fails to account for the land use that may occur at the grid points. In effect, the grid points, while regularly spaced, are located on random land uses. It would be more accurate to use INM to construct a different contour that shows all areas exposed to a change of 1.5 dB or more; the County requests that LAWA use this contour to quantify the land use impact. The INM has the ability to construct such a different contour.

Noise Mitigation: The first sentence of §7 identifies the need for mitigation of significant impacts. Since the project is shown to have a significant impact, the County requests that LAWA propose appropriate noise mitigation measures.

Alternative C Figures: Alternative C, Figure 11, does not use flight track dispersion in the noise model; however, LAWA has radar-tracking ability. Please provide a 24-hour period of actual radar tracks as an example of the extent of track dispersion over the affected areas.

Area Wide Flight Paths: Please supplement Alternative C, Figure 17 with one chart for existing conditions so the reader can identify differences. At a minimum, the text should describe how this chart changes paths relative to existing conditions.

Appendix D: Table 7 of Appendix D identifies the forecast year 2005 baseline as 2,107 operations per day and year 2015 as 2,124 operations per day.<sup>39</sup> The Quarterly Report for the 4<sup>th</sup> Quarter of the year 2000 shows that current operation levels are 2,280 operations per day (201,347 quarterly operations). Existing operations are already exceeding the 10 and 20-year projections for the No Action/No Project case. Please revise the noise analyses and comparisons to reflect realistic descriptions of future no project conditions.

Reduced Impact of Approach Overflights: Exhibit 29, Reduced Impact of Approach Overflights, shows (and the accompanying text contains) an analysis of this approach procedure and there

---

<sup>39</sup> Table 8.

appear to be community benefits to this procedure. Therefore, it is concerning as to why it not included as a recommended mitigation measure.

#### **4.4.2 New Comments on the Supplemental EIR/EIS for Alternative D**

The following comments are provided based on an analysis of EIR/EIS § 4.1, "Noise," and Appendix S-C1, "Supplemental Aircraft Noise Technical Report:"

**Noise Modeling:** Section 2.1 implies that noise monitoring and flight track system data were used to generate noise contours, but should be revised to state that the noise analysis and noise contours were based entirely on a computer noise model. The noise data presented in the Supplemental EIR/EIS do not use any of the noise data collected by the airports noise monitoring system. The airports noise monitoring and flight track system was used only to obtain operations and runway utilization data. In fact, there is a significant conflict between the noise monitoring data published by the airport and the noise modeling done as part of the EIR/EIS.

**Noise Contour Errors:** § 2.1.7 The noise contours presented in the SDEIR/EIS for the year 2000 are smaller than the noise contours published by the LAWA in its Year 2000 Q4 report. No attempt is made in the SDEIS/EIR to examine the reason for the noise model under-predicting aircraft noise. The Supplemental EIS/EIR rationalizes the lack of contour adjustment by stating, "draft FAA Order 1050.E indicates that measurements should not be used to calibrate noise contours." However, no attempt is made to identify the cause of the discrepancy. The difference could be due to errors in input data to the noise model, not a calibration issue. Failure to adequately account for flight track dispersion could cause the kind of discrepancies the data shows. The model has the capability to report noise levels by aircraft type at each location. LAWA should compare the data to measurement data for those aircraft and offer a rational and detailed explanation of the model/measurement differences. At the least, the source of the difference would then be identified (i.e., input data errors, model database differences, or model algorithm shortcomings).

**Noise Contours Require Adjustment:** The FAA has a history of being reluctant to adjust noise contours based on measurement data. This policy was based on historical attempts to use short term monitoring data to make adjustments that are not statistically justified. Such a policy is justified, in particular when attempts are made to use a few hours of monitoring data to move noise contours; however, in this case LAWA operates noise monitoring sites 24 hours a day, measuring every aircraft and has been doing so for over 20 years. These data do justify adjusting the noise contours either by correcting input errors or modifying model databases, such as noise curves and aircraft profiles. FAA does not prohibit these changes. The FAA provides a mechanism for user changes to the database. The "INM Users Guide"<sup>40</sup>, contains Appendix B, "FAA Profile Review Checklist." The first paragraph of that appendix contains the following statement, "The Office of Environment and Energy (AEE) requires prior written approval for all user changes to the Integrated Noise Model (INM) standard profiles for FAR Part 150 studies. A similar requirement under National Environmental Policy Act (NEPA) will take effect pending FAA Order 1050.1E." Following that paragraph is a detailed list of information required for the FAA review of user made changes. It is not known if any attempt was made to seek FAA approval of changes needed to make the model better match measurement data. If there was no attempt, LAWA should explain the decision—particularly if input errors have already been eliminated as a possible source of the difference.

---

<sup>40</sup> For INM Version 6, dated September 1999.

**Mitigation Must Reflect Validated Contours:** The Supplemental EIR/EIS should explicitly show the difference in noise contour location and the number of dwellings and population for the Year 2000 noise contours contained in the Quarterly Report published by LAWA and the Year 2000 noise contours contained in the Supplemental EIR/EIS. The Supplemental EIR/EIS further rationalizes the use of the noise modeling information in spite of the differences to the measurement data by stating that future measured contours will be used to adjust mitigation area. If noise mitigation programs will be based on noise measurement validated noise contours, then the mitigation measures should include a specific commitment to use such validated contours.

**Assumptions Concerning Future Noise Contours lack Validation:** The supplemental EIR/EIS further states in § 2.1.7 of S-C1 that using the smaller computer generated contour will result in showing greater noise impacts. This latter statement is based on the erroneous assumption that the noise contours presented for future conditions are accurate and that the noise contours for 1996, 2000 and the future no project case are underestimated. On what basis does the Supplemental EIR/EIS conclude that the future noise contours are more correct than the existing noise contours when the same model and methodology are used for each?

**Inadequate Number of Flight Tracks for Modeling:** Footnote 3 of § 2.1.3 states that the 74 flight tracks were adequate to produce an adequate noise model input. What data did LAWA use to draw this conclusion? Why did LAWA not complete a sensitivity analysis to determine if the discrepancy between measured noise data and modeled result differences was due to inaccurate or insufficient number of flight tracks used in the INM model? In particular, why weren't additional flight tracks used to simulate track dispersion for aircraft approaches? In the absence of supporting data, footnote 3 is misleading and should be eliminated.

**Table S11 is Mislabeled:** The title of this table indicates it is a comparison of single event noise. It is in fact a table of runway utilization data during runway construction. Please revise the title to Table S11 accordingly.

**Sleep Disturbance Data Require Clarification:** In § 6.1.1, the threshold of significance for sleep disturbance is based on the 94 SEL contour which represents a 10% awakening rate for noise events that occur at least once every 10 days. The number of awakenings presented in the data tables is not the total number of people awakened but the number awakened within the 94 SEL contour. In fact, at lower noise levels there is still sleep disturbance, albeit at a lower rate. For example, the FICAN curve shows that for an interior noise level of 45 SEL (58 SEL exterior noise level with windows open) about 1% of the population will be awakened. The awakening rate of 1% is quite low, but when applied to a large population such as that located in a 58 SEL contour, would produce a large number of people awakened. The Supplemental EIR/EIS should make it clear that the sleep disturbance data presented are not total awakenings, but awakenings within a specific contour. The methodology used in the EIR/EIS allows the comparison of alternatives within a contour that can be practically estimated and appears to be a fair basis for comparison.

**Sleep Disturbance Flight Tracks Must be Identified:** Analysis of single event for sleep disturbance does not make it clear whether or not the analysis relied on the same flight tracks as used for developing the CNEL model. Did LAWA use the same flight tracks? If so, then the sleep analysis fails to account for flight track dispersion, and given that the significance threshold is based on an event that occurs at least once every 10 days, the results are misleading. If flight track dispersion is not included in the analysis then the County requests that LAWA describe the results

as comparing the number of awakenings within a specific SEL contour for aircraft flown on the nominal flight tracks and aircraft flight deviations that occur on other tracks would cause further awakenings.

**Sound Insulation Eligibility:** §6.1.3 adds an important criterion to the eligibility program for sound insulation. The sound insulation area is now based on ANMP CNEL contours and this section adds the SEL contour map. Is this a proposed formal policy that is clearly stated in the mitigation measures (including the requirement that the location of the 94 SEL contour be verified by measurements)? Has the cost of insulating the additional homes been included in the reported costs for the Master Plan improvements? If single event contours are underestimated relative to measured noise as is the case with the CNEL contours, how would this affect the study results? How many more homes and schools would be impacted if the SEL noise is underestimated by the same amount that the CNEL contours are underestimated (as measured by comparing baseline model results to baseline year measurement results)?

**Lennox Preschool Mitigation Required:** The Lennox School District operates a preschool at 10417 Felton. The site of this school is affected by both aircraft noise and roadway noise. The SDEIR/EIS addresses only aircraft noise at this site and does not address roadway noise. How does the combined noise from aircraft and motor vehicles affect impact this school? Further, how would roadway improvements in the vicinity of this site affect roadway noise levels and what would be the corresponding impact on the school? The SDEIR/EIS identifies a significant impact for Alternative B, but fails to address noise level changes that may result from roadway improvements that will occur with other alternatives. Similarly, in §6.2.3 the statements on school mitigation contain no commitment to mitigate identified impacts, only a commitment to study further. The County requests affirmative commitment from LAWA for the full mitigation of noise impacts at all affected schools in the project area.

**Soundproofing Homes to Reduce Noise Impacts:** LAWA has outlined a number of important noise attenuation goals in Mitigation Measures MM-LU-1, MM-LU-2, MM-LU-3 and MM-LU-4. However, it is not clear how or when or even if the goals would be achieved because many of the implementation components lack definition. We are particularly concerned about the following:

MM-LU-1: Implement Revised Aircraft Noise Mitigation Program.

- ▶ Under the measure calling for 'Accelerated rate of land use mitigation to eliminate noise impact areas in the most timely and efficient manner possible,' LAWA calls for "*Increased annual funding by LAWA for land use mitigation.*" Please specify an annual dollar amount for which LAWA is willing to make a commitment.
- ▶ Under the same measure, LAWA calls for "*Reevaluating requirement for granting of avigation easements with sound insulation mitigation.*" Please specify the performance criteria that LAWA would use in this reevaluation. Under what conditions would LAWA waive the requirement for granting of avigation easements with sound insulation?
- ▶ Under the same measure, LAWA calls for "*Reduction or elimination, to the extent feasible, of structural and building code compliance constraints to mitigation of sub-standard housing.*" Please define the criteria that would justify a reduction of code compliance constraints, and the criteria that would justify the elimination of code compliance constraints. Please also estimate the proportion of currently code-constrained units that would become eligible with application of these criteria, including a specific estimate for the community of Lennox.

MM-LU-2: Incorporate Residential Dwelling Units Exposed to Single Event Awakenings Threshold into Aircraft Noise Mitigation Program:

- ▶ Although this measure adds a large number of homes to the insulation program, none of the additional units is located on unincorporated land even though many impacted homes are in Los Angeles County jurisdiction: please explain why this mitigation omits County homes.
- ▶ MM-LU-2 includes the following commitment, "*actual adjustments to the ANMP contour would be based on periodic reevaluation of the 94 dBA SEL noise contour by LAWA.*" The statement implies, but does not actually state that measurements will be used to make the actual adjustments. Please incorporate the word 'measurements' into this commitment.

MM-LU-3: Conduct Study of the Relationship Between Aircraft Noise Levels and Ability of Children to Learn. This measure commits LAWA to a program to reevaluate the single event threshold for schools and using results to select "*an acceptable replacement threshold of significance for classroom disruption.*" What group or groups will provide peer review of these studies and judge the acceptability of proposed significance thresholds?

MM-LU-4: Provide Additional Sound Insulation for Schools Shown by MM-LU-3 to be Significantly Impacted by Aircraft Noise. Please see the comment above concerning a key aspect of this mitigation measure calling for "*acceptance of results by peer review of industry experts.*" Again, the measure does not indicate which agencies will be involved in the selection of the industry experts for the peer review. Please indicate whether and which of the affected cities, county, and school districts will have a role in selecting the experts for the peer review.

## 4.5 AIR QUALITY ASSESSMENT

### 4.5.1 Review of Ambient Air Quality Data used in the 2001 Draft EIS/EIR

Ambient air quality data were used for two purposes in the 2001 study. One purpose was to define baseline conditions and the other was to estimate background concentrations. Baseline conditions in this case were defined as the maximum air quality concentrations in the vicinity of the airport for existing conditions (an approximate 1996-98 timeframe). Background concentrations, on the other hand, were defined as the concentrations present in the absence of nearby sources. In other words, the concentrations due to multiple small sources and distant large sources were not directly accounted for in the air quality impact assessment. Estimates of background concentrations were used in the analysis to add to the concentration estimates generated by computer dispersion models for the airport and other nearby sources to arrive at estimates of total ambient concentrations.

Data from two air quality monitoring stations were used to characterize both baseline and background ambient air quality conditions. One station was located onsite and immediately to the east of the airport runways in the South Airfield Complex. LAWA operated this station for approximately 7.5 months, from August 1997 until March 1998, and measured carbon monoxide (CO), nitrogen dioxide (NO<sub>2</sub>), sulfur dioxide (SO<sub>2</sub>) and particulate matter (PM<sub>10</sub>). The other station was located approximately 0.6 mile south of LAX. This station, located in Hawthorne and designated as Station No. 094, was operated by the South Coast Air Quality Management District (SCAQMD) and measured ozone (O<sub>3</sub>), lead (Pb), sulfates, CO, NO<sub>2</sub>, SO<sub>2</sub> and PM<sub>10</sub>.

The 2001 Draft EIS/EIR did not provide any justification for the location of the onsite ambient air quality monitoring station or any information concerning the primary purpose of the station. Typically, a monitoring station will be located and operated to either measure background concentrations or maximum source impact. Given the location of the station with respect to the prevailing wind direction and the airport runways, the station appears to be situated near the likely maximum source impact area. Data from the station are used to describe "Environmental Baseline" conditions, which apparently refers to maximum source impact for existing conditions. In most cases, computer modeling would be used to identify the locations of maximum concentrations for baseline conditions, and then one or more monitoring stations would be positioned at these locations. If the onsite monitoring station was not positioned at the expected location of maximum concentration, then it is possible that concentrations higher than those reported at the station occurred in the area.

The 2001 DEIS/EIR did not discuss this, but maximum concentrations from the nearby SCAQMD station are comparable to the concentrations reported onsite by LAWA for the same timeframe. This suggests either that maximum concentrations do not vary significantly in the area or that both stations are similarly affected by nearby sources. The document shows that the maximum concentrations from the onsite monitoring station actually occurred when the station was upwind of the airport.<sup>41</sup> Thus, the maximum 1-hour CO concentration shown as the Environmental Baseline value in Table 4.6-11 was apparently due to other sources in the area and not the airport. This needs to be rectified.

LAWA needs to explain the basis for siting of the onsite ambient air quality monitoring station. If it was located at or near the expected location of maximum concentration (for all pollutants), please explain how this location was selected. It is also unclear whether data from the onsite monitoring station characterized true maximum baseline concentrations in the area or only the maximum concentrations at the monitoring site location. If the data did not characterize the maximum concentrations, please identify them. Finally, the Environmental Baseline concentrations shown in the 2001 DEIS/EIR Table 4.6-11 need to identify whether they represented maximum impacts from the airport emissions or if they are due to other sources in the area.

#### **4.5.2 Review of Ambient Air Quality Data used in the 2003 Supplement to the Draft EIS/EIR**

Additional baseline data is provided in the Supplement to the Draft EIS/EIR. Baseline data are taken to include background plus contributions from airport and non-airport sources. This additional baseline data includes measurements by the SCAQMD for the period 1998 through 2000 at a nearby monitoring station. Previously, baseline data were reported for 1996 through 1998 at the same SCAQMD station and also for on-site measurements collected during 1997-98. These data are presented together in Table S4-6.5, so presumably they are reasonably comparable.

Together, these two data sets comprise approximately five years of data. No discussion of the comparison of the two data sets is provided in the Supplement DEIS, but one obvious thing to look for is data trending. In comparing the data reported in Table S4.6-5, it appears that there has been little change or a slight increase in air pollution levels during the five-year period. Elsewhere in the Supplement to the DEIS/EIR future background concentrations of air pollutants are assumed to decrease substantially over time. Although it is possible that future area-wide emission reductions

---

<sup>41</sup> Technical Report 4, Attachment Y.

will be greater than achieved during this five-year period, the ambient monitoring data do not appear to support a significant reduction in background concentrations during the next several years. Most of the comments and questions offered previously regarding ambient air quality data are still relevant and applicable.

#### Suggested Questions / Comments for LAWA

- ▶ The trends in baseline ambient air quality data given in Table S4.6-5 do not support the substantial decrease in background concentrations that are assumed to occur in future years. Can LAWA explain this and can the forecast reductions in future background air pollution levels be relied upon?

#### **4.5.3 Review of Emission Data used in the 2003 Supplement**

Baseline emissions data are given in Tables S4.6-6 and S4.6-7 for 1996 and 2000 on-airport emissions sources, respectively. The 1996 data have been updated while the 2000 estimates are new in the Supplemental DEIS. It is worth noting that the estimates for 1996 given in the Supplemental DEIS are all higher than the values given in the DEIS, and in the case of VOC and sulfur dioxide, the increases are very substantial. Compared to the original estimates given in the DEIS, the estimated emissions of VOC and sulfur dioxide are more than two times higher. The revised emission estimates for future scenarios have also increased compared to the original estimates given in the DEIS. Again, this is particularly so for VOC and sulfur dioxide which are now two to three times higher than the previous estimates.

#### Suggested Questions / Comments for LAWA

- ▶ The estimated emissions for on-airport sources given in the SDEIS/EIR have changed substantially from the estimates given in 2001. Can the estimated emissions for on-airport sources given in the Supplemental DEIS be relied upon to be reasonably accurate?

#### **4.5.4 Review of Meteorological Data used in the 2003 SDEIS/EIR**

The Supplemental DEIS indicates that the revised analyses were performed using upper air data from a location near San Diego.

#### Suggested Questions / Comments for LAWA

- ▶ Is the upper air data from the San Diego Miramar Weather Service Contract Meteorological Observatory representative of the LAX area?
- ▶ Other comments offered previously concerning the use of 10-m onsite wind data for modeling off site impacts are still applicable.

#### 4.5.5 Appropriateness of the Analysis Methodology

**General Approach:** As commented in the previous review, the Supplemental DEIS includes the results of computer modeling for future scenarios only. No analysis of the existing/baseline situation is provided, which could provide a benchmark of how well the models were performing.

##### Suggested Questions / Comments for LAWA

- ▶ Why did LAWA not model the existing/baseline situation and compare the results to existing ambient air quality monitoring data to get a benchmark of how well the models were performing?

**Aircraft Operations:** The comments and questions provided previously appear to remain applicable. Perhaps the most important of these is that it remains unclear how aircraft queuing was estimated, which is critical to the accuracy of the analysis. Also, it is not clear whether the reduced airport capacity during IFR conditions has been considered in the evaluation of worst-case air quality conditions.

The Supplement to the DEIS indicates that an updated version (Version 4.11) of the EDMS model has been used to evaluate Alternative D impacts. In so doing, the version used for the previous assessments (Version 3.2) was applied to Alternative D, and a ratio of the resulting estimated emissions for the two versions was computed for each air pollutant. These ratios were then used to estimate impacts for the other alternatives based on the results originally obtained with the older version of EDMS.

The EDMS model performs two major functions for airport sources. It estimates emissions and it calculates atmospheric dispersion. In updating the EDMS model, changes were made to both sections of the model. Hence, simply 'ratioing' the previous results based on the old and new emission estimates will not account for any changes in the dispersion algorithms. Thus, use of the developed ratios to update the previous results may not be appropriate.

##### Suggested Questions / Comments for LAWA

- ▶ How was aircraft queuing estimated? Is this critical to the air quality impact analysis?
- ▶ Did LAWA consider IFR conditions in evaluating air quality impacts and the effect this could have on reduced runway capacity and increased aircraft queuing?
- ▶ Did the 'ratioing' technique that was used to update the previous air quality impact analyses generated by EDMS account for all changes in the model or does it only account for changes in the emission algorithms?

**Off-Airport Motor Vehicles:** In the previous review, it was commented that use of wind data from a height of 10-m at the airport may not be representative of winds at off-airport intersections and that using only four receptors at each intersection may also result in underestimated maximum concentrations. These comments appear to remain applicable for the Supplemental DEIS.

#### **4.5.6 Accuracy of the Analysis**

The accuracy of the air quality analyses will depend to a large extent on the computer models used and the input data for the models. Presumably, the use of the updated EDMS model for the airport sources has resulted in improved accuracy for Alternative D compared to the previous analyses. Simple ratios were developed and applied to the previous analyses in an attempt to update the results for the other alternatives. If the ratios are based on the old and new emission estimates only, which appears to be the case, it is doubtful if the predicted concentrations for the other alternatives will be very accurate. This is because the new version of the model includes changes to both the emissions and the dispersion algorithms, and the 'ratioing' of predicted concentrations based on the emission ratios would account for changes to the emission components only. Some of the resulting concentration estimates for the other with-project alternatives given in Table S4.6-12 are considerably higher than those for Alternative D. It is conceivable that a complete assessment of these other alternatives with the new version of EDMS might yield different results.

As commented before, the accuracy of the predicted impacts from the airport sources will depend to a large extent on the aircraft queuing estimates and the estimated airport runway capacity, especially during IFR conditions. It is not clear from the analysis how these issues were addressed.

The unmitigated off-airport impacts for carbon monoxide given in Table S4.6-13 appear unreasonably low. Presumably, traffic approach volumes at many of these intersections are at least several hundred vehicles per hour and perhaps several thousand during peak hours. Yet, the predicted maximum concentrations are only marginally higher (and in some cases even equal to) the estimated background concentration. Assuming that the background concentration estimates are accurate, then maximum concentrations near congested roadway intersections could be expected to be substantially higher.

The accuracy of the predicted maximum concentrations at both on- and off-airport locations depends to some extent on the validity of the assumed substantial decrease in background concentrations of some air pollutants over the next several years. If the projected decrease in background concentrations turns out to be too optimistic, the projected maximum concentrations will likely be too low.

#### **4.5.7 Gaps in the Analysis**

The lack of an analysis of existing conditions using the same computer models and methodologies that were used to evaluate future scenarios continues to be a shortcoming. Without doing this, it is difficult to judge the accuracy of the predicted future conditions. Further, the 'ratioing' technique that was used to update the analyses of airport sources for Alternatives A, B and C and for the no-project case makes it difficult to fairly compare the alternatives.

#### **4.5.8 Appropriateness and Adequacy of Mitigation Measures**

Tables S4.6-6 and S4.6-7 provide emission estimates by source category for on-airport sources for the years 1996 (baseline) and 2000. Emission estimates are provided later in Table S4.6-9 for future years and project alternatives, but these estimates are not given by source category. Only the totals for the various air pollutants are shown. In Tables S4.6-14 and S4.6-16, it indicates that NO<sub>x</sub> and SO<sub>2</sub> emissions from on-airport sources will be significant. In developing a mitigation plan to

address this, it would be very useful to know what the major sources of on-airport NOx and SO2 are so that mitigation measures could be focused where they will be the most effective. Tables S4.6-6 and S4.6-7 indicate that aircraft emit a substantial portion of the NOx and SO2 emissions for the baseline and year 2000 cases. Thus, it seems probable that this will be true for the future scenarios, too. Table S4.6-18 provides a long list of proposed mitigation measures, but none of these involve measures to reduce aircraft emissions.

#### **4.6 LAND USE ASSESSMENT (Transportation)**

Information within the 2003 Supplemental Draft EIS/EIR on each of the project build alternatives relating to consistency with the 2002 Regional Transportation Plan (RTP) and Regional Aviation Plan (RAP) are too vague to draw meaningful conclusions. Of the four build alternatives in the LAX Master Plan, only Alternative D has any discussion of consistency with the current RAP and this discussion is contradictory. As an example, the 2003 Supplemental Draft EIS/EIR in discussing compatibility with the SCAG Regional Comprehensive Plan and Guide states that: *"Under Alternative D additional job opportunities, infrastructure growth, and indirect housing demand would occur."* However, in discussing compatibility with the SCAG RAP it states that: *"Under Alternative D, the LAX Master Plan would be consistent with the policy of the Regional Aviation Plan, which calls for no expansion of LAX."*<sup>42</sup>

How is it possible that infrastructure growth would occur at LAX without expansion of LAX? The fact of the matter is that massive infrastructure expansion would occur under Alternative "D". The result of the infrastructure expansion provides 153 fully functional, high capacity gates and does not remove concrete areas that can be used for aircraft parking. By parking aircraft, Alternative "D" can function as though it has over 200 gates and the capacity of LAX is greatly expanded. As such, Alternative "D" is incompatible with the SCAG RAP.

Revisions to the LAX Master Plan EIS/EIR need to be made that discuss compatibility of the build alternatives to the SCAG RTP and RAP including a discussion of either how Alternative "D" can be made compatible to the current RAP, or explain why it is not feasible for Alternative "D" to be made compatible. Without these discussions, meaningful analysis of this issue is not possible.

##### **4.6.1 Master Plan Commitments Lack Substance**

The referenced Neighborhood Compatibility Program<sup>43</sup> is vague. The details and "teeth" of this commitment must be clarified in order to allow an assessment of its value. The Program should be linked to the Mitigation Monitoring Program, including identification of a formal role for neighborhood review in the formulation and monitoring of specific development plans at the airport/neighborhood interface.

##### **4.6.2 Other Land Use Inconsistencies**

Discussion on Page 4-189 of the 2001 Draft EIS/EIR asserts that Master Plan Commitments LI-1 and DA-2 will reduce land use impacts of the Ring Road on the apartments on Morley Road to less than significant levels; however, these measures are not described in the 2001 Draft EIS/EIR or

<sup>42</sup> 2003 Supplemental Draft EIS/EIR, Section 4.2.6.5, page 4-169

<sup>43</sup> 2001 Draft EIS/EIR, Section 4.2.5, Page 4-116.

2003 Supplemental Draft EIS/EIR, but only referenced. In fact, throughout the 2001 Draft EIS/EIR text §§ 1 through 7, references are made to impacts and mitigation measures described in Appendix K, without any explanation or summary describing such impacts and mitigation measures. The 2003 Supplemental Draft EIS/EIR also provides no discussion of this issue. Since the LAX Expressway and State Route 1 (SR 1) improvements are integral features of the build Alternatives A through C, the 2003 Supplemental Draft EIS/EIR should be revised to incorporate this information in the body of the text.

The 2003 Supplemental Draft EIS/EIR presents additional analysis of single event noise levels as mandated by a recent court ruling by the California Court of Appeal (*Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners*, (2001) 91 Cal. App. 4<sup>th</sup> 1344.). It is commendable that LAWA chose to include this evaluation so critically important in assessing impacts to land uses surrounding airports. Of particular concern are single event noise levels as they relate to school disruptions. However, inconsistencies again appear in this evaluation: Table S4.2-2 in the Land Use Section shows that 29 schools would be affected by single event noise levels, whereas Table S4.1-2 in the Noise Section shows that 50 schools would be affected by single event noise levels. These inconsistencies need to be reconciled.

#### **4.6.3 The Land Use Assurance Letter should be Disclosed**

The contents of the Land Use Assurance Letter<sup>44</sup> should be summarized in the text and the document should describe how conflicts would be avoided. This discussion emphasizes noise compatibility considerations and minimizes the combined effects of noise, safety, air quality, lighting, and aesthetics. After acknowledging that land use compatibility is a function of these types of combined effects, very little discussion of combined effects is included in the 2001 Draft EIS/EIR or the 2003 Supplemental Draft EIS/EIR. Please identify properties that are subject to such combined effects.

#### **4.6.4 Key Mitigation Measures may Not be Implemented**

Substantial reliance is placed on Mitigation Measure MM-LU-1 "Implement Revised Aircraft Noise Mitigation Program." This measure is broad in scope, and depends upon the cooperation and funding of agencies outside of LAWA. Consequently, there is no assurance that LAWA will be able to implement this measure in a timely manner. Moreover, LAWA does not have an outstanding track record, as a number of commitments to properties already included within the current boundaries of the ANMP have not been fulfilled. A discussion of unmet commitments from prior actions should be provided along with an evaluation of the impacts that would result if LAWA were unable to fulfill the new commitments described in the 2001 Draft EIS/EIR and 2003 Supplemental Draft EIS/EIR.

Mitigation Measures MM-LU-3 and MM-LU-4 dealing with single event noise levels disrupting school sessions are of particular concern. Mitigation Measure MM-LU-3 commits LAWA to conduct a study of the relationship between aircraft noise levels and the ability of children to learn that in essence allows single event noise levels to continue and monitors the effects of these impacts on schoolchildren in the affected classrooms. As stated earlier, this approach may harm the

---

<sup>44</sup> 2001 Draft EIS/EIR, Appendix E.

children. A more responsible and conservative approach is needed that does not have the potential to do additional harm. Mitigation Measure MM-LU-4 states that:

*“Upon completion of the study required by Mitigation Measure MM-LU-3 and acceptance of its results by peer review of industry experts, any schools found to exceed a newly established threshold of significance for classroom disruption shall be incorporated into the ANMP administered by LAWA. Based on the Master Plan alternative that is ultimately approved and thresholds set forth in § 4.1, Noise, that address single overflight event noise and the ability of children to learn in the classroom, and subject to modification based on the study required by MM-LU-3 those schools listed . . . may be eligible for sound insulation.”*

Although the mitigation reads as though it is addressing the problem, it does not commit LAWA to any definable actions that would reduce impacts other than a vague reference that schools may be eligible for sound insulation. LAWA must describe mitigation measures in enough detail to commit the lead agency to an action that reduces the impact. Further, mitigation measures must be defined in enough detail to analyze the potential environmental impacts that may result from the implementation of the mitigation measure.

#### **4.7 SOCIOECONOMIC ASSESSMENT**

##### **4.7.1 Productivity Variables are based on Flawed Assumptions**

The 2001 assessment of Employment and Socioeconomic Impacts (and therefore the Growth Inducement Analysis as well) was substantially flawed by assumptions made at the outset of the analysis concerning productivity gains. This conclusion is directed largely at the assumption made in 2001 that productivity gains would be the same for all of the build Alternatives. In fact, productivity rates are variable over time and highly sensitive to changes in the economy's overall rate of growth. These cycles are evident in statistics over the past 50 years, which show national annual productivity growth in the range of 2.8% from 1948-1973, compared with 1.2% during the economic slowdown of 1992-1995.<sup>45</sup> When Gross Domestic Product growth is decelerating, productivity slows. Given the repeated emphasis throughout the 2001 Draft and 2003 Supplement to the Draft EIS/EIR that failure to pursue the expansion project would have a negative ripple effect throughout the southern California economy, it would have been more logical to link the No Project Alternative with productivity gains lower than those associated with the build Alternatives. Similarly, to the extent that Alternative D resembles the No Project Alternative it too would be associated with productivity gains lower than those associated with the remaining build. Accordingly, the SDEIS/EIR should reassess Employment and Socioeconomic impacts for Alternative D and the No Project Alternative using a lower estimate of productivity gains.

##### **4.7.2 Productivity Forecasts Require Further Justification**

The Socioeconomic Technical Report (provided only in the 2001 Draft EIS/EIR) made note of the labor-intensive nature of many service industries, and identified the tendency toward stable or reduced productivity (and resulting job growth per unit of service) in hotels, restaurants, and numerous high-end personal, household and business services.<sup>46</sup> At the same time, assumptions in

<sup>45</sup>Alejandro Bodipo-Memba, "U.S. Productivity Surged During 1998, Hinting at Escape from 25-Year Slump," Wall Street Journal, February 10, 1999.

<sup>46</sup>Section 3.2.3.

the Draft and 2003 Supplement to the Draft regarding the No Project Alternative show passenger volumes increasing from 71.2 MAP in 2005 and 78.7 MAP in 2015 (about a 10% gain). The Technical Report noted that the services and tourism/entertainment sectors showed the most substantial employment gains between 1972-1992 and again between 1992-1997.<sup>47</sup> Finally, the Report allocated substantial passenger spending on these services, particularly for hotels and dining facilities, through the 2015 horizon.

In combination, these facts would point to positive employment gains in at least those sectors for which productivity is forecast to slow – eating and drinking establishments, hotels, and amusement and recreation facilities at a minimum. Nevertheless, and in apparent contradiction of its own assessment, the Socioeconomic Technical Report forecast losses in direct LAX-related employment for both sectors between 2005 and 2015 under the No Project Alternative. Eating and drinking establishments were forecast to sustain job losses on the order of 1,725 (a 4% drop); hotels were forecast to sustain job losses on the order of 3,467 (a 7.5% drop); and amusement/recreation facilities were forecast to sustain losses on the order of 4,514 (a 14.8% drop).

An explanation is needed to justify the Technical Report forecasts of job losses that conflict with the discussion of anticipated productivity trends for hotels, restaurants, and services. Job growth in the specified service sectors should be projected.

#### **4.7.3 Definition of the No Project Alternative is Artificially Narrow**

The artificially narrow definition of the No Project Analysis weakens the analyses contained in the Socioeconomic Technical Report. As discussed previously, the 2001 Draft EIS/EIR and the 2003 Supplement both assume that under the No Project Alternative there would be no new improvements at LAX beyond those now underway, planned, or programmed. Both CEQA and NEPA favor “worst case” assessment. In this light, it would be more reasonable and informative to anticipate that LAWA would pursue a wide range of additional improvements that would in turn boost direct and indirect employment and spending, with far different socioeconomic impacts than indicated in Technical Report estimates for the No Project Alternative. The analysis of Employment and Socioeconomic impacts should be revised to incorporate the expanded assessment of actions that may in the future be taken by LAWA in the event the project is not approved and the outcomes that could reasonably be expected to result from such actions should be addressed.

The 2003 discussion of socioeconomic effects associated with Alternative D repeats a form of the unsupportable syllogism described in § 3.3.2. In the current section, Alternative D is concluded to have beneficial socioeconomic effects, Alternative D is described as substantially the same as No Action, and No Action is found to have adverse socioeconomic effects. In fact, an increase in construction jobs is the only socioeconomic difference between No Project and Alternative D that is acknowledged in the Supplement to the Draft EIS. Again, we believe that the inconsistency is due to misrepresentation in the description of alternatives – particularly Alternative D and the No Project Alternative.

---

<sup>47</sup> Section 4.1.1.

#### **4.7.4 Distribution of Passenger Spending Requires Explanation**

In estimating the distribution of passenger spending, §3.4.3.1 of Technical Report 5 indicated that it was assumed that LAX would represent the sole source for international traffic, based on historical data for the years 1985-1994. Additionally, the Section noted that:

*“As a working assumption, it was assumed that there was no connecting traffic at any of the other 4 major airports in the region...the single exception to this rule results from the fact that Ontario ‘International’ Airport did serve an estimated 50,000 international passengers during late 1993 and early 1994.”*

It is unclear how the “working assumption” and exception were applied in estimating future contributions under the 2005 and 2015 scenarios. Did the analysis treat the 50,000 international passengers as a one-time event, or did it assume that Ontario would continue to serve 50,000 international passengers (per year) through 2015? In either case, the document should have explored the factors that allowed Ontario to successfully enter this competitive market, with the goal of assessing Ontario’s ability to accept future unmet need in the region as a whole. This analysis would have been especially relevant to the socioeconomic analyses of the No Project Alternative, and may have resulted in far different conclusions. If the Socioeconomic Technical Report did base its 2005 and 2015 No Project Alternative scenarios on the assumption that Ontario would serve 0 or 50,000 international passengers (but no more), the analysis should provide a more detailed assessment of the potential role of Ontario in meeting international travel demand.

In general, and although the Technical Report promised such an assessment, the Socioeconomic Technical Report did not make any substantive effort to determine the degree to which the No Project Alternative might result in a redistribution of air services and associated economic activity to other airports in the region. As it stands, the analysis shines a very bright light on variables influencing the LAX growth scenarios, but does little to apply its powerful tools on the potential future role of other facilities in the region. This approach shortchanges the No Project Alternative. It also shortchanges the newly-proposed and preferred Alternative D. As noted above, the only socioeconomic difference between ‘No Project’ and Alternative D, according to the SDEIS/EIR, is construction employment. If true, then Alternative D would also be similar to No Project in its potential to redistribute non-construction air services and economic activity to other airports in the region. LAWA should expand the Supplement to the Draft EIS/EIR to take a closer look at this issue, considering the amount and type of activity that could reasonably be expected to shift within region, and the direct and indirect economic effects that might result.

#### **4.7.5 Distribution of Regional Spending Requires Explanation**

§3.4.3.1 of the 2001 Draft EIS/EIR noted,<sup>48</sup>

*“Parking costs are the only local impacts attributed to Resident passengers in the current analysis...[and to] the extent that such passengers spend money at restaurant and retail establishments during the time they spend in one of the region’s airports, this analysis may, to a small degree, have underestimated the impacts of Resident passengers.”*

---

<sup>48</sup> In Footnote 32.

The analysis also discounted resident expenditures on transportation to and from the airport:

*"To the extent that such transportation is provided by a private taxicab, limousine or shuttle service will cause some additional impacts on the local economy. This does not apply to connecting and visitor passengers, for whom these impacts have been measured."*

On the surface, these assumptions would be expected to impact regional spending estimates in a neutral manner, because it is applied to all airports in the region. However, since the analysis: (1) assumed that facilities other than LAX will be essentially limited to resident passengers; (2) discounted the retail, restaurant and travel expenditures of these passengers; and (3) measured such expenditures for connecting and visitor passengers, the net effect is to disproportionately minimize the regional spending contributions of airports other than LAX. Once again, the assumptions would cast an artificially unfavorable light on the No Project Alternative (though not, apparently, on Alternative D, though it is presented as equivalent apart from construction impacts).

#### **4.8 REGIONAL TRANSPORTATION**

All of the alternatives, including the No Action Alternative, call for a 41% increase in passenger activity and a 60% increase in air cargo at LAX. Passenger volume would increase from 56 MAP to 79 MAP, and air cargo would increase from 1.95 million tons to 3.2 million tons in only 12 years. Those amounts are greater than 95% of all other national airports and are greater than all the other Los Angeles regional airports combined!

If indeed the LAX Master Plan aims to promote meaningful growth at other regional airports, then realistic growth control measures must be included. The inland airports have abundant capacity and are crying for air service, and the LAX Master Plan must include measures that lead to region wide cooperation to move air service to those areas. The City of Los Angeles has refused to participate in activities of the Southern California Regional Airport Authority, which has generated several proposals to promote such efforts. Without active measures to move air traffic to other airports, the Master Plan serves only to create another incremental step in the unabated growth of LAX. We understand that LAWA has recently hired a consultant to market Ontario International Airport,<sup>49</sup> and would request that LAWA outline the goals of that marketing plan.

#### **4.9 BIOLOGICAL RESOURCES**

##### **4.9.1 Review of Baseline Conditions**

The SDEIS/EIR identifies eight distinctive biotic communities without clearly distinguishing among the following: naturally occurring communities; man-influenced/modified natural communities; man-created biotic situations; or areas under complete development, which no longer have biotic value for sensitive plant and animal species. The acreages of biotic habitats were rates in terms of value for sensitive species, and compared with marginal habitats, non-native habitats, and areas that are developed and no longer supporting habitats. The review indicated that the airport is largely developed, with open areas that are highly disturbed and offers little or no viable

---

<sup>49</sup> Press Enterprise Newspaper, "Still awaiting takeoff," September 21, 2003.

habitat for sensitive plant and animal species. The Los Angeles/El Segundo Dunes and, to a lesser extent, the non-restructured dunes north of this area stand out as the only areas having high biological value that merits recognition and a conservation effort by LAWA. It is therefore recommended that the Master Plan include a "conservation element" dictating how the Los Angeles/El Segundo Dunes will be managed. This goes beyond the requirements to manage the Habitat Restoration Area for the El Segundo Blue Butterfly.

#### **4.9.2 Review of Mitigation Measures**

Several mitigation measures are listed in § 4.10.8 that would, if successful, reduce potential impacts to sensitive biological resources to a less than significant level. The selection of mitigation measures will depend on which Alternative is chosen. It is expected that a mitigation monitoring program (MMP) will be developed and implemented. However, we recommend that LAWA separate the biological mitigation measures from the larger MMP and create a Conservation Program that focuses on the Los Angeles/El Segundo Dunes and surrounding areas. This would enhance the biological program and provide LAWA with a stronger negotiating position with United States Fish and Wildlife Service on future projects.

Section 4.11.2 mentions that LAWA initiated a formal Section 7 consultation with USFWS on September 5, 2000. The remainder of § 4.11 discusses several mitigation measures that will be implemented to reduce impacts to listed species to below a significant level. It is not clear whether these mitigation measures are the basis for the formal Section 7 or if they have been included in the required Biological Assessment. Although completion of the Section 7 consultation process by the FAA is not required to be a part of the Draft EIS/EIR analysis, the level of analysis and detail presented in this Draft would suggest that it has been included.

Apparently, USFWS and LAWA have not come to terms on the level of mitigation required to mitigate impacts to the Riverside Fairy Shrimp and its habitat. There is a brief mention of this divide at the top of page 4-691. The FAA is rightly concerned that the creation/restoration of fairy shrimp habitat (vernal pools) will create significant safety issues for aircraft by attracting birds (bird air strike hazards). However, the final endangered species mitigation measures and/or conservation management strategies will depend on final resolution of this issue between USFWS and the FAA.

The Draft EIS/EIR does not give an indication whether the present mitigation measures will be satisfactory to USFWS, or whether these measures will allow the FAA to complete its obligations under the Endangered Species Act. If this is the case, it should be clearly stated. If it is not, the reader needs to know that the mitigation measures have not been approved by USFWS and could change significantly before the Section 7 consultation process is completed and a Biological Opinion is issued by the USFWS.

As discussed above under comments for § 4.10.5 Master Plan Commitment, all biological mitigation measures should be integrated into a Conservation Program for LAWA with focus on the Los Angeles/El Segundo Dunes and the Riverside Fairy Shrimp.

#### **4.9.3 Wetlands Concerns Must be Integrated**

Only U.S. Army Corps of Engineers jurisdiction was found to occur within the Air Operation Area or the Los Angeles/El Segundo Dunes; no California Department of Fish and Game (CDFG)

jurisdiction was determined to occur. The permanent conversion/loss of the 1.3 acres of atypical wetlands is a significant impact that will require a 404 permit. It will also require a Section 7 consultation between the Corps and USFWS because of the presence of embedded Riverside Fairy Shrimp cysts in soil samples.

The biological concerns associated with wetlands should also be included in a Conservation Program rather than addressed as a separate biological issue for which no Master Plan commitments are made. Although there is very limited natural habitat at LAX, any loss of these remaining natural habitats will be considered significant by USFWS, CDFG, and local wildlife protection groups. It would seem an opportune time to develop a long-term management plan for biological resources on airport lands. Once in place, this plan/strategy would set policies and procedures (officially approved by the resources regulators) for the next several years. As the Draft EIS/EIR currently reads, LAWA has identified several biological concerns that are being addressed separately and on a one-time basis. This would leave LAWA vulnerable to future challenges as unanticipated development/programs are proposed.

#### **4.9.4 Reference to 2001 Comments from Land Protection Partners**

During 2001, the Land Protection Partners (LPP) submitted a comment letter to LAWA entitled "Review of Biological Resources Analysis in LAX Master Plan Draft Environmental Impact Statement/Environmental Impact Report" as a review of the 2001 LAX Master Plan Draft EIS/EIR. Based on a preliminary assessment of points made in the LPP letter, the County of Los Angeles has concluded that their comments raise some significant issues regarding incomplete or vague project descriptions of the build alternatives, outdated CEQA analyses, questionable survey methods, questionable El Segundo Blue Butterfly population counts, underestimating impacts, and inadequate mitigation. Many of Land Protection Partners' comments echo concerns raised in this comment letter, but with a particular focus on how the concerns impact the assessment of potential biological impacts. The County endorses the points raised by LPP, which are briefly summarized below, and looks forward to reviewing LAWA's responses:

**Vague and Confusing Descriptions of the Build Alternatives:** LPP noted that the Draft EIR/EIS does not give a complete project description of the build alternatives. Within the extent of the LAX Master Plan boundaries, it is unclear how LAWA proposes to use certain areas of biologically significant property. Designations such as "Airport Related" are useless in evaluating the potential biological impacts associated with that designation.

**Outdated CEQA Analysis:** The Draft EIR/EIS describes the LAX Northside Project as "Collateral Development" that previously was entitled through a 1983 CEQA process. No new or updated analysis is found in the Draft EIR/EIS, even though development of this project appears to be contingent on the project alternative selected for LAX. In this light, reliance on 1983 CEQA documentation that did not consider LAX as a contingent project is problematic at best.

**Questionable Survey Methods:** Land Protection Partners' document raised questions concerning survey results, particularly with respect to the incorrect choice of survey methods. LPP noted that LAWA did not conduct general biological surveys in all habitats within the proposed project site. LPP also references impacts to 100 acres of the El Segundo Dunes habitat that was not surveyed by

LAWA, even though it would be converted to a golf course under the Westchester Southside Project described in the 2001 Draft EIR/EIS.

**Questionable El Segundo Blue Butterfly Population Counts:** Land Protection Partners suggests that the surveys conducted by LAWA did not use the best available scientific methods for calculating population numbers of the Federally-endangered El Segundo Blue Butterfly (ESBB). In overestimating the ESBB population, the Draft EIR/EIS gives the false impression that the ESBB is able to sustain viable populations on limited habitat, and confuses the analysis by downplaying the need for land to be kept as conservation areas.

**Underestimation of Impacts of the Proposed Project Alternatives:** The methods used to determine impacts to habitat were misleading and not used accurately. LPP concluded that the combined affect of not surveying all potential habitat, using questionable survey methods, and overestimating ESBB populations resulted in a misleading impact assessment.

**Inadequate Mitigation Measures:** LPP found that use of a point system to rate 'habitat units' resulted in inadequate mitigation for lost habitat. For example, the Draft EIR justifies preserving smaller areas of prime habitat in exchange for the conversion of larger areas of occupied but marginally disturbed habitat. LPP noted that species need both the space and the quality of habitat, concluding that 10 acres of prime habitat may not be adequate to sustain a population that had previously lived on 50 acres of marginally disturbed habitat.

#### **4.9.5 General Comments**

The 2001 Draft EIS/EIR and 2003 Supplemental Draft EIS/EIR do not give complete project descriptions of the build alternatives. Within the extent of the LAX Master Plan boundaries, it is unclear what the disposition of certain areas of biologically significant property will be indicating designations such as "Airport Related" which are useless in evaluating the potential biological impacts associated with that designation.

LAWA did not conduct general biological surveys in all habitats within the proposed project site. As an example, the 2001 Draft EIS/EIR and 2003 Supplemental Draft EIS/EIR describe impacts to 100 acres of the El Segundo Dunes habitat that was not surveyed and would be converted to a golf course under the Westchester Southside Project.

Unfortunately, given the amount of time and effort devoted to assessing baseline biological conditions, the remaining step of integrating and folding this information into a long-term Conservation Program is missing. This may be a conscious choice by LAWA management and the City of Los Angeles; however, this approach may deprive LAWA of the opportunity to gain long-term control of its own biological resources.

## 4.10 ADDITIONAL ISSUES

### 4.10.1 Historical Resources

Illustration of the different impacts associated with the Single v. Split Viaduct LAX Expressway Alternatives should be carried forward from the Appendices to the Historic/Architectural section of the Supplemental Draft EIS/EIR.

The commitment to have a qualified architectural historian supervise noise abatement of historic properties does not assure that the historic values and character of such properties will not be altered or lost. The SDEIS/EIR should discuss this possibility and attach alternate mitigation measures or a revised significance finding, if appropriate.

The 2003 Supplemental Draft EIS/EIR concludes for all the build alternatives that:

*“The demolition of a historic/architectural resource is considered a significant impact at the state level that cannot be mitigated to a less than significant level without abandoning the project. A Statement of Overriding Considerations would be necessary to address unavoidable impacts on the International Airport Industrial District.”<sup>50</sup>*

This is insufficient information to support an override. Revisions to the SDEIS/EIR need to explain why demolition of this historic/architectural resource is required to implement the project and what benefits will result from the project that override this significant impact.

### 4.10.2 Human Health

The analyses indicated that aircraft emissions account for about 97% of total emissions and also contribute most to emissions of individual Toxic Air Pollutants,<sup>51</sup> yet none of the mitigation measures address aircraft emissions. Many of the mitigation measures would be expected to occur regardless of what happens with the proposed Master Plan – for example, parking pricing policies to encourage single trips or to minimize idle time at the curb, steps to encourage employee telecommuting, and expanded off-airport intermodal services to other airports. Others would have no air quality benefit – for example, where unmitigated impacts result in payments to a trust fund for unrelated community improvements.

In this context, it is difficult to understand how the HHRA determined that the build Alternatives, with mitigation, would have no significant human health impacts at either horizon year. A clarification of the assumptions that were made in order to reach this conclusion is necessary to validate this conclusion.

The California Office of Environmental Health Hazards Assessment (OEHHA) evaluates non-cancer risks and has established maximum reference exposure levels (REL) for each TAP. No adverse health effects are foreseen for exposures at or below the REL. The exposure of TAP at concentrations equal to the REL represents a non-cancer hazard index level of 1.0. Exposure above

<sup>50</sup> 2003 Supplemental Draft EIS/EIR, Section 4.9.1, page 4-443

<sup>51</sup> Technical Report 14a, Section 3.3.

a hazard index of 1.0 is considered a significant impact by OEHHA. The relationship for non-cancer health effects of Toxic Air Pollutants is shown in the following equation:

HI = C / REL, where:

HI = Hazard Index; an expression of the potential for non-cancer health effects

C = Annual average TAP concentration (ug/m<sub>3</sub>)

REL = Reference exposure level (REL) for TAP; the TAP concentration at which no adverse health effects are anticipated

The Supplemental HHRA Technical Report provided as Appendix 9a in the 2003 Supplemental Draft EIS/EIR states that the REL for acrolein used in the HHRA is 0.19 ug/m<sub>3</sub>.<sup>52</sup> This same document further states that under Alternative "D", total acrolein concentrations might range between 14 ug/m<sub>3</sub> and 87 ug/m<sub>3</sub> with an overall average of 23 ug/m<sub>3</sub>.<sup>53</sup> Using the OEHHA equation for determining the hazard index as shown above, the resulting hazard index would range between 73.68 and 457.90, well above the OEHHA threshold of significance set at a hazard index of 1.0. Evaluation of all scenarios indicates that the hazard index for acrolein are all above the OEHHA threshold, even in the existing condition and while the Supplemental HHRA indicates that Alternative D has the lowest exposure levels of all these scenarios it is nevertheless above the threshold of significance set by OEHHA. How is it that both the 2003 Supplemental Draft EIS/EIR determined that this impact is less than significant? Revisions to the SDEIS/EIR need to be made that disclose this significant impact and either mitigate to less than significant or provide the evidence that supports a Statement of Overriding Consideration for this significant impact.

#### **4.10.3 Environmental Action Plan**

Many of the key Master Plan Commitments and mitigation measures in the Environmental Action Plan (EAP) are broad and programmatic in nature. Many will require further study, with choices among specific options deferred to the Final EIS/EIR and other stages of the decision making process. The EAP needs to be expanded to identify when and where such subsequent environmental reviews will be required, with discussion as to how these timeframes relate to the improvement phasing plan set forth by LAWA, and to the sequence for FAA and LAWA consideration of required discretionary actions. The EAP, including all Master Plan Commitments and mitigation measures, should be refined and detailed to adequately serve as the CEQA Mitigation Monitoring Program, pursuant to Public Resources Code 21081.6.

#### **4.10.4 Video-Conferencing**

In the § 1.3 discussion of Alternatives to air travel, the 2001 Draft EIS/EIR notes a study by Apogee Research that contains key findings that video-conferencing has potential to satisfy (1) from 5-30% of non-discretionary travel; and (2) less than 5% of discretionary travel. The discussion in § 1.3 concludes with: "Given that 50% of LAX users are leisure travelers, it is projected that less than 5% of air travel demand at LAX could be satisfied by communication technologies in 2015. These amounts were factored into the assumptions of the LAX Master Plan forecasts." The Supplement to the Draft EIS/EIR did not resolve this error. The total amount of air travel demand at LAX that

<sup>52</sup> Technical Report 9a, Section 5.1

<sup>53</sup> Technical Report 9a, Section 6.1.2

could be satisfied by communication technologies should equal the combined amounts for discretionary travel PLUS non-discretionary travel (i.e., [5-30% of demand x 50% of travel = 2.5% to 15%] + [ $<2.5\%$ ] =  $\sim 2.5\% - 17.5\%$ ). It seems that a higher number should be factored into the assumptions of the LAX Master Plan forecasts.

#### **4.10.5 Sixty-Minute Access Zone**

The Zone Boundaries shown in Figure 1-3 of the 2001 Draft EIS/EIR showing the 60-minute travel time accessibility zones for airports in southern California appear to overstate driving times for at least some of the airports shown. The assumptions used in developing this map need to be discussed and clarified in order to support the map, as drawn.

#### **4.10.6 Weather Conditions**

The 2001 Draft EIS/EIR notes that only one of the four runways is sufficiently long to serve the largest aircraft when fully loaded under adverse weather conditions (hot days with little wind).<sup>54</sup> However, there is no discussion as to how many days of the year, on average, are characterized by these adverse weather conditions. There is also no discussion as to how many runways can accommodate the largest aircraft when fully loaded. Both of these issues require further explanation and investigation by LAWA.

#### **4.10.7 Remote Terminals**

The 2001 Draft EIS/EIR includes discussions of the possibility of remote terminals. However, no analysis is undertaken to determine their location or impacts. Alternative "D" described in the 2003 Supplemental Draft EIS/EIR includes a Ground Transportation Center connected to the main terminal buildings by an Automatic People Mover that appears to fit the descriptions of remote terminals mentioned in the 2001 Draft EIS/EIR. However, it is unclear whether or not the Ground Transportation Center within Alternative "D" is the remote terminal mentioned in the 2001 Draft EIS/EIR. LAWA should clarify this in revisions to the Supplemental Draft EIS/EIR, and if there are other possibilities for remote terminals, then include a full characterization of these other remote terminals as well as a description of the baseline setting for the proposed locations, the impacts of their construction and use, and mitigation measures to address any adverse effects.

#### **4.10.8 Hydrology and Water Quality**

Section 4.7 of the SDEIS/EIR inadequately addresses SUSMP and drainage issues. The environmental document does not provide sufficient information to determine what drainage impacts, if any, the project may have on County facilities (MTD 992, storm drain Project Number 5241, 647, 670, etc.). To properly assess drainage and SUSMP impacts and to determine appropriate mitigation, a Drainage Concept/SUSMP report will be required. We recommend that the applicant prepare a Drainage Concept/SUSMP report showing the extent of drainage and SUSMP quality impacts, and if necessary, provide mitigation acceptable to the County. The analysis should address increases in runoff, any change in drainage patterns, treatment method proposed for SUSMP regulations, and the capacity of storm drain facilities.

---

<sup>54</sup> 2001 Draft EIS/EIR, Section 2.2.2, Page 2-6.

We also recommend that the Drainage Concept/SUSMP report should be reviewed and approved by the County of Los Angeles Land Development Division - Subdivision Plan-checking Section before the City considers its own approval. Once approved, a copy of the final Drainage Concept/SUSMP report should be included in the environmental document.

#### **4.10.9 Solid Waste Generation and Landfill Capacity**

Chapter 4 of the Master Plan Supplement to the Draft EIS/EIR, identifies the amount of solid waste generation as a result of construction and demolition activities of alternatives No Action/No Project, A, B, C, and D. The tonnage of waste generated from construction and demolition activities alone for Alternative D – the LAWA staff-preferred alternative – is well over 130,000 tons. Although LAWA states that it will require that contractors recycle a “specified” minimum percentage of waste materials generated during construction and demolition, a significant commitment is necessary to insure adequate mitigation of the scale of impact resulting from waste generated by this project. Therefore, the minimum percentage should be specified within the EIR, with a target of at least 50 percent of the waste diverted from disposal. Similarly, the percentage of minimum recycled content for materials used on site, and the specific diversion goals that will be required of lessors, should also be specified in the EIR.

Under heading of Master Plan Commitments (§4.19.5, p. 4-534), the SDEIS/EIR proposes implementation of a more aggressive recycling program, by expansion of the existing terminal recycling program to all terminals; lease provisions requiring that tenants meet specific diversion goals; and preference for recycled materials during procurement. The document should expand the discussion to include the type of material that might be targeted and the overall recycling goal.

The environmental document recognized that due to the uncertainty regarding future landfill capacity, impacts associated with cumulative increases in solid waste generation would be potentially significant (Sections 4.19.7 and 4.19.8, pages 4-537 and 4-538). Augmentation of landfill capacity is listed as a mitigation measure, however, the responsibility for implementing this mitigation measure is left to State, County, and local solid waste planning authorities. This discussion should be revised to indicate what measures the City of Los Angeles will implement to provide for the disposal of residual solid waste generated by this project and future projects within the City of Los Angeles considering the City’s stated interest to close all landfills within the City’s boundaries by 2006.

## **5.0 CONCLUSIONS**

There is no doubt that Los Angeles International Airport is vitally important to the City of Los Angeles, to the County of Los Angeles, to the region, and to California generally. There is an obvious and pressing need for improvements at LAX, most particularly to ensure the safety and security of future air travel. However, the County of Los Angeles believes that LAWA is proposing to implement a flawed project and that the process is further compromised by an inadequate environmental review. As documented throughout this report our concerns include (a) an inadequate security planning effort, (b) misleading statements regarding growth potential, resulting in fundamentally flawed environmental analyses, (c) improper choice of a Supplement to propose and assess an entirely new preferred project, (d) use of an unwieldy and confusing document format, (e) continued reliance on a baseline that is outdated and serves to undermine rather than illuminate understanding of project impacts, (f) wholly inadequate consideration and disclosure of

Environmental Justice issues coupled with a scoping process that considered neither 2001 nor the 2003 preferred project options, (g) language suggestive of bias and advocacy and an absence of full disclosure, (h) incomplete analysis of noise and air quality and the absence of studies to establish baseline or impact-level toxic air emissions, (i) inadequate and misleading assessment of impacts on biological habitat, and (j) the failure to provide an alternative that meets stated goals and also avoids or minimizes significant impacts in the identification and assessment of Alternatives.

The problems with the 2001 and 2003 environmental documents are so serious, pervasive, and universal that the only practical remedy is to start the process over again and prepare a truly comprehensive revised EIS/EIR. The revised document would need to provide comprehensive scoping, an updated and consistent baseline, identify and assess a reasonable range of feasible alternatives, be free of internal inconsistencies, offer proper levels of analysis and explanation, and present an entirely new impact assessment that does not defer critical decisions. Only with these extensive modifications can the LAX Master Plan and associated EIS/EIR be rendered adequate.
