This is not to suggest, however, that all of the terminals currently have sufficient space to meet all future operational needs over the term of the master plan. For example, an airline could install self-service kiosks in a garage as a customer service enhancement which would have the added benefit of freeing up terminal space. Depending upon the terminal, utilizing some portion of the parking garages may be a good solution for accommodating additional space needs, such as self-service kiosks.

5. The Airlines Do Not Support the Proposed North Airfield Improvements and the Related Demolition of Terminals 1, 2 and 3 since the Proposed Benefits Do Not Offset the Excessive Costs.

Alternative C to the LAX Master Plan proposed increasing the separation between the two runways on the north airfield by relocating the northern runway (Runway 6L/24R)

some 350 feet to the north and constructing a centerline taxiway between the runways. These proposed improvements would have provided the expected separation requirements for A380 aircraft, as well as improved operational flexibility to help reduce aircraft delays. The estimated cost of these proposed improvements was approximately \$350 million.

As a matter of more recent City policy, LAWA no longer supports relocating Runway 6L/24R to the north toward the community of Westchester. Instead, to achieve the separation requirements for the A380 and provide a centerline taxiway for improved operational flexibility, Alternative D proposes relocating Runway 6R/24L 340 feet to the south at a cost of \$2.7 billion. This proposal requires the demolition and reconfiguration of Terminals 1, 2 and 3 and a portion of the TBIT. To make up for a portion of the gates lost by the demolition, it also requires the development of a new west-side satellite for replacement gates. Some of the additional and reconfigured gates would be capable of handling the A380.

The airlines support the dual objectives of accommodating the A380 and improving airfield operational flexibility, but not at the staggering cost contemplated in Alternative D. While the improved operational flexibility gained by adding a centerline taxiway should result in a modest reduction in aircraft delays, the benefits gained would not justify the cost associated with relocating a runway. Potential runway incursions, which occur predominantly on the south airfield, are not a major consideration for the north runways. Furthermore, these projects could actually result in a less efficient airfield, since the proposed reconstructed terminal complex will result in an even higher proportion of gates on the south side.

The airlines believe that relocating Runway 6L/24R to the north is a far superior operational, technical, and economical option to the currently proposed Alternative D improvements. However, the airlines respect the community's concerns about such a runway relocation. Therefore, if the runway is not going to be moved north, then the airlines recommend eliminating all of the north airfield improvements from the Master Plan. By leaving the north airfield intact, there would be no need for the costly demolition and reconfiguration of Terminals 1, 2 and 3 and the northern portion of TBIT.

6. The Airlines Question the Value and Timing of a \$9 Billion Alternative D Plan.

Alternative D is estimated to cost at least \$9 billion. Airlines and other airport users pay 100% of the costs to operate LAX through landing fees, rent charges, parking and concession revenue and federal ticket taxes. No "local" Los Angeles taxes subsidize LAX. As the primary users of LAX, the airlines would be expected to pay the majority of the costs related to Alternative D.

U.S. airlines lost \$20 billion over the last two years, and continue to suffer substantial losses. Over 100,000 airline workers have lost their jobs, and a large proportion of remaining employees have taken severe reductions in pay. With commercial aviation

reeling from war, SARS, and a stagnant economy, it is the wrong time to radically redesign LAX. No one can predict the future of the airline industry or how many passengers will be flying over the next few years. With this uncertainty, it is inappropriate for LAWA to embark on a massive, risky and expensive project with questionable benefits.

The airlines also have very serious concerns about whether or not Alternative D can even be financed. A \$9 billion plan that reduces airport capacity will raise issues with the financial markets. The negative customer service implications of the plan, which threatens to either drive passengers away from LAX and to more user-friendly airports or to not fly at all, only exacerbate the problem. Even if the plan could be financed, it would be unwise for the City to embark on a \$9 billion plan in light of the current dire financial condition of the airline industry. While all of the airlines acknowledge that the industry is cyclical, they also agree that this current downturn is unprecedented and should not be treated as a mere bump in the road that will be corrected in a few years. Until some measure of stability has been achieved, one can only guess how the industry might change, and what implications such changes might have on the financial feasibility of such an extensive and expensive plan.

At \$9 billion, the estimated cost of Alternative D is significantly higher than any other major airport capital program. For example, San Francisco recently completed a \$3 billion program, Dallas and Houston are in the final stages of programs just under \$3 billion, Atlanta is in the initial stages of a \$5 program, and Chicago is preparing to start a \$6 billion program. Significantly, these other capital programs all add airport capacity, whereas LAX does not. Thus, not only is Alternative D proposed to be by far the largest airport capital program, it is the only one that does not add capacity, which would result in a disproportionate level of investment for the return.

Additionally, it is not unusual for cost estimates to increase over time as airport capital programs become better defined. Alternative D is a very complicated program still early in the planning process that will almost certainly result in unforeseen costs. As an example, the question of mitigation costs not being included in the current cost estimates has already been raised. Therefore, the airlines expect that the ultimate cost of Alternative D would be far in excess of the \$9 billion estimate.

As a case in point, Alternative D contemplates extensive demolition, excavation and construction activities throughout LAX. These demolition, excavation, and construction activities are likely to exacerbate, disturb or otherwise impact known soil and groundwater contamination at the airport, including interference with significant planned or anticipated environmental remediation projects at the airport. Alternative D calls for the construction of two new aircraft maintenance facilities totaling approximately 300,000 square feet on the west side of the airport, south of World Way West, and just west of the existing Continental aircraft maintenance facility. This area overlays known and suspected jet fuel and halogenated volatile organic compound (“HVOC”) plumes in soil and groundwater. The ongoing and planned remediation of such soil and groundwater contamination would be greatly hindered, and such contamination might be

greatly exacerbated, by the construction activities related to Alternative D. The Supplemental Draft EIR/EIS does not adequately analyze these significant adverse environmental impacts, nor the feasible mitigation measures or project alternatives which are available to avoid or significantly lessen these environmental impacts. Not only does this mean that the Supplemental Draft EIR/EIS does not meet the requirements of the National Environmental Policy Act (NEPA) and CEQA, it calls into question the proposed construction schedule, and suggests that the costs for this project are understated.

Drawing on the experience of other capital programs, and taking into account potential funding sources such as federal grants, passenger facility charges, and increased parking, rental car and concession revenues, the airlines estimate that they would pay well over 50% of the Alternative D costs. The resultant impact on unit costs would be dramatic. Currently, although varying somewhat among airlines, the cost per enplaned passenger at LAX is about \$8, at or above the average cost among U.S. airports. After completion of Alternative D, the cost per enplaned passenger at LAX would increase by an estimated \$25 to \$30, likely making LAX one of the most expensive airports in the country.

As the second-largest metropolitan area in the country, Los Angeles is too important a market for most carriers to abandon. However, with this increased level of costs, airlines will have little choice but to try and pass these costs on to their customers, but they are finding that more and more difficult as all travelers, including business travelers, are becoming increasingly price sensitive. It is entirely possible that carriers would be forced to discontinue marginal routes, and some carriers, particularly low-cost carriers, could leave LAX altogether.

C. Alternative D Does Not Satisfy NEPA and CEQA Requirements.

Specific comments are provided in the attached Appendix A.

D. The Airlines Propose a Modified Alternative D to Improve the Security, Safety and Customer Service Level at LAX Faster, Better and Less Expensively.

The airlines understand that Alternative D is being driven by several LAWA policy directives, including a mandate to increase security measures, improve airfield safety, and reduce traffic congestion, and to do so with minimal impact on the neighboring communities, in particular the environmental justice impacts of Alternative D's concentration of traffic on the eastern side of LAX. All these objectives – safety, security, passenger convenience and airport efficiency -- can be achieved sooner and at less cost through a plan that essentially modifies Alternative D. While the concept of a Modified Alternative D is still being developed, it is currently envisioned that such a plan would include several key components, which are summarized below:

- **Airfield Safety** – South airfield improvements contained in Alternative D, including relocation of Runway 7R/25L and addition of a centerline taxiway to prevent runway incursions, would remain in Modified Alternative D.
- **Security Improvements** – Security improvements mandated by the federal government, primarily the \$300 million installation of in-line checked baggage screening systems in the passenger terminals which is already being addressed by LAWA, would be part of Modified Alternative D. In addition, the security checkpoints in the terminals would be expanded to expedite passengers into the secure areas, and the terminals would be hardened as appropriate to minimize damage and make the terminals far less attractive terrorist targets.
- **Traffic Congestion** – The development of a consolidated rental car facility would improve traffic flow in the CTA by greatly reducing the number of buses. The expansion of the flyaway bus system throughout the Los Angeles area will reduce single-occupancy traffic in both the CTA and in the adjacent roadways. Security may also be improved as fewer vehicles in the CTA should allow better responses by emergency vehicles.
- **Customer Service** – Aircraft gates would be added on the west side of the Tom Bradley International Terminal, and the building would be renovated to both replace existing remote gates and accommodate the new A380 aircraft expected in 2007. The CTA and existing parking garages would remain open to private vehicles.
- **Timing** – With Modified Alternative D, the critical safety, security and passenger service improvements needed at LAX can be constructed much more quickly.
- **Cost** – The airlines believe that the overall cost would be in the \$2 to \$3 billion range, significantly less than the estimated cost for Alternative D.

Conclusion

While the airlines support the objectives of enhanced security, improved airfield safety and efficiency, and less congestion at the CTA, they do not believe that Alternative D is the best way to meet these objectives. The financial costs of the plan, in addition to its detrimental impact on customer service, far outweigh the benefits it offers. The airlines urge LAWA to reconsider Alternative D in an effort to maintain customer convenience, reduce the overall cost of the plan, and more effectively address security concerns. As indicated, the airlines feel that the objectives of Alternative D could be better achieved, and accomplished much more economically in a shorter period of time, through a modification of Alternative D.

Appendix A

Additional Technical Comments to the Supplemental Draft EIR/EIS

In addition to the above comments, the airlines are providing these technical comments on the Supplemental Draft EIR/EIS (SEIS), some of which have already been mentioned.

1. Alternative D is not responsive to the local demand for air transportation services, given the projected growth in that demand through 2015.

While the SEIS reflects that demand will grow to 98 million annual passengers by 2015, SEIS at 3-14, Alternative D does not provide anywhere near the infrastructure improvements required to meet that demand. Quite to the contrary, it explicitly incorporates infrastructure bottlenecks intended to constrain capacity to levels commensurate with the “no-build” alternative. Those constraints will cause capacity to fall short of local demand at LAX by 20 million annual passengers by 2015. As explained further below, not only will other regional airports lack the capacity to make up for this shortfall, but the SEIS proposes to exacerbate the severity of that shortfall at LAX by taking actions that are inconsistent with the practicalities of responding to the public demand for air transportation and incompatible with Congressional policy related thereto.

2. The assumption in the SEIS that regional airports can be relied upon to meet capacity demands is speculative, beyond the scope of the SEIS analysis, and, as indicated in the SEIS itself, virtually foreclosed by the elimination of El Toro as a regional air transportation alternative.

The SEIS tacitly acknowledges that it does not and cannot explain how regional aviation demands will be met by Alternative D during the subject period 2000 - 2015. SEIS at 1-12. In particular the SEIS fails to explain how, notwithstanding the significant constraints on LAX capacity, the 30 million annual passengers shortfall caused by the loss of the Orange County International Airport can or will be distributed within the region. *See* SEIS at 1-12. Accordingly, the SEIS and Alternative D cannot be considered to even remotely satisfy the Master Plan project Purpose and Need of responding to the *regional* demand for air transportation through during the 2000-2015 period.

3. Alternative D cannot be reconciled with the second enumerated project purpose of ensuring that “new investments in airport capacity are cost effective, maximizing the return on existing infrastructure capital.” *See* SEIS at 2-1.

The cost of Alternative D is in excess of \$9 billion, *yet will provide for no increases in passenger capacity* beyond the no-build alternative. The project focus is not maximizing the return on existing infrastructure capital, but rather eliminating and then replacing that infrastructure at enormous expense. The investment of such an incredible sum by definition cannot be considered a cost-effective investment in capacity, given the significant projected capacity shortfall under the Alternative D relative to anticipated demand and as compared to the other alternatives.

4. The “alternatives analysis” in the SEIS effectively presents and considers only one alternative. There is no longer a “range of reasonable alternatives” presented by the Draft EIR/EIS (DEIS) and SEIS as required by NEPA.

The SEIS has *de facto* eliminated any meaningful consideration of Alternatives A-C by recasting the project focus as constraining local capacity. To this end, the SEIS affirmatively incorporates limits on airport infrastructure commensurate with the no-build alternative as a surrogate objective. As noted, this is facially at odds with the Purpose and Need that was set forth in the DEIS and expressly reaffirmed in the SEIS. Moreover, this effectively eliminates any other alternatives from consideration in violation of NEPA,¹ as the other alternatives all provide for increases in LAX capacity responsive to projected local and regional demand.

5. The SEIS is also inconsistent with NEPA in that it forecloses any Alternative that would meet capacity demand in contravention of FAA policy.

NEPA contemplates that the SEIS must propose within its range of reasonable alternatives an alternative that are consistent with the FAA’s basic policy objectives. *See Muckelshoot Indian Tribe v. U.S. Forest Service*, 177 F.3d 800, 813 (9th Cir. 1999). However, as more fully explained below, by effectively foreclosing further consideration of Alternatives A through C (which respond effectively to demand) the SEIS cannot be reconciled with FAA’s fundamental policy of ensuring safe and efficient operations within the National Airspace System.

6. The proposed project is contrary to express Congressional and FAA Policy in the area of air transportation and at odds with the objectives of the Airline Deregulation Act.

In the area of air transportation, Congress has explained that it is the policy of the United States “that airport construction and improvement projects that increase the capacity of facilities to accommodate passenger and cargo traffic be undertaken to the maximum feasible extent so that safety and efficiency increase and delays decrease.”²

Congress has determined as a matter of law and national policy that the most effective way to respond to the demand for air transportation services is through market forces. This policy determination was reached as part of the fundamental decision to deregulate air travel and restructure the statutory scheme governing aviation to have public demand set the limits on the scope of air transportation services.³

¹ 42 U.S.C. § 4332(2)(c)(iii); 40 C.F.R. § 1502.14; *see generally City of Carmel-by-the-Sea v. United States Department of Transportation*, 123 F.3d 1142 (9th Cir. 1995).

² 49 U.S.C. § 47101(a)(7) (2000).

³ *See Airline Deregulation Act of 1978*, Pub. L. No. 95-504, 92 Stat. 1705 (1978) (codified at 49 U.S.C. § 1305(b)(1) (1988)).

Consistent with that Congressional policy, the FAA's mission is not to artificially constrain air travel as proposed in the SEIS, but instead to provide the tools for modernization, infrastructure improvements, and enhancements of efficiency that will facilitate the competition and investment necessary to accommodate the public demand without compromising the quality of service.⁴ The essence of the statutory scheme for aviation thus contemplates that the traveling public and cargo customers will decide which airports shall be used and that the airlines that choose to serve those markets will respond accordingly.

Despite this, Alternative D has been fashioned to incorporate infrastructure limitations on aircraft gate frontage and cargo capacity developments that seek to artificially discourage additional passengers by providing for a degraded level of service as demand approaches capacity. *See* SEIS at 3-27.⁵

7. The SEIS cannot be reconciled with the Congressional policy of promoting safe and efficient operations with the National Airspace System.

Congress and the courts, in interpreting Congressional intent, have made clear that the safe operation of the airport and airway system must be the highest aviation priority. As the Supreme Court has explained, "planes do not wander about the sky like vagrant clouds." *City of Burbank*, 411 U.S. at 633-34 (*Quoting Northwest Airlines, Inc. v. Minnesota*, 322 U.S. 292, 303 (1944)) (Jackson, J., concurring). Instead, they necessarily move within a highly regulated, closely monitored and intricately complex air transportation system. *Id.*

The logical corollary of this situation is that the adequacy and sufficiency of the airport infrastructure necessary to facilitate aircraft operations plays a critical role in the efficiency of the National Airspace System. Constraints on aircraft operations can be expected to result in increased "congestion and a concomitant decrease in safety," *see id.* 639, and local restrictions related to operation can "create critically serious problems to all transportation patterns." *Id.*

This is particularly significant because, with the advent of deregulation, it is the public demand for air transportation that sets the scope and pace of operations necessary to meet that demand. Consistent with that principle, and as reflected in well-established methodology and experience, the FAA has determined that the demand generally will continue to grow as forecast until full utilization of an airport's capacity is reached. *See, e.g.,* FAA Advisory Circular No. 150/5060-5, *Airport Capacity and Delay*.

⁴ 49 U.S.C. § 47101(a)(7). *See, also, Seattle Cmty. Council Fed'n v. F.A.A.*, 961 F.2d 829, 835 (9th Cir. 1992) (FAA's mission is not to control market demand).

⁵ The SEIS indirectly acknowledges that the efforts it has proposed in the Preferred Alternative arbitrarily to limit infrastructure will not keep market forces from fueling demand for additional operations and that "the result [will be] a degraded level of services." SEIS at 3-27.

However, as demand approaches ultimate capacity, delay and congestion are increased and the efficiency of the aviation system is decreased. *Id.*⁶ By incorporating infrastructure bottlenecks designed to limit capacity infrastructure at LAX at a level of 20 million annual passengers below anticipated demand in 2015, the SEIS and Alternative D all but ensure that there will be problematic local and regional issues of delay and congestion and that the efficiency of the National Airspace System will decrease.

8. Alternative D cannot be said to provide security more consistent with future requirements.

Alternative D is styled as the “Enhanced Safety and Security Plan.” SEIS at 3-14. However, the SEIS acknowledges that existing airport security requirements will undergo a variety of changes over the next few years and “[t]he nature, timing and characteristics of such changes cannot be forecasted with any certainty at this time.” SEIS at 1-12. As such, the suggestion in the SEIS that the major components of Alternative D will best satisfy future security requirements is speculative and lacking in a reasonable basis. Indeed, as the SEIS acknowledges, the other alternatives (including the “no build” alternative) provide the necessary space requirements for TSA to respond to its mission at immensely less cost. SEIS at 3-13.

9. Alternative D is inconsistent with the third enumerated project purpose of enhancing the regional economy and Los Angeles’ role as an international gateway. SEIS at 2-1.

As noted, the SEIS acknowledges that Alternative D cannot be said to ensure that local and regional demand for air transportation services will be met. Indeed, local and regional shortfalls in capacity measured in tens of millions of passengers annually should be expected. A likely outcome of that shortfall is the potential for unmet demand to shift to airports outside Los Angeles and Southern California with an associated loss of jobs and economic benefits. *See* SEIS at 1-12. As a result, the objective of enhancing the regional economy and promoting Los Angeles as an international gateway will not be met.

10. Alternative D presents less significant environmental impacts largely by failing to achieve to project purposes and not responding to capacity needs.

The SEIS portrays Alternative D as presenting less significant environmental impacts. However, it does so simply by negating the project’s purpose and need. Foreclosing consideration of any infrastructure improvements necessary to meet the significant future increases in passenger demand is not an appropriate strategy for limiting environmental impacts.

⁶ *See also* note 5 above.

Designing Airports for Security

An Analysis of Proposed Changes at LAX

Terry L. Schell, Brian G. Chow, and Clifford Grammich

INTRODUCTION

The Los Angeles International Airport (LAX) Master Plan explores a variety of ways to meet the changing aviation needs of Southern California in coming decades. The needs include increasing the safety of passengers and airport workers. A recent proposed alternative, Alternative D—Safety and Security, includes more features for the security of airport workers and passengers.¹ Among the features of this plan are

- maintaining current gate capacity to accommodate growth to 78 million annual passengers by 2015 (from roughly 67 million in 2000), with some reconfiguration to better accommodate very large aircraft
- reconfiguring the Central Terminal Area, including removal of the U-road currently used for passenger loading and unloading, and the removal of all parking structures
- limiting Central Terminal Area vehicle traffic to emergency vehicles, mass transportation vehicles (including “FlyAway” buses to long-term parking lots), and vehicles making deliveries to tenants and concessionaires
- constructing a large Ground Transportation Center in the Manchester Square Area, approximately two miles from the Central Terminal Area; all short-term park-

ing and passenger dropoff and pickup would occur at this facility

- constructing a mass transit system or “people mover” linking the Ground Transportation Center, the Metro Green Line, the Central Terminal Area, and a consolidated car rental facility within the Central Terminal Area.

During a series of exchanges between RAND and U.S. Congresswoman Jane Harman (D-Calif.) and her staff on topics related to national security, counterterrorism, and homeland security, involving numerous visits and joint appearances both in California and Washington, D.C., Rep. Harman asked RAND to examine the relative security merits of Alternative D. Specifically, this analysis examines how the security features of Alternative D compare with current airport configuration (also referred to as the “no action/no project alternative”) in improving the security of airport workers and passengers against terrorist attacks. It follows two strands of work: (1) published and confidential RAND analyses on securing a wide range of facilities in the United States, from Los Angeles skyscrapers to the U.S. Capitol grounds; and (2) a growing body of research on improving airport and airline screening, including baggage screening, passenger profiling, use of Transportation Security Administration (TSA) employees for security screening, and enhanced aircraft safety measures (e.g., reinforced cockpit doors). This work is unique in offering one of the first explicit analyses of airport security as a function of airport design since the September 2001 terrorist attacks against the United States.

¹ See “Safety and Security Alternative Fact Sheet,” available at http://www.lawa.org/news/pdf/laxmp_factsheet_7202.pdf (as of May 8, 2003).

AN ANALYTICAL FRAMEWORK FOR AIRPORT SECURITY

Alternative D raises two general issues for consideration in improving LAX security. The first is the net effect on security of any physical change to the airport. This can be assessed by comparing the new physical features in Alternative D with existing or possible modifications of features in the current configuration and illustrates what benefits may be realized from reconfiguring the airport to include the greatest number of security features possible. The second issue is the effect of limiting airport capacity to 78 million annual passengers, which is close to the maximum capacity of the current configuration (set at 79 million). This illustrates what benefits may be realized merely by limiting air passenger traffic at LAX and ultimately redistributing it throughout Southern California. Alternatives A–C allow substantially more passengers than both Alternative D and the no action/no project alternative; Alternatives A–D call for some reconfiguration to include safety features for reducing taxiway congestion and increasing runway separation.

We begin by examining possible means of terrorist attack. The RAND–MIPT Terrorism Incident Database (known before 1998 as the RAND Chronology of Terrorism) is a database tracking terrorist activity worldwide and offers a comprehensive list of terrorist attacks against airports or aircraft since 1980. These historical data indicate both the means that have been used to attack airports as well as means of attack on other facilities that might be used against airports.

Any airport redesign for improved security can be evaluated for its effect on three security outcomes variables: (1) deterrence or detection of an attack before it occurs, (2) the number of casualties an attack would cause, and (3) the extent to which airport operations would be interrupted by an attack. For each means of likely attack, we examine how airport configuration might help in deterring or detecting such an attack as well as how it might limit the casualties and effects on operations.

We make several assumptions that are important for evaluating our conclusions. First, we assume that ongoing security expenditures are equal for each alternative, or that any security personnel and equipment that would be added under Alternative D could be added to the existing configuration. Second, we assume that additional security resulting from hardening structures in the reconfigured facility could also be achieved by hardening structures in the existing structure. We evaluate only the configuration of the airport, not the actual structures, because the engineering details of the structures specified in the plan are not yet available. Third, we assume that attackers will exploit the security weaknesses of each design, and that

attacks would be conducted to maximize their damage. This means terrorists will adapt to changes in security, so that improving one weakness in security will provide only minimal benefit if a more substantial weakness remains.

HISTORY OF THREATS TO AIRPORT SECURITY

The RAND–MIPT Terrorism Incident Database lists 225 attacks on civilian aircraft or airports worldwide since 1980.² Of these, two-thirds, or 150, were attacks on civilian aircraft and one-third, or 75, were attacks on or at airports. It is possible that the proportion of attacks on airports is slightly overstated given that a bomb detonated or detected at an airport was counted as an airport attack even if intended for an aircraft.

Attacks on aircraft have been much deadlier than those on airports. The 150 attacks on aircraft have resulted in 4,280 fatalities, compared with just 76 fatalities resulting from attacks on airports. Even if one excludes the casualties of the September 2001 attacks on and using civilian aircraft, there have still been about 1,400 fatalities resulting from attacks on civilian aircraft since 1980, or about 20 times those that have resulted from attacks on airports.

To be sure, attacks on airports have produced significant damage. Of the 75 attacks on airports

- 49 used portable explosives (mostly in luggage but also including 3 mail bombs), resulting in 58 fatalities
- 9 used vehicle bombs, resulting in 4 fatalities
- 8 used missiles, rocket-propelled grenades, or mortars, resulting in 1 fatality
- 7 used firearms, resulting in 13 fatalities.

In sum, portable explosives are the most frequent and deadly mode of terrorist attack nationwide, while attacks by firearms, though only the fourth most frequent means of attack, are the second most deadly. There have also been an unknown number of criminal, non-terrorist attacks that used firearms or other small weapons.

Attacks against airports in the United States, including LAX, have been similar to those elsewhere in the world. The RAND–MIPT Terrorism Incident Database includes data on three attacks at LAX, including a bomb attack at an Air China luggage processing facility in 1980; a 1999 plot to detonate a bomb at a security screening point which

² Numbers of attacks against airports and aircraft should be viewed as approximate for two reasons. First, the database is incomplete because funding was interrupted for a time, and researchers are now making the database complete for the late 1990s and early 2000s. Second, these numbers include deterred or detected attacks for which detailed preparations had been made. They include, for example, an attempted bomb attack against LAX that was foiled in late 1999 as described below.

was foiled when the perpetrator was arrested at the Canadian border upon attempting to enter the United States to execute the attack; and a firearms attack at an El Al ticket counter in July 2002 that resulted in three fatalities, the only fatalities to result from a terrorist attack at LAX.

There are two known means of terrorist attack that could plausibly be used against airports but have not been used to date. One is a very large truck bomb, such as that used against the Murrah Federal Building in Oklahoma City and the Khobar Towers in Saudi Arabia. Another is a nonconventional weapon such as anthrax, sarin, or a radiological "dirty" bomb. (An additional possibility we do not explicitly consider is simultaneous attacks using conventional means, such as those executed by al Qaeda, on multiple targets, including airports.) Such attacks may have far more severe consequences than past means of attack, so we also consider them in our analyses of the impact on security of LAX reconfiguration.

Before reviewing the effects of airport configuration on limiting possible means of terrorist attack, we remind the reader that while past data are helpful for designing means to prevent or limit the effects of future attacks, there are limits to their uses. Terrorists may change their methods, adapt to changes in security or perceived value or significance of the target, or adapt techniques that have been used successfully against other targets to attack airports.

THE IMPACT OF RECONFIGURING AIRPORT FACILITIES

In all, we consider how possible airport reconfiguration could help prior detection or deterrence and ultimate limitation of casualties and operational disruption for seven types of attacks (overall assessments are provided in Table 1), including those

- (1) on aircraft
- (2) with a portable bomb
- (3) by gunmen
- (4) with a small vehicle bomb
- (5) with a large vehicle bomb
- (6) with a rocket-propelled grenade or mortar, or
- (7) with chemical, biological, or nuclear weapons.

Airport reconfiguration is unlikely to have any substantial effect on the more common and lethal attacks: those against aircraft. Complete screening of baggage and passengers to prevent such an attack is already occurring. Airport reconfiguration can provide no additional protection against such attacks; it cannot affect terrorists' ability to fire weapons from the ground against aircraft; and it cannot boost the effectiveness of security measures, such

Table 1
Attack Outcomes as a Function of Threat Type and Airport Configuration

	Outcome		
	Deterrence	Casualties	Operations
Attack on aircraft	∅	∅	∅
Portable bomb	?	∅	-
Gunman	?	∅	-
Vehicle bomb (small)	?	+	+
Vehicle bomb (large)	?	?	?
RPG/Mortar	∅	∅	-
CBN	∅	∅	∅

NOTES: +, likely security advantage for new configuration; -, likely security disadvantage for new configuration; ∅, no discernible effect; ?, unknown effect; RPG, rocket-propelled grenade; CBN, chemical, biological, or nuclear attack.

as air marshals and cockpit barriers, that have been implemented on aircraft.

Airport reconfiguration may have some effect on the most common and lethal attacks against airport facilities (rather than aircraft)—those by small (e.g., luggage) bombs and by firearms—but the full extent of this effect is unknown. Not enough is known to evaluate the effect of Alternative D on deterring or detecting such attacks. The distance between parking facilities and the new Central Terminal Area may allow some extra time to use profiling or other methods to identify potential bombers or gunmen, but would have no effect on detecting those seeking to attack the new Ground Transportation Center. There is also little evidence on the effectiveness of profiling techniques or on the ability of terrorists to "game" or otherwise elude a profiling system. Assuming any engineering or building features of Alternative D can be used in the current configuration, airport reconfiguration by itself is not likely to affect the number of casualties that result from small bombs or firearm attacks. Casualties from such attacks are determined by the density of persons waiting in unsecured areas of the airport, such as ticketing, baggage claim, security checkpoint, and transportation waiting areas. These densities are not likely to change as a result of the reconfiguration so similar casualties should be expected from such attacks in both configurations. The effect of such attacks on airport operations may be slightly more severe under reconfiguration. Reconfiguration would centralize several airport functions, such as transportation and terminal entrances that are currently distributed throughout several terminals. An attack at one centralized location may have a great effect on all airport operations during cleanup, investigation, and repair, while an attack on one terminal would affect only operations at that terminal.

Reconfiguration can improve security against small vehicle bombs, but it is difficult to determine the size of this benefit. In particular, how well reconfiguration would affect the deterrence or detection of small vehicle bomb attacks is unknown. If the proposed Ground Transportation

Center were eventually seen as “the airport,” it would become the likely spot for such an attack. Cars would still be able to drive near lines of persons waiting to board the “people mover,” but the greater distances that reconfiguration could incorporate between the “people mover” and passenger dropoff and pickup areas would help limit casualties from small vehicle bombs. Reconfiguration may help maintain airport operations in the event of attack by a small vehicle bomb; the new Central Terminal Area, for example, would likely continue to function, being far removed from the Ground Transportation Center.

We can draw no conclusions about the impact of reconfiguration on large vehicle bomb attacks, because the plan does not specify how large vehicles would be handled. LAX currently has about 200 restaurants, bookstores, and other businesses that require deliveries nearly every day. Reconfiguration would boost the number of these tenants. Although the Central Terminal Area will be closed to passenger dropoff and pickup, it will need to be accessible to trucks. It is possible to search these trucks before they enter the Central Terminal Area, but this would require considerable manpower. Diverting all trucks to a separate entrance may facilitate such searches and security, but such diversion does not require reconfiguration. More generally, it is not clear how airport reconfiguration should be used address the potential problem of large vehicle attacks. Airports typically make poor targets for large vehicle bombs. For example, fatalities caused by bomb attacks at tall buildings, such as those caused by bombing of the nine-story Murrah Building and the eight-story Khobar Towers, generally occur as a result of structural collapse of the upper floors onto the lower floors.³ By contrast, airports typically have only two stories, meaning their structural collapse would have far fewer catastrophic consequences. Airports do have multistory parking structures that terrorists may seek to attack with large truck bombs, but such targets are not desirable targets for several reasons, including their minimal symbolic value, their more solid construction than residential or business buildings of comparable size, their sparse population, and their open walls that reduce energy absorbed from a blast.

There is little to distinguish Alternative D from the current configuration for boosting security against attack by rocket-propelled grenades or mortars. Reconfiguration may do little to deter, aid the detection, or limit the casualties of such attacks. It is possible that reconfiguration, by centralizing airport facilities, would aggravate the effects on airport operations of such attacks, particularly an attack that disabled the “people mover” system.

There is also little to distinguish Alternative D from the current configuration for boosting security against attack by chemical, biological, or nuclear weapons. It is worth noting that such weapons have not been used against airports. There are several reasons for this. These weapons are relatively difficult to obtain and use effectively. If a terrorist group did obtain these weapons, it could use them against nearly any target in the United States as easily as against LAX. We do not mean to imply that such attacks would never occur at LAX, only that such attacks would be less likely, and less catastrophic, than at other locations in the region and nation.

There are two additional security considerations that affect all modes of attack we analyze and that should be considered in evaluating the security effects of reconfiguration. First, the proposed reconfiguration will increase the area to be patrolled by security personnel. This may have a negative effect on deterrence and detection if security forces are not increased for the reconfigured facility. Personnel will need to be diverted to new facilities, such as the Ground Transportation Center, at which large crowds will gather, leaving fewer to patrol the Central Terminal Area than now patrol the decentralized terminals. Second, reconfiguration may make it difficult to evacuate the terminal area in the event of an attack, particularly given reliance on the “people mover” system for moving persons to and from the terminal. Such reliance might entice terrorists to issue a bomb threat and then attack large and dense crowds waiting to board the system. Evacuation plans and equipment can help mitigate this danger, but would rely on persons leaving the terminal in a way other than which they entered. Alternatively, terrorists may seek to disable the “people mover” at any point along its two-mile route and attack trapped passengers with weapons ranging from “Molotov cocktails” to biological weapons.

THE IMPACT OF RESTRICTING GROWTH

One common characteristic of both the current configuration and Alternative D that may have a great effect on airport security is the limit on capacity (both would limit capacity to less than 80 million passengers annually). Relative to Alternatives A–C, such a limit would mean that more growth in air travel would need to be absorbed by other airports in the region. Over time, this would result in a far more evenly distributed system of air travel in which LAX would handle a smaller proportion of a growing number of Southern California air passengers.

Even without changes to airport facilities or procedures, such a limit may help deter terrorist attacks on LAX by helping reduce the value terrorists may perceive in such an attack. A capacity limit, by shifting a proportion of

³ National Research Council, *Protecting Buildings from Bomb Damage*, Washington, D.C.: National Academy Press, 1985.

regional air traffic from LAX to other airports, may also help mitigate the effect of a terrorist attack on regional airport operations, because a future attack on LAX would affect a smaller proportion of regional airport operations than a present attack would. Such benefits should be viewed as highly speculative, for it is impossible to calculate their magnitude or the length of time needed to realize them. Furthermore, there may be substantial economic costs to the region resulting from restricting LAX capacity; such costs may outweigh the economic benefits of a regional air transport system better able to recover from possible terrorist attacks.

More precise calculations can be made regarding the effects of limiting capacity on potential casualties from a terrorist attack. Reconfiguration, as noted, may help improve LAX security against small vehicle bombs, but it likely would not improve security against small or portable bombs concealed in luggage, which, historically, have been about twice as lethal at airports than larger bombs. While perhaps surprising, this finding follows as a direct consequence from the physics of explosives. The force of a bomb, as well as its ability to cause casualties, is greatly reduced over distance from the bomb; more precisely, the force of a bomb decays with the cube of the distance from the bomb. Thus even small changes in distance from a bomb can result in dramatic reductions of its power (with some minor exceptions for bombs detonated in extremely rigid structures such as tunnels).⁴ This also means that the density of a population being attacked can matter far more than the sheer size of the bomb. Because the density of persons can be greater in buildings or mass transit vehicles, small bombs there can be more lethal than larger bombs in more open spaces (Table 2).

For example, the amount of explosives needed per casualty in a city bus arriving at the airport or a large aircraft filled to 80 percent capacity is about one-half, or less, that needed to kill an equal number of persons in a terminal line, while the amount of explosives needed to kill a given number of persons in an airport terminal line is about one-fifth, or less, than that needed to kill an equal number of persons in an open area, such as a sidewalk, outside the terminal. Put another way, a terrorist seeking to kill the greatest number of persons can kill more with a small bomb (e.g., luggage bomb) in a relatively dense area such as inside a terminal than with a large bomb (e.g., vehicle bomb) in a relatively open area such as a sidewalk outside a terminal (Figure 1).

Table 2
Explosives Required as a Function of Population Density in Several Airport Locations

Region of Airport	Area per Person ¹ (sq ft)	Distance Between People ² (ft)	Explosives Needed per Casualty ^{3,4}
Inside plane (767, econ, 80% capacity)	7	2.7	0.2
Inside city bus (80% capacity)	12	3.5	0.3
Inside airport bus w/baggage	30	5.5	1.3
Line of passenger in terminal			
High-density	16	4	0.5
Mid-density	25	5	1.0
Low-density	36	6	1.7
Open area in terminal or sidewalk			
High-density	81	9	5.8
Mid-density	144	12	14
Low-density	196	14	22
On roadway (lane next to airport bus) ⁵	144	12	14
On roadway (curbside) ^{5,225}	15	27	
On roadway (third lane from curb) ⁵	625	25	125
Parking lot (1 person for every 5 cars) ⁵	1,225	35	343
Parking lot (1 person for every 10 cars) ⁵	2,500	50	1,000
Parking lot (1 person for every 17 cars) ⁵	4,225	65	2,197

NOTES: ¹Population densities calculated within a circular area large enough to enclose 30 people. ²Square root of density. This would be the distance between individuals if they were evenly dispersed. ³Bomb sizes are expressed in relative units. 1 represents the power required when population density is 1 person per 25 square feet. The absolute amount of explosives will depend on the type and construction of the bomb. ⁴Does not include secondary casualties from structural failures. ⁵Calculations assume vehicles and building offer no protection from explosion; this will slightly overestimate the casualties from bombings in these locations.

Our calculations may overstate the casualties that would result from large vehicle bombs because of several simplifying assumptions. We assume, for example, that there is no protection whatsoever for persons within range of a given bomb, but a large number of persons within a given range of a vehicle bomb would probably be in their own vehicles, which should offer considerable protection from a blast and resulting debris. Similarly, a large number

NOTE: Dots represent people or pairs of people. 29:1 ratio in explosives will result in the same number of casualties.

Figure 1—Different Bomb Sizes Can Yield Similar Casualty Rates, Depending on Population Densities (Higher-Density Scenario)

of persons would be inside the terminal building, which should also offer protection from the blast. While flying glass or falling debris inside a terminal building resulting from a vehicle bomb can cause fatalities, such problems may be mitigated by thorough modification to windows or reinforcement of building structures.

In comparing potential fatalities from small and large bombs detonated at airports, we consider casualties from the bomb itself, rather than secondary effects of structural failure, because the detailed structural engineering required for predicting structural failure is beyond the scope of this project. Nevertheless, we note that the structural peculiarities of an airport may mean a small luggage bomb inside a terminal can cause greater structural damage than a large vehicle bomb outside it. The roadway overpass outside a terminal is designed to handle far greater loads, and has a much greater mass, than the interior floors of the terminal building. As noted earlier, structural collapse resulting from a bomb in an airport terminal of just two stories is less likely to have the catastrophic consequences that can result from large bombs used against taller buildings.

Small bombs detonated inside a terminal, in addition to being a more likely threat and more deadly for a given weight of explosives, are easier to build without detection and to deploy in an airport without suspicion and leave less forensic evidence about perpetrators. Any individual or organization that has the capability to launch an effective vehicle bomb attack outside a terminal has the material, skills, and motivation needed to launch several smaller and more lethal bombs inside a terminal. This is not to say that terrorists will never attack LAX with a car bomb, but instead that efforts to mitigate the damage from bomb attacks might be better focused on preventing or limiting the damage of small bombs detonated in crowded areas. Reconfiguration can offer some greater protection from some vehicle bombs, but by itself can do little to affect threats posed by small bombs. Such threats are best addressed by reducing crowded areas in the existing or reconfigured airport.

INCREASING SECURITY IN EITHER CONFIGURATION

The fact that small, portable explosives have been the most likely and most lethal means of attacks at airports suggests a number of changes can help improve security greatly either in the current configuration or in the Alternative D reconfiguration. We outline three broad areas to consider.

Expedite the Movement of Passengers into the Secure Terminal Areas

The greatest risks for casualties for most types of

attacks are in the high-density areas passengers encounter before reaching the security checkpoint, particularly lines for ticketing and for passing the security checkpoint. Airport procedures and numbers of personnel, rather than configuration, determine the number of persons that must wait in these unsecured areas. Even small increases in ticketing and screening personnel may help reduce these crowded areas.

Consider, for example, that if current personnel can screen 10 passengers per minute, and 12 passengers per minute are arriving at the terminal, then a line of 60 persons will form within 30 minutes, with new arrivals facing a wait time of at least 6 minutes. Just a 20 percent increase in screening capacity would completely eliminate the line and wait time. Increased capacity at ticket counters would have similar effects. Passenger flow is extremely predictable, and airlines already make some adjustments to handle peak flight times. In fact, completely eliminating ticket counter lines may require no additional personnel, particularly as electronic kiosks are used to handle more passenger traffic.

Similarly, reducing the wait for baggage check-in from 15 minutes to 1 minute would cut the number of persons who could be killed in a bomb attack in that area by more than 50 percent (compare dot density of Figure 2 with that in Figure 1). It would also reduce the number of persons who could be killed by a curbside bomb both by reducing the number of persons waiting there for baggage or security checks and by allowing persons inside the terminal to move further from the exterior wall.

Unfortunately, the TSA is setting funding and personnel at each airport to levels that could result in security checkpoint wait times of up to 10 minutes.⁵ This will have more detrimental effects at larger airports, such as LAX, because a 10-minute wait for a terminal that must handle 15 passengers per minute will result in a crowd of 150 persons at each security checkpoint, while such a wait at a terminal that must handle 5 passengers per minute would result in a crowd of only 50 persons.

The economic costs of such delays should be considered in efforts to improve security. These occur because the value of air travel is in the savings of time it offers relative to other modes of transportation. Anything that adds time to a trip by air reduces its value and hence its demand relative to other modes. A recent RAND analysis concluded that the costs of increased equipment and personnel needed to eliminate security delays would be more than offset by the resulting increased value passengers

⁵ The TSA recently announced it was reducing its number of screeners by about 6,000, including more than 150 at LAX. See <http://www.tsa.gov/interweb/assetlibrary/ScreeningReductionFactSheet.doc> (as of May 8, 2003).

NOTE: Dots represent people or pairs of people. Scenario assumes reduced density in check-in and sidewalk areas, but the same density in the roadway area; thus 18:1 ratio in explosives will result in the same number of casualties.

Figure 2—Different Bomb Sizes Can Yield Similar Casualty Rates, Depending on Population Densities (Lower-Density Scenario)

would perceive, and pay, for air travel.⁶ In other words, most passengers would pay the minimal increase in cost required to eliminate waiting in lines in unsecured areas of the terminal.

Eliminating lines in unsecured areas for passengers departing LAX would shift the most vulnerable location in the airport to the baggage claim area. Crowd density in this area is lower than that for ticketing counters or security checkpoints, but it is still significant. Unfortunately, eliminating these crowds is not simply a matter of increasing personnel or capacity. Nevertheless, some changes are possible to increase the security of this area. Restricting baggage claim access to those persons disembarking planes would increase the security of this area, but would possibly be seen as an inconvenience to persons meeting passengers. Alternatively, security personnel could prohibit non-passengers entering the baggage claim area from bringing any bags or backpacks into it.

Harden High-Value Structures

Potential casualties from a bomb attack could be greatly reduced through structural modifications. A high priority should be preventing damage from flying glass through use of shatterproof glazing, decreasing the size of window panels, or using stronger window frames. Other structural changes that may also be cost-effective include reinforcing walls in high-risk areas or adding support columns.⁷ Such changes may help reduce the damage and

casualties from earthquakes in the region; these secondary benefits should be considered in any cost-benefit analysis.

Use Physical Barriers

Physical barriers can help increase the separation between vehicles and buildings or crowds. These barriers would reduce the population density of an area a vehicle bomb could affect, and they could reduce the secondary damage from structural failures. Truck use on the upper (departures) deck could be limited by placing height restrictions on vehicles there and through other means to prevent the passage of heavy vehicles.⁸ Because buses currently use the lower (arrivals) deck for passenger dropoff and pickup, this would not restrict current traffic flow. Barriers such as planters or bollards could also increase the distance between cars and the terminal building and between cars and pedestrians. It may be less expensive, however, to move passengers inside the terminal further from exterior walls.

CONCLUSIONS

While there have been past terrorist attacks on LAX and future attacks cannot be ruled out, airports have been very safe places in recent decades, and the threat of terrorism at an airport should be viewed in the context of other safety and security threats facing air travelers. An airplane collision at LAX, for example, could result in more casualties than any terrorist attack not using a nuclear weapon. An earthquake could also result in more damage and a significantly longer shutdown of the airport. Any terrorist attack can result in tragedy, but the threat of terrorism should not dominate discussions of airport planning at the expense of solutions to more common problems. Any reconfiguration of LAX should be judged primarily on how efficiently the airport will function and on the effects reconfiguration will have on the transportation and economy of Southern California. There is enormous economic value to be realized in getting passengers from their homes to their destinations quickly and safely. The economic costs incurred by an inefficient airport operation could therefore outweigh the economic benefits of some of the more expensive security aspects in reconfiguration.

Terrorism is dynamic and terrorists adapt their methods to suit changes in weaponry and defense tactics. Terrorism prevention and security therefore also needs to be dynamic. Buildings are essentially static. This makes it extremely difficult, and expensive, to design airport facilities that will be as secure against attack 20 years from now as

⁶ Russell Shaver, *How Much Is Enough? Sizing the Deployment of Baggage Screening Equipment by Considering the Economic Cost of Passenger Delays*, Santa Monica, Calif.: RAND DB-412-RC, forthcoming.

they may be today. While in the past ten years there have been a number of notorious terrorist attacks using vehicle bombs, which airport reconfiguration might help mitigate, future terrorists may use rocket-propelled grenades for their attacks.⁹ This could diminish some of the short-term improvements in safety and security that Alternative D could effect.

Our analysis helps indicate the priorities for considering security in airport planning. Top priority should be given to securing aircraft, the most likely—and lethal—target of terrorist attacks on air transportation. This should include screening of all baggage and passengers, adequate security procedures and equipment on aircraft, and restricted access to aircraft on the ground.

The next priority should be given to securing airport facilities against portable bombs, the most commonly used weapons in terrorist attacks against airports. Such weapons are easy to build and the perpetrators of such attacks are hard to catch. Detonation of these bombs in crowded areas of the airport makes them more lethal, per pound of explosive, than any other means of attack.

Restricting passenger capacity as proposed in Alternative D, or as would result from the no action/no project option, could reduce the overall vulnerability of LAX in particular and Southern California aviation more generally. Restricting LAX capacity would make it a less prominent target for terrorist attack, while distributing air traffic more evenly throughout the region would help its air traffic system continue functioning in the event of an attack on one of its parts. Such restrictions may have detrimental economic effects beyond the scope of this work.

Other features of Alternative D appear less likely to improve security. The proposed reconfiguration could help limit damage caused by a vehicle bomb, but would not help limit damage caused by small bombs, and it

⁹ There are recent reports of rocket-propelled grenades selling for as little as \$150 in the European black market. See Nicholas Rufford, "Prime Suspect: Who Masterminded the Rocket Attack on MO6 Headquarters?" *Sunday Times* (London), September 24, 2000.

could increase the time the airport is shut down by such attacks. Reconfiguration could also result in two security problems that will need to be addressed in future versions of the plan. First, the present plan would substantially increase the area that would need to be secured against possible terrorist attack. This will be difficult to do with the present number of security personnel. Second, the present plan would consolidate transportation to the Central Terminal Area on a "people mover" that could become a tempting target for terrorists and that may impede evacuation of the terminal in the event of an attack, a fire, or a natural disaster.

Regardless of configuration, several improvements in airport processes could be made to improve security against terrorist attacks at LAX. The most important of these is expediting the movement of passengers into secure terminal areas. This is the best defense against small bombs and firearms—the most common, and deadly, types of terrorist attacks. Building structural improvements, including the replacement of conventional glass with shatterproof materials and changes to the terminal facade and structural supports, can also mitigate the effects of terrorist attacks. Physical barriers, including the prohibition of tall or heavy vehicles on the upper (departures) deck, to increase separation between vehicles and persons can also limit potential casualties from larger bombs.

If it is assumed that some reconfiguration of LAX (in the form of Alternative A–D) is likely, Alternative D would likely have a slightly positive effect on improving LAX security. This positive effect would be due to only one portion of the plan—restricting passenger capacity—and not those parts that are more expensive, such as reconfiguring the terminal, parking, and ground transportation at the airport. The current configuration would allow airport managers to realize the most likely security benefits of Alternative D and to add others as well. Airport planners need to consider the security benefits of restricting passenger capacity with the economic effects of doing so, as well as economic or safety reasons, such as runway separation or taxiway improvements, favoring Alternative D that were beyond the scope of this analysis.

CONGRESSWOMAN JANE HARMAN
36TH DISTRICT, CALIFORNIA

August 20, 2003

Mr. Jim Ritchie
Deputy Director of Long Range Planning
Los Angeles World Airports
1 World Way
Los Angeles, CA 90045

Dear Mr. Ritchie:

In the wake of the horrific events of September 11, 2001, Mayor Hahn called for an overhaul of the proposals for the master plan for Los Angeles International Airport. He claimed that Alternative D would focus primarily on safety, and would effectively address the security needs at LAX.

I remain concerned, however, that the Mayor's proposal ignores important security improvements outlined in a report published by RAND, issued in May. The RAND report found that features of Alternative D create "hard targets" ripe for attacks by terrorists. The report called instead for simpler, cheaper methods of securing the airport, and acknowledged that an important security improvement is to disperse air travelers and cargo into a genuine network of regional airports throughout Southern California.

Specifically, the RAND report found that:

- The greatest security risks are in high-density areas such as lines for ticketing, baggage claim and security check points. These risks are not likely to be reduced by Alternative D, which simply moves these targets of opportunity to the Ground Transportation Center and the "people mover". Significant reductions in risk could be achieved by increasing the number of screening personnel and machines, and by changing airport procedures to reduce the number of people waiting in line in unsecured areas.
- The effect of attacks on airport operations may be more severe under Alternative D. Reconfiguration would centralize several airport functions, such as transportation and terminal entrances that are currently distributed throughout several terminals. An attack at one centralized location may have a great effect

SPC00299

on all operations during cleanup, investigation and repair, while an attack on an existing terminal would affect only operations at that terminal.

- The proposed “people mover” could impede evacuation of terminals in the event of an attack, fire or a natural disaster.
- Alternative D will not bolster security against aircraft - still far more vulnerable than airports - and will not reduce the threat of attack by rocket-propelled grenades or mortars.
- Airport reconfiguration by itself is not likely to affect the number of casualties that result from small bombs, such as those concealed in luggage, or firearm attacks.
- Alternative D would not significantly increase security against attack by chemical, biological or nuclear weapons.
- Alternative D does not address vulnerability from large bombs that could be carried by delivery trucks serving over 200 restaurants and stores requiring daily deliveries.

Ultimately, the RAND report argues that developing a regional aviation plan is the most economical and expeditious way to strengthen security. A firm cap on annual passengers at LAX would shift air travel to other airports, thereby mitigating the effects of a terrorist attack on regional airport operations by dispersing the concentration of travelers and resources.

Those concerns are echoed by the recent findings of the A.C. Lazzaretto and Associates, the consultant hired by the County of Los Angeles. The Lazzaretto study is even more pointed, saying that Alternative D’s security proposals are short on detail and often contradictory. This study also raises disturbing issues about environmental justice, noise, and unmitigated traffic impacts.

As ranking member of the House Permanent Select Committee on Intelligence, I know far too well the myriad threats to our national security, both at home and abroad. We must do everything within our power to defend against those threats. I strongly urge additional consideration of and steps to implement the concerns raised by RAND and Lazzaretto and Associates, and pledge to help shape a cost-effective plan that will truly make LAX safe and secure.

Regards,

Subject: LAX Expansion

We believe that Mayor James Hahn's master plan for the Los Angeles International Airport is seriously flawed. We also believe that squandering nine billion dollars of tax payers' and air travelers' money on a thinly veiled jobs plan for the building trades is an abomination.

The LAX EIS/EIR is a document which, if followed, would:

- damage the already vulnerable U.S. airlines by increasing their operating costs
- harm the citizens of the South Bay by moving runways closer to the adjacent cities
- inconvenience the flying public and increase their susceptibility to terrorism.

While individual researchers and organizations have critiqued the Master Plan in terms of security (the Rand Corporation) or curtailing growth (a report prepared by A. C. Lazzaretto & Associates for the Los Angeles County), they have missed the most salient point: The economic foundation of the LAX Master Plan is predicated on three fallacious assumptions.

- (1) The basic shape of the airline traffic routes will remain relatively constant throughout the planning period (2004 - 2020).
- (2) The passenger mix (first class, business class, economy class) will remain relatively constant.
- (3) The technology of terrestrial transportation will remain relatively constant.

It is our contention that airline traffic routes, passenger mix, and the technology of terrestrial transportation will all change significantly.

AIRLINE TRAFFIC ROUTES

Back in 1996, Jack Driscoll, who was then the executive director of the Los Angeles Department of Airports and who functioned as the guiding light for the initial version of the draft EIS/EIR, was quoted by the *Los Angeles Times* as saying:

LAX has consistently seen an 8% to 9% increase in aviation activity in recent years, and forecasts show this demand will continue for the next twenty years.

While Mr. Driscoll has long been gone from the management of the LAX, the linear thinking embodied in his statement is very much alive and well and living in the LAX Master Planning Organization. To understand the ramifications of linear thinking, a little history on the development of airline traffic routes is required.

In the early chapters of the U.S. airline industry's history, planners in the Civil Aeronautics Board in Washington assigned the major domestic routes. Over two decades ago, the U.S. market was deregulated, and a vicious shakeout ensued. The airlines that remained after the implosion shifted most of their biggest iron birds out to the two coasts where the industry was still tightly controlled by a web of international regulations and agreements. These lumbering airliners would fly *from* hubs (such as New York) to hubs (such as London). So if a woman wanted to go from Philadelphia to Amsterdam, she would first fly to New York aboard a small plane operated by a regional carrier, then change planes, take a four-engine widebodied Boeing 747 to London, change planes again, and finally fly in a smaller aircraft to Amsterdam. It is important to understand that this multi-connective arrangement was loved by the airlines because it allowed them to fill up their big birds and make a lot of money. And it was an arrangement despised by the traveling public because only the intellectually challenged would *like* changing planes at a huge hub that is congested with wall-to-wall people.

Subsequently, the Atlantic was deregulated, and the airline executives suddenly developed an input channel and started listening to their customers. As a consequence, they initiated direct routes and began adding nimble airliners with just two engines to their Atlantic runs. Noted the English newsmagazine, *The Economist*:

This taste for smaller international jets reflects the fact that travelers now like to shun big international hubs such as New York or London and fly directly to their destinations. This is changing the international market into a web of direct intercontinental flights rather than one big aerial bridge between London and New York.

In the parlance of the airline industry, this change in airline traffic patterns represents a switch from hub-to-hub routes to point-to-point routes. This change in the basic shape of routes over the Atlantic is reflected in the types of aircraft making the point-to-point hauls. The most common jet found on the Atlantic run is no longer the Boeing 747; instead 8 out of ten birds flying between North America and Europe are two engine planes, such as the Boeing 767 or its younger and bigger sister, the Boeing 777—the first commercial airliner to be designed on a computer.

Between 1993 and 1995, Boeing and Airbus Industrie (a European airframe consortium) began working together on a large project with an awkward name: The Very Large Commercial Transport. However, as a result of mutual distrust, this joint venture started to unravel. After the breakup, Airbus commenced work on its own superjumbo jet, a monster machine that would fly hub-to-hub, particularly to the Orient. It was originally called the A3XX, and it is now called the A380.

The top management of Boeing then faced one of those you-bet-your-company kind of questions, the answer to which would affect not only its long-term viability, but also the fortunes of airline companies and airports throughout the world. And that question was: *Would air routes throughout the Pacific fragment in the same manner as they did over the Atlantic?* After much analyses and hand wringing, the executives at Boeing answered that question with a resounding YES!

Based on this answer, the company cancelled design work on two extended versions of the 747-400. Because they believed that the future of airline traffic over the Pacific would be point-to-point routes, the company then concentrated on producing and selling variations of the 777, a bird designed with point-to-point flights in mind. And they began the preliminary design of other engine and airframe configurations for traffic patterns over the Pacific because the Orient is where the action will be during the next two decades.

It should come as no great surprise to anyone that there is a direct correlation between increases in Gross Domestic Product and growth in air travel: As a nation becomes more prosperous, its people fly more often and farther for business and for pleasure. It has been estimated that during this first decade of the new century the annual growth in GDP will be about 5% in Southeast Asia and above 7% in China—significantly greater than the 2-3% rate expected during the same period for the mature economies of the world, such as the U.S. and the countries in Western Europe.

Kenneth Leung, managing director of Investment Banking Strategy in the Tokyo office of Deutsche Bank, said: “Asia will be one of the fastest growing areas of the world, if not the fastest growing over the next two decades, and commercial air travel and air cargo will be both a by-product and a staple of that process.” Goaded forward by super-strong growth, air traffic in the Middle Kingdom is expected to increase by almost fivefold in the next two decades. Because increases in air travel and air cargo produce surging demand for aircraft, it logically follows that China’s fleet of jet liners should grow the fastest of any country on the globe—increasing from 490 birds at the close of 1999 to 1,600 at the end of 2019.

Many of the new aircraft to be purchased by the nations on the Pacific Rim will be long-range airliners destined to fly on point-to-point routes, for Asia is ripe for nonstop travel. It has been estimated that in excess of 85% of the passengers that land at Tokyo’s Narita airport (one of Asia’s great hubs) are not ultimately bound for Japan, but are heading instead for Singapore, Hong Kong or other far away places in the Orient.

The main long-range aircraft that is used on point-to-point flights is the Boeing 777. The Triple-7 originally came in two versions. The 777-200 had its first delivery in May of 1995, and the initial models had a range that varied between 4,350 and 5,330 nautical miles. The second version, the 777-300, was first delivered in May of 1998, with a range of 6,550 nautical miles. These are the birds that paved the way for point-to-point routes.

From Day One, the Dash 200 and the Dash 300 had instant sales success, particularly in Asia, where there is usually a long distance between airfields. Japan Airlines, All Nippon Airlines, Thai Airways International, Cathay Pacific, China Southern, Japan Air System, Korean Air Lines, Singapore Airlines—all purchased the first two versions of the Triple 7.

In addition to developing extended range versions of the 777, Boeing's aeronautical engineers set about to design a totally new type of airliner—one that was specifically designed for the point-to-point traffic patterns. Called the Sonic Cruiser, this bird would have constituted a major break with Boeing's tradition: Whereas Boeing's 747—the ultimate hub-to-hub airliner—was big and slow, the Sonic Cruiser—the ultimate point-to-point bird—was being designed to be small and fast. Indeed, in an artist's rendering, it resembles a hot fighter rather than a transcontinental transport.

As its name would suggest, speed would have been the Sonic Cruiser's stock in trade, for it was being designed to fly just below the speed of sound—between Mach .95 and Mach .98—which means that it would have flown about 20 percent faster than today's fastest jetliners. (Mach number is the ratio of the air speed of an object to the speed of sound in the same region of the atmosphere; Mach 1 is around 740 miles per hour at sea level.) The Sonic Cruiser was specifically fashioned to cater to the carriage trade—those well-heeled tourists and business travelers who would be willing to pay a fair premium to avoid congested hubs and to get where they're going in a hurry. And it was this idea of charging a premium price for tickets that turned out to be the Sonic Cruiser's Achilles' heel. After al-Qaeda's attack on the Twin Towers on 9/11 and the baneful effects of the economic downturn, it became abundantly clear to Boeing's executives that the international traveler would be interested in lower—not higher—airfares in the foreseeable future. So with great reluctance, they shot down the Sonic Cruiser project.

It was not very long thereafter that Boeing's aero-engineers went back to the drawing board and started to design a new airliner—a bird with low operating costs that was specifically structured for the point-to-point flights over the blue waters of the Pacific Ocean. Initially known as the Boeing 7E7—and called the Dreamliner in the press—the aircraft is being designed to be a mid-range transport that will be driven forward by the robust engines that were to be used on the Sonic Cruiser. Boeing is banking on production economies—which include both sophisticated production techniques and competitive pressures on suppliers—to drive the per-unit price down. But the main selling point is a 20% fuel-burn improvement vis-à-vis birds such as the Airbus A310, the Boeing 757, and the Boeing 767. In the neighborhood of 9% of that improvement will come from the efficiency of the engines, and some will be as a result of the bird not having to carry so much fuel. Savings

from both the use of composite materials and airflow improvements should account for most of the rest.

Boeing has forecast that a market will eventually develop for 2,000 to 3,000 such airliners. Boeing's CEO Philip M. Condit has said: "We believe more passengers are going to want to fly on direct routes on midsize airplanes instead of to hubs on giant-sized airplanes." Boeing expects that the airlines will put the 7E7 in service by 2008.

The airlines of the world are slowly starting to embrace the point-to-point routes that advances in airframe and engine technology are making possible.

- In March of 2001, Continental Airlines launched a new nonstop air service between New York and Hong Kong. Prior to the advent of Boeing's 777, this flight would have required a connection at LAX. This flight is airborne for 16 hours.

- Also in March of 2001, British Airways began a nonstop service between San Diego and London-Gatwick. The inauguration of this daily flight made history since it was the first nonstop transcontinental service in the history of San Diego. The aircraft of choice: The Boeing 777. This service not only chops a connecting flight from the LAX hub, but it also tears into the regional service (the "spoke" in the hub-and-spoke system) that would have flown from San Diego to LAX.

- In October of 2003, Singapore Airlines announced that it would inaugurate the longest continuous commercial passenger service in the world in the early part of 2004. Using an Airbus A340-500, it will carry passengers nonstop from LAX to Singapore—a distance of 9,412 miles—in 18 hours and 20 minutes. A senior vice president at Singapore Airlines has observed: "When we start our service, it will be history making."

It must be understood that not everyone in either the airframe or the airline business believes that midsize airliners flying on point-to-point routes will be the wave of the future. Indeed, the executives at Airbus believe that the future belongs to great behemoths of the sky flying on hub-to-hub routes.

If Airbus's airframe builders stay on schedule, the Europeans will be able to show off the biggest passenger plane ever constructed at the Paris Air Show in 2005. With one wing as long as a nine-story building is high and with a horizontal stabilizer that is as large as the wing of a midrange airliner, the Airbus A380 is supposed to be ready to enter commercial service in 2006. This double-decker is designed to carry 555 passengers when its cavernous capacity is divided into three classes; however, the probability seems high to some analysts that the A380 will be mainly used to carry tourists from the developing countries of Asia who will be attracted by low ticket prices. As a consequence, the airlines using the A380 could configure it in what is irreverently called the "cattle class," to attain economies of scale. In this configuration, the brute-of-the-sky could seat as many as 800 passengers.

The executives at Airbus, who used \$3.5 billion in low-interest loans from European governments to help build the plane, believe that hub-to-hub airline traffic routes will continue to dominate both the passenger and the freight segments of the airline industry. Predicated on this roseate view of the future, they believe that during the next two decades the passenger and freight carriers of the world will require not less than 1,500 airplanes at least as large as the 747. So far, nine companies—all of which are foreign-based except FedEx—have ordered a total of 121 A380's which have a sticker price of \$250 million. (According to people in the industry, the super-jumbos are sold at deep discounts.)

Quite understandably, the executives at Boeing have an entirely different view of the big-bird market. They believe that no more than 320 giant-sized birds will be sold during the next twenty years due to market fragmentation, as the industry makes the transition from hub-to-hub networks to direct flights between smaller airports. And many savants in the industry agree with the Boeing position. Bruce A. Smith wrote in *Aviation Week & Space Technology*: "Many analysts agree Boeing is on the right track in predicting that point-to-point—rather than larger aircraft serving major hubs—is where the bulk of air traffic growth will be in the Asia-Pacific region." Dick Wyatt, head of fleet planning for British Airways, in a speech to aircraft finance bankers in Geneva, said that the Airbus A380, a 555-passenger jetliner, did not make economic sense for the British Airway fleet. According to Wyatt: "There are very few routes that suit large aircraft and we believe markets will continue to fragment." And Gordon Bethune, the CEO of Continental Airlines recently queried the members of the National Business

Travel Association: “What’s in it for me to sit on an airplane with 500 other people, wait for my bags with 500 other people, check in with 500 other people?”

The writers of this paper, one of whom spent a quarter of a century applying mathematical statistics to production operations problems at airframe manufacturers, believe that Boeing’s vision of the future of the market is the one that is on course.

When using passenger data for the year 2000—so the data are not skewed by al-Qaeda’s attack on 9-11, by the downturn in economic activity that has plagued so many of the developed nations, and by the SARS epidemic in Asia—it is obvious that growth rates are being lowered in the hubs of the major cities around the globe. In 2000, worldwide growth rate in passenger travel was 8%. If the hubs had received their fair share of this activity, then their increase would closely approximate the worldwide rate. Amsterdam and Frankfurt had a little less than 8%; LAX had about 5%; London (Heathrow) and Tokyo had a bit less than 4%; Atlanta had a tad less than 3%; San Francisco had about 2%; Dallas/Fort Worth had 1%; and Chicago had about minus 1%—“negative growth” as it is known in the popular press. (“Negative growth” is one of the great oxymorons—right up there with “organized anarchy” and “jumbo shrimp.”) The only major hub to beat the rate of worldwide growth was Paris - Charles de Gaulle; it had an almost 12% increase. While all roads lead to Rome, many of the air routes over the Atlantic lead to the City of Light. We believe that the inability of the hubs to match the worldwide growth rate in passenger traffic is a harbinger of a change in airline traffic patterns—from hub-to-hub to point-to-point.

THE PASSENGER MIX

It should come as a surprise to no one that the mix of passengers on airliners is, over the long run, determined by a nation’s level of economic activity. When the globalization of business is on a tear, business travelers take to the skies to go abroad and mind their markets; when per capita income is rising and the employment picture looks bright, the middle class embarks on international vacations. The world is presently on the fringe of a major change in economic activity—brought on by a technological transformation—which will significantly change the passenger mix throughout the globe.

The manufacturing sector in the United States has been the first to feel the force of what that great Austrian economist, Joseph A. Schumpeter, called “the gales of creative destruction.” In the years following 1979—when manufacturing employment peaked at 19.6 million—the sector has declined by 25%. Half of that decline took a full twenty years; the second 12.5% (2.5 million jobs) has evaporated since 2001, when President George W. Bush took office. Because California has such an immense economy, its factories bore the brunt of the gale. Since 2001, its factories have had to slough off 298,000 jobs—16% of the total manufacturing jobs. The smart money is betting that many of these jobs will never return. According to Donald Straszheim, the president of Straszheim Global Advisors, a research firm: “The job loss to China, in particular, is just in its infancy. In the manufacturing sector, there is going to be enormous further erosion of jobs to China.”

Some industries have been hit harder than others. For instance, in the automotive industry the United Auto Workers Union (UAW) had 1.5 million members in 1979; that number had plummeted to 638,722 at the end of 2002. Between 1999 and 2003, the UAW lost 50,000 jobs in the auto plants. After a four-year contract was hammered out in the fall of 2003 between the UAW and the Big Three and its two major parts suppliers (Delphi and Visteon) Gary Lapidus, an auto industry analyst at Goldman Sachs, estimated that the UAW’s headcount would drop by another 50,000 over the life of the contract. Obviously, not many UAW members will be in the market for international vacation packages in the near future. In 1998, GM, Ford, and Chrysler (which has been peddled to the big German auto company, Daimler-Benz, the maker of the Mercedes) had 58.5% of the auto market in California (the nation’s biggest), and the imports had 41.5%. By the fall of 2003, the imports had 53.1% of that market and the Big Three had 46.9%. Jeffery E. Garten, the dean of the Yale School of Management, has come to the conclusion that “Detroit’s Big Three are heading for a pileup” by 2010 that will result in either the bankruptcy of Ford and GM or a very costly government bailout. We agree that his gloomy prediction could become a reality.

Those few American politicians who have taken the time to think about the erosion of the nation’s manufacturing sector have reassured their constituents that production workers will gravitate to the service sector in much the same manner as agricultural workers once shifted to the

manufacturing sector. However, the times are changing in the service sector. Blips of light dancing down skeins of glass are bringing about this change. As a result of fiber optic cable, the cost of making a telephone call between continents will start to approach zero; consequently, any activity that can be converted to a digital format will probably end up being sent to either India or China. It is a phenomenon known as “The Death of Distance.” Near the end of the 1990’s Frances Cairncross wrote in *The Economist* as follows:

The death of distance as a determinate of the cost of communications will probably be the single most important economic force shaping society in the first half of the next century. It will alter, in ways that are only dimly imaginable, decisions about where people live and work; concepts of national borders; patterns of international trade. Their effects will be as pervasive as those of the discovery of electricity.

The speed with which America became enmeshed in a web of fiber optic cables boggles the mind. In one very short period (1998-to-2001) the amount of fiber placed in trenches throughout the U.S. increased fivefold. During the same period, a technique known as Ultradense Wavelength Division Multiplexing heightened the carrying capacity of each strand of glass 100-fold; consequently the supply of transmission capacity throughout America increased 500-fold.

As fathom after endless fathom of fiber optic cable was rolled off and laid down on the oceans’ floors and as blips of light (photons) replaced surges of electricity (electrons) in international telecommunications, high-paying jobs in America’s service sector began to migrate to developing nations on the Pacific rim. According to Forrester Research—the high-tech forecaster—27,121 positions in computer programming and mathematics left the U.S. in 2000; it estimates that 108,992 jobs will migrate from the U.S. to India and China by 2005—jobs valued at \$6,549,539,142—via fiber optic skeins. (We are intimately familiar with these trends. One of the writers spent three decades managing software-engineering organizations in the aerospace industry.) In addition, call-answering and data processing are heading to Bangalor, India, thanks to the efforts of firms such as Electronic Data Systems, which was originally started by a jug-eared little guy with a raucous East-Texas twang named Ross Parot, the lone star from the Lone Star State. Also many of the big eastern banks are now sending financial analyses and accounting work to the Middle Kingdom and the Subcontinent. In a move that is emblematic of the death of distance, radiologists in Beverly

Hills will find some of their work going to India, where physicians—many trained in American universities—will decipher x-rays for one-quarter of the U.S. fee. According to a recent study by researchers at the University of California-Berkeley, 14 million U.S. service sector jobs are in danger of being sent overseas.

As America's manufacturing and services flow to the East, American managers will fly in the same direction in droves—to check designs and to monitor quality. And American workers will stay at home in droves and try to stay employed. This switch from tourist class to business class will be a source of unalloyed joy for airline operators, for there is an old adage in the industry that goes: Economy class fills the seats, but business class fills the coffers.

This switch in passenger mix further supports the view that the trend is from big airliners with many seats flying hub-to-hub to smaller airliners with fewer seats flying point-to-point. Thus the Boeing 747, with about 420 seats, is being replaced by the 777, with about 300 seats and by the Airbus 340-500 with about 310 seats. (This substitution is obvious on the Atlantic run: Between 1990 and 2000, the departures of 747s dipped, while flights by the downsized widebodies, such as the Boeing 777 and the Airbus A340, almost tripled.) And, after 2008, many of the smaller widebodied aircraft will be replaced by the Boeing 7E7, with about 200 seats, most of which will be filled by the bottoms of business people, rather than tourists, who will be flying point-to-point to "paired cities." In the world of commerce time is money.

Symbolic of this transformation in passenger mix is the nonstop flight from LAX to Singapore that was previously discussed. Using a new Airbus A340-500—which normally carries 350 seats divided into first, business, and economy classes—Singapore Airlines is configuring this aircraft with only 181 seats divided into two classes: business and "executive" economy. In executive economy, the seats will be 2 inches wider and have 5 inches more legroom than seats normally found in the economy section. The seating arrangement will be two on each side and three down the middle. (In the economy section of the typical Boeing 777 jet, there are as many as five seats in the middle.) Because this service is structured for the business traveler heading to and from the Orient, Michael Tan, a senior vice president of Singapore Airlines, does not believe that people will have trouble flying nonstop for 18 hours straight. Says he: "People are already flying 20 to 24

hours with stopovers. The majority of the people we fly want to fly nonstop. I think the psychological issue will be easily overcome.”

The logical result of the changes in airline traffic patterns and passenger mix is that in the future LAX will experience many more air operations (i.e., takeoffs and landings) for any given number of passengers than it has in the past. And this fact is of pivotal importance in making a long-range plan for LAX because it is air operations—not people—that pound the cities of the South Bay with noise and pollution.

Mayor Hahn has promised to hold passenger traffic at LAX to 78 million a year through the year 2020 by restricting the number of passenger gates. Even *if* this approach succeeds—and it is our opinion that success is impossible—the runways will still be clogged with smaller jets filled with business travelers waiting impatiently to take off for the “long, thin routes” to the Orient. And this will mean that the \$9 billion used to reconfigure and refurbish the airport will have been frittered away.

THE TECHNOLOGY OF TERRESTRIAL TRANSPORTATION

Alternative D of the LAX Master Plan advocates a “regional approach” to the growth anticipated at LAX between 2004 and 2020; however, such a plan will not get off the ground unless the airport at Palmdale is connected to LAX with something other than that tortuous and congested trail known as Highway 14. The answer to this problem is a brilliant advance in the technology of terrestrial transportation called magnetic levitation or simply “MagLev.”

By the year 2020, the large metropolises of the world will have linked their city centers to their airports via maglev trains. It should be understood that maglev trains—which ride on air rather than rails and which are suspended by one magnetic force and pulled forward by another—represent an entirely new way of moving passengers from Point A to Point B. This wave of the future in terrestrial transportation—the maglev tsunami—is just beginning to gather force.

In October, Shanghai, China opened its maglev link between the city’s financial district and its new Pudong International Airport, located nineteen

miles away. But before this inauguration, it had already carried 83,000 passengers.

Munich, Germany, is in the advanced planning stage of a maglev line running from its city center to its airport, a distance of 22 miles. The line is expected to be operational in 2008.

Pittsburgh and Baltimore are the final contestants for a grant under the 1998 Transportation Equity Act for the 21st Century. If Pittsburgh wins the \$950 million prize, it will build a 47-mile maglev line linking its international airport and two other cities. If Baltimore wins the award, it will build a 40-mile line from the city to the Baltimore-Washington International Airport and then on to Washington, D.C. where it will tie up with Amtrak and the Metro. Both lines plan to be operational in 2012.

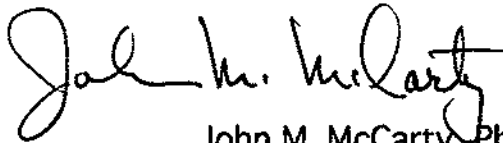

Atlanta, Georgia, is planning to link its airport with its northern suburbs by 2010.

Also under study is a maglev line that would link Anaheim to Las Vegas that would have several station-stops along the way. The first phase—from the Las Vegas airport to Primm, Nevada, a distance of 35 miles—would be operational by 2010.

Finally, a maglev line is under study that would link LAX with the Palmdale airport. According to initial estimates, the line would be about 71 miles long and have 5-to-7 stations. It would have an estimated annual ridership of about 30 million, and it could be operational by 2010.

What will make maglev systems so ubiquitous by 2020? One word says it all: speed. For instance, the train built by Shanghai zips along at 268 miles per hour—a full 81 miles per hour faster than Japan's famous bullet train. On trips of less than 621 miles, a maglev train can match air travel time. A maglev line between LAX and Palmdale would cut the travel time to about 30 minutes—or about half the time it takes to go by taxi from the heart of Washington, D.C. to the Dulles Airport.

The answer to the LAX expansion is not Alternative D. The answer is Alternative ML: a maglev line to Palmdale—the terrestrial transportation system for this century.

Mr. Jim Ritchie
City of Los Angeles
Los Angeles World Airports
Master Plan Office
P.O. Box 92216
Los Angeles, CA 90009-2216

Dear Messrs. Kessler and Ritchie:

On behalf of the Hollywood Chamber of Commerce, I'd like to express our support for the LAX Master Plan Enhanced Safety and Security Alternative, known as "Alternative D."

We find merit in the Plan's envisioned New Center Taxiway, Central Terminal Area (CTA), Consolidated Rental Car Facility (RAC), Ground Transportation Center (GTC), nearly 40 miles of infrastructure and road improvements, and the People Mover. Our support is contingent upon the People Mover system being completed and operational before vehicle traffic is prohibited within the central airport area and that luggage can be checked in via skycap or underground tunnel.

We stress that access to the airport via public transportation should be a focused priority in the years to come, as our region grapples with increased population and traffic. Though "Alternative D" provides a link to the Green Line at the Intermodal Transportation Center, we feel this link is less than optimal because a transfer to the People Mover is still required. Shortsightedness during the rail line's construction, which stopped short of the airport, and incompatible technologies with airport navigation systems have debilitated what could have been a more widely-utilized and efficient system. We urge the future planning for LAX to concentrate on providing convenient public transportation access to the airport.

LAX Master Plan
Page 2

The Flyaway Bus System is an effective and reliable method of arriving at the airport from the Valley. We understand that an expansion of the Flyaway system to other communities is being considered, but we are dismayed that Hollywood is not included, since we are the tourist hub for the City of Los Angeles. We would be happy to work with you to find a suitable location for a Flyaway program in Hollywood, which receives 10 million visitors a year. For the past couple of years we have been working to create a "parkade," or transit center for tour buses, which, located behind the El Capitan and across the street from the subway station at Hollywood & Highland, would serve as an intermodal transportation nucleus.

Lastly, we feel that by designating the Master Plan Alternative as the Enhanced Safety and Security Alternative, one gets the impression that it will be much less convenient for business travelers and tourists to utilize LAX, due to excessive screenings and delays. We suggest that, as planning moves forward, an effort be made to portray Alternative D as a tourist-friendly enhancement to the existing airport.

Sincerely,

Leron Gubler
President & CEO

Mr. Jim Ritchie
City of Los Angeles
Los Angeles World Airports
LAX Master Plan Office
P.O. Box 92216
Los Angeles, CA 90009-2216

Dear Mssgrs Kessler and Ritchie:

I am writing you in regards to the Draft LAX Master Plan Environmental Impact Statement/Environmental Impact Report (DEIR/DEIS).

As I have stated in previous comments, I am opposed to all of the master plan alternatives presented thus far. I agree and accept that some effort must be made to assure that LAX is a safe and secure airport. Alternative D is a step in the right direction, but it too has its fatal flaws of excessive expense, passenger inconvenience, uncertain traffic mitigation and additional pollution. I have enclosed one of my previous letters.

I agree with the questions and conclusions presented by the Neighborhood Council of Westchester/Playa del Rey (NCWPDR) and the County of Los Angeles. I do not agree with the county's report suggesting that runway 24R be moved further north closer to the residents of Westchester/Playa del Rey. I have enclosed a copy of the NCWPDR LAX Master Plan Position Paper and Questions on the LAX Master Plan in case you did not receive it.

I have included some of my questions below:

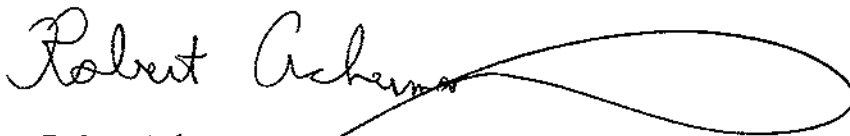

1. How will the questions to the Draft EIS/EIR be responded to? Will writers receive an individual response? Will all responses be published in the Final EIS/EIR?
2. On what date do you anticipate to complete answering all of the inquires?
3. To what depth of analysis and commentary will you provide on the Westchester community designed "Alternative E" and the revised, "Alternative E-1"?

Letter to Mssgrs Kessler and Ritchie
November 6, 2003
Page 2

4. Should the EIS/EIR be approved, to what extent will there be public input and participation in further defining the project? Will participation be encouraged from areas outside of the surrounding LAX community including outside L.A. City and County limits? Will an advisory committee be established? How will the members of the committee be selected? Will this committee include critics as well as supporters of the selected Alternative?
5. Will the airlines have any role in shaping the building process should the EIS/EIR be approved?
6. Will revenue from Airbus A380 pay back the investment being proposed in airfield and terminal improvements to handle this aircraft? Over what time period will the A380 improvements be paid for out of landing and other fees?
7. If the A380 requires 12,000 foot runways, then how will LAX handle a fully loaded long-range A380 on a proposed reconfigured runway 24L that will be less than 12,000 feet?
8. Can Ontario and Palmdale airports handle the A380? Runways? Taxiways? Ramp area? Gate areas? Parking? Catering? Cleaning? Customs and Immigration (FIS facilities)?
9. How are runway lengths measured? What is the FAA standard for runway length measurements? Are areas for landing lights at the ends of runways calculated into runway length?
10. The County of Los Angeles report made reference that a "Supplement" is not the correct format for CEQA purposes. Is the county's assertion correct? If so, would this require a new EIS/EIR to be drawn up using more current data?
11. If the EIS/EIR is deemed inadequate or rejected, will a new EIS/EIR be drafted? Will other concepts be considered? Will new data be gathered? Will the airlines and the public have the ability to submit ideas before a master plan concept has been crystallized and studied? Who will make these decisions?
12. To what extent does the FAA control, influence or direct planning efforts at LAX and other airports? Can the FAA legally force LAWA to implement certain changes?
13. When will the ground radar be installed at LAX that was recommended as a result of the 1991 ground collision between a USAir 737 jet and a SkyWest commuter plane?

I look forward to reading your replies to the comments and questions.

Sincerely,

A handwritten signature in cursive script that reads "Robert Acherman". The signature is written in black ink and features a large, sweeping loop at the end.

Mr. Jim Ritchie
Deputy Executive Director
Los Angeles Department of Airports
LAX Master Plan Room 218
PO Box 92216
Los Angeles, CA 90009-2216

Dear Mr. Ritchie:

I am writing again to express my disapproval with all of the LAX Master Plan concepts presented, including the No Project Alternative, which is misnamed as several projects are incorporated into what is supposed to be a no change baseline study.

The LAX Master Plan will not be able to meet the traffic mitigation contemplated in the Environmental Impact Report and Environment Impact Statement and the Proposed Airport Layout Plans as several traffic mitigation projects have changed. The Arbor Vitae Interchange project has been put on hold. Plans to use Sepulveda Boulevard have been dashed by the Los Angeles City Council this Wednesday when the proposal to expand Sepulveda Boulevard between Centinela and Lincoln was removed from the Coastal Transportation Corridor Specific Plan. Another traffic mitigation project in limbo is Playa Vista's improvement of the Culver Boulevard interchange at Lincoln Boulevard. The California Coastal Commission is set to make a decision on Playa Vista's plan.

The world has changed since September 11th, including the world of air transport. So too must the thinking in airport planning. Traffic at LAX is down by about 30%. It's time to go regional-expand Ontario and build-up Palmdale into the truly modern airport that was promised more than 30 years ago. This is the time to make the infrastructure improvements at these two airports for the next 20 years while there is a lull in travel.

I am also opposed to Mayor James Hahn's fifth Alternative Plan which has not been properly prepared and noticed. While I support improving security at LAX, the world's third busiest airport, I will not support any plan that will move runways closer to the residents and businesses surrounding the airport. The surrounding airport communities always pay a heavy toll when LAX expands. Westchester and Playa del Rey have lost and will lose more homes and businesses under all of the expansion plans. Communities such as Inglewood, Lennox and El Segundo will be move heavily impacted by aircraft noise and pollution under all of the expansion plans. All communities in and around the airport will also suffer with increased traffic congestion and safety hazards.

Please join with thousands of residents, businesses and hundreds of local governments in opposing the LAX Master Plan and in supporting the regional solution to meeting our air traffic needs.

Sincerely,

SPC00302

**THE NEIGHBORHOOD COUNCIL OF WESTCHESTER-PLAYA DEL REY
SPECIAL BOARD MEETING AGENDA**

Tuesday, October 21, 2003 – 6:30 p.m.
Loyola Marymount University
University Hall, First Floor, Room 1762
One LMU Drive, Westchester, CA 90045

The public is requested to fill out a "Speaker Card" to address the Board on any item of the agenda prior to the Board taking action on an item. Comments from the public on Agenda items will be heard only when the respective item is being considered. Comments from the public on other matters not appearing on the Agenda that is within the Board's subject matter jurisdiction will be heard during the Public Comment period. Public comment is limited to 2 minutes per speaker, unless waived by the presiding officer of the Board. As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability and upon request, will provide reasonable accommodation to ensure equal access to its programs, services and activities. Sign language interpreters, assistive listening devices, or other auxiliary aids and/or services may be provided upon request. To ensure availability of services, please make your request at least 3 business days (72 hours) prior to the meeting you wish to attend by contacting the Neighborhood Council Project Coordinator (323) 224-2314.

2. Pledge of Allegiance

ACTION ITEM

3. Summary of LAX Master Plan Alternative D
4. Committee Report – Airport Relations
5. Public Comments – agenda items or non-agenda items within the Board's subject matter jurisdiction. Public comments are limited to 2 minutes per speaker.
6. Discussion

MEETING PACKAGE CONTENTS

1. Agenda (this page)
2. LAX Master Plan Position Paper
3. Community Questions on the LAX Master Plan EIS/EIR
4. Proposed amendments to reports
5. Letter from Los Angeles Airlines Airport Affairs Committee (written comments)

LAX Master Plan Position Paper

Airport Relations Committee recommends adoption of this report by the
Neighborhood Council of Westchester/Playa del Rey Board of Directors

Approved by the Airport Relations Committee on Saturday, October 18, 2003

Ayes:	7
Noes:	1
Abstain:	2

Approved by the NCWPDR Board of Directors, Tuesday, October 21, 2003

Ayes:	<u>13</u>
Noes:	<u>3</u>
Abstain:	<u>3</u>

Notes:

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 **INTRODUCTION**

2

3 The Neighborhood Council of Westchester/Playa del Rey (NCWPDR) is the
4 recognized Neighborhood Council for Westchester/Playa del Rey. The Los
5 Angeles International Airport (LAX) is included in the Council's boundaries. Los
6 Angeles World Airports (LAWA), the City of Los Angeles agency that operates
7 LAX has released a Supplement to the Draft Environmental Impact
8 Statement/Environmental Report (EIS/EIR) for the LAX Master Plan (hereafter
9 referred to as "Alternative D" [July 2003]). Many of the stakeholders that
10 comprise our community (residents, businesses and real property owners)
11 expect NCWPDR to take a position on the LAX Master Plan and to ask
12 questions about the EIS/EIR document. This position paper and accompanying
13 questions respond to those expectations.

14

15 NCWPDR represents a community of over 55,000 residents and a variety of
16 businesses, institutions and government facilities. LAX has been a stakeholder
17 in NCWPDR since its inception in 2002. It has been and continues to be the
18 intention of NCWPDR to maintain a positive working relationship with LAX.

19

20 The NCWPDR Board of Directors understands the need for a safe and secure
21 airport. The NCWPDR Board also understands the needs of the residents and
22 local businesses to not be negatively impacted by airport operations. NCWPDR
23 stakeholders are also shareholders in City assets such as LAX. There is a

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 reasonable expectation on the part of citizens that government will take good
2 care of publicly owned facilities. Airports are unique government owned
3 facilities as they provide both transportation options and economic
4 development. Airports are also unique in the types of problems that they
5 present for neighbors- noise, traffic, pollution and a potential terrorist target.

6

7 There is a long history between LAX and Westchester/Playa del Rey residents
8 where some very important promises on development issues have been made
9 and not been kept -- issues such as ground radar and a new passenger
10 airport in Palmdale.

11

12

13 **POSITION PAPER**

14

15 NCWPDR has examined the Supplement to the LAX Master Plan Draft EIS/EIR.
16 The question used to come to a decision was, "Is the LAX Master Plan
17 beneficial to the community?" The answer is "no." NCWPDR requests that the
18 Board of Airport Commissioners (BOAC), Federal Aviation Administration (FAA),
19 the Los Angeles City Council and Mayor Hahn reject all LAX Master Plan
20 alternatives produced thus far and start over with active input from the
21 surrounding communities and the airlines to design a new LAX Master Plan
22 which all parties can support.

23

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 **REGIONAL SOLUTION**

2

3 There are other viable alternatives to expanding or modernizing LAX such as a
4 truly regional plan. It is well known and understood that LAX alone cannot meet
5 the future passenger and cargo capacity needs of Southern California. There
6 are several commercial airports in the area that can provide the necessary
7 capacity to meet the projected doubling of worldwide commercial air traffic in
8 2020. Some airports, notably Burbank and Long Beach, are constrained by
9 noise regulations and field size from handling additional significant growth.

10

11 LAWA is in the driver's seat in meeting future airport capacity needs with its
12 ownership and operation of Ontario International Airport and Palmdale
13 Regional Airport. While new master plans are under development for both of
14 these airports, there needs to be the leadership within City Hall to make certain
15 that construction plans are made and literally poured into concrete.

16

17 Ultimately, outlying airports such as Ontario and Palmdale will need to be built
18 into modern air terminals with high speed rail and freeway connections
19 integrated into their facilities. The longer we wait, the more expensive and
20 more difficult it will become to complete these projects. As opposed to
21 spending \$9.6 billion at LAX, LAWA can build new over 100 million annual
22 passengers (MAP) capacity at both Ontario and Palmdale for about half of what
23 is proposed for Alternative D. Furthermore, for homeland security purposes,

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 improved airports at Ontario and Palmdale can provide relief capacity in case of
2 a terrorist attack at LAX. Therefore, Southern California will not be completely
3 cut-off by air from the rest of the nation and the world. Building for the future
4 means that Ontario and Palmdale must be built now.

5

6 The LAX Master Plan EIS/EIR must include definitive programs, proposals and
7 plans for LAWA and the City of Los Angeles to put into effect to achieve a
8 regional solution. The City must make a formal commitment to undertake
9 these actions.

10

11

12 **PRIOR PROPOSALS**

13

14 At the outset, it should be absolutely clear that NCWPDR rejects the previous
15 Master Plan Alternatives A, B and C. All three of these plans are designed for
16 the express purpose of increasing the capacity of LAX to handle more
17 passengers and do not even attempt to improve the existing facilities for safety.
18 These plans were too invasive to the surrounding community with the
19 introduction of such elements as a ring road, western terminal and runway
20 reconfigurations that would have placed runways closer to the community and
21 dislocated hundreds of residents and local businesses. The literal purpose of
22 placing a new terminal at the west end of LAX was to create a new second path
23 to the airport directly through our communities. The location of a west end

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 terminal also necessitated the ill-advised "ring road" which in addition to
2 destroying a massive portion of the Westchester Business district, would also
3 disrupt existing traffic flow on North/South surface routes without any mitigation
4 proposed, or for that matter even possible.

5

6

7 **ALTERNATIVE D - Mayor James K. Hahn's "Safety and Security Plan"**

8

9 While Alternative D does in fact remove the most abhorrent parts of Alternatives
10 A, B and C, and is preferable to those alternatives, unfortunately it creates a
11 new and different set of problems that ultimately cause the committee to reject
12 it as well. Primary among our concerns is that Alternative D is not a safety and
13 security plan. Second, the proposed cost far outweighs any perceived benefits.
14 Third, Alternative D does not adequately mitigate traffic impacts.

15

16

SUMMARY ON CONCLUSIONS

17

1. The Neighborhood Council of Westchester/Playa del Rey does not
18 support Alternative D.

19

20

2. The objective of enhanced security is not met.

21

22

3. The stated cost of Alternative D is excessive relative to all benefits that
23 are described in the plan.

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1

2 4. Unlike the history of LAWA, this Alternative D does not treat the airlines
3 as partners.

4

5 5. Alternative D requires the dislocation of over 7,000 residents, of which
6 3,500 have already been relocated, at a time all affordable housing is in
7 the shortest supply ever experienced in our region.

8

9 6. Alternative D requires removal and relocation of elementary schools
10 when there is a need for school facilities.

11

12 7. Alternative D does not utilize LAX's physical facilities, Terminals 1, 2 and
13 3, that already represent a substantial investment, both public and
14 private.

15

16 8. The physical construction of Alternative D will create a long-lasting and
17 disruptive impact on the residents and businesses within the sub-
18 region. The negative impact of this disruption has not been netted out
19 from the projected economic benefits.

20

21 9. While the plan calls for a 78.9 MAP there is no feasible method of
22 controlling the number of passengers. Alternative D does not
23 adequately address the traffic impacts, mitigation, and transportation

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 operation required for 78.9 MAP on the incremental passengers which
2 could be 10 to 20 million more. The 405, 105, and 110 freeways and
3 major thoroughfares and intersections are at a point where physical
4 traffic mitigation of the impacts generated by 78, 88, or 98 MAP is not
5 feasible. Overriding considerations are not an acceptable strategy for
6 any plan.

7
8 10. The environmental impacts of Alternative D, particularly air pollution and
9 noise, will be substantial during the physical construction as well as the
10 operation of Alternative D.

11
12 For any sizeable project in our sub region, at least 2 to 3 years has been
13 required to achieve a reasonably acceptable plan. The EIS/EIR as presented
14 does not adequately satisfy the objectives outlined above. Therefore, we
15 recommend additional study to prepare a revised plan which meets the stated
16 objectives for LAX's modernization.

17
18 *Alternative D does not adequately address safety and security needs.*

19
20 The chief safety issue that the LAX Master Plan seeks to address is runway
21 incursions. LAWA has proposed center line taxiways between the runways to
22 accomplish this goal. According to FAA records, LAX has not had a runway
23 incursion with an aircraft in the past five years. We also congratulate LAWA on

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 not having any incursions in the past 12 months. In 1996, LAX opened a new
2 control tower that gives controllers an unobstructed view of the whole airfield.
3 The new tower was constructed in response to a 1991 ground collision
4 involving a Skywest turboprop that taxied onto a runway where a USAir 737 jet
5 was coming in for a landing. LAX also eliminated mid-field take-offs for
6 turboprops as a result of the accident. To our knowledge, another
7 recommendation never implemented in the aftermath of the crash was the
8 installation of ground radar. It is essential that the ground radar be installed as
9 soon as possible. As has been proven with signage along the runways and
10 departure procedures for preventing early turns over El Segundo and Playa del
11 Rey, so too can electronic traffic signals along runway exits and arrival
12 procedures be implemented to prevent aircraft incursions.

13

14 Another stated goal of the center line taxiway is to accommodate New Large
15 Airplanes (NLA's). The 555 seat A380 super jumbo jet, presently being built by
16 the European consortium Airbus in Toulouse, France, is an NLA. We are
17 aware from reading magazines such as *Aviation Week and Space Technology*
18 that Airbus officials have met with LAWA officials concerning runway, taxiway
19 and ground handling requirements for the A380 which is scheduled to enter
20 service with such foreign flag carriers as Air France, Lufthansa, Qantas and
21 Singapore in January 2007. LAWA apparently has incorporated some of those
22 requirements into the reconfiguration of the north runway complex, 24L and
23 24R.

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1

2 We also understand that several Asian airlines that ordered over 60 A380
3 aircraft told LAX officials that unless the LAX airfield and gates are ready for the
4 A380 in 2007, they will land elsewhere.

5

6 We see from the Airport Layout Plan that LAWA intends to use the FAA's
7 proposed Group VI airfield arrangement. We want to point out that the Group VI
8 airfield specifications have not been adopted by the FAA and that LAWA has
9 "modified" (i.e. diminished) some proposed Group VI airfield specifications
10 towards the east end of the newly relocated 24L, 340 feet south of its current
11 location. We are not satisfied that this new runway arrangement will meet the
12 need of the A380's and other future NLA's by compromising the runway and
13 taxiway arrangements at the outset.

14

15 There is also the issue of runway length. The longest runway at LAX is the
16 south inboard runway 25R with 12,000 in length. Although there may be
17 assurances that the A380 can take off on runways less than that length, the
18 aircraft has not been produced and tested to verify projected operational
19 capacities. LAWA should not be reckless with the public's money and begin
20 construction by pouring concrete only to find out not too much later that
21 additional changes are needed. As shown in the experience of building Denver
22 International Airport (*Denver International Airport: Lessons Learned*), making

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 changes after construction begins will greatly increase costs; this is partially
2 how a proposed \$1.5 billion project became a \$4.5 billion project.

3

4 While the stated intention of Alternative D is to cap LAX at 78.9 MAP, we do not
5 see how adding center taxiways, and therefore increasing the throughput on
6 the runways, will meet that goal. Airlines will increase flights to meet
7 passenger demand which is expected to rise to 165 MAP regionally during the
8 next 20 years. Even with 11 contact gates removed and the proposed 747-
9 compliant replacement gates along the length of the Terminal 1, 2 and 3
10 ticketing areas, we still see that the increased runway and taxiway efficiency
11 could more than compensate for the reduced number of gates.

12

13 Alternative D does not make LAX more secure. By increasing the airport
14 perimeter to Manchester Square and Continental City with the proposed
15 Ground Transportation Center (GTC) and Intermodal Transportation Center
16 (ITC) at these respective locations, LAWA is actually making LAX a larger,
17 1-1/8+ miles of additional target opportunities for terrorists. The EIS/EIS
18 document reads as though protecting buildings are more important than
19 protecting the people inside them. LAWA has already proven that it can make
20 LAX secure. We applaud LAWA for having LAX be the only top 20 airport
21 (Category X) in the United States that met the December 31, 2002 deadline for
22 baggage screening.

23

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 Alternative D relies on security technology that does not exist or is unproven.
2 Again, as in the case with Denver International Airport, LAWA should use only
3 proven off of the shelf technology. The automated baggage system was
4 replaced at DIA with a traditional belt system because the automated system
5 had never been used elsewhere. This baggage system replacement was
6 done at great expense was the cause of several delays in the grand opening of
7 Denver International.

8

9 *Alternative D does not adequately address traffic issues.*

10

11 Traffic issues will not be significantly mitigated in Westchester/Playa del Rey
12 with Alternative D. As written in the EIS/EIR, LAWA relies on other government
13 agencies to make street and highway improvements, if they are even feasible.
14 Due to the current state budget crisis, those improvements are unlikely as the
15 Legislature had depleted the state highway building fund in order to balance
16 the 2002-2003 budget. Although the Ground Transportation Center (GTC)
17 relies on freeway connections, there is not enough freeway capacity to handle
18 the load. As such, travelers will find other alternatives to access the airport
19 such as the consolidated rental car facility (RAC). The RAC's proposed
20 location on 98th Street between Sepulveda and Airport is already a problem
21 because it does not stop the existing problem of motorists cutting through
22 Westchester/Playa del Rey neighborhoods such as Osage Park, Westport
23 Heights, Kentwood and Loyola Village to access the airport. Construction of

LAX Master Plan Position Paper

1 Alternative D will also bring many traffic detours as a parade of trucks moves
2 dirt and brings in concrete and other building supplies.

3

4

5 *The proposed cost far outweighs any perceived benefits.*

6

7 LAWA officials have continually touted the positive economic benefits that LAX
8 provides to the Southern California economy. However, by making the journey
9 from the curb to the gate more cumbersome, LAWA will succeed in driving
10 away passenger traffic- the exact opposite of preserving LAX's touted role as
11 one of the region's economic engines. Planning must be done for queing of
12 automobiles and people.

13

14 With costs for just the EIS/EIR work already having spiraled out of control, we
15 are extremely worried that the projected \$9.6 billion to implement Alternative D
16 will balloon to an even higher amount and cause extreme financial difficulties
17 for LAX and its tenant airlines. It is generally considered that contingency costs
18 (i.e. construction overruns) are 3% of Alternative D when most projects have a
19 10% contingency. As stated previously, more capacity can be built for less
20 money at Ontario and Palmdale.

21

22

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 **CONCLUSION**

2

3 The Neighborhood Council of Westchester/Playa del Rey rejects LAX Master
4 Plan Alternatives A, B, C and D due to their excessive costs and negative
5 impacts on the community. We further note that Alternatives A, B and C overtly
6 increase capacity. The NCWPDR Board of Directors supports a truly regional
7 solution for meeting Southern California's airport capacity needs by building
8 out airports in Ontario and Palmdale. While the NCWPDR Board has rejected
9 the LAX Master Plan alternatives presented thus far, the Board does support a
10 safe and secure LAX and would be willing to work with LAWA, the airlines and
11 other communities in developing a LAX Master Plan which is directly tied to a
12 truly regional solution with implementation budgets and schedules.

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

QUESTIONS ON THE LAX MASTER PLAN EIS/EIR

- 1
2
3 1. What programs or activities are the FAA and LAWA participating in or working
4 towards creating a regional airport plan other than Ontario International
5 Airport (ONT) as recommended by SCAG?
- 6 2. Is there any cost analysis showing the impact of increased costs at LAX if
7 Alternative D were to be constructed? What is the breakdown of costs to the
8 passengers, airlines, bondholders, concessionaires? For what period of time
9 will those increased costs be in effect? Will Passenger Facility Charges
10 (PFC's) increase? How much for each carrier?
- 11 3. Where is the cost analysis showing the impact on neighboring communities in
12 terms of businesses during construction? Health issues such as loss of
13 hearing, increased respiratory diseases, cancers, and stress? Loss to
14 employers and employees for sick time due to these health issues?
- 15 4. How will LAWA retain low cost airlines (e.g. Southwest, Frontier, etc.) at LAX
16 who will be displaced from their existing passenger terminal facilities by
17 Alternative D?
- 18 5. What other costs that are not a part of the projected \$9.6 billion will need to
19 be borne by the City of Los Angeles, County of Los Angeles, State of
20 California and the United States of America for impacts related to LAX? What
21 costs will incurred by these levels of government for health issues created by
22 LAX?

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 6. If 78.9 million annual passengers (MAP) is the proposed maximum number of
2 passengers to be handled at LAX in a calendar year, then what do you
3 anticipate will be the number of passengers per gate when you reach that
4 level?
- 5 7. Does the budget for the LAX Master Plan include potential litigation costs?
6 What is the budget amount? Are litigation expenses included in costs
7 analyses? Are settlement costs budgeted and for what amount?
- 8 8. Is the financing to acquire the properties in Manchester Square and Belford
9 Square considered to be a part of the financing for the LAX Master Plan?
- 10 9. What amount of property is to be acquired via eminent domain?
- 11 10. How many Airbus A380 aircraft are expected to fly into LAX? How many
12 flights per day? To what extent must passenger terminals be redesigned to
13 accommodate these aircraft? How many gates will be established for these
14 aircraft and at which terminal buildings?
- 15 11. Why are some numbers explained as percentages in the draft EIS/EIR
16 document? Can you explain the numbers instead of a percentage?
- 17 12. In the LAX Master Plan press kit, a section covering noise mitigation notes
18 some of LAWA's initiatives- residential acquisition, soundproofing and
19 enforcement of over-ocean operations during the night. How effective has
20 sending letters to the Chief Pilots of airlines been in affecting compliance with
21 LAX noise regulations? What other enforcement measures has LAWA used
22 and is legally available to LAWA to use to mitigate noise?

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 13. Why are there no studies being conducted to study the health effects of LAX
2 on surrounding residents?
- 3 14. Is LAWA recording and tracking low frequency noise generated at LAX?
4 What mitigation measures are being employed to reduce low frequency
5 noise? Low frequency noise must be studied, mitigated and abated.
- 6 15. At what location do you anticipate placing the run-up enclosure? Will the
7 enclosure prevent high and low frequency noise from going out into the
8 surrounding community? What will the hours of operation be for the run-up
9 enclosure? How will aircraft be moved to and from the enclosure- aircraft
10 under power, electric tugs, etc.?
- 11 16. How will biological incursions by non-native plants, animals and insects be
12 handled?
- 13 17. What is the amount of time each runway will be out of service when a runway
14 is moved and/or extended?
- 15 18. What is the construction route? Will existing streets be blocked and/or
16 detours put into place? For how long will these happen? What will the
17 operating hours of the construction route?
- 18 19. Why didn't you use World Health Organization (WHO) documentation to
19 support your Federal Interrogatory Committee on Aircraft Noise (FICAN)
20 information? Also, why was FICAN not used for Sound Exposure Level
21 (SEL)?
- 22 20. What mitigation measure did you include for SEL? If there were none, then
23 why were they not included? What abatement measures have been done

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 elsewhere for any kind of single event noise, not limited to airports? How
2 successful were those abatement measures?
- 3 21. Where else in the world, and in the United States in particular, has habitat
4 relocation been attempted? Has this effort been successfully implemented?
5 If it is not successful, then what penalty will LAWA suffer for non-compliance
6 with the EIS/EIR?
- 7 22. In cases of Single Event Noise/Sound Noise Level, what would be the AdBA
8 for serious annoyance and speech intelligibility and moderate annoyance?
- 9 23. How does LAWA propose to evaluate and mitigate noise impact on the
10 learning process of students in schools?
- 11 24. Why is there no specific noise study in the community on schools impacted
12 by LAX?
- 13 25. Why is there not a report of the origin and destination of passengers at LAX?
- 14 26. Why does the EIS show an improvement in air quality in the area north and
15 east of Manchester Square under Alternative D vs. No Action No Plan even
16 though Alternative D relocates an enormous amount of vehicular traffic to the
17 immediate area?
- 18 27. How were the projected 2015 levels of air pollution arrived at for the area
19 north and east of Manchester Square for the No Action No Plan Alternative in
20 the EIS? Were mitigation measures implemented by LAWA between the
21 1996 baseline and the present accounted for in the projections?
- 22 28. It would seem that the reconfiguration of the north runway complex
23 proposed under Alternative D leaves room for a fifth runway on the

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 north side of LAX. What measures are included in Alternative D that
2 would prevent the construction of such a runway at a later date?
- 3 29. What fleet mix was anticipated in Alternative D for 2015? Airlines
4 continue to purchase turbo prop aircraft. Were these aircraft included in
5 the noise projections?
- 6 30. Why was there an assumption that the current Part 161 study would
7 develop mitigation actions. Nothing can be assumed until the study is
8 complete.
- 9 31. Where is a firm commitment by LAWA and the city of Los Angeles to
10 the CNEL and over-ocean procedures included in the EIS/EIR?
- 11 32. Where are the studies of increased traffic on 6L and 6R during easterly
12 operations.
- 13 33. Where is the study on single-event noise generated by easterly take-
14 offs?
- 15 34. Over 20,000 would be newly exposed to 94dBA SEL noise under the
16 EIS/EIR. What time of day would these impacts occur? What
17 mitigation measures were included for SEL impacts?
- 18 35. To reach the proposed Ground Transportation Center (GTC) at
19 Manchester Square, people will continue to exit the 405 Freeway at the
20 Howard Hughes Center and then cut through Westport Heights and
21 Osage seeking airport access. Why were the following intersections
22 and/or roadway links not studied: Airport Blvd and 74th, 76th, and 78th;

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 La Tijera and 74th, 78th-79th, and 83rd; Hindry and Aviation; Osage
2 and Manchester?
- 3 36. The GTC could not have all the protection for hazardous materials,
4 decontamination, bomb detection and disposal that the airfield would
5 have. How would all the necessary emergency vehicles, materials, and
6 staff gain access to the GTC? To come from the airfield, they would
7 have to travel on city streets which would be clogged in the event of an
8 attack or accident.
- 9 37. How could the GTC be evacuated in the case of an emergency or
10 attack? What roads could/would be used? Where would pedestrians
11 and vehicles be directed? How could security get people and vehicles
12 out of the danger zone and still maintain security? And be sure that the
13 parties responsible were not escaping?
- 14 38. What amount of traffic is being assumed for the LAX Northside area? It
15 seems that the NA/NP figures are higher than the Alternative D figures.
16 Were the impacts (in terms of traffic and air pollution) for the full
17 entitlement under the 1983 EIR charged to the NA/NP, but not to
18 Alternative D?
- 19 39. What is the cost difference for Alternative D if non-union labor is used
20 instead of union labor? Will a Project Labor Agreement (PLA) be used
21 for Alternative D? What is the cost difference between the PLA, union
22 and non-union labor?

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 40. In 2002, American Airlines published a volume regarding human health
2 risk assessment for their operations at LAX. Why did not LAWA publish
3 a similar comprehensive human health risk study for the LAX Master
4 Plan?
- 5 41. Why were the comments submitted by November 2001 not answered
6 before (or with) the release of the Alternative D Plan in July 2003?
7 (Executive Summary, page 24)
- 8 42. Numerous data issues were identified in 2001. How is the integration of
9 more data into questionable data expected to be satisfactory?
10 (Executive Summary, page 24)
- 11 43. If the purpose and need for the LAX Master Plan has not changed since
12 the publication of the Draft EIS/EIR and there have been significant
13 political event changes in addition to the Mayor's no expansion pledge,
14 why is one of the three major project objectives to "Ensure that new
15 investments in airport capacity are..." Also, we are told that the major
16 emphasis is for "Security and Safety." Why is this not even mentioned in
17 the list of project purpose and need? (Executive Summary, page 24)
- 18 44. Based on 2.8% growth from present we will be at 78 MAP in 2015. Is
19 this a realistic growth rate? (Executive Summary, page 25, table ES-1)

Proposed amendments to reports

LAX Master Plan Position Paper

Several suggestions to be submitted separately by Barry Weiss.

Community Questions on the LAX Master Plan EIS/EIR

I would like to add a few questions to those already posed. In my review of the LAX Master Plan there has been almost no attention to cargo handling facilities and their role in public safety.

Why have cargo handling facilities also not received the same scrutiny over security as passenger facilities?

Why are cargo facilities, after implementation of any of the alternatives of the LAX Master plan, still located all over the place without regard to a security plan?

What security measures does the LAX Master Plan have in place for the handling of cargo that will insure the safety of the public? Both in the air and on the ground.

Why aren't cargo facilities centralized in order to insure the safety of the public?

Why does the LAX Master Plan spend so much money on facilitating the A-380, a yet to be built, unproven European aircraft based in Toulouse, France, while American aircraft manufacturers struggle to stay alive?

Mr. Robert Acherman
6055 West 75th Place
Westchester, CA 90009-2216

Dear Mr. Acherman:

The airlines serving LAX feel strongly that the airport needs to be modernized in order to effectively serve the traveling public and remain the key economic engine to the region. They further support the planning objectives of a safer, more secure and user-friendly LAX; however, Alternative D to the LAX Master Plan falls short of reaching these objectives, which the carriers think could be better achieved through a modification of Alternative D.

To that extent the airlines appreciate the opportunity to work with the Westchester/Playa del Rey community, and discuss alternatives that address the LAX master plan objectives. The airlines, having recently been provided with a copy of the Alternative E-1 concept, are very encouraged with our progress to date and believe that we are close to identifying a concept that is acceptable to the City of Los Angeles and the key stakeholders, including the local community and the airlines.

Thanks you. We look forward to continuing our working relationship.

Sincerely,

Kelley A. Brown
Executive Director

Los Angeles, CA 90009-2216

Dear Sirs:

While Alternative D of the Draft EIS/EIR for LAX Proposed Master Plan Improvements is better than Alternatives A, B, and C, the No Action/No Project is still my preference. Alt. D would delete the ring road, western terminal, and relocation of Runway 24R closer to the Westchester/Playa del Rey community, and it would limit the number of gates; however, it would create new problems that were not adequately studied, nor were there mitigations included for the new impacts. Therefore, Alt. D is not acceptable and is fatally flawed, as are Alternatives A, B, and C.

Alt. D would cost over \$9 billion to transfer security problems from the CTA out to the community; thereby leaving the residents and traveling public still at risk. Concrete, metal and plastic would be safer; people would not. Safety seems to have been designed for equipment and facilities. People would still be in large, vulnerable groups prior to security screening (at the drop-off point in Manchester Square and at the security processing center), but aircraft/runways/terminals would be protected.

Prior to the 2002 mayoralty election, then candidate James Hahn signed the ARSAC pledge that included, in Section 2, a commitment to not increase LAX beyond its existing boundaries. Manchester Square was (and is) not within LAX boundaries.

Placing a new Ground Transportation Center in Manchester Square would shift ground traffic to totally new areas (Inglewood and the Osage neighborhood of Westchester) that are not equipped to handle it. It does not appear that adequate security could be provided at this GTC in terms of security from vehicle/luggage/personal bombs or airborne contaminations. The main body of hazardous materials and decontamination staff and equipment would be on the airfield; in the event of a disaster or emergency the staff and

SPC00305

equipment would have to travel on city streets (which would, obviously, be heavily impacted) to reach the GTC. There does not seem to be a GTC evacuation plan or place for vehicles or pedestrians to go to.

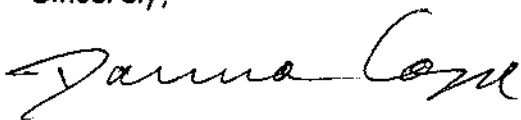

Low-frequency noise impacts were not included in Alt. D, single-event noise impacts were included, but there were no mitigation measures included.

Alt. D sends the message to other, outlying areas, such as Orange, Kern, Santa Barbara, and Riverside Counties that LAWA intends to just keep expanding LAX to handle all the Southern CA traffic - no firm commitment to a plan of action to achieve a regional approach is included.

Mitigation measures, for the most part, in Alt. D rely on other agencies or departments. There should be pro-active, firm actions included for LAWA and/or the City of Los Angeles to take (e.g., the City will formally request and actively lobby for...)

I support the positions, questions, and comments submitted by the LAX Area Advisory Committee, LAX/Community Noise Roundtable, and the Westchester/Playa del Rey Neighborhood Council. For the sake of brevity (and sanity) I will not iterate those positions in this letter. I do look forward to reviewing the responses to the issues raised by these organizations.

Sincerely,

A handwritten signature in black ink that reads "Danna Cope". The signature is written in a cursive, flowing style.

The LAX Community Noise Roundtable Draft EIR / EIS Comments

The LAX Community Noise Roundtable was created in September 2000. It is composed of elected officials or their designees from Rancho Palos Verdes, Palos Verdes Estates, Redondo Beach, Hermosa Beach, Manhattan Beach, El Segundo, Culver City, Monterey Park, Los Angeles (Districts 11 and 8), Inglewood, Hawthorne, Los Angeles County, the FAA, the ATA, Los Angeles International Airport Area Advisory Committee and representatives from area groups.

1. The dates used do not satisfy the baseline for comparison to be as of the time that the Supplemental to the Draft EIS/EIR was submitted. The baselines were outdated at the time they completed the Supplemental to the Draft EIS/EIR.

2. 4.1.6.1.5 states, " the increase of the size of aircraft would result in louder individual noise events and consequently greater total noise energy levels and slightly increased contour size". This is against our stated policy of shifting noise from one community to another.

3. 4.1.6.1.5.3 - Page 4-65. This is against our stated policy of shifting noise from one community to another. S4.1-27 indicates a 2000 increase in population newly exposed to 65 CNEL or greater; an increase of 150 dwellings added within the 65CNEL; and 4 schools, 2 churches and 3 hospitals are newly added. Where are the precise mitigation measures for these increases?

4. The LAX Noise Roundtable does not support any flight track alteration or airfield alteration that shifts noise from one community to another. The FAA has also stated that to be their policy.

The moving and/or extending of runways 24L, 24R, and 25L results in the shifting of the noise contours and/or the shifting of noise from one community to another. Moving a runway changing the take off and landing of an aircraft flight path causes a significant shifting of noise. Why does the document indicate that there is not a significant change? What metric is used to determine 'significant'?

100-00593
 3-4-5

5. The development of the A-380 and other potential jumbo jets noise characteristics have not been analyzed or incorporated. Will this increase or decrease the single event noise and the CNEL Contours? The actual noise characteristics of these advanced aircraft should be used in your study. Why does the document not mention these characteristics? How do the larger jumbo's perform with tail winds below 2, 4,6, 8, and 10 knots?

6. The World Health Organization (WHO) has upgraded noise pollution from a nuisance to a serious hazard. According to the WHO, "prolonged or excessive noise exposure has been linked to high blood pressure, heart disease, concentration problems and, of course, hearing loss. People who live in neighborhoods near highways and airports experience noise risks". Why were the affects of noise from health studies not presented in the document?

7. The threshold of significance for SEL single event noise used was 94 dba for exterior noise and 81 dba for interior noise for awakenings and is inadequate. The 94dBA and 81dBA is too high a threshold. We feel the SEL single event dba should more closely be associated with 'annoyance' and not just 'awakenings'. Why didn't the EIS/EIR deal with annoyance? Why were the reputable WHO statistics not evaluated in the guidelines?

8. Why in the NA/NP alternative is there an increase in nighttime noise?

9. We recommend that SEL single event noise be used to expand the areas for noise insulation. No one complains about a CNEL infraction. They call about single event noise. The Supplemental to the Draft EIS/EIR does not use as a mitigation measure a program to incorporate the single event criteria as a useful tool to a soundproofing program. Seeing as this is something that should have been included years ago it is only appropriate that LAX use this new legal tool to expand the area of dwellings in the soundproofing program. Why wasn't this issue addressed in the Supplemental to the Draft EIS/EIR? How many times a day are single event noise thresholds exceeded?

10. The outcome of a WHO expert task force meeting in London in March 1999, includes guideline values for community noise:

<u>Environment</u>	<u>Critical Health Effect</u>	<u>Sound Level dB(A)</u>	<u>Time hours</u>
Outdoor Living Areas	Annoyance	50 - 55	16
Indoor Dwellings	Speech intelligibility	35	16
Bedrooms	Sleep disturbance	30	8
School Classrooms	Disturbance of communication	35	During class

11. Percentages are very misleading when used in noise disturbance statistics. The actual numbers including percentages are needed for analysis. Facts, figures, noise levels, estimated values, decibels, and comparisons should have been provided. Why were the actual metrics not presented?

12. Will simultaneous landings of aircraft, on 24L, 24R, 25L, 25R runways, take place during the construction of the aforementioned runways? If so, what impact will that have on the CNEL and singles event noise?

13. What impact will simultaneous landings and/or takeoffs have on noise contours and single event noise?

14. Will simultaneous landings take place when all runways are completed?
15. What will be the noise impact of air traffic rerouting during runway reconstruction?
16. Easterly direction take offs are very disturbing to airport neighbors for awakenings and annoyance. It is apparent to the Roundtable that the awakenings of easterly takeoffs at night is far more disturbing than one out of ten instances that your report indicates. How were your figures determined?
17. Low frequency noise measurements are neglected in the Supplemental to the Draft EIS/EIR. Low frequency noise is a serious disturbance. Why aren't there any measurements and mitigation measures for low frequency noise included in this Supplemental to the Draft EIS/EIR? Please provide any information you have pertaining to this problem.
18. We recommend the suspension of all avigation easement requirements on all noise insulation programs. Why weren't the state requirements for avigational easements included in the noise insulation programs? Why hasn't LAWA included air conditioning units in all past and future noise insulation programs even though not funded by the Federal government?
19. Why is there no noise information about the Beach communities and Palos Verdes Peninsula, even though they have had noise annoyance problems for some time? Why have they been omitted? Explain the failure to look at noise impacts at CNEL levels below 65 that might include Palos Verdes Peninsula and the beach communities? (For example 50, 55, 60 CNEL)
20. Single event noise levels should expand to include a 20 mile radius. How can you determine an annoyance factor area if you don't expand your area of investigation? Why were areas negatively impacted by single event noise not included in the EIR/EIS? (See comment 10)
21. What fleet mix in 2015 was used to arrive at the conclusions in the document? How many are turbo-props?
22. The EIR/EIS states the Alternative D capacity of 78.9 MAP is a theoretical number, which may be exceeded. The use of 78.9 MAP as a limiting factor in the future growth of LAX is not enforceable. Why weren't noise impacts above 78.9 MAP investigated and documented? What is your plan? Will the relocation of the "curb front" allow more passengers to use the airport and thus more operations and thus more noise? Why were there no new theoretical MAP numbers applied to Alternative D when it increases the capacity of LAX beyond 78.9 MAP?

If the theoretical capacity as stated in the EIR/EIS can exceed 78.9 MAP if demand increases where is the regional plan which would reduce the demand on LAX? If there is no regional plan then where are the numbers showing impacts above 78.9 MAP?
23. Why hasn't the City of Los Angeles continued to support the Southern California Regional Airport Authority if they believe in a regional approach in airport capacities and a cap of 78.9 MAP at LAX?
24. As demand increases when will the capacity of normal operations start to impact over ocean operations? At what point does demand cause LAX to remain in normal operations past the 12 a.m. to 6:30 a.m. window?

VERB 00503
475

25. The EIR/EIS relies on mitigation measures based on the successful Part 161 approval by the FAA. Is this a guaranteed approval process? Why was it assumed that this would happen? Why are there no studies that show the impact without the Part 161?

26. The EIS/EIR states 6.2.3: "Prior to the determination of sound treatment eligibility, however, a new study of the relationship between specific aircraft noise levels and childhood learning abilities will be undertaken by LAWA as part of the continuing environmental monitoring process obligated under CEQA. This study will seek a predictive statistical relationship between the level of aircraft noise present at a school and the ability of children to learn, as expressed by standardized test results. When that study is complete and acceptable results are achieved, the potential for additions to the sound insulation program for schools will be revisited as part of LAWA's continuing environmental management responsibilities."

How do you plan to test the impact of noise on the ability of children to learn in affected schools like the Lennox Elementary School District when the only learning environment has been one with aircraft noise? What would be their learning abilities without noise when they haven't had the opportunity to learn without noise.

27. Speech interference was the level of significance used in the analysis. Why was this not used to measure impacts that would result in the need to identify mitigation actions?

28. The word 'significant' is used throughout the SUPPLEMENT TO THE DRAFT EIS/EIR MASTER PLAN for LAX. We have come to the conclusion. After making several inquiries about the definition of the word 'significant' to high level Deputy Executive Directors of LAWA and others, there is no one definition capable of applying to all instances of its use. The Executive Summary of Volume One of this Supplemental Draft to the EIS/EIR does not address the definition of "significant." Therefore it is necessary to ask the same question about similar but different statements included in the Supplemental Draft to the EIS/EIR. Please refer to the Executive Summary, Volume One of the Supplemental Draft to the EIS/EIR for titles and page numbers of the Executive Summary Tables. Please do not use words that are synonymous with 'significant' to explain. Define, and interpret the word 'significant'. Some of the words to avoid in explaining the definition are: important, meaningful, weighty, notable, profound. Pivotal, serious, momentous. Substantial. and other synonyms of this type. Facts, figures, noise levels. Estimated values, decibels, and comparisons should have been provided what metric values were used to determine these levels of significance?

Executive Summary pages 51-76 4.1 Noise

1. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
2. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
3. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
4. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
5. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
6. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
7. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.

4.2 Land Use

1. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
10. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
11. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.

4.24.2 Health Effects of Noise

1. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section

4.27 Schools

3. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section

29. How can noise impacts that are 'unavoidable' be acceptable?

30. Will the elimination of "avigation" easements for all impacted areas help reduce the number of legally impacted dwellings and people? How many households refused the sound insulation offers because of avigation easements requirements?

31. The California Airport Land Use Handbook concludes that no definitive, widely recognized, single event noise level guidelines currently exist relative to land use compatibility planning. This Supplemental to the Draft EIS/EIR would have been an ideal tool to establish single event noise level guidelines. Why didn't the document include the necessary research to accomplish that goal?

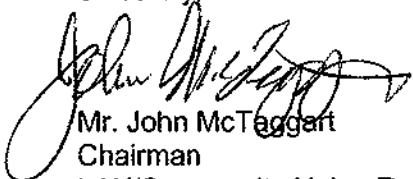

32. The Automated People Mover (APM) operation will impose undesirable noise on all 10 existing hotels in the Century Boulevard/98th Street area. The noise level; is rated by the EIS/EIR as a severe impact on 2 hotels and a significant impact on 4 others. High activity levels include 1755 day-trips (about 2 per minute) and 615 night-trips (about 1 per minute). What are the mitigation measures for noise of the APM?

33. Some requests for easterly takeoffs during over ocean operation are based the slant of runway 25R/7L from west to east. Why was the leveling of the runways on the south side of LAX not included in the EIS/EIR?

34. Do the characteristics and performance of the A380's and other jumbos interfere with its ability to comply with over ocean operations?

Thank you.

Sincerely,

Mr. John McTeggart
Chairman
LAX/Community Noise Roundtable

P.O. Box 91014 • Los Angeles, California • 90009-1014

Mr. Jim Ritchie
City of Los Angeles
Los Angeles, World Airports
LAX Master Plan Office
P O Box 92216
Los Angeles, CA 90009-2216

Dear Mr. Ritchie:

I am writing to you on behalf of the Members of the Board of Directors of the Westchester Association. The Westchester Association is comprised of 43 property owners in the Westchester Business District and their properties are located on the east side of Sepulveda Boulevard, between Manchester Avenue on the North, and Westchester Parkway on the South.

At a recent meeting of the Board of Directors, a very lengthy discussion was held regarding Mayor James Hahn's Airport Plan, "Alternative D". The Board members have all previously had the opportunity to read and hear about the Alternative D plan, and they wish to go on record as being strongly opposed to this particular plan.

The Board of Directors are very much concerned that this plan will cause approximately 6200 citizens of Westchester to be relocated from both the Manchester Square and Belford areas of the community and that this plan would have a very negative impact on their tenants and businesses. Some of the Board members have been in this area for many years and they remember years ago when the airport expanded and approximately 10,000 residents had to move out of the area. That airport expansion caused many of the businesses to close their doors permanently, and the Board is afraid that will happen again.

Therefore, the Board wishes to go on record as being strongly opposed to "Alternative D".

Yours very truly,

Robert E. Smith
Business Manager

Re: Draft and Supplemental Draft Environmental Impact report/Environmental Impact Statement; Los Angeles International Airport Proposed Master Plan and Master Plan Addendum – Comments of the City of Inglewood

Dear Mr. Ritchie and Mr. Kessler:

The following constitute the comments of LAX Expansion No ("L.A.X.E.N.") a community organization comprised of residents living in Inglewood, Lennox, Westchester and El Segundo concerning the Draft ("DEIR") and Supplemental Draft Environmental Impact Report/Environmental Impact Statement ("SEIR") for the Los Angeles International Airport ("LAX") Master Plan ("Master Plan") and Master Plan Addendum ("Addendum") (together "Project"), submitted pursuant to the requirements of the California Environmental Quality Act, Public Resources Code 21000, et seq., ("CEQA"), its implementing Guidelines, 14 Cal. Code Regs. 15000, et seq. ("CEQA Guidelines") and the National Environmental Policy Act, 42 U.S.C. 4321, et seq., ("NEPA"). All of the above listed documents shall be referred to as "The Master Plan" herein.

Our primary focus of our comments concerning the evaluation of the Draft and Supplemental Draft Environmental Impact Report/Environmental Impact Statement, Los Angeles International Airport Proposed Master Plan and Master Plan Addendum will be **Alternative D** "Mayor Hahn's Plan". Alternatives A, B, and C although presented with **Alternative D** have already been publicly addressed in our comments, and the community's comments, during the preceding EIR /EIS hearings. We will refine our comments to address specifically **Alternative D** and the movement and lengthening of the inboard northern and southern complex runways, center taxiways, and environmental justice issues related to **Alternative D**, baseline analysis, transportation funds, elimination of the existing downwind, base leg, final approach landing pattern, elimination of parking structures inside LAX, loop departures and mitigation remedies.

LAX Expansion NO! (L.A.X.E.N!) believes that an off-site check in facility will never be built in Manchester Square, allowing for the area to be utilized for Cargo facilities development. The main purpose of the Master Plan (**Alternative D**) is for the movement of the runways creating a center taxi-way forcing the removal of the parking structures located inside LAX. The elimination of Parking Lot C and D allowing for rent-a-car facilities further eliminates public parking facilities. This will become a FINANCIAL BONNANZA for Hotel / Parking Structure Owners located nearby just outside of LAX's current check in facility with their number one competitor eliminated and relegated to a relatively obscured location at Aviation and Imperial. The redesign of LAX is to eliminate its parking facilities.

FACT: Hotel Owners on Century blvd. generate more revenue from their Parking Lots than on room rentals. **Source:** Marriott / Renaissance Hotel and Hyatt Hotel located on Century blvd, accounting divisions.

Alternative D is flawed because it does not address the negative impacts caused by removing LAX's own parking structures from inside LAX and relocating them miles away at Imperial and Aviation blvd. To eliminate parking garages that are currently accessible and convenient to the everyday general flying public at a reasonable cost.

Alternative D fails to address the scenario of not having public parking garages conveniently located near terminal check in facilities forces the flying public to utilize Hotels and Parking Garages closer to LAX especially if the off site check in facility is not developed in Manchester Square or any guarantee that a Behemoths parking garage will be built to replace the parking structures that would be torn down as a result of **Alternative D**, and if policy decisions are reached allowing hotel buses, limousines and taxi cabs to make drop offs and pick ups inside LAX, the economically disadvantaged flying public will be forced to either use nearby hotels and parking garages, or be forced to travel unnecessarily by either walkway or bus to arrive at the check in terminal.

Alternative D fails to mention the removal of the ring road inside the check in area. Does it remain or is it destroyed? If it remains are five lanes really needed for emergency vehicles?

CENTER TAXI-WAYS

Alternative D is flawed and creates an artificial need for Center Taxi-ways on both the Northern and Southern Complex's. It is unnecessary to have Center Taxi-ways at LAX to prevent the chance of runway incursions when all that is needed is to return LAX to its original design specifications. Take offs on outboard runways and landings on inboard runways. What is needed is a policy revision restricting landings to only the inboard runways and restricting take-offs exclusively for the out board runways on both the Northern and Southern Complexes.

Alternative D is flawed because it does not identify the construction of the center taxi-way as the driving force for the removal of the parking garages.

Parking Structures and Parking Lot C and D Removal

Alternative D is flawed and creates an artificial need for the removal of parking structures inside LAX's terminal area and Parking Lot C and D. The main purpose of the Parking Structure Removal according to **Alternative D** is to provide safety for travelers. The Master Plan does not address the alternative of ceiling the walls of the interior parking garages containing any bomb blast from a car bomb inside the structure.

Alternative D is flawed because it does not address the possibility of the proposed parking garage becoming a white elephant if the Security Check In facility is not built in Manchester Square forcing passengers to use privately owned parking lots or be inconvenienced to use public transportation to get to and from the airport check in facility located inside LAX.

Alternative D is flawed and does not address the act of removing Parking Garages and its Environmental Justice Component. Such as the removal of the Parking Garages inside LAX check in ring road and Parking Lot C and D will force economically disadvantaged communities to park miles away at the Imperial and Aviation boulevard facility and allow communities that are more affluent willing to pay a premium to park closer to the airport at nearby privately owned hotel parking structures and lots.

TRANSPORTATION FUNDS

Alternative D does not address the issue of Transportation Funds being absorbed by the proposed LAX Expansion Project from other areas of Los Angeles and the Southern California region for the building of roads and infrastructure necessary to mitigate traffic concerns in and around Los Angeles International Airport regardless of either Alternative A, B, C, and D.

BASELINE ANALYSIS

Alternative D does not address the issue of El Toro International Airport being eliminated as an aviation alternative to help absorb 28 million annual passengers that were designated to be absorbed by the operation of El Toro International Airport.

Alternative D does not address the issue of why the baseline is computed in terms of million annual passengers and not specified in flights.

Alternative D does not emphasize that 78 million annual passengers is not a preemptive cause of action designed to prevent LAX from exceeding 78 million annual passengers. As stated by Mark Pissano Executive Director of the Southern California Association of Governments, SCAG, on Thursday, November 6, 2003, "There is no guarantee that LAX will not exceed 78 million annual passengers" said Mark Pissano.

MITIGATION

Neither the Draft nor Supplemental Draft Environmental Impact report, Environmental Impact Statement, Los Angeles International Airport Proposed Master Plan and Master Plan Addendum does not address the option of a voluntary buyout or purchasing of Inglewood residents single family homes and multiple family housing units at a dollar rate comparable to the voluntary home buy out option exercised by the residents of Westchester's subdivision Manchester Square bordered by La Cienega, Century, Airport, and Arbor Vitae Boulevards located in the City of Los Angeles. Los Angeles World Airports used the more affluent Westchester subdivision Osage as a comparable pricing guide for the purchase of single family homes and multi-family housing units in the Manchester Square by Los Angeles World Airports, even though the single family housing units in Manchester Square were inferior to the Westchester subdivision Osage.

This mitigating solution would be to purchase Inglewood residents homes at a rate comparable to the subdivision of Westchester known as Osage and for areas in Inglewood where the housing stock is equal to the area of Westchester's subdivision known as Kentwood, a comparable pricing guide would be used for the purchase of those homes. The purchase of these homes would be a voluntary option exercised by each individual homeowner as an alternative to sound insulation as preceded by residents living in the Westchester subdivision known as Manchester Square.

Specifically **Alternative D** does not address the above or the issue of LAX reimbursing residents for the dollar depreciation value of their property caused by existing and future LAX operations. It only suggests that placing residents in a comparable bunker (sound proof windows) can mitigation occur.

Mitigating Solution for movement of runways: There is a better way to solve the problems of Runway Incursions involving arriving and departing flights at LAX. Runway incursions can be easily remedied by simply having all landings take place on inboard runways only. The airport was originally designed with this philosophy being the cornerstone of its design. The original design called for aircraft to turn immediately into the terminal area from the inboard runways only on either the northern or southern complex sides eliminating the possibility of collision with intersecting / departing flights on the outboard runways.

ENVIRONMENTAL JUSTICE

The EIR lacks a technical understanding for the reader that LAX's original design and existing runway configuration was for aircraft landings to take place on inboard runways on both the northern and southern complexes. The purpose of the design was to prevent a landing plane from turning into the terminal area and before reaching the area intersecting or colliding with departing aircraft which is what can happen today if a pilot fails to stop for departing aircraft taking off on the inboard runways on both the northern and southern complex's to provide noise relief for the residents of Playa Del Rey, Westchester and El Segundo.

ENVIRONMENTAL JUSTICE CONTIUED

Alternative D and the Environmental Impact Report lack an explanation for the unofficial noise mitigation measures taken to have planes take off exclusively on the inboard runways today and under the proposed **Alternative D**. The official explanation for this unofficial noise mitigation measure today is to provide noise relief for El Segundo, Playa Del Rey and Westchester area residents.

The Master Plan fails to address ramifications of providing unofficial noise mitigation measures for Playa Del Rey, Westchester and El Segundo and causing the gated communities of Briarwood, Carlton Square Morningside Park, and Century Heights in Inglewood to have arriving planes fly over their homes on final approach, as oppose to over the parking lot of Hollywood Park, which is clearly designated as an arrival approach path to the inboard runway on the northern complex side by the Gunther Strobe located at 90th and Crenshaw.

The Master Plan fails to address purpose of providing noise relief action for the residents of Playa Del Rey, El Segundo and Westchester when they are eligible for noise mitigation (sound proof windows) by moving take-offs to the inboard runways under Alternative D away from Playa Del Rey, Westchester and El Segundo to the detriment the Communities of Inglewood, and Lennox. This is clearly an issue of Environmental Justice considering the ramifications of this UN official policy over the past decade. Further the ethnic make up of Westchester and its affluent economic base of its residents in comparison to the City of Inglewood self described low income economic base of its residents makes this in our opinion a clear violation of Environmental Justice Laws.

The Master Plan under **Alternative D** is flawed because for every plane that departs from LAX on the inboard runway will prevent an arriving plane from landing on the inboard runway forcing arriving aircraft to align their arrival glide slope with the outboard runway and negatively impacting homes that would not be affected by LAX and its ill effects of flight paths above upon housing prices and residents' health on the ground below in Inglewood, Lennox, and Los Angeles California.

The Master Plan under **Alternative D** is flawed and allows the inboard runway on the northern complex side to be moved to the south 300 feet and on the southern complex side the runway is to be moved to the south 50 feet. This will permit visual simultaneous landings on the northern complex side but will require a variance issued by the FAA allowing for the separation of aircraft to be less 4,300 feet that is the normal approved separation of runways for "dual simultaneous instrument approaches" per FAA advisory 150/5300-13, change 5, 2-4-97, "Airport Design", chapter 2, page 11, paragraph 208.a. (1) than what is currently required minimum under FAA rules and regulations.

The Master Plan under **Alternative D** intention of providing noise relief to residents of El Segundo, Playa Del Rey and Westchester at the expense of the quality of life of Inglewood Residents' is a violation of Environmental Justice.

ENVIRONMENTAL JUSTICE CONTINUED

The Master Plan is flawed and fails to address under **Alternative D** the movement of the northern complex inboard runway 300 feet south and the movement of the southern complex runways 50 feet south and how the movement of these runways will negatively impact Inglewood Residents who live in the Morningside Park Area between Century Blvd. and 90th street forcing planes to fly in airspace that had not been used by jet aircraft and flying directly over residential homes with the possibility of simultaneous landings (two planes abreast) on the northern complex side and one perhaps two planes landing on the southern complex side simultaneously.

The Master Plan is flawed and fails to address adequately variances for public participation and the method and procedure that a resident would need to take to participate in any hearing concerning a variance for simultaneous landings or procedure to be placed on the panel discussing what will or may be needed to land jet aircraft / planes two abreast simultaneously on the northern complex side and also two abreast on the southern complex side of LAX.

The Master Plan is flawed and fails to address adequately under **Alternative D** the possibility for disproportionate share of landings to take place on the northern complex side. Inglewood residents would suffer with more noise while Westchester, Playa Del Rey and El Segundo are provided noise relief with runways being moved further away from Westchester, Playa Del Rey and El Segundo. The movement of the inboard runways on both the northern and southern complex sides of LAX for the purpose to provide noise relief to Playa Del Rey, Westchester, and El Segundo to the detriment of Inglewood is a violation of Environmental Justice.

The Master Plan fails to address Environmental Justice concerning the Lengthening of runways. **Alternative D** is designed to provide noise relief for Playa Del Rey, Westchester and El Segundo to insure that early turns and fly-overs do not impact their homes but to the detriment of Inglewood and Lennox residents. Inglewood and Lennox residents will be impacted by much larger aircraft and a higher volume of aircraft. Residents who live to the east of the Airport (Inglewood, Lennox, and Los Angeles) will find larger aircraft flying over their homes as a result of longer runways at LAX under **Alternative D**.

AIR QUALITY

The Master Plan and Environmental Impact Report concerning air quality studies lack measurements less than Particulate Matter 10 (PM10). The Master Plan fails to address the over 685 signed health declarations presented to the Air Quality Management District (AQMD) consisting of residents who suffer from cancer, asthma, bronchitis and other respiratory conditions they believe is caused by the aircraft flying over their homes.

AIR QUALITY CONTINUED

The Master Plan and Environmental Impact Report lacks clear and definite language specifically identifying what the negative impacts upon the residents who live in Briarwood, Carlton Square and Morningside Park as it relates to air quality. The EIR does not clearly define what air quality impacts will be inflicted upon these neighborhoods if all arriving flights are designated to land on the out board runway or northern most runway on the northern complex side of LAX under *Alternative D*.

LOOP DEPARTURE

The proposed new loop departure procedure will place all Eastern bound aircraft over the communities of Osage, Inglewood and Baldwin Hills. This will remove the aircraft from flying over Manhattan, Hermosa, Redondo Beach and Rancho Palos Verdes Peninsula. This will endanger the lives of residents in Inglewood and Baldwin Hills. More aircraft will fly over minority communities to provide noise relief to Manhattan, Hermosa, Redondo Beach and Rancho Palos Verdes.

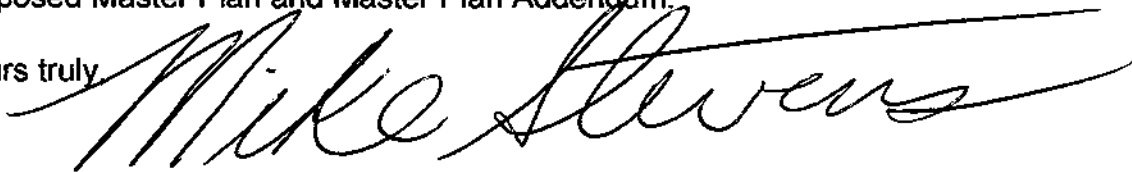

CONCLUSION

A New International Airport should be built in the Los Angeles Harbor utilizing soil sediment and other ecologically safe materials to build an island for runways and the terminal check in facility could be built on land. An airport in this location would not harm or negatively impact any residents utilizing the Alameda Corridor and could serve both Los Angeles and Orange Counties efficiently.

It is necessary to provide a quality of life and environment equal to other communities for the purpose of equality that would benefit residents living to the east of Los Angeles International Airport who are unfairly burdened with the negative environmental impacts of an airport that is too small to carry the aircraft burden for the entire southern region.

LAX Expansion NO! also adopts the comments forthcoming from the City of Inglewood, Los Angeles Board of Supervisors and asks that LAX Expansion NO (L.A.X.E.N.) be recognized as having standing to utilize those agencies comments concerning the Draft and Supplemental Draft Environmental Impact Report, Environmental Impact Statement, Los Angeles International Airport Proposed Master Plan and Master Plan Addendum.

Yours truly,

Mike Stevens
President LAX Expansion NO! (L.A.X.E.N.!)

Mr. David B. Kessler, AICP
P.O. Box 92007
Los Angeles, CA 90009-2007

Dear Mr. Kessler,

While considering the pros and cons of latest proposed modernization plan for Los Angeles International Airport, the Eighth District Council Office decided to base its position on the opinions of its constituents and the rest of the public. After all, it's the people of the City of Los Angeles and its surrounding areas who will be most affected by any changes at the airport.

To gauge the feelings of the residents, the Eighth District Council Office held a variety of meetings, where experts on the modernization plan were called in to provide details to the public. The public was also allowed to take part in the discussions, so they could voice their concerns.

As one meeting followed the next, time and time again the Eighth District staff heard how residents felt they were being neglected, left out of the process and not taken seriously. Furthermore, they expressed concern at how the plan would negatively affect them. There were concerns about how expanding the airport would leave more schools, churches and hospitals under the noisy glide path and unhealthy exhaust fumes of airplanes. There was dissatisfaction over the traffic problems that would haunt drivers before, during and after the reconstruction with traffic and the extreme exhaust that would come from traffic congestion around the airport. And, there was frustration at how the southern and eastern ends of the area would bare the brunt of the modernization plan, while the people at the wealthier northern end would apparently experience few or none of the consequences.

And, it didn't stop there. The Eighth District Council Office watched that frustration turn into anger, as they learned that with all this disruption; that with all this danger, there would be no guaranteed benefits. Does the Alternative D Modernization Plan make people safer? No one is sure. Does it constrain growth at LAX? No one is sure. Area residents are sure about one thing; the price. At \$9.6 billion, the very least the public deserves is a couple of straight answers.

The attached report is based on information obtained by the Eighth District Council Office.

Respectfully,

BERNARD C. PARKS
Councilmember

Community Reaction Report on LAX Modernization Plan
Councilmember Bernard C. Parks

Community Concerns- Most of the reported concerns come from the southern and eastern ends of the area surrounding LAX. People at the eastern end have been experiencing the effects of living under the flight path for several years. They are troubled by the noise; not just for auditory reasons, they are understandably frightened by the structural damage the vibrations can do to their homes. While double-paned windows are a relief to some, countless others remain without that benefit because they are unfortunate enough to live inches outside of the designated areas, where double-paned windows are provided for free. Children hoping to leave the loud rumbles of landing planes behind, simply can't. The overwhelming sound follows them into their classrooms, as many schools are under the flight path as well. Some experts suggest "windowless schools". This may upset parents in the community who feel their children deserve a view from the classroom; just like children who attend school away from the flight path.

After the planes land, residents are faced with what they leave behind. A number of people under the flight path have complained about airplane fuel being dumped on their homes. The effects of this are unknown. And, the mystery leads people to make their own conclusions. In one case in the Eighth District, a handful of neighbors claimed that they all acquired cancer because of the exhaust and fuel on their homes.

Minority communities near the airport feel abused and neglected. Under Alternative D, their neighborhoods are invaded the most; causing them to make more adjustments than any other communities. Minority and low-income communities would constitute 74% of the area subjected to high noise by 2015. According to "*A Preliminary Review of Issues Associated with the LAX Master Plan Supplemental Draft EIS/EIR*", the perspectives of minorities who live in the affected areas were not properly taken into account. The review, prepared by A.C. Lazzaretto and Associates states that all federal agencies are required to analyze environmental justice impacts when proposing public projects. The analysis is intended to determine whether minority and low-income communities are unfairly burdened by project impacts. The review goes on to say that the original draft EIS/EIR was found to lack even the most elementary requirements for environmental justice. Even with some later corrections, the deficiencies still remain.

Sloppy and Outdated Reports- The oversight on environmental justice issues is just one of many irresponsible errors made in the EIS/EIR. "*A Preliminary Review...*", discussion #5 states: "*The Original EIS/EIR provided an incomplete discussion of the No Project Alternative by incorporating improvements that were then only in the 'planning stages' and overstating the service levels and capacity of the existing facilities. This approach made it difficult to draw meaningful comparisons with project alternatives. Preliminary review indicates that the Supplemental EIS/EIR may also provide an incomplete picture of impacts associated with the No Project Alternative. Additionally, the No Project Alternative has not represented passenger capacity in a consistent manner. In the original 1997 Notice of Preparation, the No Project Alternative was linked to a range of 68-72 MAP whereas the 2001 and 2003 EIS/EIR documents increased this estimate to 71.2-78.7 MAP.*" The review follows this revelation by calling the public review process involved in the original EIS/EIR "confusing and cumbersome".

What Does the Modernization Plan Really Set Out to Do?

Supporters of the LAX Modernization Plan have a list of reasons why the \$9.6 billion should move ahead. Though their reasons may be well intentioned and may even sound good, there is little to no proof that their any of their predictions are accurate.

Security- When examining the issue of security, "*A Preliminary Review...*" suggests that the Supplemental EIS/EIR may fall short of an adequate review of airport security issues; calling the information "*heavily conceptual*", "*theoretical*" and "*significantly short on detail*".

The Rand Report shows that Alternative D's modifications could make it difficult to evacuate the central terminal complex quickly, if an emergency took place. Also, the newly-proposed shuttle system may be a target that terrorists can't pass up. Having the ability to disable the shuttle anywhere along the two-mile route give terrorists a dream combination: passengers, a vehicle and fear.

Another security uncertainty stems from the fact that many of the high-tech items requested in Alternative D either do not exist or are unproven. Facial recognition technology and futuristic devices that check for weapons and explosives may be in a few movie theaters, but they won't be available in airports for sometime to come.

Alternative D's security measures are designed, primarily, to protect against car bombs. However, Rand Report studied the historic risks that terrorists present to airports and found that small bombs hidden in luggage, shoulder-fired missiles and chemical, biological and nuclear weapons are more likely. Alternative D does not prepare for that fact.

Common Sense and the community tell us that the plan to move passengers out of the terminals and into one single facility, simply, makes it easier for terrorists to get to them. With all the talk of building a "terrorist-proof" airport, the Rand Report raises the question of whether airports can ever be designed to deter terrorist attacks or to minimize casualties if one occurs. The ability of passengers to successfully adjust to the new seemingly difficult systems would also be a concern.

By dispersing airport operations among numerous new facilities, the plan also would increase the area that needs to be patrolled. This would be difficult to do with the current number of personnel.

The Rand Report offers some less-expensive alternative security solutions, including:

***Reducing the Wait for Baggage Check-In:** By cutting the average check-in time from 15 minutes to one minute, the number of potential victims in a bomb attack could be cut by more than 50%.

***Erecting Barriers:** Planters and concrete pillars can act as a safeguard between vehicles and pedestrians.

Another thing that could improve security, according to the Rand Report, would be if Alternative D successfully capped the airport at 78 million passengers a year, as promised. But, even the theory of "less people, less worries" is a stretch because there is no way to limit passengers and the airlines maintain the sole responsibility of scheduling flights.

Conflicting Goals

Limiting Passengers- One of the keys of Alternative D involves the aforementioned passenger cap. While claiming to set a firm limit for passengers, many aspects of Alternative D do the exact opposite. For instance, the design of the proposed gates is more flexible and has more capacity, which may be more accommodating for the larger 600-passenger airplanes of the future. Also, space in the western portion of the airport will remain available for future consideration of a new west terminal. Meanwhile, some still question the benefits of limiting the number of passengers at the airport. Many believe that setting constraints on Southern California economy boosters, like: tourism, apparel and furniture would cause them to suffer. LAX aviation activity contributes \$61 billion to the regional economy each year, or \$167 million dollars a day. That revenue is too precious to threaten, especially for a plan with so few certainties.

Jobs- While the plan is praised for creating 350,000 possible jobs in the region, only about 50,000 construction jobs would noticeably benefit the local economy. And, those benefits would be short term. "A Preliminary Review..." finds that around the same number of jobs would be created if nothing was done at all. The review adds that even fewer jobs could result from Alternative D. In fact, the people pushing this plan acknowledge that there is no expectation for long-term economic growth.

What Does the Airline Industry Think?

After meeting with airline executives recently, they expressed concerns about the plan because: (1) they were not consulted on the plan, (2) they cannot cover the required costs and find Alternative D financially unfeasible at this time, (3) they have never participated in an airport renovation project that didn't have expansion as its primary purpose, (4) they stated several airlines have come out of bankruptcy recently and are in no position to pay the costs (5) their portion of the costs would have to be paid for by raising passenger prices.

Listed below are some of the biggest questions, issues and needs raised by Eighth District residents:

Environmental Issues

- *Sound-proofing study update**
- *Street repair and widening projects**
- *Traffic mitigation & diversion plan for the region**
- *Rapid bus and rail system connections**
- *Synchronized signal light system**
- *Various community health issues**
- *Consideration of park and ride facilities to the east and south of the City of Inglewood**
- *Interest in moving the airport as far west as possible**
- *Why are planes permitted to take-off and land between the hours of 11:00 PM and 6:00 AM?**
- *Why hasn't new criteria been established to account for flight patterns over areas such as Vermont Knolls?**
- *Why can't jet engines noise be muffled 10 miles before landing?**
- *Pollution - both noise and aerosol components will increase dramatically, because airline traffic will expand to the level required by the planned MAP goal.**
- *Included in the plan, should be a proposal to provide funds to complete the existing soundproofing contracts and identify the remaining homes that are affected, based on 55 DNL noise levels and above.**

***The infrastructure- Century Blvd. from the 110 freeway to La Cienega and other heavily-traveled streets to and from the airport should be resurfaced regularly with funding support from LAWA to eliminate pot holes and other irregularities.**

***Airplane noises are linked to: stress, hypertension, sleep deprivation and interruptions, work-related performance and learning and academic performance**

New Terminal

***Impact of banning all parking and private vehicles inside the central terminal**

***Impact of the prohibition of passenger drop off at the terminal curb**

Cost, Expense and Benefits

***Caps on passengers and cargo load**

***12-year hiring plan to redevelop flight schedules, noise and employment**

***What methodology has been devised to mass transit passengers to terminals if no curbside drop off is permitted?**

***Local residents were told from the start that the general aspects of the plans were not negotiable, if so, then why holding public hearings?**

***Of the 49,000 jobs that the airport expansion is projected to create, how many jobs for the residents in those communities that have and will be impacted be made available?**

***Though there has been outreach to unions, are there plans to reach out to non-union workers, so they will have an opportunity for employment?**

***How will the public be notified of available employment?**

Comments to the LAX Master Plan and EIS/EIR dated July 2003

Hand Delivered at the last LAX MP hearing held on October 24, 2003

From: Dennis J. Schneider
7929 Breen Av., Los Angeles, CA 90045

Attached to this cover sheet are approximated 300 pages of detailed annotated comments provided in both hard copy and on CD.

Summary:

Alternatives A, B, and C were demonstrated to be deficient in 2001. Earlier comments to the approximate 12,000 page review materials provided showed that these alternatives have unacceptable impacts on local communities and for Southern California. Although numerous comments were provided in 2001, **no responses have been provided to the public.** Although the newest alternative, Alternative D, addresses several of the prior fatal flaws and is preferable to the earlier proposed alternatives many issues remain.

LAWA and the City of LA is to be commended for their outreach efforts to verbally present their plans to the many public organizations. Plans such as the “flyaways” should be commended.

LAWA outreach for idea exchange, however, has fallen very short. The Osage Neighbors Association, which represents the eastern half of Westchester, is one of the areas most heavily impacted and has many concerns. Yet the Board of Airport Commissioner leadership, LAWA management, and the Mayor’s Office have been unable to find an available evening to meet with the ONA Board of directors during the past 14 months despite numerous requests by ONA.

Development of the alternatives has been in a restrictive environment. Documents were released in security controlled areas and anyone potentially critical of the plans was prohibited from attending. The same restricted access policy was true of the Mayor’s Blue Ribbon Committee on Manchester Square. It was held in a restricted area of LAX with specifically selected individuals. Neither handouts nor recordings were made available to the committee members; the public and press were excluded from these meetings. When an alternative plan was presented by several committee members concerned about the use of Manchester Square it was rebuffed and not seriously considered.

The approximately 6,500 pages of the Supplemental documents released in July 2003 is very tricky to read and evaluate due to persistent cross referencing between documents released in 2003 and those from 2001. Further, it is very difficult to determine the origin and dates of materials used in exhibits. Numerous times charts dated 2002 or 2003 contained only 1994-96 data without saying so. Many exhibits are sorely deficient in detail on some issues and contain conflicting information for others. The basis assumptions for specific conclusions are difficult to determine from the way in which data is presented. Broadly subjective words like “substantial,” or “minimal” are used in place of specifics.

The various alternatives (with several options inside each) are compared to a “No Action/No Project” which is unrealistic and results in a comparison of “apples to vegetables.”

Numerous critical issues in Alternative D remain unanswered or unaddressed. On that basis, alone, it should be rejected. Spending more good money just because enormous amounts of money have already been expended is a POOR justification to continue with this EIS/EIR. It should be redone due to the irrecoverable number of errors and omissions.

The Supplemental (and original) document reviews are further complicated by the page numbering differences in the electronic versions posted and the hard copy.

This Plan still concentrates over 75% of commerce at LAX resulting in an unwarranted economic risk for Southern California.

Below is a representative sample of major impact issues for Alternative D EIS/EIR

Noise

- Incomplete review of CNEL impact; changes in patterns depend on which runway configuration is implemented, mix of aircraft that actually occurs, no topology impacts are considered, frequency ranges measured (higher and lower) are not comprehensive.
- Single event (SNL) impacting level criteria are overly generous; impacts understated
- Health impacts-such as respiratory issues, learning issues, autonomic issues such as blood pressure, sleep deprivation and sleep interruptions, and gastrointestinal issues are understated.

Air analysis

- Air circulation patterns not adequately considered.
- Particles less than PM10 (ie PM2.5 studies) not done
- NOx gases not considered.

Traffic issues

- Mitigations recommended, not fixed – many to be paid by agencies other than LAWA or the city not guaranteed or funded.
- Cargo not fully controlled yet; needs separate entrance off 105 freeway.
- Traffic into the community.

Construction Impacts

- Traffic, noise, pollution
- Business impacts

Safety

Manchester Square separation from the rest of the contiguous airport.

- Ability to evacuate; how to get emergency crews there?
- Community closer to potential attacks.
- LNG facility closer to the community (northern MS area).
- Security is only as good as weakest link which may be other airports.

Substantial difference between Alt D and others that came first makes the CEQA compatibility questionable. Much of the old data from 1996 was incomplete and evaluations and comparisons with 2000 conditions does not fix the old data flaws.

Passenger Inconvenience

- Baggage handling; One stop check in needed
- Lugging baggage on APM? Handicapped, Elderly, Children, bulky items not addressed.
- Delays and transferring is inconvenient.

Consolidated Rental Car facility (RAC) would be better serving near the 105 freeway.

Impreciseness of plans; multiple options listed so impact projections can't be traced to the cost impacts on future commerce (increased fees)

Modes other than cars need consolidation and convenience; i.e. Green Line on MTA route to downtown; major bus center, cabs, level three bus routes.

Massive expenditures at LAX detracts from the possibility of the development of a practical regional solution.

Thank you for your consideration,

Dennis J. Schneider

THE FAILURE OF AMERICA'S AVIATION NOISE ABATEMENT POLICY

*Citizens
Top Priority
Concerns
About
Aviation
Noise*

EXECUTIVE SUMMARY

This study exposes the aviation industry and the Federal Aviation Administration (FAA), its federal regulatory body, as oblivious to the true impact aviation noise has on the public who live near airports as well as ignorant of the science of noise impact assessment. Based on the technique of content analysis applied to the 1,261 public comments received by the FAA concerning its draft Noise Abatement Policy 2000, this study finds that the overwhelming majority of commenters believe the FAA's noise abatement policy is a failure. 96% of the more than one thousand people who submitted comments to the FAA believe the draft Noise Abatement Policy will not adequately protect citizens from aviation noise.

KEY FINDINGS OF THE STUDY INCLUDE:

Aviation noise is getting worse

The people who actually live near airports report that the noise problem has grown, while the FAA in their draft noise abatement policy and the industry in their comments think aviation noise problem has decreased substantially. 759 commenters specifically mentioned aviation noise as a worsening problem, and 739 included this in their top three concerns.

Nighttime flights and sleep interference are citizens' greatest concerns

The top concern of citizens was sleep interference and nighttime flights. 998 commenters raised this issue, and for 968 people, it was one of their top three concerns. This is in sharp contrast to the

FAA's Noise Abatement Policy that mentioned sleep interference only four times in a 25,000 word plan, and then only tangentially. Nighttime effects are almost totally ignored by the industry and regulators.

Aviation noise is imposed on neighbors unjustly

Airport neighbors feel strongly that the FAA, airports, and aviation industry would not subject themselves to the same noise levels that they impose on neighbors. 686 people noted this incompatibility with Christian and Kantian conceptions of justice that require treating your neighbor as you would like to be treated. The solution: require that FAA and airport officials live within the FAA's significant impact zone, the 65 DNL contour around airports. If FAA officials had to live with aviation noise, the noise would be reduced drastically.

What They Said:

"With regard to the protection of public health and welfare, the FAA has previously concluded that the state of scientific knowledge 'does not support any inference of a direct, quantitative relationship between airplane noise exposure and health consequences.'"

Patricia Higginbotham for the Air Transport Association

"The 1976 Policy has been highly successful. It has guided actions over a period of almost 25 years that have substantially reduced aviation noise and its impacts. By the year 2000, the FAA estimates that there will be about 500,000 Americans exposed to significant levels of aircraft noise—down substantially from the six to seven million people exposed in 1976."

"Even as noise has been so dramatically reduced, the national aviation system, including the airport component of that system where aircraft noise is the most severe, has grown significantly in this last quarter of the century."

FAA, Noise Abatement Policy 2000

"Northwest Airlines fundamentally disagrees with the FAA's suggestion that the number of Americans impacted by aviation noise remains significant and that aggressive new measures must be taken to address aviation noise without regard to the high costs of such measures relative to the modest incremental benefits of such expensive measures."

Tom Tinkham for Northwest Airlines

"You may want to believe current policy has worked but your head is buried in the tainted soil of the aviation industry and the beltway."

Chas Feltus from the DeKalb Peachtree Airport Advisory Committee in Chamblee, GA

"Jet noise is not 'white' noise, like the hum of a fan or refrigerator. It is an intrusive, drawn-out, congested scraping noise which sounds as large as the entire sky. Worse, it is heard approaching, then peaking, then resonating repeatedly as it fades. Each jet passage is a distinct nerve-grating event, which cannot be 'tuned out.'"

Gregory Muldowney from Glen Mills, PA

Major Concerns of Commenters

Ranking of Major Issues within the Top Three Concerns of Each Commenter

More than 1,200 citizens living near airports and heliports mailed and emailed comments to the FAA in response to the draft. Overwhelmingly, they found these goals and the related policies to be insufficient. In addition, they feel the previous Policy and the subsequent laws and regulation have failed to protect their health and quality of life. The neighbors of airports report the aviation noise is a growing problem with increasing instances of interference from increased flights, and that less noisy technology has not kept up with the increase in number of flights.

The FAA will soon be releasing its revised Noise Abatement Policy. This study is designed to aid the FAA, the airline industry, and local airports' understanding of exactly what airport neighbors need. Employing the method of content analysis, this study provides an accurate image of the problems with the current and proposed noise abatement policy as seen by the people who have to live with the problems.

II. METHODOLOGY

The Noise Pollution Clearinghouse (NPC) obtained a copy of all comments submitted to the FAA. A total of 1,261 people and organizations submitted comments. An initial sample of 130 comments (approximately 10%) was read to determine the most often repeated themes and ideas within the comments. A category for each unique idea was created in a database. Categories of ideas that were mentioned by only one or two of the initial 130 commenters were eliminated to focus on the major concerns of the commenters. Since there were only 45 industry comments, their idea categories were not similarly filtered, because doing so would have virtually eliminated their concerns from this study. This process, and a few slight modifications to the categories as more comments were read, left 36 categories. (See Appendix A2 for a list and description of the categories.)

The 1,261 comments were read and checked for the presence of the 36 categories. In addition, the top three concerns of each commenter were noted. The top three concerns were taken to more accurately reflect the most important issues to neighbors (although in this paper both the top three concerns as well as all mention of the 36 categories by each commenter are presented). An idea was considered to be one of a commenter's top three concerns based on the space devoted to that idea. If three ideas were not clearly most important after this test, proximity to the beginning of the comment was used to determine importance.

III. RESULTS

1. Nighttime Flights Disturb and Interfere with Sleep

The top concern of citizens was sleep interference and nighttime flights. 998 commenters raised this issue, and for 968 people, it was one of their top three concerns. This is in sharp contrast to the FAA's Noise Abatement Policy that mentioned sleep interference only 4 times in a 25,000 word plan, and then only tangentially. From the comments, it is clear that sleep disturbance is a major concern and that less noisy Stage III aircraft have not addressed this problem. Nighttime flights prevent people from falling asleep, wake them after they manage to fall asleep, and prevent them from falling back to sleep again. Given the current aviation technology, location of airports, and scientific knowledge concerning sleep disturbance, nighttime curfews at most airports are needed to protect sleep, and thereby secure improved health and a better quality of life of people living near these airports.

That aviation noise disturbs and interferes with sleep is of little surprise to anyone who has had a flight path routed over their home. It is not uncommon for noise levels outside a home to be 90 decibels, and for interior levels to be louder than typical alarm clocks. The World Health Organization recommends that exterior levels not exceed an instantaneous value of 60 dBA and an average value of 45 dBA at night (WHO, 1999, Guidelines for Community Noise). Many communities and states also recognize the need to control nighttime noise to protect their citizens. Typical nighttime maximum levels, such as the state of New Jersey limit for residential areas, are 50 dBA.

What is truly remarkable is that the FAA has not yet taken sleep disturbance and interference seriously. An entire chapter of the Noise Abatement Policy should have been devoted to sleep disturbance and interference, yet it was mentioned only four times. Here is all the 25,000-word plan to protect citizens from aviation noise has to say about sleep:

1. "Since its inception in 1993, [Federal Interagency Committee on Aircraft Noise] FICAN has reached the following conclusions:
 - ◆ The Acoustical Society of America should form a working group tasked with development [sic] a revised standard for predicting noise-induced sleep disturbance."
2. "Current and future FICAN activities include:
 - ◆ Publishing technical positions on aviation noise topics based on definitive research by member agencies. Such topics include noise-

"For a good night's sleep, the equivalent sound level should not exceed 30 dB(A) for continuous background noise, and individual noise events exceeding 45 dB(A) should be avoided...."

Physiological Functions. *In workers exposed to noise, and in people living near airports, industries and noisy streets, noise exposure may have a large temporary, as well as permanent, impact on physiological functions. After prolonged exposure, susceptible individuals in the general population may develop permanent effects, such as hypertension and ischaemic heart disease associated with exposure to high sound levels....*

Performance. *It has been shown, mainly in workers and children, that noise can adversely affect performance of cognitive tasks. Although noise-induced arousal may produce better performance in simple tasks in the short term, cognitive performance substantially deteriorates for more complex tasks. Reading, attention, problem solving and memorization are among the cognitive effects most strongly affected by noise. Noise can also act as a distracting stimulus and impulsive noise events may produce disruptive effects as a result of startle responses.*

"Noise exposure may also produce after-effects that negatively affect performance. In schools around airports, children chronically exposed to aircraft noise under-perform in proof reading, in persistence on challenging puzzles, in tests of reading acquisition and in motivational capabilities. It is crucial to recognize that some of the adaptation strategies to aircraft noise, and the effort necessary to maintain task performance, come at a price. Children from noisier areas have heightened sympathetic arousal, as indicated by increased stress hormone levels, and elevated resting blood pressure. Noise may also produce impairments and increase in errors at work, and some accidents may be an indicator of performance deficits."

WHO, 1999, Community Noise Guidelines

While the industry is quick to deny any noise problem, they are equally quick to insist the problem has gotten better. And it is true, some aircraft have gotten less noisy. The introduction of a Stage III aircraft (among those that weigh more than 75,000 pounds) has enabled the FAA to advance the myth that aviation noise problem has decreased. People living around airports, however, report the problem is worsening. The reasons for this disconnect are many. The reduction in noise per aircraft has been more than offset by the increase in instances of interference. Moreover, less than 5% of the total number of non-military US airplanes meet Stage III requirements. Many aircraft (those weighing less than 75,000 pounds) do not have

to meet quieter restrictions, and many aircraft only marginally meet Stage III requirements. In addition, night flights, which occur at more sensitive times, have grown substantially, resulting in more instances of sleep interference. Finally, many formerly small airports have more than doubled or tripled in size, creating major problems where once only occasional overflights had once occurred.

Reliance on a Yearly Day-Night Average Sound Pressure Level as a metric and 65 dBA criterion for significant impact allows the FAA to maintain that noise impacts are decreasing while they are actually increasing. See "65 dBA is Unacceptable" below for more information concerning the inappropriate 65 DNL metric and criterion.

3. The Aviation Noise Problem is Unjust: FAA, Airport, and Airline Officials Would Not Live with this Situation Themselves

Airport neighbors feel strongly that the FAA, airport, and aviation industry officers would not subject their families to the same noise levels that they impose on airport neighbors. 686 people noted this incompatibility with Christian and Western conceptions of justice and the unfairness of the situation they endure. The "Golden Rule," the command that you treat your neighbor as you would like to be treated, is not one airports, airlines, or the FAA heeds.

The FAA steers well clear of Christian or similar secular western ethical principles. What applies to citizens on the ground, for example, that it is wrong to drive through a residential neighborhood at night, honking your horn and waking the residents, does not apply to the FAA and airlines, whose night flights wake hundreds of neighbors repeatedly.

There is an easy way to correct the inherent unfairness airport neighbors suffer at the hands of people who would not themselves live with the noise problem: require FAA and airport public employees to live within the 65 DNL significant impact contour around airports. Residency requirements exist for many municipalities across the country, such as Boston, and should be applied to the FAA and airport officials.

A residency requirement would embody the Golden Rule by employing a simple procedure that would require that public employees experience and live with the noise they permit. This procedure is akin to procedures used by five-year-olds across the country: that the one who divides the pie chooses last. Whether the issue is apple pie or aviation noise policy, this

Concerns of Commenters

Number of Commenters Supporting Each of the 36 Categories

Ranking of All Issues Mentioned by Each Commenter

SPC00309

paths – once set – must be enforceable using fines or other disincentives. Community input should be considered when choosing flight paths.

Regulate Helicopters Along with Other Aircraft

Helicopters must be subject to engine noise standards, minimum height requirements, and limitations on hovering duration. Heliports should be sited 5,000 feet away from residential areas.

Quiet Military Aviation Noise

Increase Funding for Soundproofing

Homes and public buildings must be soundproofed by the FAA so that there are no single noise events that reach higher than 45 dBA inside the building. Easements must not be required as a prerequisite for obtaining soundproofing. Multi-year funding should be considered to allow for better local planning.

Prohibit Sonic Booms Over Land

Do Not Permit "Free Flight"

Free flight would allow consistent use of the cheapest routes, even if they impose social costs on whoever is under that route. A noise abatement policy must ensure that routes are chosen to minimize the noise impact to communities.

Use Precision GPS and Other Navigation Technology to Better Track and Regulate Aircraft

GPS and other navigation technology should be used because it can keep flights on carefully designed, less disruptive flight paths, and allow violators to be identified and fined.

Do Not Use Precision GPS and Other Navigation Technology as Envisioned by the Policy

GPS and other navigation technology should not be used because it will assure that noise burdens unfairly fall on only a narrow band of residences over and over again. If it is used, paths should be spread somewhat so as to avoid overburdening a tiny section of the population.

Fund Alternative Transportation

Alternative transportation, such as high-speed rail, should be funded. If high-speed rail replaced air trips of under 500 miles, the noise situation could be greatly improved without significant sacrifices in travel time.

Address Environmental Injustice Issues

No racial, ethnic, or socioeconomic group should bear a disproportionate share of the negative environmental consequences (including noise, air, and water pollution) resulting from the operation of airports, airlines, and airplanes. The new policy must actively seek ways to abate noise for minorities and low income families.

Compensate Residents Whose Property Loses Value Due to Airports

Each year compensation should be given to homeowners and to compensate for lost value and lost quality of life.

Categories for Which a Small Number of Comments from Industry were Received:

- Wait for International Noise Standards Before Finalizing this Policy
- FAA Is Right, Noise Is a Shrinking Problem.
- Research Low Frequency Noise and Effects
- Maintain Nationwide Uniformity With Minimal Local Control
- Don't Focus On Source Noise Reduction
- Rate Noise Reduction By Results, Not Method (Like Hushkits)
- If Small Aircraft Come Under a Standard, Do a Gentle Phase-In
- If Stage IV Is Introduced, Do a Gentle Phase-In
- Don't Burden Commerce With Noise Standards
- Minimize Procedures for Air Traffic Controllers and Pilots
- DNL Is A Good Way to Analyze Noise Impact

"The information I received said that letters must be sent by Monday August 28. I am mailing this on Sunday, August 27. I am 70 years old, disabled and have been very busy this week so this is the best I can do. But I do want to protest Fed Ex. I have personally investigated the residential areas threatened by Fed Ex Noise. Two are retirement homes run by the Friends - Friends Home West on Friendly Avenue and New Garden Friends Home where I plan to move. The New Garden Friends cemetery where I plan to be buried is also in the noise cone but I don't think it will bother me there."

Jean Gordon from Greensboro, NC

"Please carefully consider - many who chose to purchase homes in airport areas when jet travel was still in the imagination of engineers are the blue collar factory workers who built the early airplanes and defense equipment insuring this country's safety. It is their spouses and their children who inhabit the homes near many of the nation's airports today. Many of those workers sacrificed their lives by exposure to various elements. Must their families continue to sacrifice quiet and air quality?"

Diane Sambrano from Inglewood, CA

"A pox on you for trying to do a 'comprehensive update...to build upon A.N.C.A....' It is bad enough that you fooled Congress into thinking the Airport Noise and Capacity Act (ANCA) would control airport capacity and limit noise. It did nothing of the kind! It was a clever way to pass control over all future regulation into your hands. It denies states' rights and the ability for voters to exercise 'the will of the people.'"

Donald Elsmore from Burbank, CA

Industry:

"Section 2 (Goals and Policies) contains the 'heart of the Aviation Noise Abatement Policy.' Unfortunately, portions of this proposed policy present serious heartburn."

Stephen Alterman for the Cargo Airline Association

"Contrary to the opinions of some parties to this debate, airlines do not fly aircraft solely to annoy local communities and politicians. Rather, the aircraft used, and the timing of the flights, are specifically designed to meet market demands."

Stephen Alterman for the Cargo Airline Association

"Moreover, with regard to the protection of public health and welfare, the FAA has previously concluded that the state of scientific knowledge 'does not support any interference of a direct, quantitative relationship between airplane noise exposure and health consequences.'"

Patricia Higginbotham for the Air Transport Association

"ATA supports FAA's confirmation that it will...maintain the priority of safety and efficient use of air space over noise mitigation."

Patricia Higginbotham for the Air Transport Association

"In particular, Northwest Airlines fundamentally disagrees with the FAA's suggestion that the number of Americans impacted by aviation noise remains significant and that aggressive new measures must be taken to address aviation noise without regard to the high costs of such measures relative to the modest incremental benefits of such expensive measures."

Tom Tinkham for Northwest Airlines

"Although each citizen benefits, whether or not they actually fly in this system, the value of this national resource to the nation is both under appreciated and threatened."

Andrew Cebula for the National Air Transportation Association

"Local opposition based on noise was identified as a major barrier to improving the Nation's airports. Aircraft noise has become the rallying point for many of these anti-airport organizations."

Andrew Cebula for the National Air Transportation Association

EXECUTIVE SUMMARY

Introduction

This document is the Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the proposed Los Angeles International Airport (LAX) Master Plan. It has been prepared to describe a new alternative for the LAX Master Plan and provide data and analyses related to the reasonably foreseeable environmental impacts of the new alternative. In response to the public comments received on the Draft EIS/EIR and the changing conditions after the September 11, 2001 terrorist attacks, a new alternative, "Alternative D - Enhanced Safety and Security Plan," has been added to the range of alternatives being considered by the Federal Aviation Administration (FAA) and the City of Los Angeles - Los Angeles World Airports (LAWA) for the proposed Master Plan.

In January 2001, the FAA and City of Los Angeles published a Draft EIS/EIR addressing three build alternatives for the Master Plan, identified as Alternatives A, B, and C, as well as the No Action/No Project Alternative. That Draft EIS/EIR was made available for public review and comment from January 18, 2001, to November 9, 2001. During that time, substantial public input was received regarding alternatives to be considered for the LAX Master Plan. Additionally, the terrorist attacks of September 11, 2001 have had a substantial influence on how airports now operate, including increased attention to, and provisions for, airport safety and security. Alternative D was subsequently formulated and refined in 2002 to provide an additional option for the LAX Master Plan.

This Supplement to the Draft EIS/EIR serves to integrate Alternative D into the existing environmental review process for the LAX Master Plan, providing a level and extent of analysis comparable to that which was previously prepared for the other alternatives addressed in the January 2001 Draft EIS/EIR. It also serves to present certain supplemental information and analysis that apply to all of the alternatives. Such information and analysis are based upon the availability of new or updated information since publication of the Draft EIS/EIR in January 2001.

This draft environmental analysis is being widely distributed to the public and to various local, state and federal government agencies so that they may comment on Alternative D and the new impact analysis during public hearings and in writing. LAWA and FAA will prepare written responses to the comments. In preparing the Final EIS/EIR, LAWA and FAA will assess and consider comments both individually and collectively, and will respond by modifying alternatives, developing and evaluating new alternatives, supplementing the analysis, making factual corrections, or explaining why the comments do not warrant further response, citing appropriate authority and reasons. LAWA and FAA will also respond by one or more of these means to the comments made on the Draft EIS/EIR and will provide their responses to comments on the Draft EIS/EIR and Supplement in the Final EIS/EIR.

Purpose and Need Statement for the Project

The purpose and need for the LAX Master Plan has not changed since the publication of the Draft EIS/EIR. An overarching consideration during the planning process has been to achieve the project objectives in an environmentally sound manner. In particular, the Master Plan project objectives are to:

- ◆ Respond to **local and regional demand** for air transportation during the period 2000-2015, taking into consideration the amount, type, location, and timing of such demand.
- ◆ Ensure that new investments in airport capacity are efficient and cost-effective, maximizing the return on **existing infrastructure capital**.
- ◆ Sustain and advance the international trade component of the regional economy and the **international commercial gateway** role of the City of Los Angeles.

Description of Alternatives Studied in Detail

The alternatives evaluated in the Draft EIS/EIR and this Supplement to the Draft EIS/EIR are the end result of eight years of the Master Plan process, ongoing scientific study, several hundred informal community meetings and an extensive formal public comment period for identification of project issues for the environmental analysis (scoping). In addition to the No Action/No Project Alternative, the Supplement to the Draft EIS/EIR and the Draft EIS/EIR analyze a total of four "build" alternatives.

If "the purpose and need for the LAX Master Plan has not changed since the publication of the Draft EIS/EIR" and there have been significant political event changes in addition to the Mayor's no expansion pledge, why is one of the three major project objectives to "Ensure that new investments in airport capacity are..." Also, we are told that the major emphasis is for "Security and Safety." Why is this not even mentioned in the list of project purpose and need?

Executive Summary

Table ES-1, Summary of Activity - Comparison of Alternatives, and **Table ES-2**, Summary of Features - Comparison of Alternatives, present key physical characteristics and projected activity levels of each build alternative as an aid to comparison to the No Action/No Project Alternative, the CEQA Environmental Baseline, and the "unconstrained" airport (e.g., number of runways, number of passengers accommodated, tons of air freight accommodated, daily flights, land acquisition, relocation of homes and businesses).

Table ES-1

Summary of Activity - Comparison of Alternatives

Activity/Facility	Environmental Baseline (1996)	Unconstrained Forecast	Planning Year 2015				
			Alternative				
			NA/NP	A	B	C	D
Passenger Activity¹							
Million Annual Passengers (MAP)	58.0	97.9	78.7	97.9	97.9	89.6	78.9

Note: Discrepancies occur between Summary of Features - Comparison of Alternatives, of The Executive Summary of the Draft EIS/EIR, and Table 3-4, Los Angeles International Airport Master Plan Summary of Facilities by Alternatives - 2015, within Chapter 3 of the Draft EIS/EIR. The information presented within **Table ES-2** of the Supplement to the Draft EIS/EIR, is consistent with that of Table 3-4 of the Draft EIS/EIR, unless otherwise noted to reflect further updates and corrections. To the extent that discrepancies exist between the table in the Executive Summary of the Draft EIS/EIR, Table ES-2 in the Supplement to the Draft EIS/EIR, and Table 3-4 in the Draft EIS/EIR, Table 3-4 and Table ES-2 are controlling.

¹ NA/NP = No Action/No Project

² Estimated future building space requirement. Actual building size will be refined as part of project-level design activities.

³ Excludes LAWA-owned on-airport properties.

⁴ MSF = Million Square Feet

⁵ This information has been revised since publication of the Draft EIS/EIR. This table uses consistent methodology for calculating NBEG based on a wingspan size factor for each nominal gate position based on the largest aircraft that can be accommodated on a particular gate. NBEG calculations in the Draft EIS/EIR converted terminal frontage to NBEG regardless of existing gate positions and their associated fixed infrastructure. Both methodologies are acceptable practice and the methodology presented herein better reflects the limitations of the existing remaining gates.

⁶ Under Alternative D, the existing vehicle trip cap for LAX Northside would be reduced to limit vehicle trips to a level comparable to that of the Westchester Southside project. As such, full development of the 4.5 million square feet of uses currently entitled for LAX Northside would not occur under Alternative D. As the exact nature and amount of land uses have not been specified to correspond with this cap, it is assumed, for purposes of impacts analysis that LAX Northside would be fully built out relative to all environmental topics except traffic and traffic-related issues such as air pollutant emission and noise.

⁷ This information has been revised since the publication of the Draft EIS/EIR. **Under Alternative A, Manchester Square is assumed to be redeveloped with commercial/light industrial uses independent of the Master Plan.**

⁸ Modified since publication of the Draft EIS/EIR to correct an error in the Draft EIS/EIR. This modification does not alter the conclusions of the Draft EIS/EIR.

⁹ Only ready-return (does not include storage support).

¹⁰ Includes airport police, central utility plant, LNG/CNG station, ground run-up enclosures, and Coast Guard building.

 If LAWA doesn't own Manchester Square, why does it assume airport use in all but Alternative A? How is it going to be procured? Eminent Domain? Why is it in conflict with the W-PdR Community Plan?

The following mitigation measure from Section 4.21, *Design, Art and Architecture Application* of this Supplement to the Draft EIS/EIR, shall be implemented to reduce visual effects from construction:

◆ **MM-DA-1. Construction Fencing (Alternatives A, B, C, and D).**

The following mitigation measure from Section 4.21, *Design, Art and Architecture Application/Aesthetics*, of this Supplement to the Draft EIS/EIR, shall be implemented to reduce potential impacts resulting from the alignment of the LAX Expressway on residents on Thornburn Street:

◆ **MM-DA-2. LAX Expressway View Analysis (Alternatives A, B, and C).**

The following mitigation measures from Section 4.21, *Design, Art and Architecture Application/Aesthetics*, of this Supplement to the Draft EIS/EIR, shall be implemented to reduce potential impacts resulting from development of the Scattergood Fuel Farm on residents on Loma Vista Avenue:

◆ **MM-DA-3(a). Scattergood Visual Effects (Alternative B).**

◆ **MM-DA-3(b). Scattergood Visual Effects (Alternative B).**

The following mitigation measures from Section 4.10, *Biotic Communities*, of this Supplement to the Draft EIS/EIR, shall be implemented to reduce potential impacts resulting from installation of navigational aids in the Los Angeles/El Segundo Dunes:

◆ **MM-BC-10. Replacement of State-Designated Sensitive Habitat (Alternative A).**

◆ **MM-BC-11. Replacement of State-Designated Sensitive Habitat (Alternative B).**

◆ **MM-BC-12. Replacement of State-Designated Sensitive Habitat (Alternative C).**

◆ **MM-BC-13. Replacement of State-Designated Sensitive Habitat (Alternative D).**

The following mitigation measure from Section 4.11, *Endangered and Threatened Species of Flora and Fauna*, of this Supplement to the Draft EIS/EIR, shall be implemented to reduce potential impacts resulting from the installation of navigational aids on the El Segundo Blue Butterfly Habitat Restoration Area:

◆ **MM-ET-2. El Segundo Blue Butterfly Conservation: Habitat Restoration (Alternatives A and B).**

◆ **MM-ET-4. El Segundo Blue Butterfly Conservation: Habitat Restoration (Alternative D).**

The following mitigation measure from Section 4.18, *Light Emissions*, of this Supplement to the Draft EIS/EIR, shall be implemented to reduce potential light and visual impacts on nearby residents resulting from development of the LAX Expressway:

◆ **MM-LI-1. LAX Expressway Lighting Assessment (Alternatives A, B, and C).**

4.2.9 Level of Significance After Mitigation

4.2.9.1 Alternatives A, B, C, and D

The level of significance after mitigation as described for Alternatives A, B, and C in Section 4.2, *Land Use* (subsection 4.2.9), of the Draft EIS/EIR has been modified to include revised and new mitigation measures as presented in Section 4.1, *Noise* (subsection 4.1.8), and *Land Use* (subsection 4.2.8), of this Supplement to the Draft EIS/EIR. The new and revised measures add specificity, clarify language, and address exposure to significant single event noise levels that could result in nighttime awakenings and classroom disruption. After accounting for these new or revised mitigation measures, which also apply to Alternative D, certain areas affected by aircraft noise associated with the proposed action would still be faced with impacts that would, under CEQA, remain significant after mitigation. Impacts that would remain significant after mitigation include:

- ◆¹ Impacts where aircraft noise levels of 75 CNEL or greater affect residential properties with exterior cognizable private habitable areas such as backyards, patios, or balconies as well as other outdoor community areas where noise would interfere with speech and other activities (this would not occur under Alternative C).

Greater outside impacts under Alt D. Why? What specific areas?

4.2 Land Use

- ◆ Interim impacts that would occur prior to completion of noise insulation or recycling of incompatible land use associated with exposure to 65 CNEL or greater noise levels, 94 dBA SEL or greater noise levels, and single event overflight noise resulting in classroom disruption as defined by MM-LU-4.
- ◆ ¹ Some school uses would still be exposed to significant single event noise impacts even after incorporation of MM-LU-4 due to high single event noise levels that would result in classroom disruption when classroom activities take place outdoors.
- ◆ Impacts on incompatible uses ineligible for insulation due to inconsistent zoning or land use designations (i.e., residential uses on land designated for industrial use);
- ◆ ² Noise impacts on substandard housing units that are not feasible to insulate due to structural ³ constraints or other factors associated with bringing properties into compliance with building codes.
- ◆ High construction noise levels would occur at residential and noise-sensitive land uses within 600 feet of construction sites.

⁵ Although increases in outdoor noise levels within the 65 to 75 CNEL contours would occur under the build alternatives, these increases would not exceed thresholds of significance. However, it is acknowledged that such increases may be perceptible and could affect outdoor speech and the quality of certain outdoor activities.

4.3 Surface Transportation

4.3.1 On-Airport Surface Transportation

4.3.1.1 Introduction

The on-airport surface transportation section addresses traffic-related issues inside the airport boundaries as more fully described in Section 4.3, *Surface Transportation* (subsection 4.3.1), of the Draft EIS/EIR. Additionally, Technical Reports 2.a, *On-Airport Surface Transportation Data* and 3.2, *On-Airport Surface Transportation Technical Report*, of the Draft EIS/EIR provide detailed supporting data regarding existing transportation operations, traffic modeling efforts and analysis of future on-airport conditions for the No Action/No Project Alternative and Alternatives A, B, and C. Technical Report S-2a, *Supplemental On-Airport Surface Transportation Technical Report*, of this Supplement to the Draft EIS/EIR, contains detailed information regarding existing transportation operations, traffic modeling efforts, and analysis of future on-airport conditions for Alternative D.

4.3.1.2 General Approach and Methodology

The analysis of On-Airport Surface Transportation presented below is based on the general approach and methodology described in Section 4.3.1, On-Airport Surface Transportation (subsection 4.3.2), of the Draft EIS/EIR. In addition, the analysis completed for this Supplement to the Draft EIS/EIR includes consideration of updates to the baseline conditions (see Section 4.3.1.3 below), and the scope of analysis for construction traffic affects of Alternative D. Changes in the general approach and methodology incorporated into this Supplement to the Draft EIS/EIR include the following:

- ◆ Existing airport conditions were defined by a traffic data survey conducted in 1995, plus additional traffic data collected in 1996 and 1997. To ensure that this data remains valid, traffic volumes entering and exiting the CTA were tabulated for the Year 2000 and compared to the original data. The findings of that comparison are described below in Section 4.3.1.3, *Affected Environment/Environmental Baseline*.
- ◆ The construction analysis for Alternative D follows the same general approach and methodology as used in the Draft EIS/EIR evaluation of the other alternatives; however, ²given that Alternative D involves substantially more modifications to the CTA and the related on-airport surface transportation system than the other alternatives, the analysis of Alternative D includes a more extensive evaluation of impacts to this system during the peak construction period. Based on the anticipated construction phasing of the components of Alternative D, the peak construction period would occur in the year 2008, whereas the assumptions for Alternatives A, B, and C addressed in the Draft EIS/EIR provided a basis to evaluate construction impacts for those alternatives in the years 2004 and 2013.

In addition to construction traffic, the number of origin and destination (O&D) passengers affects ground transportation forecasts. The airport traffic volumes used in this analysis represent peak summer airport operations. For Alternative D, the peak construction period traffic demands were determined to occur in the second quarter of 2008 and, similar to the approach used in evaluating the other alternatives, were added to the airport peak period traffic demands on an average summer weekday. The resulting traffic volumes and impacts depict the highest construction traffic scenario.

Evaluating construction impacts required two primary tasks: adding the construction traffic to the airport-related ground access demands, and reviewing the routes of the construction traffic model to determine where construction projects would adversely impact the on-airport ground access operations (e.g., detours, road closures, etc.). The construction scenario was analyzed in particular for capacity deficiencies that are expected to occur during this period.

To conduct the capacity analyses for the construction phases of Alternative D, traffic conditions were modeled with the Advanced Landside Performance Simulation (ALPS)TM computer modeling program used for the analysis of 2015 on-airport traffic conditions. ⁴Assumptions were made for the construction model with respect to the transportation network, ⁵trip generation, and trip distribution.

Table S4.3.1-1

CTA Traffic Comparison, Baseline to Year 2000

Time Period	CTA Traffic		
	Inbound	Outbound	Total
A.M. Commuter Peak Hour			
March 1997 ¹	4,100	3,280	7,380
March 2000 ²	3,760	3,170	6,930
Percent Increase/(Decrease) between 1997 and 2000	(8.3%)	(3.4%)	(6.1%)
Airport Peak Hour			
August 1996 ³	5,910	5,380	11,290
August 2000 ⁴	6,500	5,600	12,100
Percent Increase/(Decrease) between 1996 and 2000	10.0%	4.1%	7.2%
P.M. Commuter Peak Hour			
March 1997 ⁵	4,160	4,480	8,640
March 2000 ⁶	4,390	4,410	8,800
Percent Increase/(Decrease) between 1997 and 2000	5.5%	(1.6%)	1.9%
Combined Peak Hours			
1996 / 97	14,170	13,140	27,310
2000	14,650	13,180	27,830
Percent Increase/(Decrease) between 1996/97 and 2000	3.4%	0.3%	1.9%

¹ Peak hour defined as 8:00 a.m. to 9:00 a.m.; Source: Update Existing Conditions to 1996, On-Airport Transportation; June 9, 1998; Leigh Fisher Associates.
² Average of peak hour traffic on March 17 and 24, 2000
³ Peak hour defined as 11:00 a.m. to 12:00 noon.; Source: Update Existing Conditions to 1996, On-Airport Transportation; June 9, 1998; Leigh Fisher Associates.
⁴ Average of peak hour traffic on August 4, 11, and 18, 2000
⁵ Peak hour defined as 5:00 p.m. to 6:00 p.m.; Source: Update Existing Conditions to 1996, On-Airport Transportation; June 9, 1998; Leigh Fisher Associates.
⁶ Average of peak hour traffic on March 17 and 24, 2000

Source: Los Angeles World Airports, LAX AVI Traffic Count Data; Landrum & Brown, 2003.

The results of the surveys completed for Year 2000 conditions showed no material or consistent change in traffic growth or reduction in on-airport traffic since August 1996/March 1997. Although some traffic did shift between peak hours, the overall change in traffic was minimal. The slight increase in the combined peak hour traffic volumes (1.9 percent for total traffic) indicates that the continued use of the 1996/97 traffic volumes as the baseline for analysis is a conservative approach, since the lower existing volumes would result in a larger change in traffic resulting from the projects. This would lead to an indication of more impacts resulting from the build alternatives. Further, there were no material infrastructure changes that were not already anticipated between 1996/97 and 2000 (i.e., improvements that were already planned and approved, as accounted for in the No Action/No Project Alternative).

- ◆ The airport provides both close-in and remote parking for short-term and long-term parking patrons, as illustrated in **Figure S4.3.1-2**, Existing (1996) Parking Levels of Service. **Table S4.3.1-2**, Public Parking Comparison, Baseline to Year 2000, provides a comparison of the public parking demands at LAX from the August 1996/March 1997 baseline to Year 2000. Similar to the CTA traffic comparison, there is no material or consistent change in the parking demand between the baseline years and Year 2000. The March comparison shows that parking slightly decreased between the baseline year and 2000, while the August analysis shows that parking slightly increased during that month.

RE: Mayor Hahn's LAX Master Plan Proposal

Although, Mayor Hahn's recent proposed LAX Master Plan Alternative was intended to focus on "safety and security" issues, it has become apparent that there are very serious flaws in this proposal.

A recent Rand Corp. study has indicated that congregating all commercial passengers in one location increases the risk and harm to a greater number of people by a terrorist attack.

The added inconvenience of additional time required to be screened and transported to the airline terminals encourages business and wealthy travelers to engage private business jets, charters, and fractional share aircraft for transportation. These general aviation options are not regulated as strictly as commercial aircraft nor are the aircraft or their passengers screened for security purposes at LAX or any general aviation airport in the area.

I urge Los Angeles World Airports (LAWA) to thoughtfully consider the risks of this proposal and to address the lack of security at the general aviation passenger access to LAX at the Imperial entrance. In addition, encourage the FAA to increase security standards nationwide for access to all general aviation areas and other airports with general aviation traffic.

Sincerely,

Annie Sabroux.

RE: Mayor Hahn's LAX Master Plan Proposal

Although, Mayor Hahn's recent proposed LAX Master Plan Alternative was intended to focus on "safety and security" issues, it has become apparent that there are very serious flaws in this proposal.

A recent Rand Corp. study has indicated that congregating all commercial passengers in one location increases the risk and harm to a greater number of people by a terrorist attack.

The added inconvenience of additional time required to be screened and transported to the airline terminals encourages business and wealthy travelers to engage private business jets, charters, and fractional share aircraft for transportation. These general aviation options are not regulated as strictly as commercial aircraft nor are the aircraft or their passengers screened for security purposes at LAX or any general aviation airport in the area.

I urge Los Angeles World Airports (LAWA) to thoughtfully consider the risks of this proposal and to address the lack of security at the general aviation passenger access to LAX at the Imperial entrance. In addition, encourage the FAA to increase security standards nationwide for access to all general aviation areas and other airports with general aviation traffic.

1 LOS ANGELES, CALIFORNIA MONDAY, AUGUST 11, 2003

2 6:05 O'CLOCK P.M.

3 ---oOo---

4
5 MS. SMITH: Good evening, ladies and gentlemen. On
6 behalf of the Federal Aviation Administration and
7 Los Angeles World Airports, I want to welcome you to a
8 first of a series of public hearings to receive your
9 testimony on the Los Angeles Airport Master Plan and
10 Environmental Impact Statement and Environmental Impact
11 Report.

12 My name is Shauna Bain Smith. I will be your
13 facilitator this evening. The two gentlemen to my right
14 will be receiving your testimony this evening.

15 Before we start the formal proceedings, they
16 each have introductory remarks that they'd like to make
17 to you. We'll start with Mr. David Kessler, who is an
18 environmental protection specialist with the Federal
19 Aviation Administration.

20 Mr. Kessler.

21 MR. KESSLER: Thank you. Good evening, ladies and
22 gentlemen. My name is David Kessler. I'm the
23 environmental protection specialist for the Airport's
24 Division of the Federal Aviation Division,
25 Western-Pacific Region.

1 I'd like to welcome you to the first of a
2 series of public hearings the FAA and Los Angeles World
3 Airports, or LAWA, are conducting for a Supplement to
4 the Draft Impact Statement, Draft Environmental Impact
5 Report, or EIS/EIR, for the proposed Master Plan at
6 Los Angeles International Airport.

7 The Supplement to the Draft EIS/EIR addresses
8 an additional Alternative, Alternative D, the Enhanced
9 Safety and Security Plan that was added in the fall of
10 2001. This new alternative was added as a result of
11 comments submitted on the 2001 Draft EIS/EIR and the
12 terrorist attacks that occurred on September 11th, 2001.

13 The notice of availability of the Supplement
14 to the Draft EIS/EIR was published in various local
15 newspapers and in the Federal Register on Friday, July
16 11, 2003. The FAA and LAWA are the authors of the
17 Supplement.

18 The Federal Highway Administration is also a
19 cooperating agency in the preparation of the Draft
20 EIS/EIR that was published in January 2001. Both the
21 2001 Draft EIS/EIR and the 2003 Supplement have been
22 prepared pursuant to the National Environmental Policy
23 Act.

24 The purpose of these hearings is to collect
25 comments from the general public concerning the adequacy

1 of the information disclosed in the Supplement to the
2 Draft EIS/EIR on the proposed Alternative D.

3 I would like to take this opportunity to make
4 sure that everyone understands that no decision will be
5 made today regarding this proposed project. Today's
6 hearing is not a question-and-answer type of forum. Our
7 job is to listen to what you have to say about the
8 adequacy of the information in the Supplement to the
9 Draft EIS/EIR. In other words, it's your turn to talk
10 to us.

11 Since we are here to listen, we're not going
12 to respond to questions about the pros and cons of the
13 proposed project. Since 5:00 o'clock this afternoon we
14 have held a workshop just outside this room for anyone
15 to ask questions about the Master Plan, the
16 environmental process, and the various proposed
17 projects.

18 Following publication of the Supplement to the
19 Draft EIS/EIR for review and comment, the next step in
20 the joint Federal and State environmental disclosure
21 process is holding this and other public hearings during
22 this week and next week. I would like to take this
23 opportunity to recap the environmental disclosure
24 process for this project.

25 The environmental evaluation for the LAX

1 Master Plan began in 1997 with the publication of the
2 Notice of Intent to prepare the joint EIS/EIR in the
3 Federal Register. In July of 1997, we held a series of
4 meetings with members of the public and governmental
5 agencies to receive comments on the scope of the Draft
6 EIS/EIR.

7 Following those meetings, the Draft EIS/EIR
8 was published in January 2001. Both the 2001 Draft
9 EIS/EIR and the 2003 Supplement have been prepared
10 pursuant to the National Environmental Policy Act of
11 1969, or NEPA, the Council on Environmental Quality
12 Regulations, which are the implementing regulations for
13 NEPA, the California Environmental Quality Act of 1970,
14 or CEQA, and the Airport and Airway Improvement Act of
15 1982, as amended.

16 Following today's hearings and the close of
17 the comment period, we will then correct and revise the
18 EIS/EIR as necessary based on the comments received. We
19 also prepare responses to comments we receive and
20 include those responses along with those that were
21 submitted to the FAA and LAWA on the 2001 Draft EIS/EIR
22 in the Final EIS/EIR. The information contained in the
23 Supplement will also be combined with the information in
24 the 2001 Draft EIS/EIR into the Final EIS/EIR.

25 Before we begin receiving verbal comments,

1 we'd like to let you know the ground rules of this
2 hearing. First, as I said earlier, we are not here to
3 respond to questions about this project. We are only
4 here to listen to your comments and take notes. We also
5 have a court reporter present to ensure that we have an
6 accurate transcript of this hearing.

7 For anyone wishing to speak, we ask that you
8 fill out a speaker card, like this one, and give it to
9 one of the people at the sign-in desk. The cards will
10 then be brought up here to our facilitator. We will
11 then call the names of each speaker so we could proceed
12 in an orderly fashion.

13 So that everyone gets an opportunity to
14 provide verbal comment, everyone will get three minutes
15 to speak. To be fair to everyone, we are not going to
16 allow people to transfer their allotted time to someone
17 else. I ask that when you speak, you give us your name
18 and address for the record. We also have a Spanish
19 language translator for anyone wishing to provide their
20 comments in Spanish.

21 If there is anyone who is uncomfortable
22 speaking in front of a group or if you need more than
23 three minutes to provide your comments, we ask that you
24 provide your comments in writing. We have comment
25 sheets, like this one, available for use at the sign-in

1 desk. You can leave your comments at the sign-in desk,
2 or you can mail your written comments using the comment
3 sheet or a letter to either address listed on the cover
4 of the Supplement to the Draft EIS/EIR.

5 I would like you to understand that a verbal
6 comment is just as important as a written comment. So
7 please feel free to provide any comments on the document
8 you may have to us either verbally today or in writing.

9 At this time comments on the Supplement to the
10 Draft EIS/EIR are due by 5:00 p.m. Pacific Daylight
11 Time, on Monday, August 25th, 2003. The FAA is
12 currently considering a request from LAWA to extend the
13 public comment period to a total of 120 days.

14 At this time no decision has been made on
15 LAWA's request. If the FAA agrees to extend the comment
16 period, a notice announcing any extension will be
17 published in the Federal Register and in local
18 newspapers of general circulation.

19 Lastly, I would like everyone to know that
20 even though we have this meeting scheduled until
21 9:00 o'clock this evening, we will stay here as long as
22 necessary for everyone to get a chance to provide verbal
23 comments on the Supplement to the Draft EIS/EIR. As I
24 said earlier, our job here today is to listen to your
25 comments.

1 Now I will return the hearing back to our
2 facilitator, to introduce Mr. Jim Ritchie, who will
3 provide some introductory comments from LAWA. Following
4 Mr. Ritchie's comments, we will collect the speaker
5 cards and call the name of the first speaker. Thank
6 you.

7 MS. SMITH: Thank you, Mr. Kessler. I would next
8 like to introduce Mr. Jim Ritchie, who is the Deputy
9 Executive Director of Los Angeles World Airports.

10 Mr. Ritchie.

11 MR. RITCHIE: Good evening, ladies and gentlemen.
12 I'm Jim Ritchie. And on behalf of Los Angeles World
13 Airports, I would like to welcome you tonight to the
14 first public hearing at the Radisson Hotel.

15 This is one of a series of public hearings
16 incidental to the environmental review process. You may
17 recall the public hearing process in 2001 while we were
18 examining other alternatives for the modernization of
19 Los Angeles International Airport.

20 The tragic events of 2001 and the leadership
21 of Mayor Jim Hahn have reshaped our environmental
22 process. The Mayor's pressing concerns for safety and
23 security provided new guidance along with the public
24 comments received during the public comment period from
25 January to November of 2001. You are here tonight

1 primarily to provide comment on that new Alternative
2 referred to as Alternative D.

3 This is a supplement to the existing
4 environmental process, and it has undergone a rigorous
5 environmental review. We are here tonight to receive
6 your comments on this new Safety and Security Plan and
7 its impacts as disclosed in the Supplement to the Draft
8 Environmental Impact Statement/Draft Environmental
9 Report.

10 So with that, Shauna, please conduct the
11 meeting.

12 MS. SMITH: Thank you, Mr. Ritchie.

13 Again, my name is Shauna Bain Smith. And as
14 your facilitator, I'm here to ensure that everyone who
15 wishes to speak is able to do so in a timely and orderly
16 fashion. This high-tech clock here is going to be my
17 new best friend, and it's going to help you as well.

18 If you wish to speak, as Mr. Kessler
19 mentioned, I need you to fill out one of these cards
20 that you could find at the sign-in table. After you
21 fill it out, I need you to turn it in at the sign-in
22 table as well.

23 When you come up to the microphone, I need you
24 to state your name clearly and as slowly as possible so
25 that our court reporters can get your name into the

1 official record. After you speak your name, then I will
2 start the timer. I won't start the timer until after
3 you've said your name and address, and your three
4 minutes will begin at that time.

5 When you have 30 seconds of time left, you'll
6 see this yellow light flash. And at that time it's
7 probably a good idea to start wrapping up your remarks.
8 When your three minutes is completed, you will hear a
9 beep tone.

10 At that time if you still feel like you have
11 to make more remarks or need more time, as Mr. Kessler
12 mentioned, you can use one of those forms there to do
13 some written remarks, or we will allow you to fill out
14 another public speaking card here.

15 And after everyone has had a chance to speak
16 at least once in our first round, you will be permitted
17 to speak again if necessary.

18 One more thing. As you come up to speak, if
19 you come up to the podium on my right, I would
20 appreciate it if you would exit to your left and go back
21 to your seat through one of those aisles, only so that
22 we don't get a back log here in the center. And if you
23 speak at the podium on my left, you exit to the right.

24 I'm going to call three speakers at a time, so
25 you could begin to prepare to come up after the first

1 speaker is finished. And I will call your names in the
2 order you will come up to the podium. Without further
3 ado, I will call our first speakers.

4 Mr. Jack Byun, Piedmont Brown and Sam Bell, in
5 that order, please. Mr. Byun first.

6 MR. BYUN: Good evening, ladies and gentlemen. My
7 name is Jack Byun. I'm here today to speak in support
8 of Alternative D of the LAX Master Plan. As a business
9 leader in Korean Community, I appreciate Mayor Hahn's
10 efforts to modernize LAX while mitigating the impacts in
11 the surrounding community.

12 Mayor Hahn has made it his priority to ensure
13 that first and foremost safety and security, as there is
14 traveling convenience in the new design of the
15 Alternative D. The development of the Alternative D
16 will make significant improvements to the airport, will
17 bring state-of-the-art facilities and concessions. The
18 modernization of the airport will be a major business
19 attraction encouraging international tourists.

20 LAX is the third largest international gateway
21 in the United States, and it's international gateway has
22 reinforced its gross as a passenger and cargo hub. The
23 economy benefits to local and regional business will be
24 multiful. The 23 million annual visitors to Los Angeles
25 spends about \$10 billion. This translates to 5.4

1 billion in personal income for the residents of
2 Los Angeles.

3 We look forward to working closely with Mayor
4 Hahn and supporting his innovative Alternative D that
5 promotes business and travel in Los Angeles.

6 The LAX Master Plan means improved airport
7 safety. Alternative D modernized the airfields to
8 improve safety for aircraft, traveling passengers and
9 airport workers. Lax Master Plan means improved airport
10 security. Alternative D provided for multiple layers of
11 security protection for the traveling public, airport
12 workers and the surrounding communities.

13 Also Alternative D permits all observation and
14 assessment of passengers and baggages. LAX Master Plan
15 supports a regional transportation plan. Alternative D
16 addresses community interest and concern. Also LAX
17 Master Plan means modern airports.

18 Alternative D offers a redeveloped central
19 terminal area that provides for increased security
20 screening and enhanced passenger conveniences. And,
21 also, an automated people mover offers convenient access
22 from the new facilities to the central terminal area
23 every two minutes.

24 MS. SMITH: Thank you, Mr. Byun.

25 Mr. Piedmont Brown.

1 MR. BROWN: My name is Piedmont Brown. I live at
2 2057 South Atlantic Boulevard in Los Angeles. I
3 represent the Ironworkers of Local 433 and as being a
4 citizen of L.A., I think L.A. sets a trend not only for
5 this country but for the whole entire world.

6 Alternative D offers a long-awaited, greatly
7 needed modernization, especially in the light rail
8 transportation. As I've flown around through the U.S.,
9 I've seen Detroit. Orlando has this. It's very
10 convenient. It helps their elderly people. It gets you
11 to and from the airport in an orderly and conductive
12 manner. It also reduces congestion and pollution. And
13 being a citizen of L.A., this is very important for me
14 as I'm sure the people here amongst us.

15 And most important, the Alternative D offers
16 aviation safety, safety at the airport and security, the
17 best state-of-the-art that is offered in the world.

18 With this, I would like to conclude this and
19 thank you for letting me speak here.

20 MS. SMITH: Thank you.

21 Mr. Sam Bell.

22 MR. BELL: Good evening. My name is Sam Bell. I'm
23 a President of Los Angeles Business Advisors, 333 South
24 Hope Street, Los Angeles, California 90071.

25 It's a pleasure for me to be here tonight

1 representing our group, which is a group of business
2 executives, which our employers maintained the largest
3 presence of some of the larger companies in Los Angeles.
4 That is my role to representative them.

5 We want to first congratulate Mayor Hahn, Jim
6 Ritchie, the LAWA staff on the progress today. We think
7 they've done a fine job in addressing a major
8 infrastructure issue that faces the Southern California
9 region.

10 I think we can all realize but maybe not
11 appreciate the impact of LAX being the huge economic
12 engine that it is for the Southern California area.
13 Sometimes, unfortunately, we don't recognize the need
14 and the role that a huge economic engine like that plays
15 until we're faced with challenges and changes and
16 modifications to that.

17 The local impact for the Southern California
18 region of LAX is like \$26 billion dollars a year,
19 180,000 jobs. Someone said it's the largest -- it's one
20 of the three gateway airports of the United States.
21 Twelve percent of international passengers across the
22 country flow through LAX.

23 But there is one problem. LAX is old. It's
24 antiquated. It's unsafe and it's vulnerable. It's
25 really vital that we modernize and make it more safe for

1 our passengers and for the people moving through the
2 airport that work there.

3 The last modification took place 20 years ago.
4 It's designed for 707 aircraft, an aircraft that is old.
5 We have new generations of aircraft coming on board day
6 to day, and L.A.'s will be coming on board within the
7 next couple of years. Of course, we've got the major
8 challenges faced in the aftermath of 9-11.

9 So we've got to do something long-term-wise
10 relative to economic viability to the airport. LAX is
11 the linchpin for the Southern California regional
12 airport transportation system. Obviously, we've got to
13 implement the new safety and security guidelines at the
14 airport that will make it safe.

15 We feel Alternative D addresses these issues.
16 Public comment period is useful. It's constructive.
17 I'm sure we'll get great comments coming from that that
18 could be built into the final model. But our mission
19 here tonight and what we want to do is to encourage you
20 to keep moving and keep moving rapidly.

21 The worse thing that could happen to us is to
22 do nothing. It would be a financial disaster for the
23 economy, and it would be totally unsafe for the people
24 working and moving through LAX.

25 Again, we congratulate you for the progress,

1 and we encourage you to move forward steadfastly, and
2 thank you for your time.

3 MS. SMITH: Thank you, Mr. Bell.

4 Before I call our next speakers, can I remind
5 all of our audience members to please keep your
6 conversation to a minimum. We are trying to make sure
7 everyone's speaking gets into the official record, and
8 our court reporters need to be able to hear them. It's
9 hard to hear when people are speaking in the audience.
10 I would appreciate that. Thank you.

11 Our next three speakers are Kelly McDowell,
12 Charles Chung and Bart Reed, in that order, please.

13 Mr. McDowell.

14 MR. MCDOWELL: Good evening. I'm Councilmember
15 Kelly McDowell representing the City of El Segundo.
16 Given the length and the complexity of the Master Plan
17 and the environmental documents concerned with it, our
18 full comments on the technical issues presented will not
19 be ready for some time, and my City's comments tonight
20 are preliminary in nature because of that.

21 We continue to oppose Alternatives A, B and C
22 for the many reasons the City expressed both orally and
23 in writing during the public review and comment period
24 for the Draft EIS/EIR in the year 2002.

25 El Segundo has not endorsed Alternative D, but

1 we feel its stated objectives support a regional
2 aviation approach. My City supports an alternative with
3 fewer environmental impacts. We would like to see the
4 adverse impacts of the airport minimized and mitigated
5 to the greatest extent possible.

6 El Segundo supports enhanced safety and
7 security at LAX, and my City supports an alternative,
8 that by its design, will accommodate passenger and cargo
9 levels no greater than the physical capacity of the
10 airport as it exists today.

11 Limiting LAX's capacity to its current
12 capacity has always been our number one goal, and we
13 believe that limiting LAX's capacity will allow other
14 airports in the region to develop and handle a fair
15 share of future regional aviation demand, will result in
16 fewer environmental impacts and will improve safety and
17 security at the airport.

18 However, my City is greatly concerned about
19 the impacts of south side airfield changes that would
20 move the southernmost runway 50 feet closer to
21 El Segundo.

22 LAWA has stated that it believes these changes
23 are necessary to improve runway safety. However, we are
24 currently studying the impacts of the reconfiguration
25 and the options for the southern runway complex.

1 In particular, we urge full public
2 consideration of the end-around taxiways as an
3 alternative that could provide greater safety at lower
4 cost and with fewer burdens on local communities.
5 Safety at LAX must be a priority for everyone.

6 The City is prepared to support measures
7 necessary to enhance safety, even if those measures
8 increase our burden, but only if we are assured, through
9 an independent expert, that other alternatives are not
10 equally effective.

11 In conclusion, we are grateful for Mayor
12 Hahn's responsive leadership and his pledge to constrain
13 growth at LAX and to foster a regional approach to
14 meeting future aviation demand in our region.

15 It is our hope that the ultimate outcome of
16 this Master Plan process will be a regional airport
17 approach that ensures that LAX does not exceed its
18 current capacity. Thank you.

19 (The statement submitted for the
20 record was marked as Statement 1
21 and is attached hereto.)

22 MS. SMITH: Thank you, Councilmember McDowell.

23 Charles Chung.

24 MR. CHUNG: Good evening. My name is Charles Chung,
25 President of Korean-American Citizen's League of

1 Los Angeles, also chairman of Korean-American Federation
2 of Los Angeles.

3 I am here today in support of the Mayor LAX --
4 (Cell phones are ringing in the audience.)

5 MS. SMITH: Mr. Chung.

6 MR. CHUNG: Yes.

7 MS. SMITH: Excuse me. I apologize for
8 interrupting. Can I please ask that everyone turns off
9 their cell phones and any other devices in the audience,
10 please. I'll give you an opportunity to do that.

11 UNIDENTIFIED SPEAKER: Could you do something about
12 the people that are standing in the doorway?

13 MS. SMITH: And, also, if I can ask the spectators
14 and audience members that are standing near the back,
15 you are welcome to take a seat. We have plenty of empty
16 seats here, but I must ask that you carry your
17 conversations to outer parts of this area, please.
18 Thank you.

19 MR. CHUNG: I am here today in support of the
20 Mayor's LAX Master Plan.

21 Los Angeles is the second largest
22 transportation in the United States for international
23 visitor. About 5.5 million international tourists visit
24 Los Angeles in 2000. International tourists spend five
25 times more than what rest of travelers would spend. We

1 appreciate Mayor Hahn's leadership in the showing of the
2 importance of the international market. Now we stand
3 together for subject of this L.A. Master Plan. Thank
4 you.

5 MS. SMITH: Thank you.

6 Bart Reed.

7 MR. REED: Before I start, could you ask the people
8 to turn their cell phones off? You asked them and they
9 didn't pay any attention. There are like seven cell
10 phones still going.

11 MS. SMITH: Thank you, Mr. Reed. While we have
12 people speaking up here, if you could respect them and
13 make sure all cell phones or any other electronic
14 devices are turned off or put on mute, any electronic
15 devices, please. If you have a watch or anything of
16 that nature, out of respect for the speakers and of our
17 court reporters, we would appreciate that.

18 And after Mr. Reed we'll have Walter Dahlem
19 and Michael Collins. Thank you, Mr. Reed.

20 MR. REED: Hi. I'm Bart Reed, Executive Director of
21 the Transit Coalition, a Sylmar-based non-profit that
22 works on transportation mobility for our region.

23 Simply put, we are concerned since the MTA has
24 no money to pay for the Green Line extension to
25 Westchester, the notion of such an extension should fall

1 under the traffic and/or environmental mitigation with
2 the final EIR of any Alternative D, including a specific
3 design, preferably one that has the written blessing of
4 the FAA, because that's who blocked the last extension
5 of the Green Line ten years ago or so.

6 Our goal of the Friends of the Green Line,
7 which is a non-profit organization that I'm the
8 executive director of in addition to the Transit
9 Coalition, is that we would like to see the Green Line
10 connect to the Ground Transportation Center wherever it
11 ends up to be.

12 Manchester Square is being discussed as a site
13 for the Ground Transportation Center solely because it's
14 on the drawing board as the current site, but our group
15 is neutral as to where the actual location should be.

16 The Green Line Westchester Extension would
17 enhance the usefulness of the people mover that is being
18 proposed by connecting it to the local hotels and
19 businesses. We are here for the economic vitality of
20 the area.

21 A people mover has one function, to connect
22 the airport to the parking center, but the Green Line
23 adds a mitigation to the airport rather than -- and in
24 addition to mitigations of roads, is a legitimate
25 mitigation.

1 We support the LAWA people mover for airport
2 transportation purposes, but not as a people mover that
3 would harm our regional transportation efforts such as
4 getting in the way of the Green Line and aviation.

5 Friends of the Green Line recommends a direct
6 connection of the Green Line to the Ground
7 Transportation Center as an alternative to the
8 potentially duplicative Intermodal Transportation
9 Center, which is adjacent to the Aviation/Imperial Green
10 Line station.

11 A direct Green Line Ground Transportation
12 Center connection would not interfere with the people
13 mover designed to connect parking lots C and D with the
14 Ground Transportation Center, but it instead would offer
15 a separate rail-and-car-bound -- it would adjust those
16 traffic issues.

17 Federal funding for both a rail connection
18 from the south along the MTA Harbor Subdivision is also
19 useful because it is right outside the Ground
20 Transportation Center. The MTA Harbor subdivision
21 connects between LAX and L.A. Union Station. It's a
22 rail line that already exists. It just needs to be used
23 as a mitigation to the airport.

24 As far as rail connections, as I just
25 mentioned, between north and Downtown, it might be a

1 better argument for L.A. related traffic mitigation
2 than the Green -- it just might be a better argument.

3 The northern connection of the Green Line
4 would be -- okay. The northern connection would be from
5 the previously planned Westchester extension and from
6 Downtown and Inglewood via the MTA Harbor Subdivision to
7 the Ground Transportation Center.

8 And in closing, I want to say the Bay area
9 just established a rail/airport connection, and Orange
10 County has just started last week looking into its own
11 airport/rail connections via the Centerline project.
12 L.A. County should strive for nothing less than its own
13 rail connections to the airport as a mitigation for
14 traffic. Thank you.

15 MS. SMITH: Thank you, Mr. Reed.

16 MR. REED: I want to enter our brochure into the
17 record, too.

18 MS. SMITH: Can you give it to her?

19 MR. REED: Sure.

20 MS. SMITH: Thank you.

21 (The brochure and statement submitted
22 for the record was marked as
23 Statement 2 and is attached hereto.)

24 MS. SMITH: Mr. Dahlem. Walter Dahlem?

25 MR. DAHLEM: I'm going to pass.

1 MS. SMITH: Mr. Michael Collins. And after that,
2 Michael Scavo and Gene Brewer, please.

3 MR. COLLINS: Hello. I'm Michael Collins, Executive
4 Vice President of L.A., Inc., the Convention & Visitors
5 Bureau. And I'm here in support of the Master Plan that
6 is before you.

7 Again, I want to represent the industry that
8 we work with; and that is, indeed the second largest
9 economic engine in this community. It's \$10 billion
10 dollars a year in direct income, 23 million visitors and
11 reportedly 240,000 jobs.

12 LAX in our minds is the shelf upon which our
13 customers buy L.A. It is fundamental to all of those
14 very large numbers that I just rattled off, which are
15 inclined by the repetition to become unimportant. But
16 it is the method by which this economy works, and it
17 can't be overstated.

18 The Master Plan has, as anyone could see out
19 there, hundreds, if not, thousands of pages of detail.
20 And there is and there will be lots and lots of
21 discussion about those details, and those discussions
22 are merit, I'm sure.

23 But I am here to ask that the strategic
24 perspective reflected in this plan not get lost in the
25 discussion of all of those very important details.

1 There are three parts to this strategy, the strategic
2 perspective that I hope the discussion could continue to
3 focus on, because they are elemental to the success of
4 the business I just mentioned.

5 One is building a safe and secure facility.
6 It goes without saying that that is something
7 fundamental to the success of any such facility. Sadly,
8 it has become absolutely crucial, not only from a
9 practical perspective, but from a perceptual dimension,
10 that is, our customers both in the consumer and in the
11 travel industry will need to know that that is the first
12 priority.

13 Second strategic perspective is designing an
14 airport that maintains L.A.'s status as an international
15 gateway. There are cities all over the United States
16 building very long runways. Everyone seeks the same
17 customer, the international customer. Either we build a
18 user-friendly facility for this customer, or they will
19 go elsewhere. And they are being given reasons to do
20 that every single day.

21 And the last part of this strategic
22 perspective, that I hope we can maintain a focus on, is
23 that this plan recognizes a truth. And it's a very
24 controversial one, I know; that demand for air travel
25 cannot be built for Southern California; that demand for

1 air travel cannot be built on the backs of the citizens
2 of a single city.

3 This plan addresses a truth that there must be
4 a regional solution to what is clearly a regional
5 demand. Thank you very much.

6 (The statement submitted for the
7 record was marked as Statement 3
8 and is attached hereto.)

9 MS. SMITH: Thank you.

10 Mr. Scavo. Either one.

11 MR. SCAVO: Michael Scavo. I live at 18355 Figueroa
12 in Gardena. I am a representative for the Steamfitters
13 Union of Los Angeles. But, actually, when I got here, I
14 decided that I was going to speak as a frequent flyer
15 out of LAX, and I am going to speak on what I consider
16 almost an invasion of sensibility and an invasion of my
17 rights as a human to fly anymore, which is why I decided
18 to drive the last time I went to Indianapolis where I'm
19 building a race car for the Indy 500 next year.

20 The last time I flew, I had to leave very
21 late. I had to fly overnight just to be able to beat
22 the hassle of what the security process is at LAX, which
23 is why I applaud this pamphlet right here that I read.
24 This will bring this airport up to the reason why other
25 people are flying out of Long Beach and flying out of

1 Orange County and smaller airports because it is
2 consumer and customer friendly.

3 The way that they have the security at LAX,
4 it's almost offensive to fly out of the airport for me.
5 I sometimes want to turn around and walk away and go
6 back. That's not what this city deserves and that's not
7 what the city was planning on.

8 Due to 9-11 we had to update it, but it's all
9 in the wrong spots. There is no spot for it. No right
10 spot for it. What this plan will do is it will make a
11 more user-friendly airport. Okay.

12 The last time this airport was updated was
13 1984. It was updated for the Olympics. I think it was
14 finished probably in '82. It's 20 years outdated. And
15 I applaud Mayor Hahn for this safety alternative. I
16 thank you very much.

17 MS. SMITH: Thank you, Mr. Scavo.

18 Before I call Mr. Brewer -- you could come up
19 Mr. Brewer. Before you start speaking, I just want to
20 make another announcement that we do have a Spanish
21 translator available if anyone should need a translator.

22 Mr. Brewer.

23 MR. BREWER: Yes, ma'am, Ms. Smith, Mr. Kessler and
24 Mr. Ritchie, my name is Gene Brewer. I represent the
25 Teamsters Local 986, at 1198 South El Monte, California.

1 I am a business representative of the
2 Construction Division of the Teamsters, which is the
3 largest Teamsters Local west of the Mississippi river
4 with a membership in our Local of 16,000 members.

5 Not only does our Local represent construction
6 workers, but we represent warehouse members. We
7 represent manufacturing members. We represent retail,
8 food processing members, airline mechanics and pilots,
9 convention industry, plus a wide variety of other types
10 of professions which are affiliated with the L.A.
11 Airport.

12 We know that this proposal Number D projects
13 benefits that will create nearly 49,000
14 construction-related jobs in Los Angeles County. We
15 know that its projected that we will result in 350,000
16 direct jobs in the region at all skill levels in the
17 year 2015. And we know it will generate \$63.7 billion
18 annual economic activities for the region by 2015 with
19 \$22 billion annually going to the City of Los Angeles.

20 But to me, the 128,000 Teamsters that are
21 represented here by joint council, 42 in Southern
22 California, the most important point is that the
23 proposal will improve the security and safety of the
24 airport.

25 And believe me, after the unforgivable

1 incident on September the 11th, 2001, we need to have
2 safe airports not only here in Los Angeles but across
3 the entire nation of ours.

4 Mayor Hahn's Master Plan Proposal D for the
5 LAX is a must, and the Teamsters of Southern California
6 endorse his proposal. Thank you.

7 MS. SMITH: Thank you very much.

8 Our next speakers will be Peter Woo, Richard
9 Slawson and Jim Hilfenhaus. In that order, please.

10 Mr. Woo.

11 MR. WOO: Good evening. My name is Peter Woo. I'm
12 the President of Historic Council, Neighborhood Council,
13 an entity funded by the City Charter of 1999, and we are
14 elected by shareholders in our district. The district
15 comprises of Little Tokyo, Chinatown District. I am
16 coming here to testify and to propose to you to accept
17 this Plan D for the modernization of LAX.

18 We all know the airport was built in 1950.
19 The only time we modernized it was in 1984. It was
20 originally a loop runway with terminals situated on the
21 side. Later, because of the necessity, we
22 double-stacked the roadway and we have two levels.

23 The problem of that is air travel is a
24 necessity for everyone now. It is no longer a luxury.
25 The way that our present airport is overloaded, the

1 roadway, and creates a traffic jam and deadlock. It
2 creates not only delay but also pollution.

3 Before the tragedy of 9-11, it is not unusual
4 for you to get stuck in the roadway for two or three
5 hours before you get on the plane in the summertime. A
6 huge amount of traffic jammed in the airport will really
7 increase our smog emission, which is not good for the
8 environment.

9 We're moving out of the present terminal to
10 another location is not only -- if security is another
11 tier of protection, it also diverts the traffic so the
12 traffic flow can be much smoother and reduce the
13 emission, and that will be helpful, a lot helpful to our
14 environment.

15 And with all the passengers lining up outside
16 the terminal for security check now, it really makes the
17 airport very wonderful. I disagree with the theory that
18 an outside terminal is more hazardous for security. It
19 is even worse.

20 Besides, tourism is a major factor in our
21 economy. As the district I represent, a lot of business
22 rely on international travels. And we look at around
23 the world in Asia. Look at the City of Hong Kong,
24 Singapore, Taiwan. We all have new airports there, and
25 we greet our passenger with an old, obsolete airport.

1 The modernization is not about expansion.
2 It's about to improve the efficiency, to reduce the
3 planes taxiing on the runway to produce pollution.

4 So I urge you to support this plan. It's a
5 \$10-billion-dollar endeavor. It's almost two-and-a-half
6 times the city budget, but it's something worthwhile
7 that we should put and invest for the future and also to
8 add to our economy as well. Thank you.

9 MS. SMITH: Thank you, Mr. Woo.

10 Richard Slawson.

11 MR. SLAWSON: Good evening. My name is Richard
12 Slawson. I'm the Executive Secretary of the
13 Los Angeles and Orange Counties Building and
14 Construction Trades Council. Our office address is at
15 1626 Beverly Boulevard in the city of Los Angeles.

16 Our council represents 130,000 craftsmen and
17 women who live and work throughout the Los Angeles
18 region. We're here tonight to let you know that we
19 enthusiastically support Mayor Hahn and his Master Plan
20 for LAX. When this plan gets underway, besides moving
21 forward the needed modernizations of our airport, nearly
22 49,000 construction-related jobs will be directly
23 generated during the entire construction phase.

24 This is welcomed news for our regional economy
25 because putting 49,000 men and women to work at good

1 wages is a boost not only to those on the job but
2 throughout Southern California. This many new jobs will
3 have a tremendous ripple effect that will, in fact,
4 support at least 100,000 jobs around the region and
5 \$11 billion dollars to total economic activity. This
6 region desperately needs the economic stimulus that this
7 LAX Master Plan will bring.

8 I'd like for just a second to have many that
9 are here tonight with our organization that will not be
10 speaking to stand up for a minute so that everyone can
11 see the support that we have for the airport plan.
12 Thank you very much.

13 With this plan, our other concerns are also
14 being met through Alternative D, as in the case of many
15 other world-class airports, including Washington Dulles
16 International Airport, Orlando International Airport and
17 Denver International Airport. Their terminals are
18 linked by the use of trams, people movers and trains.

19 Washington Dulles uses what they call moveable
20 lounges. Orlando uses trains and Denver uses a
21 combination of moving walkways and an underground train.
22 All of these are similar to the Ground Transportation
23 Center and the Intermodal Transportation Center included
24 in Alternative D in the LAX Master Plan.

25 These then connect with the main or central

1 terminal area by the automated people mover. With the
2 heightened security measures that are needed today, this
3 makes absolute sense.

4 I would like also to commend Mayor Hahn for
5 the commitment that he made to hold LAX to 78 million
6 annual passengers. We all know that LAX must be
7 modernized, but it must also meet the needs and concerns
8 of the residents of Los Angeles and the surrounding
9 communities and especially those residents who live near
10 the airport.

11 This plan addresses traffic, security and
12 noise in its design and regulations. We support the LAX
13 Master Plan, and ask that you give it your approval.
14 Thank you very much.

15 (The statement submitted for the
16 record was marked as Statement 4
17 and is attached hereto.)

18 MS. SMITH: Thank you.

19 MR. HILFENHAUS: My name is Jim Hilfenhaus. And I'm
20 a representative from Laborers Local 300. We're the
21 largest construction Local in America.

22 We've had many comments from people up here.
23 We support the jobs issue on there. The one thing
24 people need to recognize about LAX is it doesn't
25 currently work. You've retrofitted security on top of

1 an infrastructure that cannot accept it.

2 Unfortunately, the tragedy of 9-11 has reduced
3 passenger traffic, so that the accommodations have not
4 reached crunchtime. Should it come back to
5 78-million-passenger capacity with the current standards
6 out at the airport, your gridlock is going to destroy
7 the west side of Los Angeles.

8 As another speaker mentioned, the Green Line
9 will be brought in under this. We have an area transit
10 program to be involved. Visionaries like Hector
11 Delatorre in South Gate want to extend the Green Line to
12 the Metrolink. We have a regional transportation
13 solution potentially in the offing with the
14 modernization of LAX.

15 The facilities there, as I said, with
16 security, you cannot move around. The modernization is
17 necessary. It needs to incorporate the new security
18 features which will expedite passenger flow. The trucks
19 going in under diesel standards will reduce air
20 pollution. Less traffic idling in the area reduces
21 further the air pollution.

22 The modern jets, although twice the passenger
23 capacity, are cleaner and quieter which will enhance the
24 environment of the neighborhoods under the flight path,
25 one of the continual complaints that nobody continues to

1 mention.

2 The job factors is a boost to this economy.
3 Our \$38-billion-dollar budget is because personal income
4 tax has been reduced in this state because the
5 millionaires are losing a fortune and the working class
6 is losing their jobs.

7 Now, we are always hammered as the building
8 trades for fighting for the jobs. We're proud of it.
9 We don't have anything to take back on that. Our
10 workers feed their families, buy houses, buy cars and
11 send their kids to college on the wages that are
12 provided. But in doing that, we've also taken up
13 programs for youth at risk. So there is a social
14 environment to be added to this and it is a component of
15 LAX.

16 You will see hires from the community around
17 there, and impacted areas that are under-served, with
18 decent well-paying jobs. There will be opportunities
19 for children that are at risk of being involved in gangs
20 to provide careers in the construction industries. And
21 I mean careers, not a job for a week, for a month, but
22 years, lifetimes, including retirement. This is
23 something that needs to be focused on. We can't always
24 be saying no.

25 Now, does this LAX have to move or does L.A.

1 have to move? It's an airport. It's there. It's a
2 site of transportation. The neighbors are upset. El
3 Segundo may have their reasons. But unfortunately for
4 the safety of the planes, the runways have to go in.

5 They must accept the widening and the
6 distances of the runways. We need to have something
7 that fits L.A. And the modernization security plan will
8 give us a 21st Century terminal that everyone in
9 Los Angeles can be proud to travel through speedily,
10 efficiently and safely. Thank you.

11 MS. SMITH: Thank you.

12 Henry Lee, Shawn Lim and Jonathan Hong, in
13 that order, please.

14 Mr. Lee.

15 MR. LEE: Thank you. Henry Lee. I'm a
16 Korean-American attorney, 3350 Wilshire Boulevard,
17 Suite 1110.

18 I think everybody in this room has read the
19 newspapers and heard the news, and I have, too. Every
20 time you listen to the news, there is something negative
21 about the State of California. There is something
22 negative about our budget. There is something negative
23 about our governor, and there is something negative
24 about the leaders of our state.

25 That's why I feel lucky, and at times very

1 proud to live in the City of Los Angeles because the
2 leaders of our city are promoting growth. The leaders
3 of our city is promoting safety and security, and the
4 leaders of our city are trying to create jobs.

5 Alternative D to the LAX Master Plan is a
6 perfect example of the positive leadership that our city
7 has. I think everybody here agrees, whether you support
8 it or not, that LAX is the front door to the city of
9 Los Angeles. And through that front door hundreds and
10 thousands of Koreans have come through that front door,
11 and ultimately become Korean-Americans to live in the
12 city of Los Angeles and to do business in the city of
13 Los Angeles just like me and my family.

14 And just like the front door to our own homes,
15 we should make the front door to our city bigger and
16 better and safer for all the residents who live here.
17 As a Korean-American attorney practicing in the City of
18 Los Angeles, I was recently designated a class-action
19 attorney representing 40,000 Korean-American consumers,
20 most of whom live in the city of Los Angeles.

21 And I believe I can speak on behalf of those
22 40,000 Korean-Americans and say thank you, Mayor Hahn,
23 for a plan that will create 350,000 jobs over the course
24 of the next few years. Thank you, Mayor Hahn, for a
25 plan that will improve the safety and security of our

1 front door. Thank you, Mayor Hahn, for Alternative D.

2 Alternative D has the support of the
3 Korean-American community, and hopefully has yours as
4 well. Thank you.

5 MS. SMITH: Thank you.

6 Mr. Lim.

7 MR. LIM: Good evening, everyone. My name is Shawn
8 Lim. I'm President of the Korean-American Business
9 Association.

10 First of all, I wanted to say is -- this is
11 Korea Town, middle of Korea Town. But, I mean, you're
12 saying that is -- they have Spanish people, Spanish
13 translator, but I see a lot of Korean people. That
14 means Korean people. I'm not saying is not speaking
15 English, but what I'm saying is I see some of these old
16 people. I respect all people. They come in here, show
17 up here every time, long period of time, but they speak
18 Korean language.

19 Next time a meeting like this, I want to set
20 it up with a Korean translator, so that way whatever
21 people here, some people I heard about it, they like a
22 speaking issue, but they can't speak. So next time
23 chances are, this is a Korean Town. You see a lot of
24 Korean people. So next time you have got to provide a
25 Korean interpreter, translator. I would appreciate it.

1 Okay. Welcome to Korea town, everyone. I
2 support Mayor Hahn, Alternative D, LAX is a Master Plan.
3 This idea is 100 percent support Mayor Hahn, because
4 that I have a business on Wilshire, 3319 Wilshire
5 Boulevard. We have a lot of Korean-American, then
6 Korean people, all the other nations is a business
7 owners as Korean, you know, Korean Town on Wilshire
8 Boulevard.

9 It's especially a lot of our people coming
10 from Korea, coming from Japan, coming from China. They
11 are coming here first LAX. LAX is a small. LAX after
12 9-11 terrorism everyone, they don't feel comfortable
13 here. There is a safety issue. So we have a Mayor
14 Hahn, is a Master Plan. This is a real good thing
15 working on. We're going to put the safety high-tech
16 everything. So people all over the world is coming into
17 Los Angeles airport is a safety issue.

18 So that way we have more people coming from
19 foreign people travel here, LAX feel comfortable. We
20 got to modernize everything in a new facilities at LAX.
21 So we have a lot of benefits for business people because
22 of people travel from Korea. My nationality is a Korea
23 background. I have a lot of traveler that don't come in
24 Los Angeles because safety issue.

25 But our concern is a safety issue. We need to

1 build new airport, put a high-tech safety issue so that
2 way people come here feel real comfortable. Then first
3 impression our airport is kind of old. First impression
4 you're going to make is a brand-new airport. Is a
5 Korean International Airport, move it to new airport
6 about a year ago, international airport. They made a
7 big one, expanded, complete different.

8 So our wish is Mayor Hahn had good idea. I
9 support him 100 percent. We have to do Master Plan. We
10 have to approve. Thank you.

11 MS. SMITH: Thank you.

12 Mr. Jonathan Hong. Mr. Hong?

13 At this time we're going to take a short
14 recess of approximately 10 to 15 minutes. 15 minutes,
15 Mr. Kessler and Mr. Ritchie? Is that fine with you?
16 We'll reconvene at 7:10.

17 (Recess was taken.)

18 MS. SMITH: If we could get everyone to take their
19 seats. For those of you that are new and joining our
20 audience, if you could bear with us; those that have
21 already been here, we're going to do our introductions
22 briefly again.

23 Again, good evening. My name is Shauna Bain
24 Smith. I will be your facilitator this evening. And on
25 behalf of the Federal Aviation Administration and

1 Los Angeles World Airports, I'd like to welcome you to
2 the first of a series of public hearings to receive your
3 testimony on the Los Angeles Airport Master Plan,
4 Environmental Impact Statement and Environmental Impact
5 Report.

6 These gentlemen to my right will now give some
7 introductory remarks starting with Mr. David Kessler
8 with the Federal Aviation Administration.

9 MR. KESSLER: Good evening, everyone. My name is
10 David Kessler. I am the environmental protection
11 specialist for the Airport's Division for the Federal
12 Aviation Administration, Western-Pacific region.

13 I would also like to welcome you to the first
14 of a series of public hearings that the FAA and
15 Los Angeles World Airports are conducting on the
16 Supplement to the Draft Environmental Statement/
17 Environmental Impact Report for Alternative D, Enhanced
18 Safety and Security Plan for Los Angeles International
19 Airport.

20 The purpose of these hearings is to collect
21 comment for the general public concerning the adequacy
22 of the information disclosed in the Supplement to the
23 Draft EIS/EIR on Alternative D.

24 I'd like to take the opportunity to make sure
25 everyone understands that no decision will be made today

1 regarding the proposed project. Today's hearing is not
2 a question-and-answer type of forum. Our job is to
3 listen to what you have to say about the adequacy of the
4 information in the Supplement to the Draft EIS/EIR. In
5 other words, it's your turn to talk to us.

6 Since we're here to listen, we're not going to
7 respond to questions about the pros and cons of the
8 proposed project. Since 5:00 o'clock this afternoon, we
9 held a public workshop just outside of this room for
10 anybody to ask questions about the Master Plan, the
11 environmental process and the various proposed projects.

12 I'd like to also take the opportunity to recap
13 the environmental disclosure process for this project.
14 The environmental evaluation for the LAX Master Plan
15 began in 1997 with the publication of a Notice of Intent
16 to prepare the joint EIS/EIR in the Federal Register.
17 In July 1997, we held a series of meetings with members
18 of the public and governmental agencies to receive
19 comments on the scope of the Draft EIS/EIR.

20 Following those meetings, the Draft EIS/EIR
21 was published in January 2001. Both the 2001 Draft
22 EIS/EIR and the 2003 Supplement have been prepared
23 pursuant to the National Environmental Policy Act of
24 1969, or NEPA, the Council on Environmental Quality
25 Regulations, which are the implementing regulations for

1 NEPA, the California Environmental Quality Act of 1970,
2 or CEQA, and the Airport and Airway Improvement Act of
3 1982 as amended.

4 Following today's hearings, we will correct
5 and revise the Draft EIS as appropriate and combine that
6 information into a Final EIS/EIR.

7 At this point if someone has public comments,
8 they can fill out a speaker card like this one. Cards
9 are available at the sign-in desk. They are then
10 brought up in groups to our facilitator here who will
11 call the names of the speakers. If you have -- if
12 you're uncomfortable about speaking in front of a group
13 or have more comments than can be provided to us in
14 three minutes, we have comment sheets that are available
15 also at the sign-in desk. You could either leave them
16 here today, or you could provide them to us by mail at
17 the address on the cover of the EIS/EIR.

18 Before we begin, I would also like to indicate
19 that we have afforded everyone an opportunity for three
20 minutes to speak. We're not going to allow people to
21 reallocate their allotted time to others in order to
22 ensure fairness.

23 Lastly, I would like to ask that anyone that
24 has a cell phone or pager, please put them on a silent
25 mode or turn them off to be considerate of the speakers.

1 Thank you.

2 MS. SMITH: Thank you, Mr. Kessler.

3 I would like to next introduce Mr. Jim
4 Ritchie, Deputy Executive Director of Los Angeles World
5 Airports.

6 MR. RITCHIE: Thank you, Shauna. I'm Jim Ritchie.
7 And on behalf of Los Angeles World Airports we welcome
8 you again to this public hearing. My introductory
9 remarks remain the same, and Shauna, let's get to work.

10 MS. SMITH: The ground rules, I will repeat them
11 again very quickly. Each speaker will have three
12 minutes, as Mr. Kessler mentioned. I need you to fill
13 out one of these speaker cards that you can pick up at
14 the sign-in table. You turn them back in at the sign-in
15 table, and I will call you in the order in which you
16 have turned in your speaker card.

17 When you approach the podium, I need you to
18 say your name and address, if you'd like, loudly and
19 clearly and as slowly as possible so our lovely court
20 reporters to my left can get everything you say
21 officially into the record.

22 After you speak your name, I will then start
23 the three-minute timer. When you see the yellow light
24 flash, you will have about 30 seconds left to speak. At
25 that time it's a good idea to start wrapping up your

1 remarks.

2 And if you feel like you need more time after
3 you've made your remarks, you are welcome to fill out
4 another speaker card. And after we've gone through all
5 of the first round of speaker cards and everyone has had
6 an opportunity to speak at least once, we will give you
7 an opportunity to speak again if you so choose.

8 Without any further ado, I would like to call
9 our first speaker, Mayor James Hahn.

10 MAYOR HAHN: LAX also known as Alternative D --
11 thank you.

12 MS. SMITH: I think the crowd likes you.

13 MAYOR HAHN: I hope they don't take all my time.
14 Thank you all for being here today. I appreciate
15 everybody who is here, and I appreciate the opportunity
16 to talk.

17 I am here to support the Enhanced Safety and
18 Security Plan for LAX, also known Alternative D.

19 I believe this alternative breaks new ground
20 in airport design for the 21st Century. We think it
21 can serve as a model for airports around the world.

22 My staff and I have brief thousands of
23 stakeholders on this plan, including community
24 residents, airlines, labor, local business leaders. And
25 this plan incorporates many of their suggestions and

1 addresses their concerns, and its concerns that have
2 been expressed previously as to other alternatives.

3 Alternative D puts safety and security first.
4 It includes modernization of the airfield, including the
5 addition of the center taxiways to improve safety for
6 aircraft, for traveling passengers and airport workers.
7 And it's also going to provide multiple layers of
8 security for passengers, multiple layers of security for
9 airport workers and the surrounding communities as well.

10 We're dispersing travelers and moving them
11 rapidly through four separate and secure entry points.
12 It also allows security screeners to make assessments of
13 passengers and baggage before they ever get into the
14 central terminal area.

15 And most importantly, this plan significantly
16 reduces the opportunity for a vehicle with an explosive
17 device to get close to the central terminal area by
18 eliminating private traffic through the area. Security
19 experts believe that the central terminal area and its
20 impact on our economy are the key targets for
21 terrorists.

22 Alternative D also supports my goal of
23 creating a regional air transportation plan. It designs
24 LAX to accommodate approximately 3 million annual tons
25 of cargo, 78 million annual passengers, consistent with

1 the goals of the Southern California Association of
2 Governments. We're working to promote the use of
3 regional airports to meet increased demand.

4 Alternative D also means a more modern and
5 convenient LAX for passengers. It includes new
6 passenger terminals with improved ticketing, baggage
7 processing, circulation and concessions. The automated
8 people mover designed to easily accommodate rolling
9 luggage and baggage carts is going to offer very
10 convenient access to the central terminal area.

11 Alternative D means jobs. It's expected to
12 contribute \$64 billion dollars to the regional economy.
13 In addition to connecting the Green Line to the airport,
14 we're going to have direct access from the 405 and the
15 105 Freeways.

16 I think as more people learn about
17 Alternative D, they will see that we've addressed a lot
18 of the concerns that people had. They are not for
19 unlimited growth at the airport. They are not for
20 growth that is going to harm the environment at the
21 airport. They are not for growth that will tie up the
22 traffic so that no one will be able to move. They are
23 for a responsible modernization plan, and to make LAX as
24 safe and secure as possible.

25 I want to especially thank all of our

1 community leaders and representatives who are here
2 today, also my staff, Troy Edwards and Patricia Torres,
3 I especially want to thank the Federal Aviation
4 Administration and L.A. World Airports and your staff
5 for the dedication and support of this process. Thank
6 you.

7 (The statement submitted for the
8 record was marked as Statement 5
9 and is attached hereto.)

10 MS. SMITH: Thank you, Mayor Hahn. That was perfect
11 timing.

12 Next, we'll have Jonathan Hong, Mahala Walter
13 and Erica Kim, in that order, please.

14 Mahala Walter.

15 MS. WALTER: Yes. Hi. I'm Mahala Walter; 7015
16 South Sepulveda, Los Angeles.

17 Today the Los Angeles World Airports continues
18 to celebrate 75 years of connecting Southern California
19 with the world. Commonly known as LAWA, the Los Angeles
20 World Airports has four airports. Van Nuys is the
21 world's biggest general aviation airport. Ontario
22 International serves the Inland Empire, the fastest
23 growing region in Southern California. And the Palmdale
24 Regional has its 25-year Master Plan for the residents
25 of Antelope and Santa Clara Valleys plus portions of

1 San Bernardino and Inyo Counties.

2 And then there is LAX where passengers
3 throughout the world think of LAX not only as an
4 airport, but an entire city, Los Angeles. True, LAX
5 is -- has had a spectacular past, but now we must
6 prepare for a safe future.

7 Prior to 9-11, LAX contributed \$60 billion
8 dollars per year in economic output, contributed 59,000
9 thousand jobs at or near LAX, plus 408,000 jobs in the
10 Southern California region. LAX security is of major
11 importance to not only our state, but our nation.

12 California has the fifth largest economy in
13 the world, and we need better security now. So, please,
14 Mayor Hahn, don't wait 15 years for a Master Plan for it
15 will be outdated. The war will be over. The terrorists
16 will have been hunted down, and 15 years is just too
17 long to wait for Alternative D.

18 With the TSA Home Land Security, the walls
19 came tumbling down in the terminals, moving hundreds of
20 million-dollar explosive scanners with one
21 \$100,000-dollar-yearly maintenance fee. Unfortunately,
22 these monsters had far too many false positive readings
23 with only food being the problem.

24 Who pays for Alternative D? We're told a
25 major part is going to be passed on to the airlines via

1 landing fees, et cetera. Now, that sounds just like
2 what the airlines need, especially those that are in or
3 fighting bankruptcy. Besides, the small business and
4 hotels around LAX will have a very difficult time for
5 the next many years, and some may not survive.

6 This plan has been said to be costing \$9.1
7 billion, then \$9.6 billion. Honestly, how many billions
8 more is it going to be? Proponents like to couch this
9 whole scenario about security and cars in LAX don't mix.
10 Well, I ask you, how now are those people going to get
11 to the Ground Transportation Center?

12 MS. SMITH: Thank you.

13 MS. WALTER: I just have one more. If a terrorist
14 wants to inflict major loss on life and damage, you
15 would have to have a passenger load widely distributed
16 around nine different terminals where everyone and all
17 flights will congregate in only one drop-in and drop-off
18 site. Thank you.

19 (The statement submitted for the
20 record was marked as Statement 6
21 and is attached hereto.)

22 MS. SMITH: Thank you. You're welcome to turn in
23 your written comments, Ms. Walter. Ms. Walter, you are
24 welcome to turn them in to our court reporters, and we
25 can get all of your comments in. Thank you.

1 Next, I'll have Erica Kim. Okay.

2 Alan Wayne, Sam Kim and Domingo Leon, in that
3 order, please.

4 Mr. Wayne.

5 MR. WAYNE: Yes. Is this on?

6 MS. SMITH: Yes, it is.

7 MR. WAYNE: All right. Great. Thank you. Good
8 evening. For the record, my name is Alan Wayne. I am
9 Director of Governmental and Public Affairs for the
10 United Airlines West Region. We're located at 1960 East
11 Grand, Suite 1000, in El Segundo.

12 I am appearing here tonight on behalf of not
13 only United but also ten other fellow members of the
14 Star Alliance, the largest airline consortium operating
15 at Los Angeles International Airport. In addition to
16 United, which operates a major hub at LAX, the Star
17 members include Air Canada, Air New Zealand, All Nippon,
18 Asiana, Lufthansa, Mexicana, Singapore, Thai, Varig and
19 U.S. Airways.

20 Those 11 carriers plus United's regional
21 marketing partners Skywest, whose 133 daily departures
22 are the most of any carrier at LAX, wish tonight to
23 underscore our collective support for Mayor Hahn's
24 ongoing effort to craft a Master Plan for LAX, as
25 reflected in Alternative D, that would ultimately

1 improve and modernize this critical but sadly antiquated
2 facility.

3 United and the Star carriers plus Skywest
4 account for the 30 percent of the flight activity here.
5 We are working with the City to address the airfield
6 safety, airport security, ground access and passenger
7 terminal enhancements that must be achieved if this
8 airport, which is so important to the region's economic
9 competitiveness and the thousands of jobs that depend on
10 it, is to remain in the forefront of commercial
11 aviation.

12 To do nothing or to not do this project
13 realistically is not acceptable. This project is
14 overdue. It must get underway. Other airports,
15 Seattle, Portland, San Francisco, Las Vegas, Denver,
16 Phoenix, to name just a few, have modernized or
17 advancing programs to draw business away from LAX.

18 United and the Star Carriers believe that this
19 plan focuses on the issues and elements that will move
20 LAX forward. And we plan to continue our collaboration
21 with the City and the airport to meet these future
22 requirements. Thank you very much.

23 (The statement submitted for the
24 record was marked as Statement 7
25 and is attached hereto.)

1 MS. SMITH: Thank you, Mr. Wayne.

2 Sam Kim.

3 MR. KIM: Good evening. My name is Sam Kim. I am
4 here on behalf of Korean-American Garment Industry
5 Associations.

6 I'd like to thank in advance for having this
7 function here in our Korea Town, and we appreciate it.
8 It's actually an honor to have this great function here
9 in my town.

10 In our association we have about 600 members.
11 And we employ about 20,000 employees in Los Angeles
12 vicinity. And from our association, we have decided to
13 endorse this project here, and we support Mayor Hahn's
14 project 100 percent. We're behind it.

15 Instead of going through all the details and
16 the stats, I want to say ditto to all the stuff that was
17 mentioned here, which is the same as mine. And
18 everything that Mr. Mayor said, I agree and I will
19 support that 100 percent as well.

20 This project is something that was needed long
21 ago. It is something that needs to be in place on it.
22 I'd like to see it in place as soon as possible. So in
23 closing, I'd like to thank in advance for approving this
24 project. Thank you.

25 MS. SMITH: Thank you.

1 Mr. Domingo Leon.

2 MR. LEON: Hi. My name is Domingo Leon. I am a
3 civil engineer. I am speaking on behalf of the Society
4 of Hispanic Engineers.

5 Mayor Hahn and also LAWA staff have addressed
6 a problem which is facing a problem in the future to the
7 increasing on the number of passengers at LAX and also
8 the cargo. Passengers will increase from, I think, 59
9 million to 70 million, so something has to be done.

10 And as engineers, we like any kind of plans to
11 improve the phases for jobs for construction and also
12 for engineers, also for the Hispanic, you know. I mean,
13 unfortunately, low-paid people at the airport are
14 Hispanic. We do janitorial type of work, but that also
15 we are helping out in the future.

16 I think there is room for certain improvements
17 on the Plan D. Currently, what we do is I unload my
18 suitcases. I walk 30 feet to the ticketing. Now, in
19 the future you are going to tear down the parking
20 structure. So I have to go into the terminal, which is
21 like no 30 feet, like probably miles away, and I have to
22 bring my suitcases -- it's a mover; right? You have a
23 mover thing coming. So that is a little, you know,
24 annoying and inconvenient.

25 So I would like to address the issue, as I

1 have seen airports in Frankfurt and Madrid, you don't
2 bring your suitcases to the ticket office. I mean, you
3 just do it in Downtown or at the terminal.

4 So I think I would like to address the issue.
5 You can look at that alternative off-ticketing your
6 suitcases at the terminal because there will be no cars
7 once you build the moving train into the terminals for
8 significant reason.

9 So I would like to -- I applaud, you know, the
10 Plan D, which is I think good for the community. Thank
11 you very much.

12 MS. SMITH: Thank you.

13 Our next speakers are Alex Cha, "Cha," I
14 apologize, Alex Cha, Janine Soukiasian and Kenneth
15 Alpern, in that order.

16 MR. CHA: Good evening. My name is Alex Cha. I'm
17 an attorney with Cha & Park. My address is 3435
18 Wilshire Boulevard, Suite 2600, L.A.

19 First of all, I want to thank you for having
20 regular citizens like us staying late to hear our
21 concerns. Tonight I'm here to support Mayor Hahn
22 Alternative D for three reasons.

23 First, in the aftermath of 9-11, the City's
24 major concerns are the safety and security of the
25 citizens of L.A. and the citizens of the world. And

1 with the modern LAX, there definitely will be an
2 increase in the security and safety for the citizens of
3 L.A. as well as the citizens of the world.

4 Second, LAX is the largest gateway to the
5 United States from Asia. And as you know, there are
6 state-of-the-art Asian airports such as one in Hong
7 Kong, in South Korea and Japan, which has tremendously
8 increased their reputation as well as the image of those
9 respective cities and countries. And it's about time
10 L.A., as a trend-setter, has a state-of-the-art airport.

11 And finally economically, I would want to say
12 everybody loves L.A. Everybody wants to visit L.A., and
13 a modernized airport will definitely attract more
14 visitors domestically as well as internationally to this
15 great city of Los Angeles, and a tremendous increase to
16 the businesses as well as the tourism, in the city of
17 L.A. as well Southern California. Thank you for your
18 attention.

19 MS. SMITH: Thank you, Mr. Cha.

20 MS. SOUKIASIAN: Hi. My name is Janine Soukiasian.
21 I work at mid-Wilshire at 3435 Wilshire Boulevard.

22 I am a born and raised L.A-an, if you will,
23 and I have lived in this community all my life. I
24 support Mayor Hahn's plan. And I'm concerned about the
25 air traffic and safety, LAX and past local businesses as

1 well as international travel.

2 Because of continual increase of national
3 security, tourism has lessened and has had a negative
4 impact on recent businesses.

5 I'm a recent bar applicant, and I want to
6 practice immigration law. As an Armenian-American I
7 don't see how LAX could have more visitors and tourists.
8 And immigration, it does impact. I mean, it might be a
9 selfish reason, but I would like the Armenian community
10 to grow.

11 Our concerns on both sides of this plan are
12 the same, which includes security of our citizens and
13 safe travel to further interstate commerce, which also
14 eventually affects us locally.

15 This new plan will further our economy and
16 provide an Alternative D which is attractive, a new and
17 safe mode of travel.

18 As someone mentioned before, California is the
19 fifth largest economy in the world, and Los Angeles is
20 what you first think of when you think of California.
21 "I am going to Los Angeles, L.A., Hollywood."

22 Thus, the state-of-the-art facilities and
23 modernization of the airport will play an integral role
24 in encouraging international travel. Other major cities
25 have implemented this type of plan. And when I visit

1 Chicago or New York, I have such an easy to and from the
2 airport. And I do like to mention, San Francisco and
3 Oakland, the use of Bart, the Bart Air that picks you up
4 from the airport. And then you take the Bart, you go
5 under the water and then you're in the city. I mean,
6 that is remarkable.

7 As a representative of Cha & Park, we are
8 willing to support Mayor Hahn's Alternative D plan. And
9 I will vote and work hard towards the implementation of
10 it. Thank you.

11 MS. SMITH: Thank you.

12 Dr. Alpern.

13 DR. ALPERN: Good evening. My name is Ken Alpern.
14 I'm a board certified dermatologist, drove up from my
15 clinic in Huntington Beach, but I live in West
16 Los Angeles. I am President of the Transit Coalition
17 and Co-chair of one of its most active wings which is
18 Friends of the Green Line.

19 Friends of the Green Line supports a regional
20 air traffic approach. As a matter of fact, we're not
21 only interested in LAX, but trying to establish other
22 gold line and/or Metrolink connection with Ontario. We
23 very much want this regional air approach championed by
24 Mayor Hahn become a reality. Frankly, growing up in
25 Long Beach, we all hated going to LAX. And those of us

1 living near LAX hate people coming to LAX. It's sort of
2 a mutual feeling.

3 I need to emphasize that I want to talk about
4 transportation. I've heard both sides of the security
5 issue with regards to the concept of a Ground
6 Transportation Center, and I'm glad we have more time
7 for comments. I think those living next to LAX need to
8 have their time to be heard, and I think there are two
9 sides of the issue. But if you're going to make the
10 decision to go with the Ground Transportation Center,
11 then I think it's very good for transportation and
12 particularly with respect to the Green Line.

13 Friends of the Green Line is neutral on where
14 the Ground Transportation Center is, but we know that
15 we'd like the Green Line to connect directly to it,
16 whether it's in Eagle Rock, Tombouctou or Newark, New
17 Jersey. The idea is, and we've given you a copy of this
18 brochure, that the Green Line does not hit -- does not
19 affect areas north of LAX.

20 The people mover is a wonderful concept, but
21 currently it will not benefit those coming distantly
22 from the West Side, the Valley, Downtown. And frankly,
23 the local hotels and businesses won't be benefited by
24 the people mover as much as if you have a proposed Green
25 Line extension to Westchester approved ten years ago in

1 an EIR by the MTA. We need to revisit it. It does not
2 compete with the people mover. We do not want the Green
3 Line to compete with the people mover. The idea is it
4 is to supplement the people mover.

5 But the question of security comes back as to
6 whether or not you're going to have good security at the
7 Intermodal Transit Center. Are you going to have really
8 good security? Because if you're not, then you really
9 need to shuttle people from the Green Line all directly
10 to the Ground Transportation Center.

11 The Ground Transportation Center is built next
12 to the MTA Harbor Subdivision rail line. That's one of
13 its most wonderful features. Why not exploit it?
14 Again, L.A. World Airports is not in the business of
15 building regional airport -- regional rail systems, but
16 having a Westchester system that enables northern rail
17 access to LAX, and the people mover is not outside the
18 aegis of this plan.

19 As forementioned by a colleague earlier, Bart
20 Reed, the Bay area has its own rail airport connection.
21 Orange County, they don't want to repeat the mistake of
22 L.A. It's a new century. Let's do this right. Let's
23 make this LAX reconfiguration plan a good neighbor.

24 Thank you for your attention and your time.

25 MS. SMITH: Thank you, Dr. Alpern. One quick

1 question for you, Dr. Alpern. Is the literature to
2 which you referred there the same literature that
3 Mr. Reed gave to our court reporters earlier? If not, I
4 need you to --

5 MR. ALPERN: Yes, ma'am. If you want anymore
6 copies, I'm happy to do it.

7 MS. SMITH: I just wanted to make sure they had one
8 in the record because you referred to it while you were
9 speaking.

10 DR. ALPERN: Yes, ma'am.

11 MS. SMITH: Thank you very much. Our next speakers
12 are Salvador Brown, Michelle Grumet and Ronald Murphy,
13 in that order, please.

14 Mr. Brown. Thank you.

15 MR. BROWN: Hello. My name is Salvador Brown. And
16 I'll give you my PO Box address. Is that all right?

17 MS. SMITH: Yes, sir.

18 MR. BROWN: PO Box 70312, Los Angeles, California.

19 MS. SMITH: Excuse me one second, Mr. Brown. We are
20 going to have to adjust the microphone for you. Mary,
21 would you like to excuse me. Perfect. Let's start
22 again.

23 MR. BROWN: All right. My name is Salvador Brown.
24 My mailing address, PO Box 70312, Los Angeles,
25 California 90070.

1 It seems to me that too much is being
2 concentrated in one place. This project, as proposed,
3 would increase traffic congestion in one area. There is
4 no room for another freeway, and increasing traffic in
5 the immediate area will overwhelm the surface streets
6 with the people coming off the freeway. I'm trying to
7 bypass the congestion that's on the 405 in that area.

8 The plan discusses mitigations to meet that
9 possibility, but there have been examples in the past
10 where mitigation plans, like, for example, the expansion
11 of the 405 Freeway didn't pan out. And I think that the
12 same result will happen with this plan here.

13 We have this great idea, but in the end,
14 increase in populations in the area, increase in
15 traffic, people going to and from the airport will
16 overwhelm the mitigations that's being planned today.

17 I think that the best solution, in my opinion,
18 would be to spread out that parking. Instead of having
19 it all in one area, that little area there, you should
20 spread the parking out in a more wider area so the
21 people, the traffic would spread out going to those
22 parking areas instead of like one concentrated parking
23 area.

24 And we're all worried about these truck bombs
25 going to the airport and blowing up underneath the

1 concourse area there, but how about a truck bomb blowing
2 up in one of those massive structures for the thousands
3 of people going to and from their cars. Again, that
4 would be another thing to consider, spreading out those
5 parking areas throughout that region and not in one
6 area. That's basically what I was thinking about. I
7 didn't read my speech.

8 MS. SMITH: Thank you, Mr. Brown.

9 MR. BROWN: Thank you.

10 (The statement submitted for the
11 record was marked as Statement 8
12 as is attached hereto.)

13 MS. SMITH: With time left over, Michele Grumet. Am
14 I pronouncing that correctly?

15 MS. GRUMET: I would just like to raise one issue
16 here. Since the city is spending a huge amount of money
17 on this project, this proposed project, I think there is
18 no reason why the lead agencies or the city cannot
19 afford sending a Draft EIR/EIS, or whatever, to the
20 people who are very -- who are affected in the areas
21 that don't have access to the internet, that don't --
22 you know, I know I live not too far from some of the
23 affected areas.

24 And many of the people are elderly. Some of
25 them live alone. A lot of them do not even know what a

1 CD is or do not have access to that, you know,
2 computers, and do not know how to work on a computer.
3 And I think I've worked on, you know, five other, you
4 know, projects that have had Environmental Impact
5 Reports. And I think people do not -- a lot of people
6 that are very affected by this do not understand even
7 what it is.

8 I went to a meeting that my councilman had,
9 and I wasn't even sure what it was about. And I went to
10 it, and they were talking about soundproofing these
11 people's homes, but they didn't even raise at the
12 meeting the whole issue of an Environmental Impact
13 Report. And I think the people, even if they did, they
14 just mentioned it in passing and didn't explain to them,
15 this is the most important document. This is the
16 document that they have a right to challenge or to
17 question. And they should do it in writing or they
18 should do it orally.

19 So I think people -- a lot of people, and it's
20 not that these people are not intelligent. They've just
21 never participated in anything like this before, and
22 they don't understand it. And, therefore, I think -- I
23 had asked the -- I was kind of hard-nosed about it and
24 angry about it, the Mayor saying, you know, because the
25 Mayor did grow up in my neighborhood where I live, and

1 he does know, and his parents certainly knew that many
2 of the people are elderly and are not into all of this
3 and familiar with this.

4 So I think if some kind of executive summary
5 of the main issues and maybe just a piece of paper. I
6 mean, we'd be glad, a lot of us, to go and leaflet the
7 area and say "For your comments," and this is where the
8 hearing is, because I know in my own neighborhood, I
9 live on 77th Street, and I'm the only person that got a
10 notice of any of these hearings, and the person that I
11 brought I told him about it.

12 So I think that, you know, when you talk about
13 environmental justice, I think in a lot of ways it may
14 not be done on purpose, but not everyone is up to speed
15 with the internet. A lot of people aren't. I know my
16 own mother isn't. And, you know, she has a college
17 degree.

18 So I think that to kind of take it for granted
19 that these people are somehow going to understand what
20 this is, and these are the people that are going to be
21 really affected by this, and I think, I really hope that
22 you think about that.

23 And I know that many of us there would be glad
24 to go and walk the neighborhoods. I am sure we could
25 get 10 or 15 people. And I know I and the person I am

1 with here would be glad to do that, to explain to people
2 even simply what's in store for them in their
3 alternatives. Thank you.

4 MS. SMITH: Thank you.

5 MS. GRUMET: And, also, just one other -- and the
6 thing that kind of upset me was the price, you know, it
7 was quite pricey, \$50 for CD and the price there -- and
8 there are only a couple of libraries in the particular
9 area where I am. And if everyone went, they wouldn't be
10 able to look at the documents because there is only one
11 document.

12 MS. SMITH: Thank you.

13 Ronald Murphy. Okay. Thank you.

14 Carole Hossan. Carole Hossan?

15 MS. HOSSAN: I'm Carole Hossan. I live in
16 Westchester at 7725 Hindry.

17 And just briefly for the audience, you know,
18 people in Westchester, we'd like a big, beautiful
19 airport in Palmdale where they have room for it, and
20 where they've owned Palmdale for decades. We'd like to
21 see them make use of that property.

22 I'm just going to have some brief poetry for
23 you. They are haikus. And the first one is -- they are
24 on the topic of the myth of 78 MAP. Mayor Hahn
25 mentioned 78 MAP. In newspaper articles, I've been

1 seeing 78.9 million annual passengers.

2 So this poem says, "The promise broken behind
3 that decimal point, 900,000."

4 Second poem, "Fewer gates limit MAP. Are you
5 so sure? Bigger planes bring more people."

6 Next one, it's entitled "Weasel Words."
7 "Could, should, may, perhaps mitigate." There's a good
8 one. "My neighborhood chokes."

9 Second, the last one, "Moving the runways
10 apart. Is it safety or is it increase throughput that
11 is the real goal here?"

12 And I'm saying this because we're a major
13 city. We need more than one major airport. Other
14 cities have other airports. We shouldn't be putting all
15 of our airplanes into one little, tiny space. And
16 that's considering passengers' safety and security. And
17 Los Angeles has had years to work on this. It's time
18 for them to really get serious.

19 If Palmdale had some of that billions and
20 billions of dollars put in there, what we would have?
21 We'd have something beautiful and something useful and
22 something that would spread the air traffic around.
23 Thank you.

24 MS. SMITH: Thank you. John "Ulloth?"

25 MR. ULLOTH: "Ulloth."

1 MS. SMITH: And after Mr. Ulloth, I have Joe Lyons.

2 MR. ULLOTH: Thank you for calling me so quickly.
3 After the Mayor left, it seems a lot of the interest
4 died down perhaps.

5 Thank you for holding this event. Maybe we
6 should have more than one of two years to see how we're
7 doing.

8 I signed in and they asked what my address
9 was. I'm not sure because I live all over Los Angeles.
10 We need a transit system, an air system, a highway
11 system that intergrades all of our modes together and
12 spreads all over the region. What's missing in this
13 picture? It's transit. That's what I'm here to talk
14 about today.

15 Please do nothing to limit the Green Line from
16 entering right inside the airport. Like JFK's people
17 mover, make sure it's the same technology so your people
18 mover can interline with the Green Line.

19 The reason to do that is, first of all, you
20 don't need to build a new people mover. The Green Line
21 has the capacity. It has the maintenance yard, which I
22 haven't seen identified for a people mover, and it can
23 handle all the traffic in a much faster way in terms of
24 getting it up to speed.

25 If you'll cooperate with the MTA rather than

1 being hostile to them, it will be much easier for
2 everyone. Make sure we have a one-seat ride from our
3 transit lines inside the airport, as close as you can
4 get, because it's not cars that are the most efficient
5 way to unload thousands of passengers. It's rail. It's
6 bus. Please prioritize those modes and keep the parking
7 far away from the terminal and connect that with your
8 people mover.

9 If you make sure that there is only a few
10 stops on the rail line into the airport, that will
11 benefit everyone. It will benefit people by leaving all
12 the congestion and traffic that people bring with their
13 cars at home and out of the residents' hair. It will
14 keep them out of the space of the employees and get them
15 their ride to work.

16 And I would also mention that if you want to
17 expand without airplanes the capacity of this airport,
18 connect it to L.A. Union Station. Connect it with the
19 line that runs on Slauson, the BNSF of Harbor Sub, which
20 MTA owns.

21 Please coordinate with the MTA instead of the
22 hostility toward them that has been shown in the past.
23 Thank you very much.

24 MS. SMITH: Thank you. Joe Lyons.

25 MR. LYONS: Good evening.

1 MS. SMITH: Good evening.

2 MR. LYONS: My name is Joe Lyons. And I'm an
3 airport tenant. We run stores at the airport. And I
4 would like to say a few words in favor of the Master
5 Plan.

6 I have been through a number of hearings
7 several years ago looking at the last Master Plan. And
8 as a tenant at the airport, of course, we have been
9 privy and have been experienced in seeing the
10 development of the airport over a number of years.

11 It seems to me that in looking in perspective
12 we have an airport here which is always in the top three
13 or the top five in the world. It's an airport which is
14 an engine of the economy in Southern California in the
15 western part of the U.S. It's a major gateway to Asia.
16 It's a mix of O & D, 60 percent. It's a mix of short
17 haul; Southwest, long haul; United/American
18 International, 7.5 million passengers. So you've got an
19 enormously complicated and dynamic mix of passengers.
20 And we have to look forward to the future, and at the
21 same time deal with the passengers we have today.

22 The last great infrastructure development or
23 the improvements here were made in the early 1980s in
24 connection with the Olympics. Since that time, there
25 has been a series of improvements, but at the end, they

1 haven't been able to keep up with the pace of travel.
2 Much has happened since that time. And, of course the
3 tragic events of 9-11 overshadow everything.

4 And I think this plan certainly addresses a
5 number of the critical issues we have before us; the
6 issue of security, which is first and foremost, the
7 issue of passenger movements and the people mover,
8 transit in and out of the airport, the issue of new
9 terminals or improvements in terminals to be able to
10 accommodate larger jets, and the issue of improved
11 passenger service through facilities which will address
12 the needs to service a type of traffic and passengers in
13 the future that inadequately service today.

14 So I think all of these points here come
15 through well on the Master Plan. We had an office in
16 El Segundo for a number of years. And every day I drove
17 past the rail just coming to the airport and then taking
18 a quick left and going down Nash Street. All of those
19 things I think are addressed in some form in this Master
20 Plan.

21 No Master Plan is perfect, but clearly there
22 is a need to act. There is a need to go through these
23 hearings we have today and work through a plan we have
24 out on the table, which I believe is essentially a good
25 plan and should help carry the airport into a future

1 which I think will be bright and will speak to the
2 issues that we have before us today. So thank you very
3 much.

4 MS. SMITH: Thank you, Mr. Lyons.

5 MR. LYONS: Thank you.

6 MS. SMITH: Walter Dahlem, Jonathan Hong, Erica Kim
7 and Ronald Murphy.

8 At this time we're going to take another break
9 for 15 minutes and reconvene at 8:10.

10 (Recess was taken.)

11 MR. KESSLER: Good evening, ladies and gentlemen.

12 My name is David Kessler. I'm the environmental
13 protection specialist for the Airport's Division of the
14 Federal Aviation Administration, Western-Pacific Region.

15 I'd like to welcome you to the first of a
16 series of public hearings the FAA and Los Angeles World
17 Airports, or LAWA, are conducting on the Supplement to
18 the Draft Environmental Statement, Environmental Impact
19 Report for the proposed Master Plan at Los Angeles
20 International Airport.

21 The Supplement to the Draft EIS/EIR addresses
22 an additional alternative, Alternative D, Enhanced
23 Safety and Security Plan that was added in the fall of
24 2001. This Alternative was added as a result of
25 comments submitted on the 2001 Draft EIS/EIR and the

1 terrorist attacks that occurred on September 11th, 2001.

2 The purpose of these hearings is to collect
3 comments from the general public concerning the adequacy
4 of the information disclosed in the Supplement to the
5 Draft EIS/EIR on the proposed Alternative D. I'd like
6 to take this opportunity to make sure everyone
7 understands no decision will be made today regarding the
8 proposed project.

9 Today's hearing is not a question-and-answer
10 type of forum. Our job is to listen to what you have to
11 say about the adequacy of the information in the
12 Supplement to the Draft EIS/EIR. In other words, it's
13 your turn to talk to us. Since we are here to listen,
14 we're not going to respond to comments and questions
15 about the pros and cons of the proposed project.

16 Since 5:00 o'clock this afternoon, we have
17 held a workshop just outside of this room for anyone to
18 ask questions about the Master Plan, the environmental
19 process and the various proposed projects.

20 Following publication of the Supplement to the
21 Draft EIS/EIR for review and comment, the next step in
22 the joint Federal and State environmental disclosure
23 process is holding this and other public hearings during
24 this week and next week.

25 Both the Draft EIS/EIR published in 2001 and

1 the 2003 Supplement have been prepared pursuant to the
2 National Environmental Policy Act of 1969 or NEPA, the
3 Council on Environmental Quality Regulations, which are
4 the implementing regulations of NEPA, and the California
5 Environmental Quality Act of 1970, or CEQA, and the
6 Airport and Airway Improvement Act of 1982, as amended.

7 Following today's hearing and the close of the
8 comment period, we will then correct and revise the
9 EIS/EIR as necessary based on the comments received.

10 We'll also prepare responses to the comments we receive
11 and include those responses along with those that were
12 submitted to the FAA and LAWA on the 2001 Draft EIS/EIR
13 into the Final EIS/EIR. The information contained in
14 the Supplement will also be combined with the
15 information in the 2001 Draft EIS/EIR into the Final
16 EIS/EIR.

17 Before we begin receiving additional verbal
18 comments tonight, we'd like to remind everyone of the
19 ground rules of this hearing.

20 As I said earlier, we're not here to respond
21 to questions about the project. We're here to listen to
22 your comments and take notes. We have a court reporter
23 present to ensure we have an accurate transcript of this
24 hearing.

25 For anyone who would like to speak, we ask

1 that you fill out a speaker card and give it to one of
2 the people at the sign-in desk. Cards are then brought
3 up here to our facilitator who calls the names of each
4 speaker so we could proceed in an orderly fashion.

5 So that everyone gets an opportunity to speak
6 and provide verbal comments, everyone will get three
7 minutes. To be fair to everyone, we are not going to
8 allow people to transfer their allotted time to someone
9 else. I ask that when you speak, you give us your name
10 and address for the record.

11 We also have a Spanish language translator for
12 anyone wishing to provide their comments in Spanish.

13 If there is anyone uncomfortable about
14 speaking in front of a group or you need more time than
15 the three minutes provides, we ask that you provide your
16 comments in writing. We have a sign-up sheet, like this
17 one, available for your use at the sign-in desk. You
18 can leave your comments at the sign-in desk, or you may
19 mail your comments using the comment sheet or letter to
20 either address listed on the cover of the EIS/EIR.

21 I would like you to understand that a verbal
22 comment is just as important as a written comment. So
23 please feel free to provide any comments on the document
24 you may have either verbally today or in writing.

25 At this time comments on the Supplement are

1 due by 5:00 p.m. Pacific Daylight Time, on Monday,
2 August 25th, 2003. The FAA is currently considering a
3 request from LAWA to extend the public comment period to
4 a total of 120 days. At this time no decision has been
5 made on LAWA's request. If the FAA agrees to extend the
6 comment period, a notice announcing any extension would
7 be published in the Federal Register and the local
8 newspapers of general circulation.

9 As I've stated earlier, while we have this
10 meeting scheduled until 9:00 o'clock this evening, we
11 will stay here as long as necessary for everyone to
12 provide their verbal comments on the Supplement. As I
13 said, our job here is to listen to your comments.

14 Now, I'll return the hearing back to our
15 facilitator to reintroduce Mr. Jim Ritchie to provide
16 some additional introductory comments.

17 MS. SMITH: Thank you, Mr. Kessler.

18 Mr. Jim Ritchie, Deputy Executive Director of
19 Los Angeles World Airports.

20 MR. RITCHIE: Thank you. Again, I'm Jim Ritchie. I
21 welcome you on behalf of Los Angeles World Airports.
22 And we'll conduct the final stage of the meeting. Thank
23 you again.

24 MS. SMITH: Thank you, Mr. Ritchie.

25 I will call Daniel Walker and Darrel Clarke to

1 the podium. In that order, please. Just to remind you
2 that you have three minutes. And when you see the
3 yellow light appear, that means you have 30 seconds to
4 start wrapping up. Thank you.

5 Mr. Walker.

6 MR. WALKER: Thank you. My name is Daniel Walker.
7 Thanks for this opportunity to come and address you.

8 Tonight I am speaking as cochair of the
9 Friends of the Green Line. I'm also a local resident.
10 I live at 7416 West 82nd Street, which is about eight or
11 nine blocks north of the airport.

12 Friends of the Green Line is an all-volunteer
13 group. You may have heard from some of our colleagues
14 earlier. We basically are just users of mass transit
15 that live in the area around LAX and other parts of the
16 city that we simply would like to see improved access to
17 LAX.

18 We don't have any bone to gripe with the LAWA
19 experts and the fine engineers and planners at LAWA and
20 the city officials. We just think in the past there has
21 been some oversights or some conflicts, or whatever the
22 situation is. Today we don't have very good mass
23 transit access to LAX, and we'd like to see approved
24 access through the Green Line or other mass transit rail
25 services to LAX.

1 Specifically, we would like to see the airport
2 in their Master Plan address a fast rail service from
3 Downtown along the Harbor Subdivision right-of-way the
4 MTA owns. We would like to see the plans that you have
5 accommodate, not necessarily design the entire rail
6 corridor from LAX to Downtown, but make sure that the
7 plan at least doesn't preclude that from happening. So
8 far I know you have just preliminary plans, but we don't
9 really see much more than just a dotted line.

10 The people mover, we had some discussions
11 about that in our group, and we're generally supportive
12 of that concept. Using a people mover to get around the
13 airport rather than the current bus system is a step
14 forward if that comes out and meets a fast rail service,
15 either the Green Line or someday also the Harbor
16 Subdivision connection to Downtown. We think that will
17 be an improvement over today's system, which is simply
18 just cars and buses.

19 So the Friends of the Green Line is definitely
20 supportive of improving access to LAX, getting cars off
21 the roads and the local streets and highways. It seems
22 like you've made a lot of effort to provide direct
23 freeway access to the new facilities, but we don't see
24 that same amount of planning or effort of extending the
25 rail lines as well.

1 It seems like you've done a great job
2 internally of looking at how you can move people around
3 within the airport, but maybe it's MTA's job or your job
4 to work with MTA to find a line that can make it to LAX
5 and improve access. Not only to LAX, but also a rail
6 system that can access Burbank Airport, which is on the
7 Metrolink system. Metrolink also goes out and goes
8 right past the Ontario Airport, and that Master Plan is
9 coming out as well for some study.

10 So we think that a fast rail network would
11 certainly benefit the local residents of Westchester,
12 and it would also make a better L.A. World Airport.
13 Thank you for your time.

14 MS. SMITH: Thank you very much.

15 Mr. Darrel Clarke.

16 MR. CLARKE: Thank you. That was a well-timed
17 finish.

18 MS. SMITH: I agree.

19 MR. CLARKE: Okay. I'm Darryl Clark. I live at 339
20 10th Street, Santa Monica. I'm currently chair of the
21 City of Santa Monica Planning Commission. I am also
22 cochair of the Sierra Club Angeles Chapter
23 Transportation Committee, although tonight I'm speaking
24 as an individual.

25 Two things I would like to focus on. One is

1 that ground connections are critical, as was just
2 commented. I look at in terms of the Green Line
3 definitely needs to access LAX directly. The former
4 Santa Fe now MTA-owned Harbor Subdivision track from
5 Downtown Union Station to Aviation Boulevard in front of
6 LAX could run a very good rail car service in the near
7 term at a rather low cost.

8 We have to think about the 405 Corridor as
9 more than just high-speed ramps from a freeway that
10 doesn't move into the airport. I drive that freeway
11 every day. Fortunately, I'm going from Santa Monica to
12 Orange County, and the bad traffic is the other way.
13 But to have a fast approach to a non-moving freeway,
14 we've got to do better.

15 Down the road, I would really like to see the
16 Green Line extended north along the 405 Corridor to the
17 San Fernando Valley, so it would be serving both LAX as
18 well as the whole west side.

19 And, finally, the Lincoln Corridor. I'm an
20 appointee of the City of Santa Monica on the Lincoln
21 Corridor Task Force Citizen's Advisory Committee. And
22 that's a major challenge because we all know Lincoln
23 Boulevard is just a detour to the 405. We're not going
24 to -- we have no more right-of-way. We're not going to
25 be widening Lincoln Boulevard. We're probably going to

1 be ending up with something like peak hour dedicated bus
2 lines for more rapid bus service at least in the near
3 term on Lincoln Boulevard. That's my personal opinion,
4 but I think that's sort of where we're headed with that.
5 So ground connections are critical.

6 The second point I'd really want to touch on,
7 I find myself favoring a much more modest improvement to
8 the airport than the \$10-billion-dollar tearing down
9 three terminals, reconfiguring the whole central
10 terminal area.

11 First of all, I have to wonder if it's really
12 necessary to in terms of making it terrorist proof. It
13 just creates a different single point of failure. We
14 have a single point of failure at a remote terminal
15 rather than multiple points of failure at individual
16 terminals, and it would make it less convenient for
17 people like me that typically get dropped off or drive
18 ourselves down to the airport or hopefully someday take
19 the train down there.

20 And just the enormous cost of such a
21 reconfiguration. I would really say, keep the basic
22 terminal arrangement. Add a people mover to replace the
23 many buses that are jamming all of those roadways today.
24 Add better ground links, but don't do a major
25 reconstruction. I just don't think it is necessary,

1 which leads me to a final recommendation in 17 seconds.

2 I would suggest another alternative be added.
3 We have the past alternatives from the previous mayor
4 administration. We have this alternative. If we had an
5 alternative of not a no-build, but build less, improve
6 ground connections, improve circulation, but don't do a
7 major reconstruction.

8 MS. SMITH: Thank you very much.

9 MR. CLARKE: Thank you.

10 MS. SMITH: Do we have any other speaker cards
11 filled out? Anyone else wishing to speak, please feel
12 free to fill out one of these speaker cards and turn
13 them into the sign-in table. We're here for you at
14 least another half hour, and we'll stay here longer if
15 we need to.

16 MR. KESSLER: At this time since we don't have any
17 other speaker cards, we'll go into another recess until
18 we get another speaker card.

19 MS. SMITH: Thank you.

20 (Recess was taken.)

21 MS. SMITH: It's 9 p.m. If we don't have any
22 further comments from the public, this hearing will be
23 officially closed. Thank you very much for coming out.

24 As you know, there are some additional
25 hearings this week and next week. We'll wait to hear

1 Mr. Kessler for some closing remarks.

2 MR. KESSLER: All right. If there is anyone else
3 who has not had an opportunity to speak concerning the
4 information proceeding to the Supplement Draft EIS/EIR?

5 Not seeing anyone else, I'll remind everyone
6 if you feel uncomfortable about providing verbal
7 comments today, we will be accepting written comments by
8 5:00 p.m. Pacific Daylight Time, on Monday, August 25th,
9 2003. You could mail your comments to me either at the
10 FAA or Jim Ritchie at LAWA at the address on the cover
11 of the Draft EIS/EIR.

12 I want to thank everyone for your comments
13 today. The public hearing for the Supplement to the
14 Draft EIS/EIR on the LAX Master Plan is now closed.
15 Thank you.

16 MS. SMITH: Thank you.

17 (Whereupon the proceeding adjourned
18 at 9:01 o'clock p.m.)

Councilmember Kelly McDowell,
City of El Segundo
Comments on the
LAX Master Plan Draft EIS/EIR Supplement
August 2003

- Good Evening. I am Councilmember Kelly McDowell, representing the City of El Segundo.
- Given the length and complexity of the Master Plan and environmental documents, our full comments on technical issues will not be ready for some time, therefore the City's comments tonight are preliminary.
- The City continues to oppose Alternatives A, B, and C for the many reasons the City expressed orally and in writing during the public review and comment period for the initial Draft EIS/EIR in 2002.
- *ES* ~~We feel the stated objectives of preferred Alternative D support a regional aviation approach that makes proper use of Inland Empire airports.~~ *not endorsed alt. D, but*
- *MY* ~~The City supports an alternative with fewer environmental impacts. We would like to see the adverse impacts of the airport minimized and mitigated to the greatest extent feasible.~~ *(i+s)*
- *ES* ~~The City supports enhanced safety and security at LAX.~~
- *MY* And the City supports an alternative that by design will accommodate passenger and cargo levels no greater than the physical capacity of the airport as it exists today.
- Limiting LAX's capacity to its current capacity has always been our number one goal and we believe limiting LAX's capacity will allow other airports in the region to develop and handle a fair share of future regional aviation demand,
- will result in fewer environmental impacts,
- and will improve safety and security at the airport.

- However, the City is greatly concerned about the impacts of southside airfield changes that *would* move the southernmost runway 50 feet closer to El Segundo.
- LAWA has stated that it believes these changes are necessary to improve runway safety.
- However, we are currently studying the impacts of the reconfiguration, and the options for the southern runway complex.
- In particular, we urge a full public consideration of end-around taxiways as an alternative that could provide greater safety at lower cost and with fewer new burdens on local communities.
- Safety at LAX must be a priority for all of us.
- The City is prepared to support measures necessary to enhance safety, even if those measures increase our burden, but only if we are assured, through an independent expert, that other alternatives are not equally effective.
- In conclusion, we are grateful for Mayor Hahn's responsive leadership and his pledge to constrain growth at LAX and foster a regional approach to meeting future aviation demand.
- It is our hope that the ultimate outcome of this Master Plan process will be a regional airport approach that ensures that LAX does not exceed its current capacity.
- Thank you.

Subject: FW: Talking points for LAX EIR hearings with respect to rail/airport connections

Sent: Sunday, August 10, 2003 1:59 PM

Subject: Talking points for LAX EIR hearings with respect to rail/airport connections

To All:

The following "talking points" below are the result of many meetings and discussions of rail advocates, the latest of which was last Thursday evening's Friends of the Green Line (FoGL) Meeting in El Segundo.

Key: Since the MTA has no money to pay for a Green Line extension to Westchester, the notion of a Green Line extension should fall under traffic and/or environmental mitigation, with a final EIR of any Alternative D including a specific design--preferably one that has the written blessing of the FAA.

More talking points:

1) Our goal is for the Green Line to connect to the GTC, wherever it ends up. Manchester Square is being discussed as a site for the GTC solely because it's on the drawing board as the current site--FoGL is neutral on where the actual location should be..

2) A Green Line Westchester extension would enhance the usefulness of the People Mover by connecting it to local hotels and businesses.

FoGL supports the LAWA People Mover for airport transportation purposes, but not a People Mover that would harm future regional transportation efforts.

3) FoGL recommends a direct connection of the Green Line to the GTC as an alternative to a potentially-superfluous Intermodal Transit Center adjacent to the Aviation/Imperial Green Line station.

A direct Green Line/GTC connection would not interfere with the People Mover designed to connect Parking Lots C and D with the GTC, but would instead separate rail- and car-bound LAX traffic.

4) Federal funding for both a rail connection from the south (along the MTA Harbor Subdivision Line to the GTC), as well as funding for rail connections from the north and Downtown, might be a better argument for LAX-related traffic mitigations than "a Green Line extension to Westchester".

The northern connection would be from the previously-planned Westchester extension, and from Downtown and Inglewood via the MTA Harbor Subdivision Line to the GTC.

5) The Bay Area just established a rail/airport connection, and Orange County has just started looking into its own airport/rail connection via its Centerline--L.A. County should strive for nothing less than its own rail connection(s).

The nine Public Hearings for the Supplement to the Draft EIS/EIS and Draft Master Plan Addendum are scheduled as follows:

Date

Location

8/10/03

SPHL

AX Express Proposal

Most world-class airports offer direct rail service to the heart of their cities. Friends of the Green Line (FoGL) advocates the LAX Express with rail service between Los Angeles International Airport (LAX) and downtown Los Angeles Union Station.

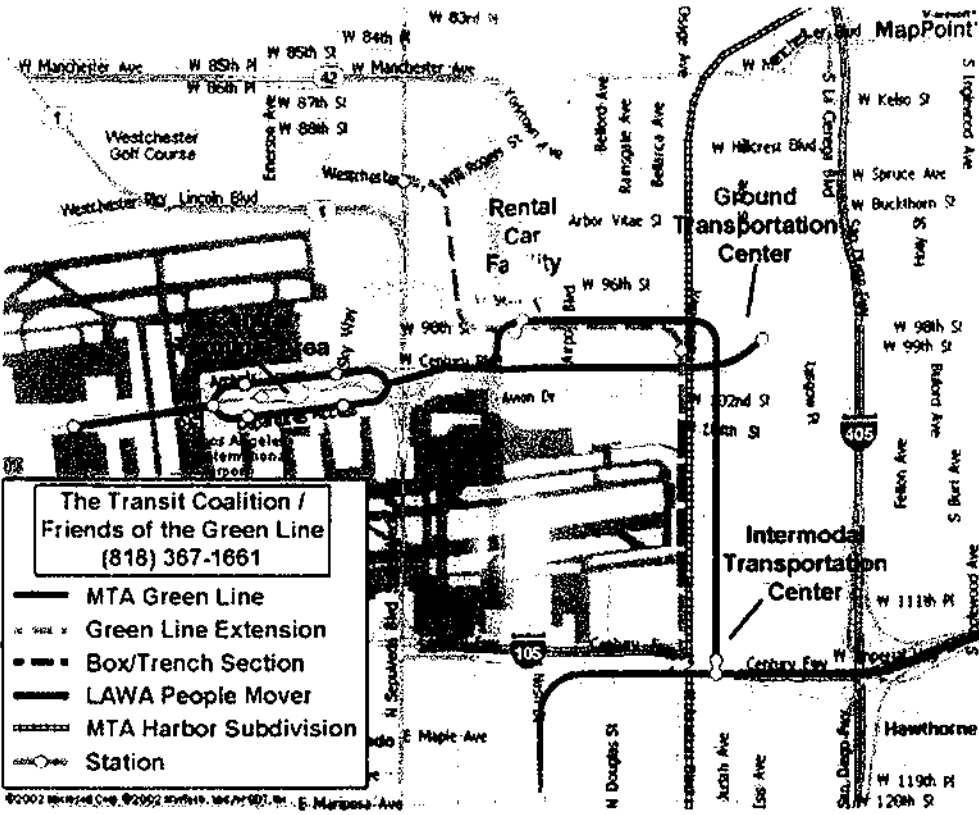

The Metropolitan Transportation Authority owns a lightly used existing Right-of-Way known as the MTA Harbor Subdivision.

This map shows the complete Right-of-Way, which runs northwest from San Pedro, past LAX, then continuing northeast on to Long Beach Junction, a rail interchange with connections to Los Angeles Union Station (LAUS). At LAUS there are connections to existing rail lines and future proposals like California High Speed Rail to the Bay Area.

The LAX Express proposal could provide local and Crosstown Express service for South Bay and West Los Angeles residents between transit hubs at LAX and LAUS.

Green Line Rail Access To Westchester Via LAX

The Transit Coalition / Friends of the Green Line (818) 367-1661

- MTA Green Line
- - - Green Line Extension
- - - Box/Trench Section
- LAWA People Mover
- - - MTA Harbor Subdivision
- Station

Friends of the Green Line (FoGL) recommends that any plan for improvements in security, noise abatement and traffic include the FoGL LAX Express proposal and the FoGL Green Line extension proposal to Westchester via LAX as an integral part of the overall LAX Master Plan and not just a connection to the Green Line on the outskirts of LAX. By reducing the number of transfers, more passengers will utilize public transit and this will reduce traffic congestion, air pollution and noise around LAX.

FoGL recommends a regional airport system, and the LAX Express can be modified for direct transit between most of the major Airports in the Los Angeles Region. The above map shows the Green Line as originally adopted by the MTA, and includes the Los Angeles World Airport (LAWA) proposed People Mover. FoGL remains neutral on any LAWA proposal and supports efforts to regulate passenger capacity at LAX.

Light Rail and Airports A Perfect Match

Construction of the Green Line past LAX was halted in the 1990's due to concerns about interference from the trains' overhead power collectors interfering with airplane landing systems. An exhaustive study showed a shallow trench, which lowers the light rail trains below the line of sight of the radar beacons, solves the problem.

The Santa Clara Valley Transportation Authority (VTA) Light Rail system in San Jose California was extended past the end of the runways at NAS Moffett Field with its highly sensitive electronic equipment without any problems, using the same exact configuration recommended by the Green Line Interference study.

This photo shows the train's overhead wires—the source of the potential interference—just above the level of the fence and just feet from the end of the runway as a VTA Light Rail train passes under the flight path in a trench that helps shield any interference from the train.

FoGL advocates extending the Green Line in a trench, similar to the one shown in the above photo, past LAX's south runways and continuing on to Westchester.

Why The Green Gap?

Extending the Green Line 2.5 miles north to Westchester with stations at LAX would save 15-30 minutes per trip by eliminating the walking and shuttle transfer currently needed to get from the Green Line to LAX.

Extending the Green Line 2.5 miles east to the Norwalk Metrolink Station would save 15-45 minutes per commute by not having to use the current shuttle bus system.

Extending the Green Line 2.5 miles south to the South Bay Galleria would move the terminus to an existing transit hub, a busy shopping mall and provide a friendlier pedestrian environment.

Commuters on this Shuttle bus will miss the East Bound Green Line Train by seconds and have a 15-minute wait for the next mid-day train to arrive.

Save Our Health

Traffic noise at all I-105 freeway median Green Line stations frequently reaches the 85 to 90 db range.

This is not only uncomfortable but also unhealthy. Prolonged exposure to noise levels over 85 db may gradually lead to some hearing loss. Simple measures such as sound barriers can significantly reduce noise levels at the station platforms.

Protection from noise and weather is urged at all Green Line Stations.

Friends Of The Green Line Goals

- 1 Extend the Green Line thru LAX to Westchester to allow access from the North and the South
- 2 Provide Express Train Service between LAX and Union Station
- 3 Extend the Green Line South to the South Bay
- 4 Extend the Green Line East to the Norwalk Metrolink Station
- 5 Provide shelter from noise and weather at Green Line Stations

Conceptual Westside Rail

Who Are We?

Friends of the Green Line (FoGL) is an all-volunteer organization of frustrated commuters and transit users working for improved mobility and less pollution in the Greater Los Angeles Region. FoGL is not affiliated with the MTA or LAWA.

FoGL recognizes the Green Line as a form of mass transit that is positioned to improve ground and air transportation throughout Southern California, in particular because of its proximity to LAX, the Westside, the South Bay and the Norwalk Metrolink Transit Center which would link MetroRail to Orange, Riverside and San Diego Counties.

How Can You Help?

The Transit Coalition is a 501 (c) (3) non-profit organization. Please contact us if you would like to attend our meetings, make a tax-deductible contribution, volunteer your time or help in any other way.

Green Line Extensions:

The Ones That Got Away!

Friends of the Green Line

There are three ^{parts} parts to this ^{strategic perspective} strategy:

1. Building a Safe and Secure facility: This is elemental to the future on a both practical and perceptual dimension. *Sadly,*
2. Designing an airport that maintains LA's status as an international gateway: The international customer is the most sought after in the world. Either we build a user-friendly facility for this customer or they will go elsewhere.
3. Last, this plan recognizes a truth that Southern California's demand for air-travel cannot be built on the backs of the citizens of single city. This plan addresses the truth that there must be a regional solution to regional demand.

Thank you.

Redesson Plaza
3515 Wilshire

Notes Re LAX

I'm.....

Speak in support of the Masterplan that's before you.

Our organization represents an industry:

~~\$11.8 billion~~ ^{10 billion}

23 million visitors

240K jobs

LAX is the shelf from which our customers buy LA.

The MasterPlan, Option D has 100's pages of detail.

There is and will be lots of discussion of those details.

But, I am here to ask that the strategic ~~vision~~ ^{perspective} reflected in this plan not get lost the discussion of details.

not exact

Speaker 11

Good afternoon, my name is Richard Slawson and I am the Executive Secretary of the Los Angeles/Orange Counties Building and Construction Trades Council. Our Council represents over 130,000 Craftsmen and women who live and work throughout Los Angeles. We enthusiastically support Mayor Hahn and his master plan alternative for LAX.

When this plan gets underway, besides moving forward the needed modernization of our airport, nearly 49,000 construction-related jobs will be directly generated during the entire construction phase.

Statement #4

This is welcome news for our regional economy because putting 49,000 men and women to work, at good wages, is a boost not only to those on the job but throughout Southern California. This many new jobs will have a tremendous ripple effect that will in fact support 100,000 jobs around the region and \$11 billion to total economic activity.

This region desperately needs the economic stimulus from this LAX Master Plan.

Our other concerns are also being met by the Alternative D Plan. As in the case of many other world class airport, including Washington Dulles International Airport , Orlando International Airport and Denver

International Airport, their terminals are linked by the use of trams, people movers and trains. Washington Dulles uses what they call movable lounges. Orlando uses trains and Denver uses a combination of moving walkways and an underground train.

All of these are similar to the Ground Transportation Center and the Intermodal Transportation Center included in alternative D in the LAX Master Plan.

These then connect with the main or Central Terminal Area by the automated people mover. With the heightened security measures that are needed today, this makes absolute sense.

I would also like to commend Mayor Hahn for the commitment that he made to hold

LAX to 78 Million Annual Passengers. We all know that LAX must be modernized, but it must also meet the needs and concerns of the residents of Los Angeles and surrounding communities and especially those residents who live near the airport. This plan addresses, traffic, security and noise in its design and regulations.

We support the LAX Master Plan and asked that you give it your approval.

Thank you.

Testimony by Mayor James K. Hahn

Joint Hearing of the Federal Aviation Administration and
The City of Los Angeles/Los Angeles World Airports
Radisson Plaza Hotel
3525 Wilshire Blvd.
Los Angeles, California
5 p.m., Monday, August 11, 2003

Good evening. My name is Mayor Jim Hahn of the City of Los Angeles.

I am here to voice support for the Enhanced Safety and Security Plan - Alternative D. I believe this alternative that has evolved over the past year breaks new ground in airport design and planning for the 21st century and can serve as a model for airports throughout our nation and the world.

This plan designs the future LAX to accommodate approximately 78 million annual passengers and 3 million annual tons of cargo. Modernizing LAX in this way will help to secure LAX's role as the airport of choice for long haul operations - both passengers and cargo.

78 million annual passengers is consistent with the goals established in the Southern California Association of Governments Regional Transportation Plan. These goals promote growth of underutilized airports in outlying areas and allow us to achieve a more decentralized distribution of future air traffic around the region. It is also fair for the surrounding communities who will also have to bear a burden with increased traffic. Previous proposals that called for up to 98 million annual passengers were unrealistic.

I am pleased that support for my plan is growing. As people learn more about it, they come to understand that my plan is the environmentally superior alternative of all the concepts and plans studied over the past decade. They also realize that my plan incorporates leading-edge technology and design standards to provide travelers and airport workers with unmatched safety and security at the world's largest origination and destination airport.

LAX Master Plan means improved airport safety.

- Alternative D modernizes the airfield to improve safety for aircraft, traveling passengers, and airport workers.
- Center taxiways will provide additional protection against runway incursions.
- Parallel taxiways and full taxiway spacing improve aircraft movement and reduce taxiing times, improves safety and reduces delays for passengers.

LAX Master Plan means improved airport security.

- Alternative D provides for multiple layers of security protection for the traveling public, airport workers and the surrounding communities.

- Alternative D eliminates the high concentration of people as a potential terrorist target - it disperses the passengers and moves them rapidly among four separate and secure entry portals.
- Alternative D eliminates roadway traffic in the Central Terminal Area and significantly reduces the chance of an oversized vehicle explosive device being delivered to the Central Terminal Area.
- Alternative D permits early observation and assessment of passengers and baggage.

LAX Master Plan supports a regional transportation plan.

- Alternative D addresses community interests and concerns; Alternative D supports only LAX's fair share of the total regional air service market.
- Alternative D allows other regional airports to accommodate a greater share of the air traffic demand.

LAX Master Plan means a modern airport.

- Alternative D offers a redeveloped Central Terminal Area that provides for increased security screening and enhanced passenger conveniences.
- Alternative D will have new passenger terminals that provide for improved ticketing, baggage processing, circulation and concessions
- An Automated People Mover offers convenient access from the new facilities to the Central Terminal Area every two minutes
- The Automated People Mover trains will be modern, designed to easily accommodate rolling luggage and baggage carts.

LAX Master Plan improves ground transportation.

- Alternative D provides key improvements to the ground transportation system in and around LAX.
- Alternative D reduces thousands of private vehicles and commercial shuttle buses from the roadways and significantly reduces the impacts on surface streets and freeways.
- Alternative D designs convenient, easy access to the new facilities and proposes mitigation measures that provide direct access to and from the I-405 and I-105 Freeways to discourage residential street use.
- Alternative D means a direct connection to the Metro Green Line and encourages the use of mass transit.
- An expanded FlyAway Program encourages the use of high-occupancy vehicles and eliminates thousands of vehicles from the region's roadways.

LAX Master Plan sustains a region's key economic engine.

- LAX Master Plan means jobs; 351,000 jobs in the region by 2015, 295,000 jobs in LA County and nearly 139,000 jobs in the City of Los Angeles.
- LAX Master Plan means LAX will contribute \$64 billion to the regional economy in 2015, \$22 billion annually to the City of Los Angeles.

- Alternative D means nearly 49,000 construction-related jobs.

In conclusion, I want to emphasize that the goal of creating the Enhanced Safety and Security Master Plan is to modernize LAX to protect one of Los Angeles' key economic engines. At the same time, the plan addresses community interests and concerns by designing the facility to serve only LAX's fair share of the total regional air service market.

I thank the staffs of the Federal Aviation Administration and Los Angeles World Airports for your dedication and support of the master plan process. I look forward to the process continuing so that we can begin the long-overdue modernization of LAX as soon as possible. Thank you.

Speaker 1615

Testimony for LAX Master Plan Hearing
August 11, 2003

I am here to support the Enhanced Safety and Security Plan for LAX – also known as Alternative D. I believe this alternative breaks new ground in airport design for the 21st century and can serve as a model for airports throughout the world.

My staff and I have briefed thousands of stakeholders on this plan, including community residents, airlines, labor, and local business leaders. I believe that this plan incorporates many of their suggestions and addresses their concerns with the other alternatives.

Alternative D puts safety and security first. It includes modernization of the airfield, including the addition of center taxiways, to improve **safety** for aircraft, traveling passengers, and airport workers.

It also provides for multiple layers of **security** for the passengers, airport workers and the surrounding communities. It disperses travelers and moves them rapidly through four separate and secure entry points. It also allows security screeners to make assessments of passengers and baggage before they get into the Central Terminal Area.

Most importantly, this plan significantly reduces the opportunity for a vehicle with an explosive device to get close to the Central Terminal Area by eliminating traffic through the area. Security experts believe that the Central Terminal Area and its impact on our economy – not passengers – are the key targets for terrorists.

Alternative D also supports my goal of creating a regional air transportation plan. It designs LAX to accommodate approximately 3 million annual tons of cargo and 78 million annual passengers, which is consistent with the goals established in the Southern California Association of Governments Regional Transportation Plan. We are also working to promote use of our other regional airports to meet demand.

Alternative D also means a more modern and convenient LAX for our passengers. The plan includes new passenger terminals with improved ticketing, baggage processing, circulation and concessions. An Automated People Mover designed to easily accommodate rolling luggage and baggage carts will offer convenient access to the Central Terminal Area every two minutes.

Alternative D also provides key improvements to the ground transportation around LAX to reduce congestion and pollution. It will finally provide a direct connection from the Metro Green Line and direct access to and from the 405 and 105 freeways. Approximately 36 new lane-miles and improved curb access will improve passenger access and reduce traffic congestion on surface streets. An expanded FlyAway Program will eliminate thousands of vehicles from the region's roadways.

Finally, Alternative D means jobs and is expected to contribute \$64 billion to the regional economy.

As people learn more about Alternative D, I have found that they support the leading-edge technology and design standards that will provide travelers and airport workers with unparalleled safety and security. They also find that this plan is the environmentally superior alternative compared

with the other plans that have been studied over the past decade.

I want to thank all of the community leaders, business leaders, airline representatives, labor leaders, and others who shaped Alternative D. I want to acknowledge Deputy Mayor Troy Edwards and Patricia Torres of my staff. And I want to especially thank the Federal Aviation Administration and Los Angeles World Airports staffs for your dedication and support of the master plan process. I look forward to the process continuing so that we can begin the long-overdue modernization of LAX as soon as possible.

Thank you.

Today, the Los Angeles World Airports continues to celebrate 75 years of connecting Southern California to the World. Commonly known as LAWA, the Los Angeles World Airports actually consists of FOUR airports...VAN NUYS is the world's BUSIEST general aviation airport. ONTARIO INTERNATIONAL serves the Inland Empire, the fastest growing region in Southern California. The PALMDALE REGIONAL has its' 25 year Master Plan for residents in Antelope & Santa Clarita Valleys, plus portions of San Bernardino/Inyo Counties. And the fourth one, LAX, where travelers throughout the world think of LAX as not only a ~~an~~ airport but an ^{entire} city, LOS ANGELES. True, LAWA has had a spectacular past BUT now we must ^{now} prepare for a SAFE future.

Prior to 9/11, LAX contributed \$60 BILLION per year in economic output, contributed 59,000 JOBS at or near LAX, plus 408,000 JOBS in the southern California region.

~~The~~ LAX security is of major importance to not only our state, but ^{our} the nation. Since California has the 5th largest economy in the world, we ^{must start} ~~must start~~ improving security NOW; not ^{please} waste time on a Master Plan that will be out dated in 15 years, when the war will be over. The terrorists will have been hunted down. Just think in 15 years, ^{is just too long to wait} ~~this project may be nearing completion.~~ *for alternative D.*

With TSA/Home Land Security, the walls came tumbling down in the terminals, moving in 100 huge explosive scanners, costing ^{million dollars} ~~1.9 MILLION~~ each, plus a ^{yearly} ~~yearly~~ \$100,000 maintenance fee. Unfortunately, these monsters had ^{with a} 25% false positive readings with food being a problem! *far too many*

* WHO PAYS for Alternate D? We're told a major part will be passed on to airlines via landing fees, etc. NOW that sounds like just what airlines need, especially those who are either in or fighting off bankruptcy!! Besides, the small businesses & hotels around LAX will have a very difficult time for many years and some may not survive. This plan was said to cost 9.1 BILLION, then 9.6. How many billions more will it be?

Honestly,
* Proponents like to couch this whole scenario around "security" as cars and LAX facilities DON'T MIX! Now how do they think people are going to get to this Ground Transportation Center? If you were a terrorist wanting to inflict major loss of life and damage, would you rather have the passenger load widely distributed around 9 different terminals or where EVERYONE for ALL flights congregated at 1 check in/drop off site?

Speakers 18/17

STATEMENT BY ALAN B. WAYNE
REGIONAL DIRECTOR - GOVERNMENTAL AND PUBLIC AFFAIRS
UNITED AIRLINES / LOS ANGELES

SUPPLEMENT TO THE DRAFT ENVIRONMENTAL IMPACT STATEMENT/
ENVIRONMENTAL IMPACT REPORT
LOS ANGELES INTERNATIONAL AIRPORT MASTER PLAN

MONDAY, AUGUST 11, 2003
RADISSON PLAZA HOTEL, LOS ANGELES

FOR THE RECORD, MY NAME IS ALAN WAYNE. I AM DIRECTOR OF
GOVERNMENTAL AND PUBLIC AFFAIRS FOR UNITED AIRLINES' WEST
REGION.

I AM APPEARING TONIGHT ON BEHALF OF NOT ONLY UNITED, BUT
ALSO TEN OTHER FELLOW MEMBERS OF THE STAR ALLIANCE, THE
LARGEST AIRLINE CONSORTIUM OPERATING AT LOS ANGELES
INTERNATIONAL AIRPORT. IN ADDITION TO UNITED, WHICH OPERATES A
HUB AT LAX, THE STAR MEMBERS INCLUDE AIR CANADA, AIR NEW
ZEALAND, ALL NIPPON, ASIANA, LUFTHANSA, MEXICANA, SINGAPORE,
THAI, VARIG AND U.S. AIRWAYS.

THOSE ELEVEN CARRIERS, PLUS UNITED'S REGIONAL MARKETING
PARTNER SKYWEST, WHOSE 133 DAILY DEPARTURES ARE THE MOST OF
ANY CARRIER AT LAX, WISH TONIGHT TO UNDERSCORE OUR COLLECTIVE
SUPPORT FOR MAYOR HAHN'S ONGOING EFFORT TO CRAFT A MASTER

PLAN FOR LAX THAT WOULD ULTIMATELY IMPROVE AND MODERNIZE THIS CRITICAL, BUT SADLY ANTIQUATED FACILITY.

UNITED AND THE STAR CARRIERS, PLUS SKYWEST, WHO ACCOUNT FOR 30 PERCENT OF THE FLIGHT ACTIVITY HERE, ARE WORKING WITH THE CITY TO ADDRESS THE AIRFIELD SAFETY, AIRPORT SECURITY, GROUND ACCESS, AND PASSENGER TERMINAL ENHANCEMENTS THAT MUST BE ACHIEVED IF THIS AIRPORT, WHICH IS SO IMPORTANT TO THE REGION'S ECONOMIC COMPETITIVENESS, AND THE THOUSANDS OF JOBS THAT DEPEND ON IT, IS TO REMAIN IN THE FOREFRONT OF COMMERCIAL AVIATION.

TO DO NOTHING, OR TO NOT DO THIS PROJECT REALISTICALLY, IS NOT ACCEPTABLE. THIS PROJECT IS OVERDUE AND MUST GET UNDERWAY. OTHER AIRPORTS - SEATTLE, PORTLAND, SAN FRANCISCO, LAS VEGAS, DENVER, PHOENIX - TO NAME A FEW, HAVE MODERNIZED OR ARE ADVANCING PROGRAMS TO DRAW BUSINESS AWAY FROM LAX.

UNITED AND THE STAR CARRIERS BELIEVE THAT THIS PLAN FOCUSES ON THE ISSUES AND ELEMENTS THAT WILL MOVE LAX FORWARD, AND WE PLAN TO CONTINUE OUR COLLABORATION WITH THE CITY AND THE AIRPORT TO MEET THESE FUTURE REQUIREMENTS.

THANK YOU.

It seems to me that too much is ^{being} concentrated in one area. This project, as proposed would increase traffic congestion in that one small area. There is no room for another freeway, and increased traffic in the immediate area will overwhelm the surface streets with people getting off the freeway looking for alternative ways to ~~get to~~ by pass the freeway congestion.

What about the mitigation studies done to address the traffic? Well, complex studies have been done ~~for~~ for the 405 Fwy expansion. Yet, after the expense and long years of construction, it is just as congested as if no work were done to reduce the congestion.

← I believe the same results will be likely for the current traffic mitigation plan for ~~the~~ Alternative Plan D.

To mitigate traffic and improve security for people arriving and returning to their cars, I think the parking should be spread out in smaller lots through out ~~the~~ ^{the} region. From those parking areas have shuttles ^{transport} ~~move~~ the passengers to the people movers.

As people buy their air line tickets, ^{they} ~~people~~ can be ^{assigned} ~~directed~~ to the various parking facilities. ~~We control the flow of~~ ~~traffic by spreading it out~~ This would be an effective means by which to spread the traffic ~~out~~ through out that area and prevent large concentrations of traffic.

Many are concerned with a car bomb going off in the terminal area, but a giant parking structure full of thousands of travelers is just as juicy a target ^{terrorist's} for a car bomb.

~~By creating~~ ^{more} smaller parking facilities

By creating smaller, more numerous parking structures, the attractiveness of such a target is reduced, and even if such an ~~the~~ attack occurred at one structure the loss of life and injuries would be reduced.

There would also be plenty of other structures to fall the increased ^{parking} demand of a lost structure

It would also be easier to distribute the loss of one or two lost structures among the remaining parking structures, than if one giant structure were lost.

**Official Hearing Transcript
Ontario, California
Tuesday, August 12, 2003**

Following this page is the transcript of the oral testimony taken at the above hearing. Each speaker at the hearing has been assigned a unique identification number. The numbers assigned to each speaker for this hearing are:

Number	Speaker	Affiliation
SPHO00001	Kelly McDowell	City of El Segundo
SPHO00002	Max Villar	Los Angeles Convention and Visitors Bureau
SPHO00003	Mary Jane Olhasso	City of Ontario
SPHO00004	Mahala Walter	None Provided
SPHO00005	Frank Zavala	Laborers Local 300
SPHO00006	Jorge Rivera	Local Union 250
SPHO00007	Peter Barrera	Local Union 250

Any exhibits attached to this hearing transcript have been previously reproduced in this Final EIS/EIR as individual public comment letters.

2 AT 6:00 O'CLOCK P.M.

3 ---o0o---

4
5
6 MS. SMITH: Good evening, ladies and gentlemen.
7 On behalf of the Federal Aviation Administration and
8 Los Angeles World Airports, I would like to welcome
9 you to the second in a series of hearings to receive
10 public testimony on the Los Angeles Airport Master
11 Plan Environmental Impact Statement and Environment
12 Impact Report.

13 My name is Shauna Bain Smith, and I will
14 be your facilitator this evening. The two gentlemen
15 to my right will be receiving your testimony. And
16 before we start the formal proceedings, they have a
17 few introductory remarks.

18 I'll start with Mr. David Kessler with the
19 Federal Aviation Administration.

20 Mr. Kessler.

21 MR. KESSLER: Thank you. Good evening ladies
22 and gentlemen.

23 My name is David Kessler. I'm the
24 environmental protection specialist for the Airports
25 Division of the Federal Aviation Administration

1 Western Pacific Region.

2 I'd like to welcome you to a second of a
3 series of public hearings the FAA and Los Angeles
4 World Airports, or LAWA, are conducting on the
5 supplement to the Draft Environmental Impact
6 Statement/Environmental Impact Report, or EIS/EIR,
7 for the proposed Master Plan at Los Angeles
8 International Airport.

9 The supplement to the Draft EIS/EIR
10 addresses an additional alternative, Alternative D,
11 the Enhanced Safety and Security Plan that was added
12 in the fall of 2001. This new alternative was added
13 as a result of comments submitted on the 2001 Draft
14 EIS/EIR and the terrorist attacks that occurred on
15 September 11th, 2001.

16 The notice of availability of the
17 supplement to the Draft EIS/EIR was published in
18 various local newspapers and in the Federal Register
19 on Friday, July 11, 2003. The FAA and LAWA are the
20 authors of the supplement. The Federal Highway
21 Administration is also a cooperating agency in the
22 preparation of the Draft EIS/EIR that was published
23 in January 2001.

24 The purpose of these hearings is to
25 collect comments from the general public concerning

1 the adequacy of the information disclosed in the
2 supplement to the Draft EIS/EIR on the proposed
3 Alternative D.

4 I would like to take this opportunity to
5 make sure that everyone understands that no decision
6 will be made tonight regarding the proposed project.
7 Today's hearing is not a question-and-answer type of
8 forum. Our job is to listen to what you have to say
9 about the adequacy of the information in the
10 supplement to the Draft EIS/EIR. In other words,
11 it's your turn to talk to us. Since we're here to
12 listen, we are not going to respond to the pros or
13 cons of the proposed project.

14 Since 5:00 o'clock this afternoon we've
15 held a public workshop just outside of this room for
16 anyone to ask questions about the Master Plan, the
17 environmental process and the various proposed
18 projects.

19 Following publication of the supplement to
20 the Draft EIS/EIR for review and comment, the next
21 step in the joint Federal and State Environmental
22 Disclosure process is holding this and the other
23 public hearings during this week and next week.

24 I would like to take this opportunity to
25 recap the environmental disclosure process for this

1 project.

2 The environmental evaluation for the LAX
3 Master Plan began in 1997 with the publication of a
4 notice of intent to prepare the joint EIS/EIR in the
5 Federal Register. In July of 1997 we held a series
6 of meetings with members of the public and
7 governmental agencies to receive comments on the
8 scope of the Draft EIS/EIR. Following those
9 meetings the Draft EIS/EIR was published in January
10 2001.

11 Both the 2001 Draft EIS/EIR and the 2003
12 supplement have been prepared pursuant to the
13 National Environmental Policy Act of 1969, or NEPA,
14 the Council on Environmental Regulations, which are
15 the implementing regulations of NEPA, the California
16 Environmental Quality Act of 1970, or CEQA, and the
17 Airport and Airway Improvement Act of 1982 as
18 amended.

19 Following today's hearing and the close of
20 the comment period, we will then correct and revise
21 the EIS/EIR as necessary based on the comments
22 received. We will also prepare responses to the
23 comments we receive and include those responses
24 along with those that were submitted to the FAA and
25 LAWA on the 2001 Draft EIS/EIR into the final

1 EIS/EIR. The information contained in the
2 supplement will also be combined with the
3 information in the 2001 Draft EIS/EIR into the final
4 EIS/EIR.

5 Before we begin receiving verbal comments,
6 I would like to let you know the ground rules of
7 this hearing. First, as I said earlier, we are not
8 here to respond to questions about this project. We
9 are here only to listen to your comments and take
10 notes.

11 We also have a court reporter present to
12 ensure that we have an accurate transcript of this
13 hearing. For anyone wishing to speak, we ask that
14 you fill out a speaker card like this one. Give it
15 to one of the people at the sign-in desk. The cards
16 will then be brought up here to our facilitator who
17 will then call the names of each speaker so that we
18 can proceed in an orderly fashion.

19 So that everyone gets an opportunity to
20 provide verbal comments, everyone will get three
21 minutes to speak. To be fair to everyone, we are
22 not going to allow people to transfer their allotted
23 time to someone else. I ask that when you speak,
24 you give us your name and address for the record.
25 We also have a Spanish language translator for

1 anyone wishing to provide their comments into
2 Spanish.

3 If there's anyone who is uncomfortable
4 speaking in front of a group or you need more than
5 three minutes to provide your comments, we ask that
6 you provide your comments in writing. We have
7 comment sheets like this one available for your use
8 at the sign-in desk. You can leave your comments at
9 the sign-in desk, or you can mail your comments
10 using the comment sheet or a letter to either
11 address listed on the cover of the EIS/EIR.

12 I would like everyone to understand that a
13 verbal comment is just as important as a written
14 comment. So please feel free to write any comments
15 on the document you may have to us either verbally
16 today or in writing.

17 At this time comments on the supplement to
18 the Draft EIS/EIR are due by 5:00 p.m. Pacific
19 Daylight Time on Monday, August 25th, 2003. The FAA
20 is currently considering a request from LAWA to
21 extend the public comment period to a total of 120
22 days. At this time no decision has been made on
23 LAWA's request. If the FAA agrees to extend the
24 comment period, a notice announcing any extension
25 would be published in the Federal Register and local

1 newspapers of general circulation.

2 Lastly, I would like everyone to
3 understand that even though we have this hearing
4 scheduled until 9:00 o'clock this evening, we will
5 stay here as long as necessary for everyone to get a
6 chance to provide verbal comments on the supplement
7 Draft EIS/EIR.

8 As I said earlier, our job today here is
9 to listen to your comments. At this time I would
10 ask everyone in the room to please turn off your
11 cell phones and pagers to be courteous to those
12 making verbal comments at tonight's hearing.

13 Now I'll return our hearing back to our
14 facilitator and introduce Mr. Jim Ritchie, who will
15 provide some introductory comments from LAWA.
16 Following Mr. Ritchie's comments, we will collect
17 the speaker cards and call the name of the first
18 speaker.

19 Thank you.

20 MS. SMITH: Thank you, Mr. Kessler.

21 I would like to introduce Mr. Jim Ritchie,
22 Deputy Executive Director of Los Angeles World
23 Airports.

24 Mr. Ritchie.

25 MR. RITCHIE: Thank you, Shauna.

1 Good evening, ladies and gentlemen. I'm
2 Jim Ritchie representing Los Angeles World Airports,
3 and welcome tonight for this public hearing.

4 This is the second in a series of public
5 hearings incidental to the environmental review
6 process. You may recall the public hearing process
7 in 2001 while we were examining other alternatives
8 for the modernization of LAX. The tragic events of
9 2001 and the leadership of Mayor Jim Hahn have
10 reshaped our environmental process. The mayor's
11 pressing concerns for safety and security have
12 provided new guidance along with the public comments
13 received during the public comment period from
14 January to November of 2001.

15 You are here tonight primarily to provide
16 comments on that new alternative referred to as
17 Alternative D. This is a supplement to the existing
18 environmental process, and it has undergone a
19 rigorous environmental analysis. We are here
20 tonight to receive your comments on this new safety
21 and security plan and its impacts as disclosed in
22 the Draft Environmental Impact Statement and
23 Environmental Impact Report.

24 So with that, Shauna, let's proceed.

25 MS. SMITH: Thank you, Mr. Ritchie. Thank you,

1 Mr. Kessler.

2 Again, my name is Shauna Bain Smith. I
3 will be your facilitator this evening. My only
4 purpose here is to ensure that those that wish to
5 speak are able to do so in a timely and orderly
6 fashion.

7 This high-tech clock is my best friend and
8 will help us do that. You will have three minutes
9 to speak, as Mr. Kessler said. When you have 30
10 seconds left on your time, you will see a yellow
11 light flash here. When your time has expired, you
12 will see a red light and you will hear a beep tone.

13 I ask that when you approach the podium,
14 after you've turned in the speaking card that
15 Mr. Kessler showed you, you state your name and your
16 address as clearly and slowly as possible so that
17 our court reporters can put it into the official
18 record. And I will not begin the timer until after
19 you have said your name and your address.

20 And with that, I will call the first
21 speakers, Councilman Kelly McDowell.

22 MR. MC DOWELL: Good evening. I'm Councilman
23 Kelly McDowell representing the City of El Segundo
24 tonight. Given the length and complexity of the
25 Master Plan and the environmental documents

1 associated with it, my City's full comments on the
2 technical issues will not be ready for some time,
3 and therefore my comments tonight are somewhat
4 preliminary.

5 My city continues to oppose Alternatives
6 A, B and C for the many reasons the City expressed
7 orally and in writing during the public review and
8 comment period for the initial Draft EIR/EIS in
9 2002. El Segundo has not endorsed Alternative D,
10 but we feel its stated objectives support a regional
11 aviation approach.

12 Specifically, the City of El Segundo
13 supports a regional approach alternative that makes
14 proper use of Inland Empire airports. We support an
15 alternative with fewer environmental impacts. We
16 would like to see the adverse impacts of the airport
17 minimized and mitigated to the greatest extent
18 possible. And we support enhanced safety and
19 security at LAX and we support an alternative that
20 by its design will accommodate passenger and cargo
21 levels no greater than the physical capacity of the
22 airport as it exists today.

23 Limiting LAX's capacity to its current
24 capacity has always been our number one goal, and we
25 believe that limiting LAX's capacity will allow

1 other airports in the region to develop and handle a
2 fair share of future regional aviation demand, will
3 result in fewer environmental impacts, and will
4 improve safety and security at the airport.
5 However, the City is greatly concerned about the
6 impacts of Southside Airfield changes that would
7 move the southernmost runway 50 feet closer to our
8 city of El Segundo.

9 LAWA has stated it believes these changes
10 are necessary to improve runway safety. However, we
11 are currently studying the impacts of the
12 re-configuration and the options for the southern
13 runway complex. In particular, we urge full public
14 consideration of end-around taxiways as an
15 alternative that can provide greater safety at lower
16 cost and with fewer new burdens on local nearby
17 communities.

18 Safety at LAX must be a priority for us
19 all, and El Segundo is prepared to support measures
20 necessary to enhance safety even if those measures
21 increase our burden, but only if we are assured
22 through an independent expert that other
23 alternatives are not equally affected.

24 In conclusion, we are grateful for Mayor
25 Hahn's responsive leadership and his pledge to

1 constrain growth at LAX and foster a regional
2 approach to meeting future aviation demand in our
3 region. And it is our hope that the ultimate
4 outcome of this Master Plan process will be a
5 regional airport approach that ensures that LAX does
6 not exceed its current capacity.

7 Thank you.

8 MS. SMITH: Thank you.

9 Max Villar.

10 MR. VILLAR: My name is Max Villar. I live in
11 Los Angeles. My address is 333 South Hope,
12 18th Floor in the Los Angeles Convention Visitor's
13 Bureau.

14 My position at the Los Angeles Convention
15 Visitor's Bureau is director of the Americas, and as
16 such, I'm also participant as the marketing arm for
17 Los Angeles World Airports in the international
18 market. Specifically, I'm responsible to develop
19 travel business from Mexico, Latin America and LAX
20 and Ontario Airport. We have a success story to
21 tell.

22 Aeromexico started service about three
23 years ago with one flight from Guadalajara to Mexico
24 to Ontario Airports and was turned around and turned
25 over to a daily flight. Recently they have added

1 another flight from Ontario to San Jose Los Cabos.
2 We were instrumental to bring another airline to
3 Ontario Airport as well, which is Lineas Ayadas
4 Aztecas with a daily flight from Mexico to
5 Guadalajara.

6 So what I'm saying -- what I'm trying to
7 say here is that we're here to support the Master
8 Plan as stated to preserve L.A.'s status of the main
9 gateway in the West Coast.

10 It is also fitting to mention that we are
11 engaged in an industry that represents, according to
12 your numbers, about 21 billion dollars in direct
13 expenditures and over 328,000 employment.

14 Approving the plan not only means better
15 service to our great region of Los Angeles, but it
16 also showcases the Ontario Airport as one of the
17 premier international airports in Southern
18 California.

19 As I will normally promote it while I'm
20 abroad and talking to my Spanish-speaking
21 colleagues, Los Angeles y Ontario (inaudible)
22 perfecto.

23 Thank you.

24 MS. SMITH: Thank you.

25 Mary Jane Olhasso.

1 MS. OLHASSO: Mary Jane Olhasso, city of
2 Ontario, 303 East B Street, Ontario. Olhasso is
3 O-l-h-a-s-s-o.

4 The Mayor of Ontario, Mr. Gary Ovit, has
5 asked me to read this letter into the record. It is
6 dated today, August 12th, 2003, addressed to
7 President Stein and Commissioners.

8 "As both the Mayor of Ontario and a member
9 of the Skag Aviation Task Force, I am in support of
10 Alternative D of the LAX Master Plan. Under this
11 plan LAX will accommodate its fair share of
12 passengers and cargo while providing limits which
13 will encourage growth at other Southern California
14 airports. This will create a regional solution to
15 the air transportation issue and preserve our
16 position as global economic leader."

17 "We look forward to a continued
18 partnership in providing air service to the
19 residents and businesses of Southern California."

20 Signed, sincerely, Gary C. Ovit, Mayor.

21 MS. SMITH: Mahala Walter.

22 MS. WALTER: Mahala Walter, M-a-h-a-l-a, at 7015
23 South Sepulveda, Westchester.

24 Proponents like to coach the following
25 scenario about security as cars and LAX facilities

1 don't mix. Now, I want you to think about that.
2 How on earth are they going to get to the ground
3 transportation center then?

4 If there were a terrorist waiting to
5 inflict major loss of life and damage, would you
6 rather have the passenger load widely distributed
7 around nine different terminals or where everyone
8 for all flights would be congregated in one security
9 end drop-off center off-site?

10 There's a definite problem with a check-in
11 drop-off site at Manchester squares. The gridlock
12 on the 405 is totally impossible now. Using
13 Sepulveda, the community surrounding the airport can
14 be at their terminal in just a few minutes.
15 Alternate D would add at least an hour or two to
16 travel time.

17 The whole idea of safety is to get the
18 travelers in and out of the airport fast. Why
19 should travelers staying at the Radisson Hotel
20 across the street from LAX have to take the shuttle
21 to the ground transportation center to get on the
22 people-mover to go to the airport?

23 The word from USC students is that if the
24 105 does not go directly to LAX, they'll fly Jet
25 Blue. Why now doesn't the green line go directly

1 into LAX, and why not work together with MTA to
2 solve the current and future problems of not only
3 the airport, but the 405 and Sepulveda Boulevard?

4 Adding a one or two nonstop lanes for
5 departures coming off of Lincoln to join Skyway
6 Drive into LAX would be a very helpful thing for
7 Westside, Santa Monica, Marina del Rey travelers,
8 relieving Sepulveda traffic during peak and holiday
9 hours.

10 LAX must start the new center runways
11 immediately. However, I wish to see extending the
12 north runway over Pershing Drive. Since we are at
13 war, the butterflies might as well deal with these
14 inconveniences just as the rest of us are having to
15 do.

16 The south runway, I would like to know why
17 is it necessary to move it 50 feet closer to
18 El Segundo and the Hyperion.

19 Retinal scanning is one of the most
20 important security measures I think we can take at
21 this time for LAWA employees, airlines, TSA,
22 concessionaires, taxis, shuttles, airport drivers
23 plus owners and pilots at the 48 airports that are
24 in our area.

25 MS. SMITH: Thank you, very much. At this time,

1 before I call the next speaker, I would like to
2 remind all of our participants that if in fact you
3 do need more time to make your comments after we
4 finish the first round and everyone is provided an
5 opportunity to make comments at least once, you're
6 welcome to fill out another speaker card, and we
7 will call your name again. That's it.

8 Mr. Walter Dahlem, please.

9 MR. DAHLEM: No comment.

10 MS. SMITH: No comment?

11 At this time we don't have any other
12 comments or public speaking cards filled out, but
13 we're here until 9:00 p.m. If anyone wishes to
14 comment, please do fill out a public speaker card,
15 turn it in at the sign-in table, and we'll be happy
16 to take your testimony.

17 We'll take a break for approximately
18 fifteen minutes and reconvene at 6:30, 6:35.

19 Thanks.

20 (Brief recess was taken.)

21 MS. SMITH: If I can get everyone to make their
22 way back into the public hearing room, please.

23 You don't want me to start singing for you
24 guys. You know what I'm saying?

25 I was going to clear the room and start

1 singing.

2 THE REPORTER: Is this on the record?

3 MS. SMITH: Our public hearing is now officially
4 re-commencing. I'm introducing Mr. David Kessler
5 again to give a few introductory remarks for those
6 that are just joining us.

7 MR. KESSLER: Good evening, ladies and
8 gentlemen. My name is David Kessler. I'm the
9 environmental protection specialist for the Airports
10 Division of the Federal Aviation Administration
11 Western Pacific Region.

12 Again, I would like to welcome you to the
13 second of a series of public hearings the FAA and
14 the Los Angeles World Airports are conducting on the
15 supplement to the Draft EIS/EIR for the proposed --
16 excuse me -- for the proposed Master Plan at
17 Los Angeles International Airport.

18 The supplement addresses an additional
19 alternative, Alternative D, the Enhanced Safety and
20 Security Plan that was added in fall of 2001.

21 The new alternative was added as a result
22 of comments submitted on the 2001 Draft EIS/EIR and
23 the terrorist attacks that occurred on September 11,
24 2001.

25 The purpose of these hearings is to

1 collect comments from the general public concerning
2 the adequacy of the information disclosed on the
3 supplement to the Draft EIS/EIR on the proposed
4 Alternative D.

5 I would like to remind everyone that to
6 make sure that you understand that no decision will
7 be made today regarding the proposed project.
8 Today's hearing is not a question-and-answer type of
9 forum. Our job to listen to what you have to say
10 about the adequacy of the information in the
11 supplement to the Draft EIS/EIR.

12 In other words, it's your turn to talk to
13 us. Since we're here to listen, we're not going to
14 respond to questions about the pros and cons of the
15 proposed project.

16 Since 5:00 o'clock this afternoon we've
17 held a public workshop just outside this room for
18 anyone to ask questions about the Master Plan, the
19 environmental process, and the various proposed
20 projects.

21 At this time I'd like to see if
22 Mr. Ritchie would have any other additional remarks,
23 and then we'll go to our next speaker.

24 MR. RITCHIE: No, sir. I have no comments.
25 Let's proceed.

1 MS. SMITH: Just to remind you again, each
2 speaker will have three minutes. When you have 30
3 seconds left, you'll see a yellow light. When
4 you're time is expired, you'll see a red light and
5 you'll hear an beep tone.

6 If you can state your name and address
7 when you come to the podium please, and speak slowly
8 and clearly, spelling your last name when possible
9 for our court reporters, we'd appreciate that. And
10 I won't start the time until after you've stated
11 your name and address.

12 Our first speaker is Jorge Rocky Rivera.

13 While we wait for Mr. Rivera, I'll go to
14 our second speaker, Frank Zavala.

15 MR. ZAVALA: Good afternoon. My name is Frank
16 Zavala. Location of address is 12635 Franklin
17 Court, Unit 3A in Chino, California. I'm a field
18 representative for the Laborers' Local 300 and an
19 auditor as well, and last name is spelled Z-, as in
20 Zebra, -a-v, as in Victor, a-l-a. I just want to
21 make sure that's clear. She did say that.

22 Well, I'm here to speak in regards to this
23 plan. Actually, I'm a resident as well as a family
24 member out here. I have three girls out here. And
25 it's plenty of work for our members, for Laborers'

1 Local 300 that I represent as well. And I'm here to
2 speak not only for the laborers, but to -- about all
3 the crafts in the unions. We have plenty of members
4 that live out here from all types of crafts. So
5 this is more beneficial to the residents of, I would
6 say, Ontario and also Chino and various locations,
7 because the unions are represented from different
8 wide world of cities, so -- and the Master Plan that
9 we're supporting, I'm sure you've already heard the
10 comments, and I'm not going to go into length with
11 that, but it is very, very well planned out.

12 And in the past there's been some
13 questions in regards to it, so I would like to state
14 personally here and as well as a field
15 representative that this plan here is the best plan
16 for everyone in the surrounding communities.

17 Thank you, very much.

18 MS. SMITH: Thank you. Jorge Rocky Rivera,
19 please.

20 If you can state your name and spell your
21 name for our court reporters, please, Mr. Rivera.

22 MR. RIVERA: Jorge Rocky Rivera, Jorge,
23 J-o-r-g-e, Rocky, R-o-c-k-y, Rivera, R-i-v-e-r-a.

24 As I introduced myself, again, my name is
25 Rocky Rivera. I'm a resident of Riverside,

1 California. I live at 5141 Poinsettia Place. I'm
2 also a member of Local 250. I'm also an individual
3 who helped build the Bradley Terminal when I worked
4 for Sam p. Wallace of Local 250.

5 I come here in support of Alternative D,
6 and the reason being is that it provides not only
7 safety, but jobs, present and in the future, because
8 we got to take into consideration -- we can be like
9 the crab, walk sideways and never go nowhere, or we
10 can take a step forward and face the future head on.
11 Because the only way you're going to do it is by
12 being bold, and that's what our pioneer forefathers
13 did before in the past.

14 I say for security it is the best because
15 it does give us -- it gives us a way to implement
16 the security in which baggages are checked and
17 individuals are also checked.

18 I will make my comment short because I'm
19 not a public speaker. From the past, my history, I
20 was a construction worker, and before that I was a
21 boxer.

22 So anyway, I thank you for your
23 opportunity to give me this chance to speak. You
24 have a nice day.

25 MS. SMITH: You're an excellent orator to me.

1 Thank you.

2 Mr. Peter Barrera.

3 And again, I'll ask if you can spell your
4 name for the court reporters, please.

5 MR. BARRERA: Yes. My name is Peter Barrera
6 B-a-r-r-e-r-a. I live at 1908 Bellmont Lanes,
7 Redondo Beach, California. I'm a fifth-generation
8 Californian.

9 I've been here -- I mean, my family -- all
10 my life. And when I'm -- I'm a member of the
11 organization of the Local 250. I'm a business
12 organizer for refrigeration and air-conditioning.

13 The -- one of the reasons that I'm here to
14 speak is I was just talking to a person, Richard
15 Slausson, and it kind of reminds me of the airports
16 that I've been to in the past. I've been to Orlando
17 where they have people-movers, and it was easier for
18 us to get -- I've been into Dulles where there was
19 people-movers. I've been to Denver, Colorado where
20 my son goes to school at. It's people-movers. It's
21 time for (inaudible) people-movers, and for
22 security-wise it would be the best. I mean, I'm for
23 it. Like I said, I live in the area. My family
24 lives in the area, and I want to stay in the area.
25 So I'm for this.

1 Thank you, very much.

2 MS. SMITH: Thank you. At this time I'm not
3 holding any more speaker cards.

4 I will remind you that we're here until
5 9:00 p.m., and if you wish to speak, please fill out
6 a speaker card and turn it in at the sign-in desk.
7 If you wish to submit a written comment, we have
8 forms at the sign-in desk as well that you can fill
9 in. We're here for the duration.

10 At this time I think we'll take another
11 break and wait for some more speaker cards.

12 Thank you.

13 For the record, we'll reconvene at
14 7:00 p.m.

15 (Brief recess was taken.)

16 MS. SMITH: We still don't have any more
17 speaking cards, so we're going to extend our break,
18 and we'll come back at 7:15.

19 Thank you.

20 (Brief recess was taken.)

21 MS. SMITH: As to any more speakers, Mr. Kessler
22 from the Federal Aviation Administration has some
23 closing remarks. He'll be at the podium shortly.

24 Mr. Kessler.

25 MR. KESSLER: Thank you. I have it at

1 9:00 o'clock, the evening, by my watch. I will ask
2 if there's anyone else who has not had an
3 opportunity to speak, please identify yourself.

4 Not seeing anyone, I will remind everyone
5 that if you feel you are unable to provide us with
6 verbal comments today, we will be accepting written
7 comments until 5:00 p.m. Pacific Daylight Time,
8 Monday, August 25th, 2003. You can mail your
9 comments either to me at the FAA or to Jim Ritchie
10 at LAWA. The mailing addresses are listed on the
11 cover of the EIS/EIR.

12 I want to thank everyone for your comments
13 today. This public hearing for the supplement to
14 the Draft EIS/EIR on Los Angeles International
15 Airport Master Plan is now closed.

16 Thank you.

17 MS. SMITH: Thank you. And that's a wrap,
18 folks.

19 (The deposition was concluded at 9:05 p.m.)

**Official Hearing Transcript
Luminarias Restaurant
Monterey Park, California
Wednesday, August 13, 2003**

Following this page is the transcript of the oral testimony taken at the above hearing. Each speaker at the hearing has been assigned a unique identification number. The numbers assigned to each speaker for this hearing are:

Number	Speaker	Affiliation
SPHMP00001	David Lau	City of Monterey Park
SPHMP00002	Mike Eng	City of Monterey Park
SPHMP00003	Benjamin Venti	City of Monterey Park
SPHMP00004	Larry Johnson	None Provided
SPHMP00005	Patti MacJennett	Los Angeles Convention and Visitors Bureau
SPHMP00006	Daniel Humber	Ironworkers Local 433
SPHMP00007	Walter Dahlem	UA Local 345
SPHMP00008	Philip Morris	Bricklayers, Stonemasons, Marble Masons Union
SPHMP00009	John Ferruccio	Pipe Trades Local Union 250
SPHMP00010	Carole Hossan	None Provided
SPHMP00011	Luis Robles	Laborers Local 300

Any exhibits attached to this hearing transcript have been previously reproduced in this Final EIS/EIR as individual public comment letters.

3 ---oOo---

4
5 MS. SMITH: Good evening, ladies and gentlemen. On
6 behalf of the Federal Aviation Administration and
7 Los Angeles World Airports, I would like to welcome you
8 to the third in a series of hearings to receive public
9 testimony on the Los Angeles Airport Master Plan,
10 Environmental Impact Statement and Environmental Impact
11 Report. My name is Shauna Bain Smith, and I will be
12 your facilitator.

13 The two gentlemen to my right will be
14 receiving your testimony this evening. Before we start
15 the formal proceedings, they each have introductory
16 remarks. I will start with Mr. David Kessler who is an
17 Environmental Protection Specialist with the Federal
18 Aviation Administration.

19 Mr. Kessler.

20 MR. KESSLER: Thank you. Good evening, ladies and
21 gentlemen. My name is David Kessler. I'm the
22 Environmental Protection Specialist for the Airports
23 Division of the Federal Aviation Administration,
24 Western-Pacific Region. I would like to welcome you to
25 the third of a series of public hearings the FAA and the

1 Los Angeles World Airports, or LAWA, are conducting on
2 the Supplement to the Draft Environmental Impact
3 Statement/Environmental Impact Report, or EIS/EIR, for
4 the proposed Master Plan at Los Angeles International
5 Airport.

6 The Supplement to the Draft EIS/EIR addresses
7 an additional Alternative, Alternative D, the Enhanced
8 Safety and Security Plan that was added in the fall of
9 2001. This new alternative was added as a result of
10 comments submitted on the 2001 Draft EIS/EIR and the
11 terrorist attacks that occurred on September 11th, 2001.

12 The Notice of Availability of the Supplement
13 to the Draft EIS/EIR was published in various local
14 newspapers and in the Federal Register on Friday, July
15 11, 2003. The FAA and LAWA are the authors of the
16 Supplement. The Federal Highway Administration is also
17 a cooperating agency in the preparation of the Draft
18 EIS/EIR that was published in January 2001.

19 The purpose of these hearings is to collect
20 comments from the general public concerning the adequacy
21 of the information disclosed in the Supplement to the
22 Draft EIS/EIR on the proposed Alternative D.

23 I would like to take this opportunity to make
24 sure that everyone understands that no decision will be
25 made today regarding the proposed project. Today's

1 hearing is not a question-and-answer type of forum. Our
2 job is to listen to what you have to say about the
3 adequacy of the information in the Supplement to the
4 Draft EIS/EIR. In other words, it's your turn to talk
5 to us. Since we're here to listen, we are not going to
6 respond to questions about the pros and cons of the
7 proposed project.

8 Since 5:00 this afternoon we held a public
9 workshop just outside of this room for anyone to ask
10 questions about the Master Plan, the environmental
11 process and the various proposed projects.

12 Following publication of the Supplement to the
13 Draft EIS/EIR for review and comment, the next step in
14 the joint Federal and State environmental disclosure
15 process is holding this and the other public hearings
16 during this week and next week.

17 I would like to take this opportunity to recap
18 the environmental disclosure process for this project.
19 The environmental evaluation of the LAX Master Plan
20 began in 1997 with the publication of a Notice of Intent
21 to prepare the joint EIS/EIR in the Federal Register.
22 In July 1997 we held a series of meetings with members
23 of the public and governmental agencies to receive
24 comments on the scope of the Draft EIS/EIR. Following
25 those meetings, the Draft EIS/EIR was published January

1 2001.

2 Both the 2001 Draft EIS/EIR and the 2003
3 Supplement have been prepared pursuant the National
4 Environmental Policy Act of 1969, or NEPA, the Council
5 on Environmental Quality Regulations, which are the
6 implementing regulations for NEPA, the California
7 Environmental Quality Act of 1970, or CEQA, and the
8 Airport and Airway Improvement Act of 1982, as amended.

9 Following today's hearings and the close of
10 the comment period, we will then correct and revise the
11 EIS/EIR, as necessary, based on the comments received.
12 We will also prepare responses to those comments we
13 receive and include those responses along with those
14 that were submitted to the FAA and LAWA on the 2001
15 Draft EIS/EIR into the Final EIS/EIR. The information
16 contained in the Supplement will also be combined with
17 the information in the 2001 Draft EIS/EIR into the Final
18 EIS/EIR.

19 Before we begin receiving verbal comments, we
20 would like to let you know the ground rules of the
21 hearing. First, as I said earlier, we're not here to
22 respond to questions about the project. We are only
23 here to listen to your comments and take notes. We
24 have a court reporter present to ensure that we have an
25 accurate transcript of this hearing.

1 For anyone wishing to speak, we ask that you
2 fill out a speaker card, like this one, and give it to
3 one of the people at the sign-in desk. The cards will
4 then be brought up here to our facilitator who will then
5 call the names of each speaker so we could proceed in an
6 orderly fashion.

7 So that everyone gets an opportunity to
8 provide verbal comments, everyone will be given three
9 minutes to speak. To be fair to everyone, we are not
10 going to allow people to transfer their allotted time to
11 someone else. I ask that when you speak, you give us
12 your name and address for the record. We also have a
13 Spanish language translator for anyone wishing to
14 provide their comments in Spanish.

15 If there is anyone who is uncomfortable
16 speaking in front of a group or if you need more than
17 three minutes to provide your comments, we ask that you
18 provide your comments in writing. We have comment
19 sheets, like this one, available for your use at the
20 sign-in desk. You can leave your comments at the
21 sign-in desk or you can mail your written comments using
22 the comment sheet or a letter to either address listed
23 on the cover of the EIS/EIR.

24 I would like you to understand that a verbal
25 comment is just as important as a written comment. So

1 please feel free to provide any comments you may have on
2 the document to us either verbally today or in writing.
3 At this time comments on the Supplement to the Draft
4 EIS/EIR are due by 5:00 p.m., Pacific Daylight Time, on
5 Monday, August 25, 2003. The FAA is currently
6 considering a request from LAWA to extend the comment
7 period to a total of 120 days. At this time no decision
8 has been made on LAWA's request. If the FAA agrees to
9 extend the comment period, a notice announcing any
10 extension would be published in the Federal Register and
11 local newspapers of general circulation.

12 Lastly, I would like everyone to know that
13 even though we have this hearing scheduled until
14 9:00 o'clock this evening, we will stay here as long as
15 necessary for everyone to get a chance to provide verbal
16 comments on the Supplement to the Draft EIS/EIR. As I
17 said earlier, our job here today is to listen to your
18 comments.

19 At this time I would also ask everyone in the
20 room to please turn off your cell phones and pagers to
21 be courteous to those making verbal comments at
22 tonight's hearing.

23 Now I will turn the hearing back to our
24 facilitator who will introduce Mr. Ritchie who will
25 provide some introductory comments from LAWA. Following

1 Mr. Ritchie's comments, we will then collect the speaker
2 cards and call the name of the first speaker. Thank
3 you.

4 MS. SMITH: Thank you. Mr. Jim Ritchie, Deputy
5 Executive Director of Los Angeles World Airports.

6 Mr. Ritchie.

7 MR. RITCHIE: Thank you for that kind introduction.
8 Good evening, ladies and gentlemen. I'm Jim Ritchie.
9 And on behalf of L.A. World Airports, welcome to the
10 Luminarias Restaurant tonight for a public hearing.

11 This is the third of a series of public
12 hearings incidental to the environmental review process
13 that Mr. Kessler has described. You may recall the
14 public hearing process in 2001. In fact, we're in the
15 same room while we were examining other alternatives for
16 the modernization of the LAX.

17 The tragic events of 2001 and the leadership
18 of Mayor Jim Hahn has reshaped our environmental
19 process. The Mayor's pressing concerns for safety and
20 security have provided new guidance along with the
21 public comments received during that public comment
22 period from January to November of 2001.

23 You're here tonight primarily to provide
24 comments on that new alternative referred to as
25 Alternative D. This is a supplement to the existing

1 environmental process and it has undergone a rigorous
2 environmental analysis. We're here tonight to receive
3 your comments on this new Safety and Security Plan and
4 its impacts as disclosed in the Supplement to the Draft
5 EIS/EIR. Ms. Smith.

6 MS. SMITH: Thank you, Mr. Ritchie. Thank you
7 Mr. Kessler. Again, my name is Shauna Bain Smith. As
8 your facilitator I am here to ensure that everyone who
9 wishes to speak is able to do so in a timely and orderly
10 fashion. This high-tech clock to my left will help us
11 do that. And I just wanted to go over some of the rules
12 that Mr. Kessler briefly explained.

13 Every person will have three minutes to speak.
14 I won't start the time until after you've given us your
15 name and address for the record. I ask that when you
16 give your name, you do so slowly and as clearly as
17 possible so that the court reporters can get it. And if
18 you can spell your last name, we would greatly
19 appreciate that.

20 Once I start the timer. When you're at 30
21 seconds of time left, you will see this yellow light
22 flash in the middle of the timer. At that time I
23 suggest you start wrapping up your remarks. When your
24 time has expired, you will see the red light flash and
25 you will hear a beep tone. At that time I will have to

1 ask that you complete your remarks.

2 If after you've given your remarks you feel
3 that you still need more time, as Mr. Kessler said, you
4 could provide your comments in writing, or if time
5 permits we will allow you to fill out another speaker
6 card. And once everyone has had an opportunity to speak
7 at least once, you're able to come up and speak again.

8 With that, I will call our first speakers.
9 Mayor David Lau, please.

10 MR. LAU: Thank you. My name is name is David Lau.

11 MS. SMITH: Give us a second. Our tech will take
12 care of that. Mayor Lau.

13 MR. LAU: My name is David Lau, Mayor of the City of
14 Monterey Park; 320 West Newmark Avenue, Monterey Park,
15 California.

16 The City of Monterey Park is extremely
17 disappointed with the Supplement to the Draft
18 Environmental Impact Statement and Environmental Impact
19 Report, LAX Master Plan. This document shares the same
20 deficiencies and problems as the January 18, 2001 Draft
21 EIS/EIR document that proposed the first three
22 Alternatives, A, B and C. L.A. World Airports and the
23 Aviation Administration once again failed to address
24 impacts to the west San Gabriel Valley community that is
25 currently suffering from severe negative impacts from

1 the LAX operations.

2 Our citizens submitted comments to the January
3 18, '01 draft document and voiced our concerns regarding
4 absence of remedy of the impacts to outlying areas. In
5 regard to Alternative D, Monterey Park is clearly
6 concerned with the proposed changes to the airport that
7 will bring about larger aircraft and a disproportionate
8 increase to the number of approaches to the north runway
9 complex.

10 The city appreciates LAWA's efforts to reduce
11 a number of aircraft operations by encouraging the use
12 of larger wide body aircraft. However, the louder noise
13 associated with the larger aircraft will not offset the
14 benefit of lesser traffic. Our community cannot
15 tolerate the noise level generated by LAX operation at
16 81 decibels. How are we expected to live with an
17 estimated 81 decibels or even higher noise levels.
18 Thank you very much for your attention.

19 MS. SMITH: Thank you. Our next speaker is
20 Councilman Mike Eng.

21 MR. ENG: Yes. My name Mike Eng; 712 Baton Way in
22 Monterey Park. Thank you very much for having your
23 hearing in the beautiful City of Monterey Park. This is
24 a residential community of about 64,000 people.

25 We have a median age that is higher than the

1 county, which means that we have a lot of seniors that
2 live here. We also have four school districts, which
3 means we also have a lot of young people and a lot of
4 students.

5 As an elected official I can tell you that
6 Monterey Park was founded about almost 90 years ago by
7 people that came here to escape underground pollution.
8 We're very concerned now by above-ground pollution. And
9 that's why we're here today.

10 I understand, as an elected official, the
11 difficulty of balancing various economic health and
12 safety factors, but let me tell you where our residents
13 come down on this issue.

14 First of all, we are very concerned that Plan
15 D continues the lack of monitoring for the cities east
16 of Vermont. We feel that by not having permanent
17 monitoring instruments in these eastern-most cities,
18 that this deprives us of the right to give you the data
19 that you need to know about the negative impact of noise
20 levels.

21 Currently noise assessment levels for cities
22 that are east of Vermont Avenue where there is no
23 monitoring equipment is based on radar data that is fed
24 into a computer for purposes of mathematical modeling.
25 The problem is that mathematical modeling, while looking

1 good on paper, does not take into account single effect
2 noise levels that could be as high as 81 decibels, as
3 was caused here in Monterey Park. By not taking into
4 account single effect noise levels that could be caused
5 by aircraft as low -- that are 1,900 feet above our city
6 is similar to saying that Cal Tech should not report to
7 earthquake data because there was only one earthquake
8 that year and they required two to have mathematical
9 modeling.

10 So what is it that we want? We would like to
11 have a realtime, realistic monitoring system that puts
12 actual monitors in our city. That's number one.

13 Number two, we would like to have studies of
14 the impact of the noise level in our cities that do not
15 have current access to actual noise monitors more
16 frequently than every five years. The last time that we
17 had sound monitoring equipment here in this city and the
18 surrounding areas was five years ago. We don't feel
19 that the data that's taken every five years and fed into
20 a computer along with modeling gives you the type of
21 data that you need to make the decisions about such
22 issues as threshold levels and frequency of flights and
23 modification of runways.

24 So in conclusion, we would like to have more
25 representation, not less. It's one thing that noise

1 will make us deaf. But when your procedures make us
2 speechless and muzzle our voices by not having the data,
3 that is not fair. Thank you.

4 MS. SMITH: Thank you. Councilman Frank Venti,
5 please.

6 MR. VENTI: Yes. Good evening Mr. Kessler and
7 Mr. Ritchie and facilitator. My name is Benjamin Frank
8 Venti. Benjamin and Frank. Venti is spelled V, as in
9 Victor, e-n-t-i.

10 First of all, I've lived in Monterey Park for
11 about 40 years. I have seen the impacts and heard the
12 impacts and felt the impacts of these aircrafts that
13 continue to come over.

14 I'm a little concerned about the fact that
15 we -- one of the things I read outside here on your
16 criterias was criteria number 8, which says "To minimize
17 the environmental impacts of the surrounding
18 communities." I think that's what we're trying to do.

19 But I also read a letter dated November 8,
20 2001 that was sent to you in regards to our concerns.
21 And let me just read some of the headings of these
22 concerns. I don't think they've been addressed and
23 we're concerned about that because now what's going to
24 happen with the wide body aircrafts, they are going to
25 actually come further east, but we are east. We are

1 east of LAX. They are going to drop down and come
2 further and it's going to cause some very -- noise
3 concerns to us.

4 The air quality impacts, the noise impacts,
5 the human health impacts, the traffic impacts. That's
6 another thing I don't see you addressing. And that is
7 the fact that with all this cargo being brought into
8 LAX, we are going to have an increase of truck traffic
9 coming from the Alameda corridor and that whole area of
10 the airport. I think it's -- it's a big concern for us
11 because most of those freeways come right through
12 Monterey Park. So the actual traffic issues are a real
13 problem.

14 And the environmental justice. Let me just
15 explain one thing to you. We are basically a minority
16 city. We're adjacent to East Los Angeles, a heavily
17 minority area also. And we just kind of feel that we're
18 being pushed with all this aircraft coming over there as
19 opposed to wanting to deal with Palmdale, wanting to use
20 that more frequently, wanting to get -- to stop the
21 people in Orange County from being -- from stopping the
22 FAA from putting in an airport at the El Toro facility.
23 I think it's very important that this should stop.
24 You're the Federal Government. You should be able to
25 have some impact on these people and not let them push

1 it over here just because we happen to be a more
2 minority area and a poverished area in this area here.

3 So in conclusion, I would like to say that in
4 reading this, in looking at -- and we haven't really
5 digested the new environmental impact. It doesn't seem
6 like you've had covered the areas that we're greatly
7 concerned with. So we ask that you consider that. And
8 I understand that the Los Angeles World Airports is
9 trying to push the cargo facility -- cargo traffic into
10 the Palmdale/Ontario and all these other airports. We
11 appreciate that. We would like you to continue pushing
12 for that. We thank you very much. By the way, welcome
13 to the City of Monterey Park. Thank you.

14 MS. SMITH: Thank you. Our next speaker is Larry
15 Johnson. Mr. Johnson.

16 MR. JOHNSON: Hi. I'm Larry Johnson, J-o-h-n-s-o-n.
17 I live at 8203 Owens Street, Buena Park, California.

18 First of all, I would like to say that it is a
19 beautiful presentation out there. That alternative is a
20 beautiful facility to add to our region. One reason I
21 believe that it is important is that people, especially
22 lately, they've been talking about the loss of jobs
23 leaving the area and trying to attract new business to
24 our area. One of the first things anyone interested in
25 starting a business here is going to see is the airport.

1 That is our face to the world. What they've seen for
2 the last five or ten years hasn't been a real pretty
3 face. It's been a lot of confusion, a lot of -- well,
4 you know, it just needs to -- it's a problem that needs
5 to be alleviated. It's a problem that needs to be
6 addressed. There is a lot of other -- you know, it's
7 just part of the regional planning for our airports.

8 LAX is just one facility, but it's the main
9 facility we have right now. It's the one with the
10 infrastructure in place. It's the one that can get
11 things going the soonest. What we have here is a very
12 good plan. One thing I've been reading about is people
13 talking about the \$9-billion-dollar bid and how that can
14 escalate.

15 It seems that whenever a construction project
16 comes up, people compare it to the Boston Big Dig
17 Artery. You know, it bloomed from probably four times
18 of what it originally cost. And I say, why compare it
19 to that? Why can't we compare it to the Gold Line, for
20 instance, the project that came in virtually on time and
21 on budget. All that matters is good management and good
22 workforce. We have both available.

23 In conclusion, you know, the project, it's not
24 like the Boston Project. It's something that's very
25 doable. There is no magic about it. It's something we

1 have the technology to do. We have the manpower. And
2 we just need to get some inertia behind it and get some
3 decisions made. Because to do nothing would be -- that
4 wouldn't be the legacy to leave behind. Thank you.

5 MS. SMITH: Thank you. Patti MacJennett please.
6 Did I pronounce your name correctly?

7 MS. MACJENNETT: Yes.

8 MS. SMITH: And after Ms. MacJennett, we'll have
9 Daniel Humber.

10 MS. MACJENNETT: Hi. I'm Patti MacJennett. That's
11 M-a-c-J-e-n-n-e-t-t, Senior Vice President of Marketing
12 with the Los Angeles Convention and Visitor's Bureau.

13 I'm here to speak in support of the LAX Master
14 Plan. Our organization represents the tourism industry
15 in Los Angeles County.

16 Tourism is the second largest industry. It
17 employs over 240,000 people in L.A. County. Last year
18 the tourism industry, the 23 million visitors that came
19 to Los Angeles injected \$11.8 billion dollars into our
20 economy.

21 L.A. is a strong position as a travel
22 destination, a large measure due to LAX's international
23 gateway status providing visitors direct access from all
24 over the world.

25 Today airports and cities are fiercely

1 competing for visitors and the lucrative visitor dollar.
2 This is particularly true of the very high-spending
3 international visitor.

4 And today tour operators and travel agents, as
5 well as today's travelers, have choices. They have lots
6 of choices and they are choosing airports that are safe,
7 modernized and convenient.

8 We know that the Master Plan Option D has
9 hundreds of pages of details which are going to be
10 greatly discussed. But I'm here to ask you that in all
11 of these discussions the vision of this plan does not
12 get lost and that three important points that we feel
13 this plan addresses do not get lost. And that is that
14 we build a safe and secure facility. That is obviously
15 critical on all dimensions; that we design an airport
16 that maintains L.A.'s status as an international
17 gateway. Either we build a user-friendly facility or
18 our customers, our visitors are going to go elsewhere.

19 And, lastly, this plan does address the need
20 that there must be a regional solution to Southern
21 California's demand for air travel. Thank you for your
22 time.

23 MS. SMITH: Thank you. Daniel Humber.

24 MR. HUMBER: Daniel Humber, H-u-m-b-e-r. That's
25 2220 Via Corona, Montebello, California.

1 I've been a resident for California all my
2 life. I grew up with LAX. Since September 11th, you
3 know, picking up friends and family members at the
4 airport with security issues, it was very inconvenient
5 when we had to go to that parking lot and be bussed in
6 because of a high alert status. Now if we get a high
7 alert status, we're going to go back to the bussing and
8 parking lot, outlying parking lots.

9 The facility is outdated. It was designed for
10 smaller planes originally. They got the big planes in
11 there now that barely fit on the runways. It's not safe
12 for travel. And like a lot of people mentioned, you
13 know, people look at us. Denver put in a beautiful
14 airport.

15 I'm a member of Ironworkers local 433. A lot
16 of union members went up there and worked on that
17 airport. We have plenty of skilled craftsman here in
18 town that could build a beautiful facility there. It
19 needs to be upgraded. It's outdated. It's not safe.
20 It's not secure for people who want to come to Los
21 Angeles. You could see international -- you know, we
22 have a lot of airports around us. And it's true, they
23 are worried about cargo coming into LAX. Well, the
24 cargo could be diverted to all these other airports, but
25 we've got to focus on bringing people in and out of this

1 airport.

2 I've traveled a lot. I've been to a lot of
3 different airports. We're just way behind. I don't
4 know how many -- you have A, B, C and D. How far do we
5 have to go down the alphabet before we get going? I've
6 been here two years ago. When are we going to do
7 something about it and quit talking about it? Get
8 something where everybody could agree on and get this
9 airport modernized and safe. Because when I was in CTAG
10 airport, they had the shuttle system that worked fine.
11 I've been in a lot of airports. We're behind. And
12 something has got to be done with that airport. It's
13 outdated. Something needs to be done there.

14 I just feel that Los Angeles is -- we have
15 lost a lot of industry here. People -- I don't think
16 people really look at Los Angeles. I think
17 San Francisco right now has done a lot of work on their
18 airport. Up in Portland they've done a lot of work.
19 Everybody has been doing work on the airport. What
20 about us? When are we going to get the ball rolling on
21 our airport and make it attractive for businesses,
22 travelers, people who want to come? We have a lot to
23 offer here in California. There is a lot of places
24 people like to come and see.

25 But in conclusion, I would just hope we could

1 get through all this, what we need to do, and make
2 everybody happy and modernize this airport. Thank you.

3 MS. SMITH: Thank you. Next we have Walter Dahlem.
4 And after Mr. Dahlem we'll have Phillip Morris.

5 Mr. Dahlem.

6 MR. DAHLEM: Yes. My name is Walter Dahlem. Last
7 name is spelled D-a-h-l-e-m. I'm the President of UA
8 Local 345 Landscape & Irrigation Fitters of Southern
9 California, Division of Plumbers and Pipe Fitters of
10 Southern California.

11 I've attended the last two meetings, Monday
12 night and last night, heard a lot of pros, heard some
13 cons. And all I can say is my Local, and I suppose
14 along with the rest of the Southern California Pipe
15 Trades, would fully endorse Amendment D and the work it
16 brings for the construction trade and also the
17 infrastructure that goes with it, to bring up the whole
18 entire economy of Southern California, particularly L.A.
19 Thank you.

20 MS. SMITH: Thank you, Mr. Dahlem. Philip Morris,
21 please. After Mr. Morris we'll have John Ferruccio.

22 MR. MORRIS: Hello. My name is Philip Morris. Last
23 name is spelled M-o, double R, i-s. I'm the President,
24 Secretary & Treasurer of the Bricklayers and
25 Stonemasons, Marble Masons Union in Los Angeles.

1 Some of my brothers and sisters here have
2 already pointed out some -- or I just want to echo their
3 remarks. Patty here -- I guess Patty left -- about the
4 tourism and the Convention Center Downtown. Everybody
5 is worried about bringing conventions. We want to build
6 new hotels around staples arena there and draw big
7 conventions here, like Chicago, New York City and the
8 likes.

9 If the people can't get here, an antiquated
10 airport like we have here in the City of Los Angeles
11 compared to the rest of them, we're lagging way behind.
12 We've got to get this airport going, not only the
13 construction hours, the man-hours worked, and the
14 economy that the brother said of dollars spent by the
15 workers. We've got to get things rolling and get it
16 going for the whole survival of Los Angeles in itself.
17 The economy is in a bad shape, and this will be a boom
18 to everybody.

19 I can't believe somebody would oppose this
20 strictly on the noise factor. I never met anybody that
21 went deaf from the noise of an aircraft going overhead.
22 I've lived here 40 years. I've lived with the
23 airplanes -- I live right here down the street in
24 Baldwin Park. Solely for the noise factor I think
25 that's a misnomer there. There is no basis for opposing

1 something just because of the noise.

2 I say, let's get on with it and get going in
3 the right direction for the City of Los Angeles and all
4 the residents here. Thank you.

5 MS. SMITH: Thank you. Mr. Ferruccio. And after
6 Mr. Ferruccio we'll have Carole Hossan, please.

7 MR. FERRUCCIO: Thank you. Good evening. My name
8 is John Ferruccio. That's F-e-r-r-u-c-c-i-o. And
9 presently I am residing in the City of Gardena. I've
10 been there all my life.

11 I'd like to go on the record in support of
12 Alternative D this evening. As I've said, my wife and I
13 have been life-long citizens of Los Angeles. And we've
14 seen quite a few changes in the city, most of them very
15 good. And I think we should continue to grow.

16 Currently I am a member of the Pipe Trades
17 Local Union 250 of the South Bay area. And I worked 22
18 years in the field. And presently in the last five
19 years I've been a union organizer in my trade. And I
20 feel that this would be -- what a better way to promote
21 my industry to not only the people and the young people
22 that we are encouraging to get into the trade, but also
23 people that are coming from other states getting
24 involved in our trade to get them involved in something.
25 And this would be a great way to start with a big

1 project that the LAX proposal would adopt.

2 I believe the long-awaited renovations for LAX
3 are overdue. And once again, I definitely am in favor
4 of Mayor Hahn's proposal. Thank you.

5 MS. SMITH: Carole Hossan.

6 MS. HOSSAN: Carole Hossan, Westchester, right by
7 LAX.

8 I would like to say, as I said at the other
9 place, I and many other people in Westchester would like
10 to see a beautiful new airport in Palmdale where they
11 have the room for it and where they want it. LAX is
12 surrounded by communities. It's a cramped space. It's
13 at its limit really, although supposedly its capacity is
14 much more even without renovations. But this plan has
15 said that it is going to be limited to 78 million annual
16 passengers. Well, there is no realistic way to do that.

17 I just wanted to briefly say about the noise.
18 Part of LAX's goal should be being a good neighbor and
19 trying to accommodate people in Monterey Park with their
20 noise concerns. And we, of course, have definite noise
21 concerns living right next to it. And our sound
22 monitors are not close to where we live. In Westchester
23 we would like more sound monitors and more pollution
24 monitors to see exactly what it is we are breathing.

25 Now, on another note, I'll read you some poems

1 that I wrote for the occasion. 78.9 million annual
2 passengers, the mayor at his last -- at this hearing
3 even said 78, but we've been seeing newspaper articles,
4 and I believe in the EIS 78.9. Well, that's a lot --
5 900,000 extra people than we're promised, which is a lot
6 when you live right next to the airport. So I made that
7 point. So I won't read that one.

8 But another thing is they were saying about
9 the larger planes, "Fewer gates limit MAP. Are you so
10 sure? Bigger planes bring more people. Fewer gates,
11 it's true, but remaining gates will be changed for
12 larger planes."

13 So we're not too sure about this 78 MAP.
14 That's why a lot of surrounding cities signed onto
15 regionalism. So we would like you to really be real.
16 You've had Palmdale and Ontario for decades. Let's do
17 some creative building out there and not expand LAX.
18 Thank you.

19 MS. SMITH: Thank you. Luis Robles, please.

20 MR. ROBLES: Good evening. My name is Luis Robles.
21 My address is 117 West Victoria Avenue in Montebello.
22 I'm also a fellow representative and President of
23 Laborers Local 300. We represent approximately 7,000
24 construction craft laborers in the City of L.A.

25 I'm here today to voice my support for the LAX

1 upgrade, or Alternative D Plan by Mayor Hahn. By
2 upgrading the existing conditions at LAX, you will not
3 only make flight out of L.A. more secure, you will add
4 millions of dollars to the local economy through the
5 jobs that will be created by this project. You will
6 help -- you will also help business survive by providing
7 income to hard-working families that will also spend
8 that same money in their local area. They will have the
9 ability to visit restaurants, go to shopping centers, go
10 to entertainment, all that money that will go around and
11 still be spent here in the cities.

12 The people that will be working in the
13 construction phase from all over L.A. County,
14 individuals will take pride in what they do.

15 The tragic events of 9-11 was a rude awakening
16 for Americans. It is our responsibility to redesign
17 this airport and make it safer for future generations.
18 Alternative D provides multiple layers of security that
19 will make it more difficult for such tragic events to
20 repeat themselves.

21 By not taking action, roadway congestion will
22 continue to grow increasing the possibilities of
23 explosive vehicles with the ability to reach the
24 airfields. It doesn't take much to realize if we all
25 drive down Sepulveda, that all that stops any explosive

1 vehicle to go down is a sign that says "No Explosive
2 Vehicles Allowed." It will make it a lot safer.

3 For those of us who reside in the east side,
4 we have a difficult choice when we fly. Our choices are
5 LAX, Burbank, Long Beach or Ontario. They are all very
6 difficult to get to during rush hour.

7 The proposal to build more fly-away stations
8 is necessary for the east side. This will make LAX more
9 appealing. For me, personally, the ability to leave my
10 car and take a tram to the airport will give me that
11 extra convenience when flying.

12 I thank you for the opportunity to speak on
13 behalf of the 7,000 laborers we represent and hope that
14 our support for the Alternative D will help make your
15 decision a little easier. Thank you.

16 MS. SMITH: Thank you. By our watch it's
17 approximately 6:45. At this time we would like to call
18 a 15-minute recess and reconvene at 7:00 p.m. We do
19 encourage you to visit our sign-in desk, please, and
20 fill out a speaker card so that we could hear your
21 testimony. We'll reconvene at 7:00 p.m. Thanks.

22 (Recess was taken.)

23 MS. SMITH: We have another speaker card. For those
24 of you who would like to participate in the public
25 hearing, take a seat and participate, please.

1 Mr. Herb Herr, or "Hair." Herb.

2 Mr. Herr? One more chance for Mr. Herb Herr, "Hair."

3 Maybe I'm pronouncing it wrong.

4 At this time I don't have any more speaking
5 cards. Gentlemen, shall we take another recess -- okay.
6 Is that Mr. Herr?

7 MR. HERR: "Herr."

8 MS. SMITH: If you give us one moment, we're waiting
9 for our other party here.

10 MR. HERR: Actually, what I'm doing is asking a load
11 of questions in the adjacent room and looking at the
12 diagrams and getting explanations, some of which are not
13 very clear. There is a lot to be worked out on this --

14 MS. SMITH: Just give me one moment because you're
15 not on the record yet. We are waiting for our other
16 party to arrive, and then we will have you on the
17 record. Okay?

18 MR. HERR: Yeah, if I could come back later. I
19 might get some more questions answered over there first.

20 MS. SMITH: That's fine with us. We'll be here
21 until 9:00 p.m.

22 (Recess was taken.)

23 MS. SMITH: We still do not have any speaker cards.
24 We would encourage you to please fill out a speaker card
25 if you wish to speak. If not, please use these written

1 comment forms. We will be here until 9:00 p.m. We want
2 to take your testimony. We're willing to take your
3 testimony, and our court reporters would love to hear
4 your testimony as well. In the meantime our workshop is
5 still open if you need to look at some of the exhibits
6 and ask some of your questions there. It's open for you
7 there as well. Until 7:20 we'll recess again and
8 reconvene at 7:20.

9 (Recess was taken.)

10 MS. SMITH: At this time we do have one speaker
11 that would like to come up to the podium, but he would
12 like several more minutes to ask questions of our
13 consultants. So we are extending the recess to 7:45
14 p.m. by my clock. It's about 7:25 now. So at 7:45 we
15 will reconvene. Thank you.

16 (Recess was taken.)

17 MS. SMITH: Good evening. Again, it's 7:45 p.m.
18 We don't have any other speaker cards filled out, but we
19 would encourage you to please visit our sign-in desk,
20 fill out a speaker card and come give us your testimony.
21 We'll be here until 9:00 p.m. Until we receive another
22 speaker card, we are in recess. We will reconvene at
23 8:15 to check in to see if there are more speakers
24 waiting. Thank you.

25 (Recess was taken.)

1 MS. SMITH: Good evening, ladies and gentlemen.
2 It's 8:15. And at this time we don't have any speaker
3 cards in our possession. Again, we do encourage you to
4 visit our sign-in desk and sign up to speak, if you
5 wish, fill out a speaker card. We will be here until at
6 least 9:00 p.m. and we would love to get your testimony.
7 Thank you. We will recess until 8:30. Thanks.

8 (Recess was taken.)

9 MS. SMITH: Good evening, ladies and gentlemen. It
10 is 8:30 p.m. At this time we still do not have any
11 public speaking cards at our desk. We are here and
12 available to hear your testimony. We are going to
13 continue the recess until 8:45. Thank you.

14 (Recess was taken.)

15 MS. SMITH: Good evening, ladies and gentlemen.
16 It is approximately 8:45. Once again, we are awaiting
17 more public speaking cards. We are here until 9:00 p.m.
18 or thereafter if you need us. At this time we will
19 continue to recess until we get a speaking card. And
20 we'll check back in with you right before 9:00 p.m.
21 Thank you.

22 (Recess was taken.)

23 MR. KESSLER: Is there anyone else who has not had
24 an opportunity to speak concerning the information in
25 the Draft EIS/EIR and the Supplement?

1 Not seeing anyone else, I will remind everyone
2 that if you feel that you are unable to provide us with
3 verbal comments today, we will be accepting written
4 comments until 5:00 p.m. Pacific Daylight Time, Monday,
5 August 25th, 2003. You could mail your comments either
6 to me at the FAA or to Jim Ritchie at LAWA. The mailing
7 addresses are listed on the cover of the Supplement to
8 the Draft EIS/EIR.

9 I want to thank everyone for your comments
10 today. This public hearing for the Supplement to the
11 Draft EIS/EIR on the Los Angeles International Airport
12 Master Plan is now closed. Thank you.

13 (Whereupon the proceeding adjourned
14 at 9:00 o'clock p.m.)

3 ---oOo---

4
5 MR. WALL: Now, ladies and gentlemen, on behalf of
6 Los Angeles World Airports and the Federal Aviation
7 Administration I would like to welcome you this evening
8 to the fourth in a series of public hearings dealing
9 with the Supplemental Environmental Impact
10 Report/Environmental Impact Statement for
11 Los Angeles International Airport.

12 I'll begin by introducing one at a time the
13 two gentlemen to my right, who will make some brief
14 comments. And then we'll begin the public hearing
15 process.

16 Mr. Dave Kessler from the Federal Aviation
17 Administration.

18 Mr. Kessler.

19 MR. KESSLER: Good evening, ladies and gentlemen.
20 My name is David Kessler. I'm the Environmental
21 Protection Specialist for the Airports Division of the
22 Federal Aviation Administration, Western-Pacific Region.

23 I would like to welcome you to the fourth of a
24 series of public hearings the FAA and Los Angeles World
25 Airports, or LAWA, are conducting on the Supplement to

1 the Draft Environmental Impact Statement/Environmental
2 Impact Report, or EIS/EIR, for the proposed Master Plan
3 at Los Angeles International Airport.

4 The Supplement to the Draft EIS/EIR addresses
5 an additional Alternative, Alternative D, the Enhanced
6 Safety and Security Plan that was added in the fall of
7 2001. This new alternative was added as a result of
8 comments submitted on the 2001 Draft EIS/EIR and the
9 terrorist attacks that occurred on September 11th, 2001.

10 The Notice of Availability of the Supplement
11 to the Draft EIS/EIR was published in various local
12 newspapers and in the Federal Register on Friday, July
13 11, 2003. The FAA and LAWA are the authors of the
14 Supplement. The Federal Highway Administration is also
15 a cooperating agency in the preparation of the Draft
16 EIS/EIR that was published in January 2001.

17 The purpose of these hearings is to collect
18 comments from the general public concerning the adequacy
19 of the information disclosed in the Supplement to the
20 Draft EIS/EIR on the proposed Alternative D.

21 I would like to take this opportunity to make
22 sure that everyone understands that no decision will be
23 made tonight regarding the proposed project. Today's
24 hearing is not a question-and-answer type of forum. Our
25 job is to listen to what you have to say about the

1 adequacy of the information in the Supplement to the
2 Draft EIS/EIR. In other words, it's your turn to talk
3 to us. Since we are here to listen, we are not going to
4 respond to questions about the pros and cons of the
5 proposed project.

6 Since 5:00 this afternoon we have held a
7 public workshop on the side of the room for anyone to
8 ask questions about the Master Plan, the environmental
9 process and the various proposed projects.

10 Following publication of the Supplement to the
11 Draft EIS/EIR for review and comment, the next step in
12 the joint Federal and State disclosure process is
13 holding this and the other public hearings during this
14 week and next week.

15 I would like to take this opportunity to recap
16 the environmental disclosure process for this project.
17 The environmental evaluation of the LAX Master Plan
18 began in 1997 with the publication of a Notice of Intent
19 to prepare the joint EIS/EIR in the Federal Register.
20 In July 1997 we held a series of meetings with members
21 of the public and governmental agencies to receive
22 comments on the scope of the Draft EIS/EIR. Following
23 those meetings, the Draft EIS/EIR was published in
24 January 2001.

25 Both the 2001 Draft EIS/EIR and the 2003

1 Supplement have been prepared pursuant the National
2 Environmental Policy Act of 1969, or NEPA, the Council
3 on Environmental Quality Regulations, which are the
4 implementing regulations for NEPA, the California
5 Environmental Quality Act of 1970, or CEQA, and the
6 Airport and Airway Improvement Act of 1982, as amended.

7 Following today's hearings and the close of
8 the comment period, we will then correct and revise the
9 EIS/EIR, as necessary, based on the comments received.
10 We will also prepare responses to the comments we
11 receive and include those responses along with those
12 that were submitted to the FAA and LAWA on the 2001
13 Draft EIS/EIR into the Final EIS/EIR. The information
14 contained in the Supplement will also be combined with
15 the information in the 2001 Draft EIS/EIR into the Final
16 EIS/EIR.

17 Before we begin receiving verbal comments, we
18 would like to let you know the ground rules of this
19 hearing. First, as I said earlier, we are not here to
20 respond to questions about this project. We are only
21 here to listen to your comments and take notes. We
22 also have a court reporter present to ensure that we
23 have an accurate transcript of this hearing.

24 For anyone who would like to speak, we ask
25 that you fill out a speaker card, like this one, that

1 are available at the sign-in desk. After you filled one
2 out, you could give it to one of the people at the
3 sign-in desk. And they will bring the cards up here to
4 our facilitator who will call the names of each speaker
5 so we can proceed in an orderly fashion.

6 So that everyone gets an opportunity to
7 provide verbal comments, everyone will be given three
8 minutes to speak. To be fair to everyone, we are not
9 going to allow people to transfer their allotted time to
10 someone else. I ask that when you speak, you give us
11 your name and address for the record. We also have a
12 Spanish language translator for anyone wishing to
13 provide their comments in Spanish.

14 If there is anyone who is uncomfortable
15 speaking in front of a group or if you need more than
16 three minutes to provide your comments, we ask that you
17 provide your comments in writing. We have comment
18 sheets, like this one, available for your use at the
19 sign-in desk. You can leave your comments at the
20 sign-in desk or you can either mail your written
21 comments using the comment sheet or a letter to either
22 address on the cover of the EIS/EIR.

23 I would like you to understand that a verbal
24 comment is just as important as a written comment. So
25 please feel free to provide any comments on the document

1 you may have to us either verbally today or in writing.

2 At this time comments on the Supplement to the
3 Draft EIS/EIR are due by 5:00 p.m., Pacific Daylight
4 Time, on Monday, August 25, 2003. The FAA is currently
5 considering a request from LAWA to extend the public
6 comment period to a total of 120 days. At this time no
7 decision has been made on LAWA's request. If the agency
8 agrees to extend the comment period, a notice announcing
9 any extension would be published in the Federal Register
10 and in local newspapers of general circulation.

11 Lastly, I would like everyone to know that
12 even though we have this hearing scheduled until
13 9:00 tonight, we will stay here as long as necessary for
14 everyone to get a chance to provide verbal comments on
15 the Supplement to the Draft EIS/EIR. As I said earlier,
16 our job here is to listen to your comments.

17 At this time I would like to ask everyone in
18 the room to please turn off your cell phones and pagers
19 to be courteous to those people making verbal comments
20 at tonight's hearing.

21 Now I will return our hearing back to our
22 facilitator who will introduce Mr. Jim Ritchie, who will
23 provide some introductory comments from LAWA. Following
24 Mr. Ritchie's comments, we will collect the speaker
25 cards and call the name of the first speaker. Thank

1 you.

2 MR. WALL: Thank you, Mr. Kessler. I would now like
3 to introduce Mr. Jim Ritchie, who is the Deputy
4 Executive Director of long-range planning for
5 Los Angeles World Airports.

6 MR. RITCHIE: Thank you, Tom, and welcome everyone.
7 I am Jim Ritchie from Los Angeles World Airports, and on
8 behalf of the Airports, welcome to San Pedro for this
9 hearing process.

10 For the purposes of consistency with the many
11 hearings that we will be doing, I'll read my comments
12 into the record.

13 You may recall the public hearing process in
14 2001 -- in fact, we were here just about two years to
15 the day -- while we were examining other alternatives
16 for the modernization of the LAX.

17 The tragic events of 2001 and the leadership
18 of Mayor Jim Hahn have reshaped that environmental
19 process. The Mayor's pressing concerns for safety and
20 security have provided new guidance along with the
21 public comments that we received during that public
22 comment period in 2001 that ran from January through
23 November.

24 You are here tonight primarily to provide
25 comments on that new Alternative, referred to as

1 Alternative D. This is a supplement to the existing
2 environmental process, and it has undergone a rigorous
3 environmental analysis.

4 We are here tonight to receive your comments,
5 we welcome them, to take a look at this new Safety and
6 Security Plan and its impacts, as disclosed in the Draft
7 Environmental Impact Statement/Environmental Impact
8 Report. Thank you very much. And, Tom, let's go to
9 work.

10 MR. WALL: Thank you, Mr. Ritchie. We want to make
11 sure that everyone tonight feels comfortable. And we
12 want to make sure that everyone has a chance to say
13 exactly what they feel like saying during the three
14 minutes allotted.

15 What I intend to do is to call the speakers up
16 one at a time. I'll call three at first so that you
17 have a little heads-up. If you're concerned about
18 public speaking, if you would prefer simply to make your
19 comments in writing, you can do that, but I want you to
20 feel comfortable this evening.

21 I want to introduce our two court reporters,
22 Lisa and Kim. They are going to copy verbatim what you
23 say. So it's very important that you state your name
24 and address clearly so they can get it in the record,
25 and then speak slowly and clearly. As you can hear, we

1 have an echo in this room. So it will be difficult
2 sometimes for them to follow if you're not very clear.

3 The clock in front of me is our official
4 timer. It is very simple to operate. I hit a button,
5 and it starts counting down from three minutes. If
6 there is a problem during your speech, if you want to
7 take some time, I can pause it to get your thoughts
8 together for those who might be nervous this evening.

9 When we get to 30 seconds remaining, a yellow
10 light will light at the top of the clock. And when your
11 time is up, when your three minutes are up, you'll see
12 three zeros on the clock and the red light will be on.
13 We would appreciate at that time if you could wrap up if
14 you have not completed your comments.

15 If everyone is ready to go, I'll call the
16 first three speakers.

17 The first will be Mr. Fred Mackenbach,
18 followed by Mr. Mike Molina, followed by Mr. Dwight
19 Abbott.

20 Mr. Mackenbach, if I could have you join us at
21 the lectern. I will not start the clock, sir, until you
22 are finished stating your name and address so that does
23 not count as part of your three minutes.

24 MR. MACKENBACH: Good evening. My name is Fred
25 Mackenbach, 732 Via Somonte, Palos Verdes Estates,

1 California. I'm on the City Council of Palos Verdes
2 Estates.

3 I have just two points that I would like to
4 make. The figure of 40 million, maybe 42 million sticks
5 in my mind as what the airport was designed to do back
6 in the '80s. If my memory and the figures I was given
7 are correct, we got up to almost 68 million before 9-11.
8 We're told that the capacity of the current airport is
9 roughly 78 or 79 million.

10 Now, when somebody tells me they are going to
11 basically tear the airport apart and completely
12 reconfigure it and say they are going to hold the
13 passenger count to 78 or 79 million, it is very
14 difficult to believe those figures based on past
15 history. That's point number one.

16 Point number two. I've been attending the
17 meetings that were initially at the FAA and now at -- in
18 conjunction with the airport, the noise group, and the
19 noise continues over the peninsula. The noise is not
20 addressed in the proposal. And I am always taken back
21 by the fact that we are positioned uniquely, the airport
22 is positioned uniquely along the ocean.

23 I was looking at the video earlier. And in
24 the lower right-hand corner it showed this airplane
25 taking off. And here is this wide span of the Pacific.

1 All they've got to do is go out farther and higher
2 before they come back over. And we're just sick and
3 tired of the turboprops. Those things are not being
4 addressed either in the proposal or apart from the
5 proposal.

6 So it makes it very difficult when somebody
7 comes with a plan and -- that a lot of people feel is
8 disguised as security. And I'm not against security.
9 I'm for security. But the issues that are really
10 driving people crazy and impacting values of homes,
11 being concerned at night, are not being addressed.

12 I thank you for listening to me very politely.
13 And I tried to be as right to the point as I could.
14 Thank you very much.

15 MR. WALL: Thank you, sir. Very well done. A good
16 role model for us this evening.

17 Our next speaker is Mr. Mike Molina.

18 MR. MOLINA: Good evening. I'm Mike Molina, 200
19 North Spring Street, Los Angeles. I am a Chief of Staff
20 for Councilwoman Janice Hahn.

21 And I'm here this evening merely just to offer
22 my welcome to the airport staff and Mr. Kessler,
23 yourself as well, to say welcome to San Pedro. And the
24 councilwoman wholeheartedly endorses this public comment
25 period. And, Mr. Kessler, so you know, she also

1 supports the extension of the public hearing process to
2 120 days because she is a firm believer that the more
3 opportunity we can provide the public to provide public
4 comment and opinions regarding this -- this plan, the
5 more sound and the better the plan will be at the very
6 end.

7 So I'm just here to offer a welcome from the
8 councilwoman of the district that we're in this evening,
9 and most especially provide a welcome to the many people
10 who have gathered here this evening and encourage all of
11 you to provide comment either through written form or
12 verbal form this evening about this most important
13 project in the life of the city now and in the next
14 decade. So once again, thank you and welcome.

15 MR. WALL: Thank you, sir. Following Mr. Dwight
16 Abbott will be Beverly Ackerson, Lynn Jones and Joe
17 Visaleya.

18 Mr. Abbott.

19 MR. ABBOTT: Thank you. My name is Dwight Abbott;
20 address 1825 Via Estudillo, Palos Verdes Estates,
21 California. Just another quick background before --
22 well, okay.

23 I have done a review and I found three
24 important areas. Number one, passenger convenience.
25 Number two, safety and security, and number three, the

1 cost.

2 First passenger convenience. I find the
3 Master Plan imposes great inconveniences on the
4 passengers that will use it. The FAA now recognizes
5 passenger convenience as an important airport design
6 factor and defines it in terms of the time to move the
7 passenger from the parking lot of the departure airport
8 to the parking lot of the arrival airport, not simply
9 airline gate to airline gate. That's the old
10 definition. The LAX Master Plan will greatly increase
11 the parking lot to parking lot time required over the
12 current LAX configuration.

13 The proposed Ground Transportation Center and
14 the Intermodal Transportation Center are nearly a mile
15 removed from the terminal area. They are connected via
16 a train called a people mover that passengers must ride
17 to the terminal. Passengers must carry any carry-on
18 baggage and other packages on the train. The current
19 LAX configuration imposes no such inconvenience.

20 Safety and security. Aircraft collisions
21 during taxi take-off and landing can result in more
22 casualties than any terrorist attack. I believe that
23 the proposed reconfigured runways are an improvement.
24 However, I believe that the proposal to move the runway
25 to five left only 50 feet to the south is short-sighted.

1 Moving it farther south would provide greater aircraft
2 separation, less weight turbulence, interference between
3 runways and improved safety.

4 The location of the new rental car facility
5 very near the end of the newly positioned runway to four
6 left is unsafe. An aircraft landing short of the runway
7 or not successfully taking off when the runways are
8 configured for easterly departure will risk impacting
9 the proposed rental car facility.

10 The Master Plan puts high importance on
11 security, as it should, but it includes several factors
12 that appear to reduce security. Centralizing passenger
13 check-in at the proposed Ground Transportation Center
14 provides a single location that if incapacitated will
15 shutdown entire airport operations.

16 Similarly, the train, the people mover, is
17 another single point failure that can shutdown airport
18 operations. A small bomb, a bomb scare, a mechanical
19 failure, even protesters on the track to bring the
20 entire airport operations to a halt.

21 An independent RAND Corporation study that
22 you're probably aware of that looked at security
23 afforded by the Master Plan found that the proposed
24 changes would not increase security.

25 I have additional comments. I have submitted

1 a written report. Those additional comments concerning
2 cost and proposals for a better approach are included in
3 that written comment.

4 (The statement submitted for the
5 record was marked as Statement 1
6 and is attached hereto.)

7 MR. WALL: Thank you very much, sir. Ms. Beverly
8 Ackerson.

9 MS. ACKERSON: I'm Beverly Ackerson, 27129 Spring
10 Creek Road, Rancho Palos Verdes. Down a little.

11 MR. WALL: Thank you, Beverly.

12 MS. ACKERSON: I have two items. One is that the
13 residents on the Palos Verdes peninsula are not included
14 in your Master Plan, yet, we are impacted by turboprops
15 and jets that go over us. And the FAA has been to our
16 home. Tracon has been to our homes. And they state,
17 yes, we do have the noise problem. And the
18 recommendation of the South Bay Task Force by Donna
19 Vickers was to move the turboprops off the peninsula and
20 reroute them. They would reroute them around the
21 peninsula out from LAX.

22 The jets, we recently have a lot more jets
23 going over the top of us. And we are getting calls from
24 across the peninsula. It isn't one isolated area. We
25 do have ravines and canyons that traps the noise and the

1 vibration from that noise.

2 So we really wonder why we are not included in
3 the Master Plan when you impact -- when LAX impacts us
4 so much and keeps us awake at night with the eastern
5 departures going to the Asian countries.

6 And we've heard reasons of being overweight
7 aircraft, the slight incline going to the west that is
8 easier for them to take off to the east. But the pilots
9 themselves at a meeting told us that it is because of
10 curfews that they take off at that time from LAX going
11 to Australia, Japan and the Asian countries. I think
12 the curfew issue needs to be addressed. And I would
13 like to see LAX recommend to Congress that they do look
14 into the curfew issue.

15 The second thing is, when -- I just looked
16 briefly. I haven't looked at all of the total plan yet,
17 but briefly looking at the way the people are moved
18 around the airport, I think is a safety issue. I don't
19 like to see so many people in one spot in the center of
20 the airport that then are going to go like spokes to the
21 airlines. I think that's a set-up that could be a very
22 big problem. Thank you.

23 MR. WALL: Thank you, Mrs. Ackerson. Next Mrs. Lynn
24 Jones.

25 MS. JONES: Good evening. Number one, security --

1 I'm sorry.

2 MR. WALL: Mrs. Jones, yes, if you could give us
3 your name and address, please.

4 MS. JONES: 5511 Eau Claire Drive, Rancho Palos
5 Verdes.

6 MR. WALL: Thank you.

7 MS. JONES: Number one, security. From all the
8 indications that I've seen via the internet and also
9 here, the security looks like it only takes place at the
10 CTA. People do not seem to be screened, or their
11 luggages not screened prior to placing it in a plane or
12 moving to the CTA, which is in the middle of the
13 airport. This seems like it is a dangerous place so
14 close to the airplane slots.

15 Number two, in the EIR/EIS Report are they
16 addressing other than noise the following: Pollution
17 from aircraft; two, easterly flights; three, curfews on
18 foreign carriers.

19 Number three, why is Congress not insisting on
20 an EPA and the AQMD be involved in assessing the EIR and
21 the EIS?

22 Since the aircraft taking off at LAX or any
23 other airport, a jet, is like setting fire to a gas
24 station. That's the pollution that you're getting in
25 the air. And I think that the pollution should be

1 addressed.

2 Number four, the EIR, the EIS addresses the
3 noise from jets only, not turboprops. Thank you.

4 MR. WALL: Thank you, Mrs. Jones.

5 Next is Mr. Joe Visaleya followed by
6 Ms. Katheryn Cvelbar and Mr. Joel Barton.

7 Mr. Visaleya.

8 MR. VISALEYA: Yeah, Joe Visaleya; 1218 Koleeto,
9 Harbor City.

10 I have several things I want to present.
11 Number one is, it was brought up by Mr. Abbott about
12 access by the people. Presently we have over 12,000
13 lineal feet of curb available at the airport for picking
14 up and discharging passengers. The new facility doesn't
15 appear to have that.

16 Secondly on the parking. We have 8,000
17 parking spaces within 600 feet of the terminal. If you
18 use the center -- using the airport's own figures of
19 8,000 parking spaces in those structures, and those
20 structures are generally within 600 feet of where you'd
21 be entering the terminal, which means it's going to be
22 very inconvenient.

23 And, thirdly, will we have the same amount of
24 counter space when we arrive at the CTA? Presently you
25 have pretty close to 5,000 lineal feet of counter space.

1 And any of us who fly in and out realize that presently
2 we have to wait in line. If that is made smaller, the
3 length of time that we as passengers will have to wait
4 will be increased.

5 And, thirdly, the other thing I wanted to
6 bring up is presently we have about four or five
7 accesses to LAX. You have Sepulveda Boulevard north and
8 south. You've got Lincoln. You've got the 405, the
9 105, as well as Century.

10 The way this new system is laid out, we have
11 basically one. We have maybe three accesses. You could
12 come across on Century. You might be able to come
13 across Imperial and then up Aviation, which may not be
14 acceptable, and coming off the 405.

15 There is -- right now we have so many local
16 streets that we can get on that they can manipulate the
17 traffic and the transportation system. The grid permits
18 us to all get into the airport at a much more easily
19 activity than we do when it's going to all be confined
20 to one small location, the intersection of Aviation and
21 Century, or wherever that intersection is. I wasn't
22 able to ascertain the exact location.

23 But these are the things that I think need to
24 be addressed. And as Mr. Abbott pointed out, the FAA is
25 concerned about time from your vehicle to the time of

1 your vehicle at your next destination. And this system
2 that we have here is not going to do it.

3 And one other thing. On the safety issue, we
4 talked about this thing of safety. I understood that we
5 were going to be checking in at the outer terminal. And
6 seeing the video today, it looks like we're going to be
7 carrying our bags unsecured to the CTA.

8 MR. WALL: Thank you, sir, for your comments.

9 Ms. Katheryn Cvelbar, please.

10 MS. CVELBAR: Katheryn Cvelbar, C-v-e-l-b-a-r, 23530
11 Arlington Avenue, Torrance.

12 I actually came here tonight to blast you
13 about what I have been reading in the newspapers about
14 the plans, and what the gentleman was just talking
15 about, having your luggage checked at an outer limit.
16 And upon having the plan explained and shown how it
17 actually would work, I actually like it. I think right
18 now I, myself, I always use lot B for my parking anyway.
19 This seems to be -- and use the shuttle to get to the
20 airport. This seems so much more easier.

21 I just feel that I think it's a good thing
22 that you have expanded the number of meetings and
23 hearings like this so that the more people who are able
24 to see the plans and actually how they are laid out and
25 how they will work, more people will like it a lot more.

1 My only question is that, the plan hinges upon
2 the Manchester Square area being a part of airport
3 property. Is it currently still residential or has all
4 of that been purchased by the airport and is vacant?

5 Thank you.

6 MR. WALL: Thank you, ma'am, very much.

7 Next will be Mr. Joel Barton followed by
8 Mr. Johnny O'Kane, Mr. Pete Makoni and Terry Martin.

9 MR. BARTON: Good evening, Joel Barton, 833 Airport
10 Boulevard in the city of Los Angeles. I was originally
11 just going to show up here to speak about the good
12 aspect of the creation of good construction paying jobs
13 with this project. But after viewing the video and
14 reading all this material here and going and looking at
15 those boards back there, this is amazing how good this
16 project is going to be for LAX.

17 I'm a Los Angeles native. LAX looks -- I love
18 this city. It's going to put us in the 21st Century. I
19 like that idea. I liked everything I saw about this.
20 You know, you talk about Orange County and all the other
21 airports, but LAX is the airport.

22 I like the idea of having everybody take the
23 train in because I take a lot of flights out of LAX. I
24 don't like sitting there waiting for someone to pick me
25 up breathing all the fumes coming from all the cars

1 constantly circling the airport. So I do like that
2 aspect of it. I like the added security. So I just
3 wish to speak in favor of this project.

4 MR. WALL: Thank you, sir.

5 Next will be Mr. Johnny O'Kane.

6 MR. O'KANE: Johnny O'Kane, 3158 Almeria Street, San
7 Pedro.

8 And I'm a union ironworker. So, of course,
9 I'm in favor of construction. And it just seems to me
10 that progress can't always be in someone else's
11 backyard. And the jobs for us as construction workers
12 would be grand at the time, but overall you're going to
13 have jobs that come off of the work that we do, which
14 will be Californians paying tax in a state that could
15 use some tax money right now. I'm in favor of it 100
16 percent. Thank you.

17 MR. WALL: Thank you, sir.

18 Folks, if I could remind you, please, it's
19 difficult for the court reporters to hear if there is
20 other talking going on in the room. So if we can keep
21 the noise down, please, while the speakers are speaking.

22 The next speaker is Mr. Pete Makoni.

23 MR. MAKONI: Pete Makoni, 4345 East Rosecrans
24 Avenue, Hawthorne, California.

25 I'm in favor of this project because it helped

1 all of us here. California and L.A. is a multi-cultural
2 people live here. And the people come from all over.
3 You are all aware if you're going to Dallas, anywhere
4 else the airplanes are modernized. Ours have been built
5 in the 1950s and remodified in 1980s. You all hear
6 about that all the time, the near miss in landing and
7 takeoff, the near miss. The airport is not big enough
8 for the airline flying out and coming in.

9 Also I like the plan to take the
10 people outside. I fly out of LAX about three or four
11 times a year. And you see how many people gridlock.
12 You hear on the news. It takes you three to four hours
13 since 9-11 to wait on the freeway, Century Boulevard, to
14 wait to get in the airport. And, also, you're going to
15 check in, for safety's sake. That's why I like this
16 plan. And it's good for all people.

17 I'm a construction worker. I'm a pipe fitter
18 by trade. In ten years I'll be retired. But I look
19 forward to my children and my grandchildren to fly out
20 in a safe place like LAX.

21 MR. WALL: Thank you, sir.

22 Next is Terry Martin. Following Mr. Martin
23 will be Mr. Daniel Humber, Mr. Larry Johnson and
24 Mr. Arthur Guzman.

25 Mr. Martin.

1 MR. MARTIN: Good evening. Terry Martin, 18355
2 South Figueroa, Gardena. 30-year member of United
3 Association, Local 250 steam and refrigeration pipe
4 fitters, currently serving as union representative
5 representing 5,000 members.

6 I have a list here of 600 of our members that
7 live within a ten-mile radius of this auditorium.
8 That's not including the family and friends. That's
9 just our members.

10 And I'll tell you, listening to some of our
11 Rancho Palos Verdes audience, I'm going to have to get
12 into contact with nine of my members that live there and
13 tell them to pay attention to that one commercial where
14 the father and son are sitting there and that plane
15 flies overhead, and that piece of plane falls off and he
16 says, "You better get yourself a good realtor. Trust
17 me."

18 Well, I think this airport, in a lot of cases
19 with most people living in Rancho Palos Verdes, unless
20 it's old money, knew about the airport problem if they
21 had any.

22 Property values, apparently Newport Beach has
23 more money because they got what they wanted. That's
24 where they turn the engines off when it takes off and
25 they don't have that problem.

1 I'd like to thank Mayor Hahn for all these
2 different alternatives, including the one that he
3 recently tried to get over there at El Toro, another
4 alternative that was turned down by Orange County.

5 This is going to create a lot of jobs. And
6 being in construction in which it would be nice to
7 finally go to LAX and walk away from their urinal. In
8 case you forgot to flush, it flushes itself. That's
9 some of the work we do. The heating and cooling, the
10 pipeline work, any relocation work we'll be doing it.

11 Tonight I have 15 of my members that took
12 their time away from their families to be in attendance.
13 These are members that live in San Pedro or in the
14 surrounding area. They are participating in the public
15 hearing, which we encourage all people to do, take part.

16 It's not easy getting up to speak, but I'm
17 very proud to be a member of a union, very proud of our
18 mayor, very proud of our airport authority for taking
19 time, very proud of the FAA. And I'm very proud of this
20 new Alternative D. Let's get it done. Thank you.

21 MR. WALL: Thank you, Mr. Martin.

22 Next will be Mr. Daniel Humber.

23 MR. HUMBER: I'm Daniel Humber. I reside at 2220
24 Via Corona, Montebello, California. I'm a union
25 ironworker.

1 I was on the internet this morning with MSN.
2 And I was really surprised at what I'd seen here. It
3 says five airports to avoid. And it says five airports
4 to avoid, if you can.

5 "LAX is oppressive, says one traveler."

6 "I dread it, says another traveler."

7 It also had another article on five airports
8 to layover, you know. They talked about these airports,
9 you know. And they talked about Orlando Airport. It's
10 the best airport in the United States for a layover, bar
11 none. Easy to find parking isn't a problem. And the
12 terminal is easy -- incredibly user-friendly.

13 And they went down the list and talked about
14 Denver and they talked about Chicago O'Hare and they
15 talked about Atlanta International. They are talking
16 about how great these airports are. So there is --
17 we've got five airports that have solved the problems
18 that they had to do to make these things modernized.

19 It also talked about San Francisco. It's
20 being done right now. It's much better today for what
21 work they have done already. You know, we've got -- we
22 can do the work, you know. We've got a lot of people
23 who are in the business here. We do big projects in
24 this town. And we have a lot of skilled labor that can
25 modernize this airport.

1 You know, I talked last night in Montebello --
2 up there in another one up -- on the other one we had
3 last night and talked about the safety issues, you know,
4 especially if they have an alert. We had the alert
5 here. And it was -- it was a mess, that we came into
6 the parking lot and being shuttled into the airport. So
7 we need this -- we need this.

8 And, also, it talked about the five airports
9 to avoid. It said LAX International. "Friends do not
10 let friends fly into LAX." You know, the circular
11 design needs to be redesigned. LAX is oppressive. It's
12 dingy, dilapidated, noisy, overcrowded, unfriendly and
13 with poor facilities.

14 You know, I'm embarrassed and I'm a native
15 Californian. I was born in Burbank. This has been my
16 city. I want to be proud of my airport. You know, I
17 fly out of LAX a lot. It's a main hub, if we get direct
18 flights to Hawaii, New York and other places, you know.
19 I don't want to have to use these other airports to have
20 to do these transfers and things.

21 And I like to turn this in for the record,
22 too, so you guys have it for the record and review it.
23 So thank you very much.

24 (The statement submitted for the
25 record was marked as Statement 2

1 and is attached hereto.)

2 MR. WALL: Thank you, sir, very much.

3 Next will be Mr. Larry Johnson.

4 MR. JOHNSON: I'm Larry Johnson, 8203 Owens Street,
5 Buena Park, California.

6 First I'd like to say, when I saw the
7 presentation tonight and last night of the Plan D, you
8 know how proud I'd be to go to that airport or have my
9 friends or family come in. It's -- you know, it's going
10 to be a good thing for everyone. You know, it's not
11 just -- it's not just the construction jobs. It's
12 business. It's tourism.

13 The first thing a tourist or someone seeking
14 to relocate a business when he comes to L.A. is the
15 airport. And, you know, sometimes I'm surprised I don't
16 see some -- why some of them don't turn around and go
17 back of what they see when they come.

18 I flew in and out of Orlando last spring. I
19 am just amazed at how clean, how well laid-out, how good
20 the people mover worked. It was -- we checked our
21 baggages, you know. We didn't walk maybe 200 feet.
22 We're on the people mover. Then we're right at the
23 terminal. All the newer airports seem to be going that
24 route. And I can see why. It's -- you know, it spreads
25 out the people, gets them away from being concentrated

1 in such a big area like they are now.

2 As a union ironworker, I don't see anything in
3 that proposal that our craftsmen could not handle and
4 build very well.

5 One thing I've seen in the newspaper, I think
6 it was Monday in the Times, they were talking about
7 comparing this project to other projects with huge cost
8 overruns. And they compared it especially to the Boston
9 Big Dig. And, you know, that's like comparing apples to
10 oranges. The Boston Big Dig is basically trying to put
11 all the downtown freeways underground while they are
12 still running. This is a complicated project, but it's
13 all doable. It's doable now.

14 Palmdale was a great alternative. I just
15 worked out at Plant 42. I can tell you, they don't have
16 the infrastructure in place out in Palmdale. It would
17 be nice. It would be a nice regional commuter airport,
18 but for now I don't see it happening. I can see this
19 happening now. It should have happened five years ago.
20 And hopefully when all the talk is said and done, it
21 will happen. Thank you.

22 MR. WALL: Thank you, Mr. Johnson.

23 Next is Mr. Arthur Guzman followed by Mr. Tom
24 Lemmon, Ms. Carole Hossan and Mr. Denny Schneider.

25 Mr. Guzman, welcome.

1 MR. GUZMAN: Thank you. Arthur Guzman, 17111 Steven
2 Street in Gardena, which is about approximately a
3 15-minute drive to LAX.

4 And I am understanding what the concerns that
5 those who oppose this project have. But in reality, if
6 you were to weigh the total picture, you would see that
7 the positives outweigh the negatives.

8 We all understand that the State of
9 California, and in particular Los Angeles, is in an
10 economic downturn. And we need -- by these projects,
11 these well-paying projects, these jobs will help
12 stimulate the economy. Not only will it help stimulate
13 the economy, but it will also put to work apprentices,
14 our high school graduates that feel that college
15 education is not their main concern. It's not their
16 forte. How do we give these people the skills, the
17 tools that they need to be a middle-class American? As
18 we all know, it's a strong middle-class America that
19 also secures democracy and freedom for us all. We have
20 to take a look as to Third World countries like Cuba,
21 China, the Middle East. And you will see where there is
22 no strong middle-class America. There is no democracy
23 and freedom.

24 So this is an opportunity that we all have to
25 help stimulate the economy through good, decent-paying

1 jobs. You do not stimulate the economy by giving tax
2 cuts to a certain segment of society. When this
3 administration in Washington first took office, my wife
4 and I received \$600. Did that help stimulate the
5 economy? Obviously not because we're still suffering an
6 economic downturn.

7 The way we stimulate the economy is to provide
8 good, decent-paying jobs, also, to train people out of
9 high school into decent, good-paying jobs. That helps
10 stimulate the economy. After all, what do we do with
11 these kids who graduate from high school that don't want
12 to go on to college? We have to find a place for them
13 to make a good, decent living. And projects like this
14 will give them the opportunity to do that because this
15 project will employ about 20 percent of apprentices. So
16 it's for us a win-win situation. Thank you.

17 MR. WALL: Thank you, Mr. Guzman.

18 Next Mr. Tom Lemmon. Welcome, sir.

19 MR. LEMMON: Thank you. Tom Lemmon, 3566 Bayonne
20 Street in San Diego.

21 As a union asbestos worker, I want to
22 compliment -- oh, I broke the table -- Mayor Hahn and
23 Staff for this visionary LAX plan. I wish the City of
24 Los Angeles and the County's success in approval of this
25 most important project that creates jobs.

1 (Someone came up to fix the podium.)

2 MR. LEMMON: Thank you.

3 MR. WALL: Now don't break that again, sir. Okay.
4 Here we go.

5 MR. LEMMON: My hope is this that project will be
6 approved and move forward. I also hope that my hometown
7 of San Diego will soon follow L.A.'s lead and do
8 something with its unlimbered feild. Thank you for the
9 opportunity to speak.

10 MR. WALL: Thank you, sir. Ms. Carole Hossan.

11 MS. HOSSAN: I'm Carole Hossan, Westchester. And I
12 know here in San Pedro people are very interested in
13 pollution because they get a lot of pollution from the
14 Port. Well, we have the same situation at LAX, but we
15 don't know what we're -- we don't have the studies.
16 We'd like to see more studies of our air quality
17 monitoring because I believe the closest one we have is
18 at 120 in La Cienega. The other evening I believe I
19 misspoke and said Century, but La Cienega.

20 A speaker had a question about the Manchester
21 Square area, which is the proposed new Gateway to LAX.
22 Well, that is currently a residential area. Some people
23 don't want to move. And Mayor Hahn in his campaign
24 pledge said he was going to use existing LAX facilities.
25 Now, that currently is not an existing LAX facilities.

1 So that's an expansion into the community of
2 Westchester.

3 And I heard another speaker say, well,
4 Palmdale is there, but it's not ready. Well, if not
5 now, when? Spend some of that money in Palmdale. There
6 would be lots of work there building a new beautiful
7 airport instead of enabling LAX to grow. It's already
8 bigger than it should be. And why should the City of
9 Los Angeles -- I can't say this enough -- only have one
10 major airport that serves Central California to the
11 Mexican border. We deserve better, more airports, more
12 jobs. Build a beautiful airport in Palmdale. Thank
13 you.

14 MR. WALL: Thank you, ma'am. Next will be Mr. Denny
15 Schneider.

16 MR. SCHNEIDER: Denny Schneider, 7929 Breen Avenue
17 in Los Angeles.

18 I come before you as the Vice President of
19 ARSAC, Alliance for a Regional Solution to Airport
20 Congestion. According to the EIR, one out of every
21 20 people is impacted by the economics of LAX. And
22 that's great except that we also have all of the air
23 commerce, 75 percent of it at least, concentrated at
24 LAX. If anything happens there, the economy here is
25 going to tank. We would have a lot more jobs if we

1 built a regional solution and distributed the air
2 traffic.

3 Now, if we look at the EIR and read it in
4 detail, it doesn't necessarily match the renderings that
5 we've seen. And, in fact, it is very difficult to
6 evaluate what Alternative D is because within
7 Alternative D, there are at least 40 different options
8 within it.

9 As an example, the runway on the north is
10 supposed to be moving some amount toward the Central
11 Terminal Area. One area of the plan says 340 feet.
12 Another says 380. Another says 388. It says that the
13 runway on the northern-most runway would stay at 150
14 feet. It would be evaluated to be increased to 200
15 feet. It doesn't say whether it's going to move north,
16 south or whatever. The real issue is costing it, but
17 it's also a matter of what are the impacts going to be
18 on all of the people of Southern California.

19 The 405 is already like a parking lot. You're
20 going to add more than 20 million cars. You want to add
21 one and a half million annual tons at LAX. It's one of
22 the smallest footprints of any airport in the world of
23 this caliber. One and a half, divide that by ten tons
24 per truck and figure out how many trucks it's going to
25 take. You need a different and more infrastructure.

1 That's why it needs to be spread out. That's why it
2 needs to be developed across all of Southern California.
3 Thank you.

4 MR. WALL: Thank you, Mr. Schneider. Our next
5 speaker will be Mr. Harry Rose followed by Mr. Joe
6 DiMassa followed by Mr. Dennis Dyer, and then Mr. Robert
7 Hunter.

8 Mr. Rose.

9 MR. ROSE: Good evening, gentlemen. My name is
10 Harry Rose. I live at 7725 Hindry Avenue in the lovely
11 community of Westchester. If you don't know where that
12 is, that's eight-tenths-of-a-mile south of the proposed
13 boondoggle of the Ground Transportation Center that LAWA
14 planned on acquiring.

15 I came here tonight to speak primarily on two
16 issues. The first issue is regionalism of airports.
17 How many airports, how many international airports do we
18 have in Southern California to serve the entire southern
19 half of the state? From my count we have one, to serve
20 all the way down to San Diego. I mean, this is insane.
21 If we want to come here and talk about jobs, let's talk
22 about building a real airport somewhere. I mean, you're
23 not going to do the job on 20 -- or 3,200 acres, give or
24 take a few hundred that you add in land acquisitions.
25 You need room. Denver has 53 square miles for an

1 airport. If you're going to operate a large
2 international airport, you need to operate it away from
3 a community in an area that's not congested so that
4 people can get there. I mean, this is a project to
5 2015. According to the City of Los Angeles, the
6 population of my community is going to double in 2025.
7 And if that happens in all of the west side communities,
8 you guys are going to have this wonderful modern airport
9 and nobody is going to be able to get there.

10 The other issue I want to talk about primarily
11 is Manchester Square. The residents of Manchester
12 Square are denied the option for soundproofing and the
13 insulation of jet noise for a noise mitigation project
14 and are forced to indefinitely endure unsafe and unfit
15 environmental conditions perpetuated by LAWA, or
16 conceded to LAWA's voluntary acquisition project, which
17 is wrought with violations of federal law for land
18 acquisitions and relocation of displaced persons,
19 including discrimination, coercion and under-valued
20 purchase offers for property.

21 Resident appeals to the FAA in Washington,
22 D.C., have resulted in lack of uniform treatment of
23 minority persons and a subjective disregard of FAA
24 guidelines for airport acquisition procedures prescribed
25 in FAA Order 5100 37A.

1 In essence, this particular land acquisition
2 is being financed by noise mitigation money. That's
3 money that's set aside for soundproofing people's homes.
4 And, yet, when people who live in Manchester Square ask
5 for soundproofing, they are told they don't qualify for
6 soundproofing, but LAWA will buy your house. Personally
7 I would like for the FAA to answer to that. Thank you.

8 (The statement submitted for the
9 record was marked as Statement 3
10 and is attached hereto.)

11 MR. WALL: Thank you, Mr. Rose.

12 Next will be Mr. Joe DiMassa. Welcome, sir.

13 MR. DIMASSA: Thank you. My name is Joe DiMassa.
14 My address is 3725 Myrtle Avenue in Long Beach. I'm the
15 general manager of Yusen Terminals, a major container
16 terminal at the L.A. complex located at Terminal Island.

17 And I'm here tonight to express our support
18 for this Master Plan, as provided by the Mayor's office.

19 This plan will provide needed safety,
20 security, and will allow for a state-of-the-art
21 transportation facility. This is needed for us to
22 maintain our position here in the L.A. basin and the
23 L.A. region as a world leader in transportation
24 logistics. Not only will it help in a regional way, but
25 it will help in a local way and our local economies,

1 which will especially help us maintain and generate more
2 jobs.

3 I can't emphasize more how important it is for
4 this project to move forward. Thank you very much.

5 MR. WALL: Thank you, Mr. DiMassa.

6 Next is Mr. Dennis Dyer. Welcome Mr. Dyer.

7 MR. DYER: My name is Dennis Dyer. I live at 1102
8 Paseo del Mar -- excuse me, here in San Pedro.

9 And first of all I would like to say, my wife
10 loves to travel. And she drags me to the airport about
11 five times a year. So I go through LAX quite often.
12 And in general I think that the plans as presented
13 are -- all of them, really, look very good because I
14 really agree with the idea of dealing with the surface
15 traffic inside the airport. It's just horrendous. And,
16 really, something needs to be done about that.

17 But in general, the one drawback that I can
18 see with the plan is that I believe that passenger
19 convenience -- I think other people have mentioned this
20 as well. Passenger convenience is really being reduced,
21 reduced substantially. This is because of a couple of
22 things.

23 One is the people mover, of course, adds an
24 extra step in everybody's trip. That's going to be more
25 time, more effort to have to go through the whole

1 process. Also, I think that the plan is going to
2 refocus surface street traffic and, of course, cause the
3 same sorts of surface street traffic problems that other
4 people have addressed.

5 One other thing is it looks to me the plan is
6 eliminating the heliport that's currently there. It
7 occurs to me that given the inconvenience of someone
8 deplaning and then getting their luggage and then
9 getting on the people mover and then taking it to where
10 they finally get to surface transportation like a cab,
11 public transportation, so that they can get to their
12 final destination, it occurs to me that given the
13 inconvenience of all of that, that there will be a
14 certain level of people who would love to just be able
15 to get off a plane here, get on a helicopter and go
16 straight to Downtown or the Valley or down here to the
17 Harbor. So I would suggest that the helipad should be
18 back into the plan in some way or another. Thank you.

19 MR. WALL: Thank you, Mr. Dyer, very much.

20 Next is Mr. Robert Hunter. Welcome
21 Mr. Hunter.

22 MR. HUNTER: How are you doing? Robert Hunter,
23 28832 Carnation Court, Castaic.

24 You know, they call LAX an international
25 airport. Really, it's just a large regional airport

1 that needs adjusted. But those people in California,
2 just like we did the power crisis, we put off building
3 power plants for 35 years until we were in a crisis. It
4 cost us three times the amount of money. It brought the
5 state to almost a halt. If we don't do something about
6 LAX in the very near future, it's going to be the same
7 thing. We're going to end up doing something that we're
8 going to regret in a hurry.

9 And this has been a well thought-out plan.
10 It's been adjusted to fit a lot of the problems and
11 a lot of the worries of residents and the people of
12 California. It's got everything. It's got mass
13 transport. It helps pollution. And it addresses
14 security. And it does provide jobs for Californians
15 which will boost the economy. But in the long run, all
16 of our children and the people that live here after
17 we're gone will have a facility that they can use rather
18 than at the end of the Century hopefully. Thank you
19 very much.

20 MR. WALL: Thank you, Mr. Hunter. Mr. Murphy, do I
21 have any other speaker cards? All right. We will take
22 a 15-minute break.

23 I want to congratulate and thank you all for
24 the thoughtful comments, a lot of divergent views.
25 That's exactly why we're here this evening. Thank you

1 very much. We'll be back in 15 minutes.

2 (Recess was taken.)

3 MR. WALL: Good evening. We don't have any other
4 speaker cards filled out, but we do encourage you to
5 please visit our sign-in desk, fill out your speaker
6 card and give us your testimony. Until we receive
7 another speaker card, we are in recess. We will
8 reconvene at 8:15 to check to see if there are more
9 speakers waiting. Thank you.

10 (Recess was taken.)

11 MR. WALL: Good evening, ladies and gentlemen. It's
12 8:15. At this time we don't have any speaker cards in
13 our possession. Again, we do encourage you to visit our
14 sign-in desk and sign up to speak, if you wish, fill out
15 a speaker card. We will be here until 9:00 p.m. We
16 will be in recess.

17 MR. WALL: Ladies and gentlemen, it is 8:30 p.m. At
18 this time we still do have not any public speaking cards
19 at our desk. We are here and available to hear your
20 testimony. We are going to continue the recess until
21 8:40. Thank you.

22 (Recess was taken.)

23 MR. WALL: Thank you. It is now about 8:40 p.m. Is
24 there anyone else who has not had an opportunity to make
25 a comment? If so, please fill out a comment card.

1 Seeing no one, we will recess again and remain in the
2 hall until the public hearing closes at 9:00 o'clock.

3 (Recess was taken).

4 MR. KESSLER: Is there anyone else who has not had
5 an opportunity to speak concerning the information in
6 the Supplement to the Draft EIS/EIR?

7 Not seeing anybody else, I will remind
8 everyone that if you feel you are unable to provide us
9 with verbal comments today, we will be accepting written
10 comments until 5:00 p.m. Pacific Daylight Time, Monday,
11 August 25th, 2003. You can mail your comments either to
12 me at the FAA or to Jim Ritchie at LAWA. The mailing
13 addresses are listed on the cover of the EIS/EIR.

14 I want to thank everyone for your comments
15 today. This public hearing for the supplement to the
16 Draft EIS/EIR of the Los Angeles International Airport
17 Master Plan is now closed. Thank you.

18 (Whereupon the proceeding adjourned
19 at 9:00 o'clock p.m.)

COMMENTS ON LAX MASTER PLAN

Name: Dwight Abbott, 1825 Via Estudillo, Palos Verdes Estates, CA

Background includes: ASEB, Univ degree in Aero Engr, licensed pilot, freq user of LAX & other major airports.

My review finds deficiencies in three important areas: 1) passenger convenience, 2) safety and security, and 3) costs.

Passenger Convenience

This master plan imposes great inconvenience on the passengers that will use it.

The FAA now recognizes passenger convenience as an important airport design factor and defines it in terms of time to move the passenger from the parking lot of the departure airport to the parking lot of the arrival airport - not simply airline gate to airline gate as previously defined. The LAX Master Plan will greatly increase the parking lot to parking lot time required over that of the current LAX configuration.

The proposed Ground Transportation Center (GTC) and Intermodal Transportation Center (ITC) are nearly a mile removed from the terminal area. They are connected via a train (people mover) that passengers must ride to the terminal. The passengers must carry any carry-on baggage and packages on the train. The current LAX configuration imposes no such inconvenience.

Safety & Security

Aircraft collisions during taxi, takeoff and landing can result in more casualties than any terrorist attack. I believe that the proposed reconfigured runways are an improvement, however, I believe that the proposal to move the runway 25L only 50 feet to the south is short sighted. Moving it farther south would provide greater aircraft separation, less wake turbulence interference between runways, and improve safety.

The location of the new Rental Car Facility very near the end of the newly positioned runway 24L is unsafe. An aircraft landing short of the runway or not successfully taking off when the runways are operating in an easterly departure pattern will risk impacting with the proposed Rental Car Facility.

The master plan puts high importance on security as it should, but it includes several factors that appear to reduce security.

Centralizing passenger check-in at the proposed Ground Transportation Center provides a single location that if incapacitated will shut down the entire airport operations. Incapacitation could come from earthquake, fire, electrical outage, and other factors as well as from terrorist activity. The current multi-terminal, decentralized check-in configuration does not have this weakness.

The proposed train (people mover) is another single point failure that can shut down airport operations. A small bomb, bomb scare, mechanical failure, or even protestors on the tracks could bring the entire airport operations to a halt.

An independent RAND Corporation study of the security afforded by the proposed LAX Master Plan found that the proposed changes would not increase security compared to the current LAX configuration.

Cost

The proposed cost of about \$10 billion is simply too high. My written statement explains this conclusion.

Summary

The proposed LAX Master Plan is unacceptable.

Los Angeles County Supervisor Don Knabe has called the LAX Master Plan unacceptable.

Congresswoman Jane Harmon also does not support the plan.

Media reports state that the airlines don't favor it.

The communities near the airport do not favor it.

Certainly the user passengers can not favor it due to the high costs it will impose on them, the lengthened parking lot to parking lot time, the greater inconvenience, and the dubious added security.

A new plan is needed. That plan should have 4 features:

- 1) minimize parking lot to parking lot time for travelers
- 2) improve aircraft safety
- 3) not include centralized facilities that when incapacitated can cause shutdown of the entire airport
- 4) reduce development costs to a level half or less of those proposed.

5 best airports for layovers

Power Trip / Christopher Elliott

Airport layovers are as inevitable these days as cramped economy class seats, annoying security checkpoints and nitpicky ticket agents. But unlike the other realities of flying, you've often got a choice about the terminal you're trapped in.

Which airport should you pick? J.D. Power and Associates tried to answer that question a few years ago when it released its "inaugural" customer satisfaction study on U.S. airports. It named Orlando, Fla., the No. 1 airport, a choice I'm inclined to agree with. But then it offered a bizarre selection for runner-up: Las Vegas (Nev.) McCarran International Airport.

What's wrong with McCarran? Well, just walk through the doors and take a whiff. If you're a nonsmoker, you'll know what I mean. Even though passengers are only allowed to light up in limited smoking "areas" in the terminal, those places seem to be everywhere — in bars, waiting areas and almost anywhere there's a slot machine. I dread landing in Las Vegas.

My point is that customer satisfaction surveys seem to be just about as reliable as calling a few frequent travelers and asking them which airports they like. So that's what I decided to do.

Here are five favorite airports for layovers, as determined by my completely unscientific, random poll of road warriors. And by me.

1. Orlando International Airport (MCO).

I've been stuck at Orlando several times for up to a whole day, have flown into and out of every one of its terminals, and I think J.D. and company are right about this one. Orlando is the best airport in the United States for a layover, bar none. It's easy to find, parking isn't a problem and the terminals are incredibly user-friendly. Like some of the other highly-rated Florida airports, notably Tampa, Orlando

5 best airports for layovers

1. **Orlando International Airport (MCO).**

Orlando is the best airport in the United States for a layover, bar none. It's easy to find, parking isn't a problem and the terminals are incredibly user-friendly.

2. **Denver International Airport (DEN).**

The layout of its terminals is highly intuitive and the food is palatable, which is more than I can say for a lot of other airports. Plus, it *looks* great. "It's the coolest-looking airport,"

3. **Chicago O'Hare International Airport (ORD).**

The international terminal is really a work of art "Best Airport in North America"

4. **Hartsfield Atlanta International Airport (ATL).**

1996 Summer Olympics, when this airport gave itself a much-needed facelift and opened a new international terminal.

5. **San Francisco International Airport (SFO).**

The new San Francisco International is much better than what it was, and it's still improving. I like to think of it as a work in progress, with coming-soon train service, redesigned road and new parking facilities, a vice president for a San Francisco computer company, counts the new SFO among his favorites.

5 airports to avoid if you can

1.

2.

3.

4. **Los Angeles International Airport (LAX).** Friends don't let friends fly into LAX. The circular design isn't well suited, a desperately needed expansion. "LAX is oppressive," "It's dingy and dilapidated, noisy and overcrowded, unfriendly and with poor facilities."

*Victims of
Environmental & Governmental Havoc
Caused by **LAX** Airport*

Since initiation of the **LAX** voluntary acquisition project in 1999, the Los Angeles World Airport has acquired private land for public use and subsequently demolished and moved acquired homes out of the noise-impacted area, leaving the remaining Manchester Square neighborhood "damaged" desecrated, unsafe and un-fit to live. Tall chain link fences have been erected throughout most parts of the neighborhood, enclosing old broken concrete foundations of former-standing homes and other vacant lots and abandoned houses. Today, Manchester Square is a mere skeleton of its former thriving community.

The residents of Manchester Square are denied the option for soundproofing and insulation of jet noise for this noise-mitigation project and are forced to indefinitely endure unsafe and unfit environmental conditions perpetuated by **LAX**, or concede to **LAX**'s voluntary acquisition project which is wrought with violations of federal law for land acquisition and relocation of displaced persons including discrimination, coercion, and under-valued purchase offers for property. Resident appeals to the FAA in Washington D.C. have resulted in *lack of uniform* treatment of minority persons and a subjective disregard of FAA Guidelines for airport acquisition procedures prescribed in FAA Order 5100 37A.

Your review of the previously mailed (MARCH 07, 2003) document and exhibits and your subsequent attention to this matter will serve the mass of Californians victimized by **LAX**.

Respectfully Submitted, In Truth and Light

**C.L. Parrish,
Resident Homeowner / Advocate for Minority Persons**

“Coercive action was taken by LAX to intimidate homeowner to rescind advocacy of rights and representation to a willing minority individual”

LAX's full-fair-offer policy is an inflexible one-price procedure...

LAX denied homeowner a sound proofing option for this noise-mitigation project, exacting the only alternative: to participate in Acquisition, or to remain in a noise impacted neighborhood -which has been “damaged,” demolished, nearly abandoned of single-family homes and residents, unsafe and un-fit to live, due to the airport’s destructive actions in this Acquisition and Relocation project.

Los Angeles World Airport practiced unlawful subjective omissions and deviations from the Uniform Act using the term “voluntary” acquisition as their authority.

**IN THE STATE OF CALIFORNIA
CITY OF LOS ANGELES, COUNCIL DISTRICT 11**

**C. L. Parrish/
Manchester Square Resident and Homeowner,**

Petitioner,

v.

**Theodore Stein, Jr./
President, Airport Commission
Los Angeles World Airport,**

Respondent.

**PETITION FOR AUDIT OF "VOLUNTARY" ACQUISITION EXEMPTION AND
ACQUISITION AND RELOCATION PROCEDURES**

Petitioner, C.L. Parrish, pursuant to Public Law 91 -646 Uniform Relocation Assistance and Real Property Acquisition Policies, 49 CFR Part 24 and FAA Order 5100.37A, petitions Honorable persons and Agencies of California to take notice of, act against, and implement corrective action for a particular havoc of state and federal law and abuse of power committed by the Los Angeles World Airport (LAWA).

The Petition for Audit is a result of the Los Angeles World Airport's (LAWA) procedurally barred and unlawful practices and policies, inequitable treatment, coercive actions, and denied benefit entitlements causing material damage to residents, within the current acquisition of private property from specific and designated areas within the community of Westchester known as Manchester Square/Belford.

The purpose of the Petition for Audit is to determine whether LAWA violated state and federal law for conformity and compliance of Acquisition and Relocation procedures prescribed in the Uniform Act; whether LAWA failed to administer a *uniform* corrective action of a prevalent, known violation, and states:

1. Petitioner is a citizen of the State of California, a resident and homeowner in Los Angeles County, Council District 11, and currently resides in the neighborhood of Westchester known as Manchester Square. Respondent Theodore Stein, Jr., is President of the Board of Airport Commissioners that governs the operating department of the Los Angeles World Airport (LAWA) for the City of Los Angeles.

2. Respondent failed to strictly adhere to the Uniform Act procedures for acquisition and relocation, to such a degree that displaced persons are materially affected; accordingly, LAWA invalidates its certificate of assurances for compliance of the Uniform Act to FAA, thus requiring forfeit/withdraw of all future FAA funding or reimbursement for airport projects utilizing acquired land void of Uniform Act requirements, till such time corrective action is taken to correct known violations or until property owners are compensated for material damage.

3. Respondent's use of a "voluntary" acquisition exemption does *not* meet all federal regulation requirements.

4. Respondent practiced unlawful subjective omissions and deviations from the Uniform Act using the term "voluntary" as their authority.

5. Respondent's Noise mitigation project *does* need to acquire all, or substantially all designated residential property for redevelopment into noise compatible land uses to accomplish the noise mitigation project –not voluntary.

6. Respondent denied Petitioner a sound proofing option for this noise-mitigation project, exacting the only alternative for Petitioner: to participate in Acquisition, or to remain in a noise impacted neighborhood -which has been "damaged," demolished, nearly abandoned of single-family homes and residents, un-safe and un-fit to live, due to the airport's destructive actions in this Acquisition and Relocation project.

7. Respondent refused negotiated purchase; engaged in an inflexible one-price Offer policy

8. Respondent denied Petitioner's request to *uniformly* correct a prevalent violation of "timeliness of purchase offers" for an individual case involving a minority and project-wide; a correction that was granted to Petitioner upon appeal to the FAA in Washington D.C..

9. Issue. Respondent invoked coercive action in order to compel an agreement for the price to be paid for property in violation of Uniform Act and FAA Guidelines.

10. Issue. Respondent invoked coercive action to intimidate Petitioner to rescind advocacy of rights and representation of a willing minority individual in violation of Uniform Act and FAA Guidelines [S. R. Sribour case]

11. Petitioner's extraordinary measures and volumes of research and time necessary to become proficiently knowledgeable of Public Law 91 -646, Uniform Relocation Assistance and Real Property Acquisition Policies, federal regulations 49 CFR Part 24, FAA Order 5100.37A, in order to present technically sound case to FAA and LAWA and obtain only one correction of a basic acquisition procedure for "timeliness of purchase offers," which recouped monumental amounts of material damage, is incomprehensible, unorthodox, and nearly unattainable by most residents.

12. Respondent unlawfully charged specific "Close of escrow" fees to displaced persons, despite technical merit evaluation by FAA to reconsider practice.

13. Petitioner is alleging specific and unlawful procedures and inappropriate determinations of entitlements within the Relocation Phase, personally experienced as an advocate for Rights of Manchester Square residents and as a voluntary representative of a minority individual.

14. Respondent violated his own declared Appeal Process procedures.

15. Respondent failed to update *inadequate* Purchase Price Differential (PPD) under Housing of Last Resort (HLR) provisions; derived unlawful payment determinations of PPD from inferior neighborhoods with home sale values less than that of displaced neighborhood; causing substantial financial consequences affecting purchase of comparable replacement dwelling.

16. Petitioner in this case has exhausted the remedies by the airport by filing appeals to the Los Angeles World Airport staff, the Airport Commission, the City Attorney's Office, and other governmental representatives, and by meeting with an Ombudsman and retaining legal council. The request for Audit of Acquisition and Relocation Procedures has been drafted following repeated written appeals spanning twelve months (one year) for *uniform* correction of violations in LAWA's acquisition policy.

17. Petitioner experienced extreme stress, and financial hardship, and suffered disproportionate injuries as a result of the airport project.

18. The Honorable persons and Agencies of this review can exert significant influence on this Petition and the issues raised pursuant to oath of office to serve people, especially when a large mass of Californians is affected, particularly those residing in Manchester Square within the community Westchester and because violations herein are continuing to present date, and not limited to Petitioner's standing, advocacy claims, investigation and evidence.

19. Petitioner incorporates by referencing the Memorandum of Points and Authorities in support of the Petition for Audit of Voluntary exemption and Acquisition and Relocation Procedures of the Los Angeles World Airport and the Exhibits in the Appendix.

WHEREFORE, Petitioner C. L. Parrish moves Honorable persons and Agencies of this review and enclosure to seek the following relief:

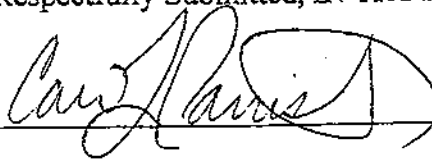

- a. Accept responsibility to pursue and resolve issues of this case.
- b. Accept responsibility to pursue and resolve issues on project-wide magnitude
- c. Require the Respondent to answer the allegations in this Petition and Points and Authorities in Support
- d. Seek a project-wide audit for "timeliness of Purchase offer" presentations following an approved appraisal and establishment of just compensation
- e. Seek a project-wide audit for *uniform* corrections of known violations
- f. Seek a project-wide audit for evidence of negotiated purchase(s) –flexible offers.
- g. Seek an evidentiary audit of federal requirements for a "voluntary" acquisition
- h. Seek an evidentiary audit for intended use of acquired land
- i. Seek a project-wide audit of "close of escrow" fees charged to displaced persons, particularly those evaluated by FAA and recommended to reconsider not charging
- j. Seek a project-wide audit for appropriate benefit entitlement determinations and strict conformity to procedures deriving a Purchase Price differential (PPD) payment
- k. Seek an evidentiary audit for HLR provision for "updates" of inadequate PPDs
- l. Seek a project-wide audit of actualized Relocation Appeal Process
- m. At the conclusion of the evidentiary audit find that:

1. Respondent failed to strictly conform to Uniform Act procedures for individual parcels of land.
2. Respondent failed to strictly conform to Uniform Act procedures for project-wide acquisition.
3. Respondent violated state and federal law by exceeding the prescribed thirty day (30 day) time span permitted from an establishment of just compensation to Purchase Offer presentation date; Respondent's delays have ranged between two and six months (2 – 6 months)
4. Respondent failed to *Uniformly* correct known violations of a basic acquisition practice requiring "timeliness of Purchase Offers"
5. Respondent failed to implement a "negotiated Purchase" policy; LAWA's full-fair-offer policy is an inflexible one-price procedure
6. Respondent invalidated a certificate of assurance for conformity and compliance of the Uniform Act procedures, policies, and practices
7. Respondent failed to meet "voluntary" acquisition requirements narrowly defined in FAA Order and Uniform Act
8. Respondent intends to purchase and redevelop acquired land to noise compatible land use; not reconveyed to continual residential use with avigation easements
9. Respondent abused it discretion and power in failing to provide full benefit entitlements of relocation provisions for "separate household"

10. Coercive action was taken by Respondent to unlawfully defer negotiations in order to compel an agreement for the price to be paid for Petitioner's property
11. Coercive action was taken by Respondent to intimidate Petitioner to rescind representation and advocacy of rights to a willing minority individual; and a *Reversal* of favorable determinations [S.R. Sribour]
12. Respondent erroneously charged: Reconveyance fees, Recording fees and documentation [Fax] fees, in close of escrow of acquired dwelling; despite technical merit evaluation by FAA to reconsider practice
13. Respondent violated Uniform Act procedures by improperly deriving Purchase Price Differential (PPD) payments from comparables located in *inferior* neighborhoods with lower home sales values than displaced neighborhood; not from "same or better" neighborhoods
14. Respondent failed to *update inadequate* PPD payments under provisions of Housing of Last Resort (HLR)
15. Respondent failed to comply with own declaration of Appeal Process
 - n. Seek professional services of independent company specializing in Acquisition and Relocation provisions to conduct Audit, IE, O.R. Colan & Associates; Alliance
 - o. Seek continuous professional monitoring from a Federal Cognizant Agency of all present and future airport procedures till completion of the airport project
 - p. Seek project-wide mandated corrective action and/or compensation for material loss for all present and past land acquisitions found in violation of the Uniform Act.

- q. Inform the lead agency (FHWA) and the Federal Aviation Administration, (FAA) of Respondent's repeated procedural non-conformity and non-compliance with Uniform Act for individual parcels of land and throughout entire airport project, and request subsequent appropriate consequences of actions.

Respectfully Submitted, IN TRUTH AND LIGHT

C. L. Parrish,
Manchester Square Resident/ Homeowner

POINTS IN SUPPORT OF PETITION FOR AUDIT

INTRODUCTION

The spirit of the Uniform Act is clearly people-oriented; the implementation of the Uniform Act by the Los Angeles World Airport clearly is not. The allegations of violations in the Acquisition Phase and Relocation Phase are written from first-hand experience and knowledge of the Petitioner. Also, the mentioned plights of S.R. Sribour, henceforth, are from first-hand knowledge, as the Petitioner has served as a volunteer advocate for the Rights of this neighboring Thai family, single father and daughter, who case is wrought with violations including coercion, discrimination, denial of entitlements and indefinite delays of *small-business* and *residential* relocation payments.

Since initiation of the airport project in 1999, the Los Angeles World Airport has acquired private land for public use and subsequently demolished and moved acquired homes out of the affected area leaving Manchester Square nearly abandoned of single-family residents. This growing airport project has left the remaining Manchester Square neighborhood "damaged" demolished, unsafe and un-fit to live. Tall chain link fences have been erected throughout most parts of the neighborhood, enclosing old broken concrete foundations of former-standing homes and other vacant lots and abandoned houses. Today, Manchester Square is a mere skeleton of its former community. EXHIBIT A.

C.L. Parrish, hereinafter referred to as "Petitioner" desires to participate in this airport project, and to relocate out of affected area, as Acquisition is the only alternative to remaining on an irreversibly demolished street within a baron neighborhood of Manchester Square. Petitioner, however, is unable to proceed with the acquisition because of the airport's procedurally barred and *unlawful* practice of a utilizing an inflexible one-price procedure for purchase offers, which is presented in a "take-it-or-leave it" manner. This unlawful situation has continued for twelve months.

"If you truly do not agree with our offer then you may rescind your interest to participate in the program." - Intissar Durham, of LAWA September 21, 2002

Respondent also demonstrated lack of veracity and unresponsiveness to Petitioner's earlier requests for a correction of a basic acquisition procedure that violated the Uniform Act policy. LAWA declined to respond to Petitioner's repeated letters of appeal, certified mailings, and telephone queries which compelled Petitioner to present case directly to the FAA in Washington D.C. to encourage a response from LAWA and to remit a technical review of merits of the alleged violation of the Uniform Act requiring "timeliness of Purchase offers."

Petitioner's indispensable, extraordinary measures and volumes of research and time necessary to become proficiently knowledgeable, well beyond the handbook of Benefits and Rights of Displaced Persons provided by the airport, to present a technically sound case to FAA Officer Rick Etter in Washington D. C., perpetuated a favorable technical merit evaluation by FAA of Petitioner's appeal. LAWA, in turn, implemented corrective action for the violation of "timeliness of purchase offers" resulting in "significant agency delays" and granted Petitioner an updated appraisal—a reestablishment of valuations recouping \$60,000 (sixty-thousand dollars), an amount necessary to correct the violation of the Uniform Act. Petitioner stated that LAWA's inefficient procedures resulted in "significant agency delays" of two and one half months (2 ½ months) from the date of the purchase offer presentation following the establishment of the estimate of compensation. The FAA Order 5100 37A Chap. 3. SEC 1. 3 --3(a), guidelines for proper airport procedures in implementing the Uniform Act, clearly allows for a thirty-day (30-day) time-span to present a purchase offer following establishment of just compensation. Again, material damages recouped totaled \$ 60,000 (sixty thousand dollars) in corrective action by airport.

LAWA *denied* Petitioner's requests for correction of this prevalent violation for a minority individual, S.R. Scribner, whom the Petitioner serves as a willing representative and advocate of Rights, at the choosing of S.R. Scribner, and LAWA also denied a project-wide correction of this same violation of the Uniform Act claiming a "voluntary" acquisition exemption of the Uniform Act policies and FAA Guidelines therein.

Accordingly, LAWA must invalidate its certificate of assurances to

**"In this case (Scribner) it happened to take three months to complete the process. Despite the timeframe of the process and because the program is voluntary it is ultimately the decision of the property owners whether the offer is fair and just"
— Lourdes Romero, LAWA, Aug. 23, 2002**

FAA for conformity and compliance of the Uniform Act, thus requiring withdraw of all federal funding or reimbursement for each parcel of land or entire project void of Uniform Act provisions during acquisition and relocation.

Petitioner also presented evidence to LAWA of appraisal procedural violations within the updated appraisal, which repeated the appeal process; Requests of "amicable negotiations" for an agreed purchase price based on the inexact nature of the appraisal process, an expeditious acquisition of property and corrections of appraisal procedural violations. LAWA repeatedly denied all requests and refused a *negotiated purchase* for twelve months (one year) to date, with NO foreseeable resolution -coercive action taken by the airport to *defer negotiations* in order to compel an agreement for the price to be paid for the property, in violation of the Uniform Act.

Respondent's lack of veracity, unresponsiveness, and non-conformity to Uniform Act procedures is not limited to Petitioner's allegations of this case. LAWA also practices inequitable treatment of certain displaced persons within the acquisition relocation process including: coercion, discrimination, inadequate payment determinations, and denied entitlements.

S. R. Sribour has suffered serious financial hardship from this airport project and has received *no* Relocation Payments for his *small business*, or his *residential move*, both occurring on August 01, 2002. LAWA's continuing unresolved issues, inadequate determinations and violations of the Uniform Act policies are prolonging issuance of proper entitlement payments indefinitely.

On October 09, 2002 the Respondent invoked coercive actions of intimidation over S.R. Sribour, of minority race, and Petitioner during an airport meeting. LAWA denied S.R Sribour the Right to representation by another willing party of his choosing to speak on his behalf, namely the Petitioner in violation of the Uniform Act.

During the same October 09, 2002 meeting, Dario Polintan, of LAWA and Bob Swenson,

'The business portion of your (S.R. Sribour) relocation claim does not seem to a point of contention and we will process your claims for your two business expeditiously' – Lourdes Romero, Aug. 23, 2002

W.D. Schock Company Inc, *reversed* a previously favorable determination of Aug. 23, 2002 to expeditiously issue a small-business relocation payment to S.R. Sribour, per letter by Lourdes Romero, dated Aug. 23, 2002. *No* payment for small business relocation was

ever issued.

LAWA AND FAA FAIL TO UNIFORMLY IMPLEMENT UNIFORM ACT

LAWA denied Petitioner's request for a *uniform* correction of the violation of "timeliness of purchase offers" causing "significant agency delays"; FAA denied technical merit of appeal to Sribour for this issue, but granted favorable merit to Petitioner. FAA stated to the Agency that in the case referencing, *specifically*, S.R. Sribour, the three month (3 month) agency delay *was* conforming to Uniform Act and its FAA Guidelines; in the case of the Petitioner, the two and one half month (2 ½ month) delay was not conforming -contradicting his earlier technical merit review & FAA Order 5100 37A Chap. 3 SEC 1. 3 -3(a) *The Offer to purchase the property should be within thirty days (30 days) of the establishment of just compensation.* LAWA practices delays ranging from 2 -6 months.

The result of this havoc of laws and subjective deviations of the Uniform Act policies is loss of Rights, *material damage* and substantially under-valued offers to purchase property.

Both Petitioner and S.R. Sribour have similar properties in location (neighbors), lot size and living space and had airport-appointed appraisals conducted within thirty days of each other, by the same appraiser, Lea Associates. LAWA's failure to grant *uniform* corrective action for S.R. Sribour, resulted in a \$70,000 (seventy-thousand dollars) difference in the purchase Offer.

EXHIBIT B.

It is the duty of the airport to *uniformly* make all corrective actions necessary if procedural violations actually occurred on individual parcels of land or if violations are prevalent in the project-wide acquisition, or risk the consequences. Also, the FAA, in an advisory capacity to the airport for appeals, becomes a critical entity in this airport project and the recommendations provided by an FAA Officer must be delivered in a *uniform* manner that strictly adheres to its own FAA Guidelines for an airport's proper implementation of procedures prescribed for the Uniform Act.

The Petitioner claims that The Los Angeles World Airport's (LAWA) project-wide acquisition and relocation procedures are amiss of the Uniform Act provisions and are preventing *full entitlements* and denying *full rights* and causing *material damage* to the displaced residents from Manchester Square. A favorable assessment of this Petition by way of an Audit of conditions herein, to be conducted by knowledgeable individuals and/or an independent professional company familiar with acquisition and relocation procedures prescribed by the Uniform Act of 1970, will confirm validity of the facts presented.

POINTS OF AUTHORITIES

POINTS OF AUTHORITIES

Under the Uniform Act of 1970, known as 49 CFR Part 24 in the Code of federal regulations, the Legislative effort was to address the burden of public projects on private individuals. The purpose of the Uniform Act was to establish uniform policy of fair and equitable treatment of persons to be displaced and provide certain eligible protections and relocation benefits that go beyond the just compensation allowed under the Fifth Amendment of the United States Constitution [Fourteenth due process], [California Constitution Article 1 SEC. 19]. The provisions of these benefits are outlined in the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970.

MAJOR COMPONENTS of the Uniform Act in particular interest to this case are as follows: 1) It requires an "approved" appraisal be prepared prior to presentation of Purchase offer 2) No coercion is allowed in the negotiation process 3) If the agency intends to acquire the real property, it shall not intentionally make it necessary for the property owner to institute legal council 4) Appraisal must be completed by qualified independent appraisers 5) Appropriate financial assistance shall be provided to all displaced parties

The Uniform Act was amended in 1987 and the Department of Transportation (DOT) was appointed lead agency. D.O.T. in turn delegated this responsibility to the Federal Highway Administration (FHWA).

On March 02, 1989, the FHWA published the government-wide single rule in the Federal Register. The objective of the single rule was to maintain a consistent application of the regulations as well as the following duties: 1) encourage the expeditious acquisition of property through "negotiation" 2) establish public confidence in land acquisitions 3) provide fair treatment of persons displaced 4) minimize litigation and relieve congestion in the courts 5) ensure that agencies implement the regulations in an efficient manner.

FAA Order 5100 37A is not a regulatory order but it is the implementing procedure to assist airport owners in carrying out provisions of the Uniform Act, 49 CFR Part 24 for airport projects.

CLAIMS OF "VOLUNTARY" ACQUISITION SUSPECT

Certain major components of the Uniform Act are subjectively omitted and modified by LAWA causing under-valued offers to purchase, loss of benefits, entitlements and provisions to displaced individuals, under a false authority that a "voluntary" acquisition allows for deviations and/or omissions of prescribed Uniform Act procedures. The requirements for a voluntary acquisition are narrowly defined in Uniform Act and FAA Order 5100 37A Chapter 3. SEC. 3 -9

et al. and when applicable invoke optional use of the Uniform Act; however, subjective omissions of procedures and deviations from practices and policies are not permitted. The Uniform Act, when engaged, provides full rights and entitlements and procedures *uniformly* to displaced persons within the entire project; with or without eminent domain power.

Petitioner alleges that the Manchester Square acquisition *may not* be a voluntary acquisition and states the following: specific Manchester Square/Belford noise-impacted properties are intended to be purchased by Acquisition *without* the option for soundproofing for this Noise-mitigation program, then demolished or moved, in order to accomplish the noise-mitigation project; not reconveyed to continued residential use with aviation easements. Noise mitigation projects, which acquire designated residential property for redevelopment into noise compatible land uses do require the acquisition of all or substantially all of the property in the project area to accomplish the intended noise mitigation. Therefore acquisitions for these projects may NOT be considered "voluntary" transactions; with or without the eminent domain authority to acquire needed property FAA Order 5100 37A Chap. 3. SEC. 1. 3 -9(3).

The Los Angeles World Airport's (LAWA) project-wide procedures are amiss of the Uniform Act policies contained herein, under which the Petitioner is appealing.

The spirit of the Uniform Act is clearly people-oriented. The implementation of the Uniform Act by the Los Angeles World Airport clearly is not.

STATEMENTS SUBMITTED FOR THE RECORD

<u>STATEMENT NUMBER</u>	<u>DESCRIPTION</u>	<u>PAGE</u>
1	Statement Submitted by Mahala Walter	31

1 INGLEWOOD, CALIFORNIA, MONDAY, AUGUST 18, 2003

2 ---oOo---

3
4 MR. WALL: Ladies and gentlemen, good afternoon.
5 And welcome to the public hearing to hear testimony on
6 the Los Angeles Airport Supplemental Environmental
7 Impact Report and Environmental Impact Statement. I'll
8 be your facilitator this evening.

9 My name is Tom Wall. I'd like to introduce
10 the two gentlemen to my right. First, Mr. David Kessler
11 from the Federal Aviation Administration.

12 MR. KESSLER: Good evening, ladies and gentlemen.
13 My name is David Kessler. I'm the Environmental
14 Protection Specialist for the Airports Division of the
15 Federal Aviation Administration, Western-Pacific Region.

16 I would like to welcome you to the fifth of a
17 series of public hearings the FAA and Los Angeles World
18 Airports, or LAWA, are conducting on the Supplement to
19 the Draft Environmental Impact Statement/Environmental
20 Impact Report, or EIS/EIR, for the proposed Master Plan
21 at Los Angeles International Airport.

22 The Supplement to the Draft EIS/EIR addresses
23 an additional Alternative, Alternative D, the Enhanced
24 Safety and Security Plan that was added in the fall of
25 2001. This new alternative was added as a result of

1 comments submitted on the 2001 Draft EIS/EIR and the
2 terrorist attacks that occurred on September 11th, 2001.

3 The Notice of Availability of the Supplement
4 to the Draft EIS/EIR was published in various local
5 newspapers and in the Federal Register on Friday, July
6 11, 2003. The FAA and LAWA are the authors of the
7 Supplement. The Federal Highway Administration is also
8 a cooperating agency in the preparation of the Draft
9 EIS/EIR that was published in January 2001.

10 The purpose of these hearings is to collect
11 comments from the general public concerning the adequacy
12 of the information disclosed in the Supplement to the
13 Draft EIS/EIR on the proposed Alternative D.

14 I would like to take this opportunity to make
15 sure that everyone understands that no decision will be
16 made today regarding the proposed project. Today's
17 hearing is not a question-and-answer type of forum. Our
18 job is to listen to what you have to say about the
19 adequacy of the information in the Supplement to the
20 Draft EIS/EIR. In other words, it's your turn to talk
21 to us. Since we are here to listen, we are not going to
22 respond to questions about the pros and cons of the
23 proposed project.

24 Since 5:00 this afternoon we have held a
25 public workshop just outside of this room for anyone to

1 ask questions about the Master Plan, the environmental
2 process and the various proposed projects.

3 Following publication of the Supplement to the
4 Draft EIS/EIR for review and comment, the next step in
5 the joint Federal and State environmental disclosure
6 process is holding this and the other public hearings
7 beginning last week and continuing through this week.

8 I would like to take this opportunity to recap
9 the environmental disclosure process for this project.

10 The environmental evaluation of the LAX Master Plan
11 began in 1997 with the publication of a Notice of Intent
12 to prepare the joint EIS/EIR in the Federal Register.

13 In July 1997 we held a series of meetings with members
14 of the public and governmental agencies to receive
15 comments on the scope of the Draft EIS/EIR. Following
16 those meetings, the Draft EIS/EIR was published in
17 January 2001.

18 Both the 2001 Draft EIS/EIR and the 2003
19 Supplement have been prepared pursuant the National
20 Environmental Policy Act of 1969, or NEPA, the Council
21 on Environmental Quality Regulations, which are the
22 implementing regulations for NEPA, the California
23 Environmental Quality Act of 1970, or CEQA, and the
24 Airport and Airway Improvement Act of 1982, as amended.

25 Following today's hearings and the close of

1 the comment period, we will then correct and revise the
2 EIS/EIR, as necessary, based on the comments received.
3 We will also prepare responses to the comments we
4 receive and include those responses along with those
5 that were submitted to the FAA and LAWA on the 2001
6 Draft EIS/EIR into the Final EIS/EIR. The information
7 contained in the Supplement will also be combined with
8 the information in the 2001 Draft EIS/EIR into the Final
9 EIS/EIR.

10 Before we begin receiving verbal comments, we
11 would like to let you know the ground rules of this
12 hearing. First, as I said earlier, we are not here to
13 respond to questions about this project. We are only
14 here to listen to your comments and take notes. We
15 also have a court reporter present to ensure that we
16 have an accurate transcript of this hearing.

17 For anyone wishing to speak, we ask that you
18 fill out a speaker card, like this one, and give it to
19 one of the people at the sign-in desk. The cards will
20 then be brought up here to our facilitator who will call
21 the names of each speaker so we can proceed in an
22 orderly fashion.

23 So that everyone gets an opportunity to
24 provide verbal comments, everyone will get three minutes
25 to speak. To be fair to everyone, we are not going to

1 allow people to transfer their allotted time to someone
2 else. I ask that when you speak, you give us your name
3 and address for the record. We also have a Spanish
4 language translator for anyone wishing to provide
5 comments in Spanish.

6 If there is anyone who is uncomfortable
7 speaking in front of a group or if you need more than
8 three minutes to provide your comments, we ask that you
9 provide your comments in writing. We have comment
10 sheets, like this one, available for your use at the
11 sign-in desk. You can leave your comments at the
12 sign-in desk or you may mail your written comments using
13 the comment sheet or a letter to either address listed
14 on the cover of the EIS/EIR.

15 I would like you to understand that a verbal
16 comment is just as important as a written comment.
17 Please feel free to provide any comments on this
18 document today or in writing. At this time comments on
19 the Supplement to the Draft EIS/EIR are due by 5:00
20 p.m., Pacific Daylight Time, on Monday, August 25, 2003.
21 The FAA is currently considering a request from LAWA to
22 extend the public comment period to a total of 120 days.
23 At this time no decision has been made on LAWA's
24 request. If the FAA agrees to extend the comment
25 period, a notice announcing any extension would be

1 published in the Federal Register and in local
2 newspapers of general circulation.

3 Lastly, I would like everyone to know that
4 even though we have this hearing scheduled until
5 9:00 this evening, we will stay here as long as
6 necessary for everyone to get a chance to provide verbal
7 comments on the Supplement to the Draft EIS/EIR. As I
8 said earlier, our job here today is to listen to your
9 comments.

10 At this time I would like to ask everyone in
11 the room take a moment to turn off your cell phones and
12 pagers to be courteous to those people making verbal
13 comments at tonight's hearing.

14 Now I will return our hearing back to our
15 facilitator who will introduce Mr. Jim Ritchie who will
16 provide some introductory comments from LAWA. Following
17 Mr. Ritchie's comments, we will collect the speaker
18 cards and call the name of the first speaker. Thank
19 you.

20 MR. WALL: Thank you, Mr. Kessler. Representing
21 Los Angeles World Airports this evening is Mr. Jim
22 Ritchie, the Deputy Executive Director for long range
23 planning. Mr. Ritchie.

24 MR. RITCHIE: Thank you, Tom, and welcome on behalf
25 of Los Angeles World Airports to the Inglewood forum

1 tonight -- or not the Inglewood forum, I should say the
2 Hollywood Park. We welcome you in a series of public
3 hearings that are throughout the region. We will
4 conduct approximately 12 throughout this environmental
5 period.

6 Recalling the past, recalling the year of
7 2001, you will recall we had a series of significant
8 events. We had a new mayor -- well, I should back up.
9 We started with a public comment period on three
10 alternatives at the time, Alternatives A, B and C
11 referred to as expansional alternatives. We had a new
12 mayor come to office. That new mayor gave us guidance
13 on how we should address issues raised during the public
14 comment period. And, particularly, he made a -- took a
15 specific stance on expansion and told us to plan a new
16 alternative. Additionally, in that year, of course, we
17 had the tragic events of September the 11th and we
18 proceeded on with reshaping, consistent with Mayor Jim
19 Hahn's leadership and guidance, a Safety and Security
20 Alternative that we would present to you this evening.

21 That Alternative is referred to as
22 Alternative D. That Alternative has undergone the same
23 rigorous environmental analysis that previous
24 alternatives have where at the point you understand now
25 we have released it to the public. This evening we look

1 forward to receiving your comments on the document as
2 you have reviewed it. We've had a workshop out front,
3 as Mr. Kessler indicated. We're here to listen to you.
4 We welcome your comments. And much like we shaped the
5 environmental process in the past based on the public
6 comment period, we're here to do the same tonight.

7 So with that, again, thank you, welcome. And
8 Mr. Wall, let's proceed.

9 MR. WALL: Thank you, Mr. Ritchie. In order to
10 assist you in determining how much time is left in your
11 three-minute presentation, we have an electronic clock.
12 When I start the clock, which will be after you have
13 stated and perhaps spelled your name and address for the
14 court reporters Lisa and Kim, I will start the clock and
15 you'll see a green light illuminate. When you have 30
16 seconds left, the yellow light will illuminate. And at
17 the end of three minutes the red light will come on and
18 it will start to beep. We appreciate your assistance in
19 moving through.

20 I will probably call three names at a time so
21 you could be prepared to come up to the microphone. You
22 could use either microphone. So if we're ready to
23 begin, I'll call the first three speakers.

24 First will be Jessie Gaddis, Laura Royster and
25 Rose Morse.

1 Jessie, if you'll come to the microphone,
2 please. Yes, ma'am. And, again, if you will state and
3 spell your name and address for the record.

4 MR. GADDIS: Yes. My name is Jessie Gaddis. But
5 the address is 8838 Haas Avenue, Los Angeles, 90047.

6 Okay. My presentation here today is I have
7 quite a few questions, but I know time is limited and I
8 really -- I'm concerned about the path, which as you see
9 my address I'm concerned about the path that you have to
10 be in the order to qualify for this operation of
11 soundproofing.

12 Okay. If I'm laying up there and watching my
13 TV and I'm looking at two lights focusing right on me,
14 that's on my pathway. Look to the right, there is
15 another one. Well, okay. I'm getting two or three at
16 the same time. So that is on my pathway. And I want to
17 know what can be done about it. And that's why I'm
18 voicing my opinion, to be heard today. This isn't my
19 first meeting of attending about this matter. And I'm
20 very much concerned and I want improvement done about
21 it. And that's my opinion about it.

22 When are we going to get to hear from this?
23 So I know it takes time for everything, but, like I say,
24 time is of vital importance. And we want to be heard
25 and we want to be assured that we can get quality in our

1 neighborhood, which I truly know that that is coming
2 over -- that noise is coming over my household. I am a
3 single person, a taxpayer, and I feel I deserve to ask
4 these questions. And I want to be heard. So that's my
5 opinion about the matter. Thank you.

6 MR. WALL: Thank you, ma'am. The next speaker will
7 be Laura Royster. Either microphone, ma'am.

8 MS. ROYSTER my name is Laura Royster L-a-u-r-a,
9 Royster, R-o-y-s-t-e-r. My address is 8826 Haas,
10 H-a-a-s, Avenue, Los Angeles, California.

11 Is it three minutes I get?

12 MR. WALL: Yes, ma'am.

13 MS. ROYSTER: Because it is on 59 -- 57 now. You
14 didn't reset it. I won't need the complete three
15 minutes, but I would like to have that. Okay.

16 Since May I have been contacting the
17 residential soundproofing program. I have not received
18 what I would consider a fair letter explaining anything
19 to me. As Ms. Jessie has said, the planes fly directly
20 over our home. I was told it appears they are flying
21 over our home, but they are not, that they are a
22 distance away. But when I can look up at a plane and
23 almost see the writing on it -- at least see the writing
24 on it and the emblem on the plane, for someone to tell
25 me the planes are not flying over my home is not correct

1 information.

2 I am also concerned -- I'm not that concerned
3 at this present time about whatever you planning on
4 doing. I'm concerned about the noise level that's in
5 our area. Constantly -- and in my letter the only thing
6 I requested was someone do a survey. Constantly the
7 planes are flying over. Sometimes it even appears that
8 they are waiting to land. Sometimes there are four or
9 five planes that are over -- over our area.

10 Well, I was given incorrect information, too,
11 because I was told we would get some type of response.
12 You're saying that we don't get anything, right, today?
13 That someone would get back to us later? Is that what
14 I'm understanding you to say?

15 MR. WALL: We're just receiving testimony.

16 MS. ROYSTER: Okay. My testimony is, we need help
17 and assistance in getting something done whereas our
18 homes can be soundproofed as we're told we're right in
19 the middle, but we don't qualify. To me that doesn't
20 make sense. If someone is on 88th and someone is on
21 89th that's getting assistance and we're between there
22 and we can't get assistance, something is wrong.

23 I'm also told we were governed by a plan that
24 was done in 1992 as for some noise level. Okay. Are
25 you saying the pathway hasn't changed since 1992 or the

1 noise level of the planes? Okay. I would like some
2 answers as well. Thank you very much.

3 MR. WALL: Thank you, ma'am.

4 Next will be Rose Morse.

5 MS. MORSE: My name is Rose Morse, R-o-s-e,
6 M-o-r-s-e. I'm at 8806 Haas Avenue, on the same block
7 as Ms. Jessie and Ms. Royster.

8 From what I can tell, and which is very true,
9 sometimes the planes come over until they -- sometimes
10 my windows actually shake. So when I called to find out
11 about it, they would come and do a survey or check it
12 out or whatever, the gentleman, I don't remember who I
13 spoke with. It was the office in Westchester. And what
14 he told me was that if it -- I don't remember if he said
15 if it wasn't -- wasn't 62 decibels or something like
16 that, then I didn't qualify.

17 And I told him, I said, "Well, I don't
18 understand that because from what I was told, the house
19 right next to me, which is on 88th and Haas Avenue, they
20 were on the waiting list. I don't know that for a fact
21 because I have not talked to the owners, but that's what
22 I was told." So I'm right next door to them.

23 And like I said, those planes, they are very
24 loud. Like I said, sometimes you can't hear the TV. Or
25 if you're talking on the phone, you have to say, "Oh,

1 hold on a minute because I can't hear until they clear
2 the path."

3 So I -- I -- like I said, I'm baffled by that
4 and I would like to know what -- you know, what do you
5 have to do to qualify? Do you have to sit on the runway
6 out at LAX to do that or what is it? I'm not trying to
7 be funny by saying that, by, I mean, the noise is just
8 like that. Okay. Thank you very much.

9 MR. WALL: Thank you for your comments.

10 Next will be Mr. Roy Hefner followed by
11 Mr. Kevin Norton and Mr. Larry Henderson.

12 Welcome, Mr. Hefner.

13 MR. HEFNER: Thank you. Roy Hefner, 6548 West 80th
14 Place, Los Angeles, 90045.

15 First of all, I'd like to thank the FAA and
16 the Airport Department for having these public meetings.
17 I know it's very trying for you to go out and hear us
18 night after night after night. And I know that last
19 time when the A, B, C one, Jim Ritchie used to say to
20 me, "Why do you even bother to come up because I know
21 what you're going to say." But I'm going to surprise
22 him tonight. I'm only going to deal with one basic
23 issue tonight. That is the relocation of the runways.

24 As you know, in your EIR it indicates that the
25 major reason to go ahead and relocate the runways was

1 for safety and security. And you list the incursion
2 factor as one of the problems. Certainly incursions are
3 a problem. However, if you look at the type of
4 incursions that have existed not only at LAX but
5 throughout, it's not the kind of incursions that the
6 public thinks about. When they hear the word incursion,
7 they think one airplane is going to come and crash into
8 another airplane.

9 We know that the FAA has published four
10 different categories of incursions of which the A
11 category only includes about six percent of all
12 incursions that are listed. And the others are all on a
13 relative basis.

14 LAX has an incursion ratio of I believe from
15 99 to 201 of 1.29 for over 100,000 operations. And when
16 we look at that, we say, "Hey, what kind of incursions
17 were they?"

18 Even this last year, the last ten months they
19 come out and they have six, but they have no Class A
20 incursions. Those are the serious ones. Even on a
21 national basis, that's only six percent.

22 And what causes the incursions? It's
23 primarily I think 58 percent the FAA says is of pilot
24 error. And then you have another 38 percent, something
25 of that nature, that deals with nothing more than bus

1 lines going ahead and not being where they are supposed
2 to be. But there is a very small percent of incursion.

3 The thing that disturbs me more than anything
4 else about the relocation of these runways is it's being
5 done for modernization procedures. It's not being done
6 for incursions and for safety. You're simply moving
7 these runways to go ahead and allow a greater number of
8 aircraft to utilize the airfield. And, of course, that
9 means the larger one yet to come, the A380. I'm not
10 going to deal with that issue per se, but I get
11 disturbed when I read EIRs, as the last time and this
12 time, when you go ahead and create a situation that has
13 an impact upon the public, which is a false impact and
14 it should be explained in a more realistic way.

15 One last item. I want to know how you're
16 going to build the Ground Transportation Center in
17 Manchester Square when you don't own it yet.

18 MR. WALL: Thank you, Mr. Hefner.

19 Next will be Mr. Kevin Norton.

20 MR. NORTON: Kevin Norton, 8833 Airport Boulevard,
21 Los Angeles. My name is Kevin Norton. I'm a business
22 representative with IBEW Local 11. We have over 7,000
23 members who live and work in Los Angeles. I also
24 represent California State Association of Electrical
25 Workers which represents 90,000 electrical workers in

1 California. We're a community stakeholder with an
2 office over here in Westchester. We've been training
3 and providing quality jobs in this community for over 50
4 years.

5 We're in support of Mayor Hahn's expansion of
6 LAX. We feel that it's hard times for construction
7 workers. And much needed quality, local jobs for local
8 people will be provided by the project. We think that
9 it's wonderful that Mayor Hahn wants to use local people
10 on the project. And so we rise in favor of it. Thank
11 you very much.

12 MR. WALL: Thank you, Mr. Norton.

13 Next will be Mr. Larry Henderson followed by
14 Ms. Willa Short and Mr. Arthur Guzman.

15 Welcome Mr. Henderson.

16 MR. HENDERSON: Good evening, gentlemen, ladies and
17 gentlemen of the audience. My name is Larry Henderson,
18 833 Airport Boulevard, IBEW business representative
19 also.

20 My partner Kevin Norton said almost everything
21 that there is to say about that. We appreciate Mayor
22 Hahn and his expansion project here. Everybody who uses
23 this airport knows that on any given holiday, you can't
24 hardly get in and out of there. This is not only good
25 for labor. This is good for the whole neighborhood,

1 good for people that need to use the LAX. An expansion
2 and a modernization of the way in and out is definitely
3 a need. We no longer have two engine reciprocating
4 aircraft. We've got modern jets coming in, one on top
5 of each other. We need a way to get them in and out, a
6 way to unload the people. And this plan looks very
7 efficient.

8 I want to thank you for all of your efforts.
9 And that's it for me. Thank you very much.

10 MR. WALL: Thank you, sir. Willa Short, please.

11 MS. SHORT: Thank you. I really didn't intend to
12 speak. My name is Willa Short. I live at 10108 3/4th
13 8th Avenue, Inglewood. I really didn't intend to speak.
14 So I'll make it short.

15 I do think that we do need airport expansion.
16 However, it is not too good for the community. There
17 have been cases of cancer in the area where I live. The
18 planes are going over my head actually 2:00 and
19 3:00 o'clock in the morning. When I go out to hose
20 down, it's dust. It's that black soot. So I don't
21 think it's too feasible. But, however, you know,
22 progress must go on.

23 However, I think they should increase a little
24 bit more at some of the other airports. Then we won't
25 have so much traffic over our heads, because in front of

1 us on 8th Avenue we have Smart & Final. They do not
2 listen to us. They honk their horns and they spew their
3 gas, the 18-wheelers. And they say "honk honk" in the
4 morning.

5 So I thank you for your attention. Thank you
6 very much.

7 MR. WALL: Thank you, Mrs. Short.

8 MS. SHORT: Yes, thank you.

9 MR. WALL: Mr. Arthur Guzman. He'll be followed by
10 Mr. Gordon Mego and Mr. Tom Moxley.

11 Welcome, Mr. Guzman.

12 MR. SPEAKER: Art Guzman, G-u-z-m-a-n, 17111 Steven
13 Street in Gardena.

14 As I hear the speakers speak here this
15 evening, I really sympathize and understand some of
16 their concerns because they are some of my concerns
17 simply coming from the area. But there is no way in the
18 world we're going to stop progress. Right now Los
19 Angeles is in an economic slump. And the only way we
20 will recover from an economic slump is to have good,
21 decent-paying jobs.

22 My wife and I received \$600 when the existing
23 administration in Washington took place. That was
24 supposed to stimulate the economy and we were supposed
25 to have economic development and growth. That never

1 happened because it never increased jobs. By increasing
2 or creating good, decent-paying jobs, that will
3 stimulate the economy. If we do not upgrade LAX, it
4 will become dilapidated. The surrounding areas will
5 become dilapidated. And pretty soon we have a ghetto
6 right here in LAX.

7 So we have to meet the challenges of
8 technology. And that is to upgrade the airport so that
9 it increases capacity so we can have economic --
10 stimulate economical growth here in the Los Angeles
11 area.

12 Another thing. What happens to these students
13 who graduate from high school that do not want to go on
14 to college? What chance do they have to fulfill the
15 American dream? Well, by having good, decent-paying
16 jobs. And this would be one example or one opportunity
17 for those who graduate from high school to go on and get
18 into our apprenticeship programs to get highly skilled
19 where they can get some decent wages and fulfill the
20 American dream. ;.

21 It's my understanding that this project should
22 it go through will employ something like 20 percent of
23 the labor force, which will be apprentices. This will
24 give them the opportunity to buy nice homes, to move
25 into an area should they decide to stimulate the

1 economy, by buying automobiles, by buying dishwashers,
2 TVs. And it's a snowball effect. You start on the top
3 of the hill with the snowball. You increase momentum
4 and the velocity. Pretty soon by the time it gets down
5 to the end of the hill, you have a big old snowball. So
6 this, even though it has some negative aspects to it,
7 the positive aspects of it outweigh the negatives by a
8 tremendous amount. So we're all for this project.

9 MR. WALL: Thank you for your comments, sir.

10 Mr. Gordon Mego followed by Mr. Tom Moxley.

11 Welcome, sir.

12 MR. MEGO: Hi. My name is Gordon Michael Mego, 4535
13 West 141st Street in Hawthorne. I'm a native and
14 resident of Hawthorne since October of 1952, former
15 aerospace engineer from the 1970s and '80s, design
16 engineer for various weapon systems, aircraft and so
17 forth.

18 My father had been a lead and senior mechanic
19 for American Airlines at the airports here back in the
20 1950s. So I got to see a lot of the different
21 operations behind the scenes and even up until current
22 times and have flown in many different aircraft starting
23 with the Lockheed Constellation, which it was a TWA,
24 that tri-tail, which is a very interesting plane.

25 So I've seen a lot that has gone on over the

1 years as far as, you know, the operations. I always
2 remember up until the '84 Olympics they have the moving
3 walkways, which I thought was fantastic for those that
4 carried the kind of -- traveled at kind of a slower pace
5 and so forth. But as I look at, you know, the new plan,
6 which is kind of following after, you know, the various
7 alternatives, the Riordon plan, I don't see it as
8 passenger friendly. And the convenience factor will be
9 greatly diminished. The efficiency operations for the
10 airlines and airport is not really greatly enhanced.

11 And as far as security aspects, you really,
12 essentially, are widening the envelope of the overall
13 airport property of the operations, will extend from the
14 ocean to the 405 Freeway essentially. And as far as the
15 terrorist aspects and all that, you really are
16 increasing that envelope that will be subject to
17 potential strikes and so forth.

18 As far as people being protected against that
19 really -- the Manchester Square area is definitely not a
20 way to go. You're concentrating too many people in one
21 area. And, essentially, why is the airport even going
22 ahead with the purchase of the properties when in all
23 reality there has been no contract let off or, you know,
24 the plan that's being proposed, nothing has been
25 approved. So nothing should have been even going

1 forward. Everything should have been stopped in its
2 tracks as far as that goes. And I believe it still
3 should remain a residential area.

4 As far as everything, the terminals,
5 everything should remain as they are with various
6 enhancements to basically the efficiency of the
7 operations of the airport, passenger convenience. And,
8 also, maintaining the inner perimeter roadway is very
9 important for bringing people to and from the airport
10 for unloading --

11 MR. WALL: Thank you sir --

12 MR. MEGO: -- and so forth, and also bringing in the
13 metro rail Green Line that will stop off at each of the
14 terminals so we have multi-modal system.

15 MR. WALL: Thank you, sir, for your comments.

16 Mr. Tom Moxley.

17 MR. MOXLEY: My name is Tom Moxley. That's
18 M-o-x-l-e-y. Address is 2057 South Atlantic Avenue,
19 Los Angeles, 90040. I'm here on behalf of 4200 members
20 that I represent, the ironworkers. We applaud Mayor
21 Hahn in his plan D. We support it.

22 Dealing first with safety, I worked at LAX.
23 I've traveled out of LAX, and my greatest fear is on the
24 ground until I get in the air. The airport was built
25 for 707s. The planes run close to each other. I've

1 worked at every terminal out there over 32 years. And
2 it's time that we not just put Band-Aids on like we have
3 in the past, but we truly modernize that airport for the
4 planes that are built today.

5 Dealing with security, I think Mayor Hahn's
6 idea of moving the terminal out to Manchester Square is
7 an excellent alternative. All the ticketing, baggage
8 and everything before it gets near the aircraft to have
9 time to disseminate the good and the bad and deal with
10 it appropriately.

11 I would be remised if I did not say that it's
12 the jobs. I travel a lot throughout this country and I
13 see modern airport and realize that LAX is the hub of
14 the Pacific rim. If we lose that to Vancouver, Denver,
15 Phoenix, we will lose jobs. These are jobs all around
16 the airport where people in the neighborhoods and
17 Inglewood and Westchester, Hawthorne and the other
18 cities travel to their jobs. They are airport-related.
19 They are manufacturing jobs. They are not just
20 construction jobs. The people I represent live in every
21 community here in Southern California and they are all
22 in favor of this.

23 Thank you for your time and this time to be
24 able to speak.

25 MR. WALL: Thank you for your comments, sir. Next

1 will be -- ma'am, please. Please. This will be -- next
2 will be Mr. Virgil Benson followed by Mahala Walter
3 followed by Kenneth Alpern.

4 Welcome, Mr. Benson.

5 MR. BENSON: Thank you. Virgil Benson, B-e-n-s-o-n,
6 3612 West 116th Street in California.

7 Basically I'm here to talk about the impact of
8 the noise in the area which I live, and that is the City
9 of Inglewood.

10 Impact on the noise, will it affect the land
11 values in the City of Inglewood, that is the commercial
12 and industrial? Primarily I'm concerned about the
13 multi-residential and residential values of the City of
14 Inglewood. If there is a diminution in value, will that
15 be considered a taking? What I'm saying of taking,
16 would that be considered an eminent domain taking such
17 as the First Amendment of the California Constitution
18 requires just compensation for that taking for the land
19 itself? If we are talking about a just compensation for
20 the decrease in value, who is going to be determining
21 what that value is going to be as far as what the
22 diminution in value is going to be on our land and on
23 our homes on the land as a result of the increase in
24 noise over our properties?

25 Now, we've always seen in other communities

1 where they have complained about the airport noise,
2 whereas what it does, it decreases the value of the
3 residential homes in the area in which the planes fly
4 over. If that in fact happens, who is going to be
5 compensated and who determines what compensation we will
6 be getting? Will it be your appraisers or will it be
7 local appraisers that will make that determination as to
8 the diminution of value on the land that we own? If
9 it's a taking, can we then do an inverse condemnation
10 against you in which to determine what the value of the
11 taking is going to be?

12 Now, if you're talking about bringing
13 insulated windows and insulating attics for the noise
14 factor, will that then be set against the value of the
15 property itself in which the taking is going to be?

16 Now, as we know in the past and over the years
17 when planes flew over on the beach community, the
18 airport then utilized the public use of the Eminent
19 Domain law of the State of California in taking those
20 lands, those homes, and they were compensated for those
21 homes. But there were a lot of complaints about the
22 just compensation of the homes were not at market value.
23 So who is going to determine what the market value is
24 going to be as far as the taking of the homes? I'm
25 concerned about my own properties. I'm also concerned

1 about the City of Inglewood because what's it's going to
2 impact are the land values and the commercial and
3 industrial and the residential areas in which I live and
4 in which I've invested in this community over the past
5 30 years.

6 So my concerns are basically just this. Who
7 is going to determine what the land values are going to
8 be? And is that taking going to be based on eminent
9 domain? And if so, will we be getting just compensation
10 for the land? Thank you very much.

11 MR. WALL: Thank you, sir, for your comments and
12 questions. Next will be Mahala Walter followed by
13 Mr. Kenneth Alpern and Mr. Eric Jackson.

14 MS. WALTER: Mahala Walter, M-a-h-a-l-a,
15 W-a-l-t-e-r, 7015 Sepulveda Boulevard, Westchester.

16 As your former airport commissioner, you told
17 me we need a three-dollar flyaway to LAX just like what
18 the valley has. You also said we don't -- why doesn't
19 the Green Line go to LAX? It would make it easier to
20 get to work. :

21 Now, I can tell you the flyaway is really
22 going to happen, but what about the Green Line? Instead
23 of Alternative D, extend the Green Line north two and a
24 half miles up Aviation turning left on 98th Street. And
25 then you go right to LAX at Sepulveda. Combine this

1 change with a north runway extension over Pershing
2 Drive. Not only will you have more land space available
3 for LAX passenger dissemination, but the two-mile
4 perimeter for shoulder firing missiles is also extended
5 over the ocean for shared protection by the coast guard.

6 Construction on the runways should start now,
7 not 2014. Contrary to Alternative D, the plane and the
8 traffic noise levels and the congestion will be
9 considerably less for the 105, 405 Sepulveda and the
10 Inglewood communities. There will be no need for a
11 people mover nor disruption on Century Boulevard.
12 Manchester Square will become a beautiful park not only
13 for tourists to see and enjoy, but, also, the community.

14 Seeing that there is a Green Line station plan
15 on Aviation between 98th and Century, one could
16 visualize the retail recreation center at this stop
17 where tourists could enjoy a six hour layover. LAX
18 could become the most tourist-friendly airport in the
19 world, benefiting Angelenos.

20 The Green Line has the right-of-way to go
21 north on Sepulveda Boulevard, hooking up with Slauson
22 for a Green Line LAX express to downtown Los Angeles
23 Union Station. However, the community won't like to
24 have the Green Line go through downtown Westchester, and
25 I certainly don't want it going by my house. Then when

1 I focus on the fact that in 20 years I will almost be
2 90. With a short walk, I could go anywhere. And best
3 of all, our grandchildren will enjoy a positive
4 environmental impact on our city.

5 MR. WALL: Thank you, ma'am. If you'd like to
6 submit those comments in writing, you can do so.

7 (The statement submitted for the
8 record was marked as Statement 1
9 and is attached hereto.)

10 MR. WALL: I want to remind everyone that Lisa and
11 Kim are trying to record everything that you're saying.
12 So we would like you to speak as slowly and clearly as
13 you can. I see smoke coming off of their fingertips
14 over there.

15 Next will be Mr. Kenneth Alpern.

16 MR. ALPERN: Good evening. My name is Ken Alpern.
17 I'm co-chair of Friends of the Green Line, which is a
18 very active wing at the Transit Coalition. Good evening
19 and thank you for the opportunity to let myself be heard
20 again. ;.

21 Last week at the Wilshire District I was able
22 to talk about the overall ideas of the Ground
23 Transportation Center being appropriately utilized
24 wherever it is. We're neutral on the location. But
25 we -- we really feel it's next to a rail line, and that

1 opportunity is not being utilized. And we're not going
2 to be able to achieve the true traffic mitigation, the
3 environmental mitigation that we need to make LAX
4 reconfigured in an environmental and traffic-friendly
5 way. For those of you who have been unable to read our
6 brochure, we're more than happy to forward that. That
7 might take care of a lot of what I'm about to say.

8 The following are concrete, concrete requests
9 that we're going to ask LAWA to do under the aegis of
10 traffic and environmental mitigation, and we're going to
11 send this to the councilmembers of Los Angeles and to
12 L.A. World Airports.

13 Specifically, we're asking the L.A. City
14 Council to include in the final EIR that the Green Line
15 extension north along Aviation Boulevard to the Ground
16 Transportation Center be included as an integral part
17 of the locally preferred alternative to rail traffic
18 access to LAX.

19 Two, the FAA, Caltrans, the LADOT and the MTA
20 should each approve in writing on the Green Line route
21 including the necessary trenching along Aviation
22 Boulevard to avoid potential electromagnetic
23 interference from the light rail wires with the airport
24 radar beacons. This has been done in San Jose. We can
25 do it here. Every airport in the country has been able

1 to do this. Certainly L.A. can do the same.

2 L.A. World Airports should allocate enough
3 funding to put preliminary design and engineering work
4 on the Green Line alignment to Manchester Square or
5 wherever the Green -- excuse me, wherever the Ground
6 Transportation Center is. For purposes of practicality,
7 I'm mentioning Manchester Square.

8 We need to have remote airport access anywhere
9 along the Green Line. And, frankly, this would both
10 obviate the need of a Norwalk flyaway service to LAX as
11 well as an Intermodal Transit Center. Frankly, I have
12 very strong concerns that security won't be as good as
13 at the Intermodal Transit Center as it will be at the
14 Ground Transportation Center. I'm very concerned that
15 even though I know you don't want to stop the Green Line
16 cold at Aviation and Imperial, it will have that effect.
17 After all, if we do manage to extend the Green Line
18 north, what are we going to do, deconstruct the
19 Intermodal Transit Center? It's just not something
20 that's good for long-term purposes.

21 Thank you. Again, we're going to be sending
22 this more in writing in a polished letter to you and to
23 the L.A. City Council. Thank you so very much for your
24 time.

25 MR. WALL: Thank you for your comments.

1 Next will be Mr. Eric Jackson. He'll be
2 followed by Mr. Jack Kenton and Mr. Lawrence Teeter.

3 Welcome, Mr. Jackson.

4 MR. JACKSON: Thank you. Eric G. Jackson Junior,
5 2526 West 18th Street, Los Angeles, 90019.

6 I used to be a resident of L.A. right over by
7 the airport. I lived on 105th and Wilton for five
8 years. The noise was uncomfortable, but not unbearable.
9 Progress, this is the United States of America.

10 Now, in the '70s you had roll-up windows,
11 8-tracks. In the '80s you came out with cassettes and
12 air conditioner. In the '90s you got lasers, CDs,
13 television in the back of cars, television in the
14 visors. We cannot stop the progress of this airport.
15 We have to move forward.

16 Take the City of Denver. You're 20 miles from
17 the City of Denver with Denver International Airport.
18 Go to Chicago. It's the same thing. Where do you
19 propose that we put this airport? Are butterflies more
20 important than human life? Nobody is talking about
21 let's move the butterflies. Move the butterfly
22 sanctuary. This project has to go.

23 You've got the youth. You've got jobs and you
24 have opportunity. All of us are not able to send our
25 kids to college. When it costs \$500 a unit to go to SC,

1 tell me who could afford it when you make \$60,000 and
2 you have a family of four. You will continually eat at
3 McDonald's. You will die of heart failure because
4 you're going to have too much cholesterol. People are
5 tired of working for kibbles and bits. Where is the
6 industry? If construction doesn't move in the United
7 States, the economy stops.

8 My father is 88 years old, still living and
9 never made over \$6.00 an hour in his life. When I got
10 out of the service in 1970, I came to Los Angeles and
11 made a \$1.78. Now I make over \$35 an hour. This is
12 America. And we must be courageous. And those who
13 cannot afford to go to college has to get a well-paying
14 job. I have a college education, but I make more than
15 an average teacher with a master's. So construction is
16 the way to go. I am for Plan D and we must move
17 forward.

18 God bless America.

19 MR. WALL: Thank you, sir, for your comments. Next
20 will be Mr. Jack Kenton followed by Mr. Lawrence Teeter
21 and Ms. Joyce Jacquet.

22 MR. KENTON: My name is Jack Kenton. I live at 835
23 Dune Street in El Segundo.

24 With all due respect to everyone that wants
25 jobs, I think we all want jobs, but I don't think we

1 should build an airport just for jobs. Let's build
2 light rail. Let's build transportation systems and not
3 necessarily noise here.

4 The runway issue, we have a north complex,
5 south complex. We want to put a taxiway between the
6 pairs of runways. That's supposed to be because we have
7 a safety problem with runway incursions. I don't think
8 that is justified to go through the expense. The
9 millions and billions of dollars of picking up a
10 perfectly good runway and moving it 50 feet. We had an
11 alternative of putting a taxiway out at the back end of
12 the outport runway going around the inboard runway. I
13 think if we have a safety problem, let's go that route.

14 On the security issue, we're talking about
15 moving vehicles from the Central Terminal Area and
16 moving them to the proposed Ground Transportation
17 Center. The idea is to get the terrorist attack away
18 from the populated area where the terminals are.
19 However, I can't see that we gain that much by moving
20 the target now to the Ground Transportation Center.
21 I'll be happy if someone could prove it to me that that
22 is what would happen. But it seems to me we still have
23 a large number of people that would be a target at the
24 Ground Transportation Center just as we would have had a
25 large target in the Central Terminal Area.

1 The move -- the vehicles, the movement, when I
2 looked through the Master Plan, I just cannot see enough
3 of a large change to justify all the expense that we're
4 going to put into it. And I don't think we should be
5 doing it just for jobs. We need jobs. Let's do it at
6 El Toro. Let's do it at Ontario, Palmdale, not just
7 here.

8 And by the way, when you do move that runway
9 50 feet, it gets 50 feet closer to my house in
10 El Segundo. And even another 50 feet of the noise
11 coming off that south runway is more than I want.
12 Thank you.

13 MR. WALL: Thank you, sir, for your comments
14 tonight. Next will be Mr. Lawrence Teeter.

15 MR. TEETER: Yes, good afternoon. My name is
16 Lawrence Teeter. I'm the attorney for Coalition Against
17 the Pipeline. We oppose this project for a variety of
18 reasons.

19 First of all, you're in violation of CEQA and
20 NEPA because you haven't considered a genuine no-project
21 alternative. The court says that a no-project
22 alternative is the status quo, the existing situation.
23 That's not what you consider. The existing situation is
24 Manchester Square is a functioning residential
25 community. You've written that out by treating the

1 disappearance of Manchester Square as a noise mitigation
2 measure. So you're not considering a no-project
3 alternative. And that means you're violating the first
4 principle of CEQA. You have to consider a reasonable
5 range of feasible alternatives. And you have to do it
6 in good faith. And you have to consider a true
7 no-project alternative.

8 The second problem is that this environmental
9 document is not a good faith document. It's a post hoc
10 rationalization for a preconceived result. Manchester
11 Square's disappearance is foreordained by the fact that
12 the City is telling people who live in the area they are
13 not eligible for noise insulation because the area has
14 been targeted for acquisition. And that news is going
15 out to people before this project is even approved. The
16 California Supreme Court has made it absolutely clear,
17 you can't do that. The environmental process has to run
18 its course. The environmental impact report has to be
19 completed and certified and analyzed in good faith
20 before you can take steps indicating that you've
21 committed to a specific course of action.

22 When Mayor Hahn told you, "Go ahead and
23 consider Alternative D because that's what I want,"
24 that's another indication of a fix of a foreordained
25 result. And no wonder the public gets turned off. What

1 you're going to find if you approve this project, it is
2 that is a violation of state law and it is a violation
3 of federal law and people have remedies.

4 The second area of major violation is that you
5 could have looked at a whole range of existing
6 alternatives. You could have looked at an expansion of
7 the Green Line. Somebody else already pointed that out.
8 You could have looked at people movers from Lot C or the
9 other lots. I'm not proposing that, but those are some
10 of the other alternatives you should have considered.

11 You should have considered if you need more
12 space at Lot C, expanding that upward, not taking that
13 existing residential community of Washington Square.
14 But that was the foreordained result. This is a fix,
15 and you didn't engage in the reasonable analysis of a
16 good faith reasonable analysis of feasible alternatives.

17 The other problem is Section 4(f) of the
18 National Transportation Act says you can't go ahead with
19 a project that is going to result in a use of a
20 sensitive resource. And this project, unless there are
21 no feasible alternatives and unless you've considered
22 and rejected all feasible -- all -- unless you have no
23 feasible mitigation measures you can adopt, this project
24 is going to result in increased stress on
25 environmentally sensitive areas including the wetlands

1 area in the Playa Vista.

2 MR. WALL: Thank you, Mr. Teeter. We appreciate your
3 comments. I encourage you to put those in writing and
4 send those to either Mr. Ritchie or to Mr. Kessler.

5 MR. TEETER: I've already done so. Thank you.

6 MR. WALL: Thank you. Next will be Ms. Joyce
7 Jacquet, followed by Mr. Giammarco, followed by
8 Mr. Hunter.

9 Welcome, ma'am.

10 MS. JACQUET: My name is Joyce Jacquet. The last
11 name J-a-c-q-u-e-t. And I live at 9431 South Hobart.

12 And my concern is the noise, because I have
13 gone to the office on Sepulveda to try to get some help
14 because of the noise. If the trees wasn't in front of
15 my house, the airplane lights would shine directly in my
16 living room window. And I can't seem to get any help.
17 Nobody seems to care. So I hope something can be done
18 about it. Thank you.

19 MR. WALL: Thank you, ma'am. Mr. Giovanni
20 Giammarco. ;.

21 MR. GIAMMARCO: Hi. My name is Giovanni Giammarco,
22 G-i-a-m-m-a-r-c-o, and I live in Marina del Rey. I'm an
23 investor and property owner, which is designated as the
24 Manchester Square area. And beside residential, there
25 are multi-family areas there. This is my first forum.

1 I commend you guys for doing an excellent job on getting
2 the word out and all the information.

3 What I'd like to find out is in future
4 upcoming forums, if there would be somebody that we
5 could ask questions to in regards to the buy-back
6 program. Nobody seems to have any questions or answers
7 to that particular Westchester -- or the Manchester
8 Square area. All of your plans have somehow designated
9 that particular area to be used either as a park or a
10 runway or something. I'd like to find out what the
11 future holds for several properties I own in the area.
12 That's it.

13 MR. WALL: Thank you, sir. Next, Mr. Robert Hunter
14 followed by Thirkiel Patterson -- I'm sorry, Ms. or
15 Mrs. Patterson, and then Ms. Sparky Carpio.

16 MR. HUNTER: Hello. My name is Robert Hunter. I
17 live at 2057 South Atlantic Boulevard, Los Angeles.

18 You know, when you look at LAX, it just
19 doesn't work. The pollution there is terrible. The
20 configuration of the airport, it really is a large
21 regional airport. It doesn't serve the purpose. The
22 reconfiguration that Plan D puts with LAX makes it
23 viable. It has got mass transit. It provides jobs for
24 local workers. Not everybody could go to college, and
25 these are good-paying jobs.

1 You know, California, we have a habit of
2 putting everything off until tomorrow, until it's too
3 late, until we have an emergency, like we did with the
4 power plants and the electricity system with the state.
5 We blocked it for 40 years until it became an emergency
6 and we had to do it. It cost us a lot more and it
7 probably wasn't done the best way. It's better that we
8 can plan things out like we've done with this airport.

9 We've reconfigured the thing three or four
10 times. And I believe the best plan is the one that we
11 have right now, Plan D. Mass transit, it makes the air
12 cleaner and, hopefully, it will make life better for
13 everybody in Los Angeles for a long time to come.

14 Thank you.

15 MR. WALL: Thank you for your comments, sir.

16 Mr. Patterson.

17 MR. PATTERSON: Yes, good evening. My name is
18 Thirkiel Patterson. I reside at 3634 West 106th Street
19 in Inglewood.

20 I'm a 30-year resident. I sympathize with
21 most of the resident people who live around here, but
22 progress -- I don't believe they are going to be able to
23 stand in the way of progress because the City of
24 Inglewood pacified me in the property that I own in
25 Inglewood when the noise level became intolerant. And

1 I'm pretty sure this program here would initiate some of
2 the same type of pacification, however you want to see
3 it.

4 I represent over 6,000 union workers in
5 Southern California. And we're in support of this
6 project. Thank you.

7 MR. WALL: Thank you for your comments, sir.

8 Mrs. Carpio. Welcome.

9 MS. CARPIO: Thank you. Sparky, S-p-a-r-k-y,
10 Carpio, C-a-r-p-i-o. I live at 407 E-x-t-o-n, Number 4,
11 Inglewood, California 90302.

12 I just want to say that I know people need
13 jobs, and Mayor Hahn's plan might be good for the
14 economy, but doesn't people's quality of life matter
15 more? What about the neighboring communities? How can
16 you say that something that has in just months grown
17 from 78 MAP to 78.9 MAP not being an expansion plan?
18 And I guess you don't care what the Southern California
19 Association of Government said about 78 MAP or less, but
20 there is a lot of second guessing. And, oh, Palmdale
21 really needs to be used. And I hope Mayor Hahn stays
22 true to his word of regionalization.

23 MR. WALL: Thank you very much.

24 MS. HOSSAN: It's Carol Hossan, like "Ha," 7725
25 Hindry, Westchester, 90045.

1 My theme is going to be the stealthiness of
2 all of this. Here is a quote I really like from a
3 comment from a report to the County.

4 "Because the new larger aircraft require many
5 smaller connecting planes to fill its 600 seats, this
6 improvement will strengthen the confluence of
7 connections that reinforce LAX as the preeminent airport
8 of the Southern California region, and at the same time
9 reduce the incentive for airlines to utilize other
10 regional facilities."

11 Now, I and many other people have been saying
12 that for months, but it is very reassuring and maybe
13 more convincing to you to have experts say it, too.

14 This is a poem, "If not now, when? City of
15 L.A. says regionalization. Actions belie words."

16 Now, I'm not going to go into the story of
17 SCRA with you, but those in the know know what that's
18 all about. The death of SCRA caused by the City of
19 Los Angeles, here is the second one.

20 "The myth of 78 MAP, fewer gates limit MAP.
21 Are you so sure? Bigger planes bring more people."

22 This is, again, from the County report.
23 "Alternative provides 150 fully functional and
24 high-capacity gates and does not remove the concrete
25 which will remain available for airport parking. The

1 true number of gates is there for over 200."

2 Interesting.

3 Stealth versus security -- or regarding
4 security. This is entitled, "Bull's-eye" and we
5 remember what the RAND study said about the plan.

6 My poem, "Bull's-eye" "Security, no. All
7 those people in one place, massive target stands."

8 And a -- a -- I guess a regular note. I ask
9 if you have the Westchester Streetscape Project
10 mentioned in your plan, if what they are planning is,
11 you know, in your EIS, et cetera. I'm hoping what
12 Westchester is planning is taken into account because
13 the County report says that a lot of current projects
14 are not mentioned in your supplement. Thank you.

15 MR. WALL: Thank you very much. Next is Mr. Harry
16 Rose followed by Mr. Daniel Walker.

17 MR. ROSE: Good evening. My name is Harry Rose. I
18 live at 7725 Hindry Avenue, Westchester, California.

19 I'm here tonight to speak of jobs. By God,
20 there is nothing like a public works boondoggle to get
21 the economy rolling again, isn't it folks?

22 Something that our union friends are probably
23 not aware of is that the community of Westchester and
24 Playa del Rey have devised an alternative to Alternative
25 D that we like to call Alternative E. And in devising

1 this alternative, we kind of looked at the Alternative D
2 and asked ourselves, what really needs to be done here?
3 From our standpoint, what really needs to be done is we
4 need to move the parking lot. And I think that we can
5 do this for far less than \$9.6 billion dollars.

6 What we propose to do was to move the parking
7 lot to the corner of Aviation and Century Boulevard on
8 airport property and to extend the Green Line into the
9 Ground Transportation Center along a trench on Aviation
10 Boulevard to -- at the Ground Transportation Center
11 provide the passenger with check-in and complete luggage
12 screening so once you arrive at the airport, you're free
13 of your luggage. You can travel on a people mover to
14 the airport.

15 And we thought that Manchester Square might be
16 a great location for a park, especially since the City
17 Council of Los Angeles promised us that's what it was
18 going to be. But we thought maybe a Convention Center
19 would be nice, too, something close to the hotels, maybe
20 a little larger than what they could accommodate, but
21 smaller -- small enough that it wouldn't compete with
22 downtown.

23 We propose moving the car rental facility,
24 consolidating it at the corners of Imperial and Aviation
25 so we don't have people driving down our streets asking

1 us, "Gee, how do I get to Hertz from here?"

2 And looking at the runway complexes, we see an
3 Alternative D essentially building up a flight field
4 that can handle far more capacity than it currently can.
5 And we thought we wouldn't even mess with the north
6 runway complex, but move the inside runway south in the
7 south -- north in the north -- move the inside runway
8 north in the south runway complex to accommodate the
9 larger aircraft. That would also provide them with the
10 12,500-foot runway and keep them where they belong, away
11 from our community.

12 We've really gotten no consideration at all
13 from the City of Los Angeles for our proposals. We'll
14 be submitting them in writing. And I'm certain that
15 this proposed alternative of the communities would
16 provide those much-needed construction jobs at a far
17 less -- far more reasonable cost to the airline and air
18 passengers. Thank you.

19 MR. WALL: Thank you, Mr. Rose.

20 MR. WALKER: Good evening. I'm Daniel Walker. I
21 live at 7416 West 82nd Street in Los Angeles. That's in
22 Westchester about 10 blocks north of LAX.

23 In talking to my family and people in my
24 neighborhood, they have -- they use LAX regularly and
25 they'd like to see it improved, but they also have a lot

1 of concerns primarily in terms of traffic congestion,
2 air pollution and noise. Those are the main three
3 things that my family talks about.

4 I'm a Friend of the Green Line, grass roots,
5 all-volunteer group. And we're promoting -- we're
6 promoting the Green Line to go to more places. Just
7 this last month the Green Line set an all time record of
8 over 36,000 rides, probably in conjunction with the
9 opening of the Gold Line. Even though the line really
10 goes from nowhere to Norwalk to nowhere here in the
11 South Bay area, it has so much more potential.

12 When you go to Europe and you go to the better
13 airports, what you can do is you could get off your
14 airplane and you have access to a rail system that takes
15 you all throughout Europe. You simply don't need to
16 take short -- short hop airline flights throughout the
17 rest of France, for example, when you land at Paris.

18 There is no reason why in California we can't
19 improve the quality of lives for my friends and
20 neighbors out here by reducing the need for some of
21 those local commuter flights by having a good rail
22 connection. The MTA already owns a line that runs from
23 LAX toward downtown L.A. that could be easily upgraded
24 for quiet, non-polluting light rail transit. The City
25 of Inglewood is very interested in hearing more about

1 that, studying that. That would provide the link from
2 here to Santa Barbara or from here to Las Vegas, here to
3 San Diego. It would reduce the need for people to drive
4 to LAX. It would certainly reduce the amount of
5 pollution in the local area.

6 So there is a lot of reasons why a better mass
7 transit airport access would make things better, not
8 only for the airport, but the communities around the
9 airport.

10 So the Friends of the Green Line is asking
11 LAWA and the City of L.A. and the City of Inglewood to
12 look a little bit more closely at this former BNSF, now
13 MTA-owned right-of-way that runs from the airport to the
14 rest of downtown Los Angeles and the rest of the County,
15 and see if that can be used as some mitigation for some
16 of the traffic and some of the pollution that are caused
17 by the airport.

18 So I certainly can sympathize with a lot of my
19 neighbors that are talking today about the problems they
20 face and the concerns they have about more people coming
21 to LAX. And I understand what people are saying about
22 jobs because we certainly need jobs as well. We are
23 here to talk about better access.

24 No matter what size the airport is, no matter
25 where the ultimate Ground Transportation Center ends up,

1 if it's located near the Harbor Subdivision tracks, we'd
2 like to see a station there that's connected to the rest
3 of the rail network. The people mover is a fine idea,
4 but let's get a real light rail connection as well.
5 Thank you.

6 MR. WALL: Thank you, Mr. Walker.

7 Ladies and gentlemen, do we have any other
8 speaker cards at this time? I want to thank everyone
9 who has spoken this evening for your thoughtful
10 comments. We'll take a short recess and we'll be back
11 if we have others that wish to speak. Thank you.

12 (Recess was taken.)

13 MR. WALL: Gentlemen, if you're ready, may I call
14 Diane Sambrano, please, to the podium. I'll remind you,
15 ma'am, if you would state your name and address and I
16 will begin the clock when you completed that.

17 MS. SAMBRANO: Okay. My name is Diane Sambrano,
18 3640 West 111th Place, Inglewood, California 90303.

19 Good evening, and thank you again for having
20 the public hearing. I unfortunately am disappointed
21 that we did not have any local publicity from our local
22 representatives.

23 But with regards to the LAX expansion
24 Alternative D, I think that we need to keep in mind, as
25 you heard many people tonight say, that jobs is

1 everything. And progress is everything. And I would
2 encourage you to think that with that concept comes a
3 certain amount of quality of life for those of us who
4 live near the airport that they simply choose to
5 disregard. Our quality of life should not be sacrificed
6 so that someone can have an occasional part-time
7 short-term job. The benefit for those traveling to and
8 from other destinations should not be the sole burden of
9 those of us who live near LAX.

10 Both the SCAG, the COG and everyone else in
11 this country seems to understand that putting all of
12 your eggs in one basket is not a good idea, but the
13 regionalization should in fact be the plan that we
14 pursue. And by encouraging more and more traffic to
15 come to LAX is a direct decrease of suggesting people to
16 go to other locations, whether it's Ontario, Palmdale or
17 El Toro. The quality of life for the people that live
18 near this airport should be considered.

19 As often some people say, "You knew the
20 airport was there." None of us purchased cell phones.
21 And I assure you, very few people in 1950 bought stock
22 in cell phones. And if they did, they are not in this
23 room tonight. They are living somewhere else very far
24 away from any of this discussion.

25 To say that everything is about progress is

1 tantamount in telling me that greed for some is more
2 important than the need for all. My quality of life and
3 the quality of life due to benzene, carcinogens, traffic
4 congestion, and simple noise pollution should not be the
5 very thing that makes someone else who doesn't endure
6 those things rich. Anyone who wants to get rich off of
7 all those issues should try living in my community.

8 Mitigation has not been addressed to a degree
9 that is sufficient for the members of this area of the
10 region. We should not, as I said before, bear the
11 burden so that everyone else has convenience. Those who
12 are elected are elected to serve the people and not
13 simply those who can pay off campaign contributions. We
14 the people of this area deserve equal and appropriate
15 environmental justice. And it is unfortunate that the
16 entity who put this plan and program together chose to
17 do it on a limited scope and not make the written
18 documents available to the masses who they will affect.

19 MR. WALL: Thank you, Ms. Sambrano. Do we have any
20 other speaker cards at this time? Seeing none being
21 brought forward, we will recess again until we have
22 additional speaker cards.

23 Ms. Michele Grumet, please. And, ma'am, are
24 you familiar with the process? All right. If you'll
25 state your name and address, please, for the court

1 reporters, then I'll start the time.

2 MS. GRUMET: Okay. Michele Grumet, 2036 West 77th
3 Street, Los Angeles, 90047.

4 My objection is that many people in the
5 affected communities, and particularly seniors, are not
6 computer literate and cannot afford the high prices of
7 the documents such as \$330 for the Supplement EIR, 140
8 for the appendices, \$755 for the technical reports to
9 the Supplement, and the Draft and Master Plan addendum
10 \$340, \$50 for the disk. You would think that a
11 \$9-billion-dollar project could afford to provide the
12 public with free access to those documents.

13 Now, talking about the cost of the EIR, I feel
14 that the cost of the EIR, which should be free to the
15 public, has impeded the public's ability to participate
16 in the EIR process by limiting access to the EIR and
17 violating CEQA. And I guess that a project of this
18 cost, the lead agencies can just not afford to provide
19 the affected parties with documents for free.

20 I, myself, have worked on several such
21 documents; EIRs in the past. And always people who
22 requested the documents were given the documents. And I
23 think it's very difficult for many people to go to
24 libraries because there is only, for instance, in South
25 L.A. where I live, that particular area, there are only

1 two public libraries. So people would have to stand in
2 line to wait because you're not allowed to check out the
3 EIR. So I think this violates the CEQA process.

4 Thank you.

5 MR. WALL: Thank you, ma'am, for your comments.
6 Next we'll call Ms. Cecil Carpio.

7 MS. CARPIO: Thank you. Cecil Carpio, 407 Exten
8 Avenue, Inglewood.

9 This isn't technical at all. I guess it's
10 about as technical as crying for jobs, jobs, jobs. But,
11 you know, LAX Master Planning didn't address terrorism
12 the first time around. Alternatives A, B and C, why?

13 During the late '60s and the early '70s
14 high-jacking was in the forefront of international news.
15 Presidential committees studied airport safety and
16 security. Los Angeles Department of Airports has been
17 running an unsecure, unsafe airport all these years. If
18 everyone -- if anyone is serious about safety and
19 security, the push would be for decentralization.
20 Los Angeles World Airports would not allow itself to
21 grow. L.A. Mayor James Hahn wants El Toro. Why? To
22 pull another Palmdale. El Toro should be forced to
23 become a part of the Southern California system.

24 The Manchester Square Voluntary Program is a
25 heartless process of acquiring property for LAX

1 expansion. And it's not voluntary. This hearing must
2 not really be that important either because I'd like to
3 note that at, what, 8:30 I have not seen the members of
4 Inglewood City Council including Mayor Dorn. I haven't
5 seen the city administrator. I haven't seen members of
6 the Inglewood Aviation Commission, except for me. I
7 haven't seen the board members of the Inglewood Unified
8 School District, you know, not to mention the Planning
9 Commission of the City of Inglewood. So why are we all
10 here?

11 MR. WALL: Thank you, ma'am, for your comments.
12 Next Ms. Patt Sanders. Welcome, Ms. Sanders.

13 MS. SANDERS: Thank you. Good evening. My name is
14 Patt Sanders. I reside at 8716 South 3rd Avenue.

15 I carry many hats. I'm a library
16 commissioner. And on top of that I'm the elected member
17 of the 51st Assembly District for the Los Angeles County
18 Central Committee.

19 Previous speaker, the one before me, ditto, I
20 won't go over all of the other comments regarding the
21 EIR not making it available to people.

22 My parents, my father is 81 years old and
23 lives in Inglewood. There was some other comment made
24 previously of why don't we move. Why should we when we
25 have worked for our homes? I'm a 28-year retiree from

1 the City of Los Angeles. I reside in Inglewood. I
2 cannot hear myself think with all these planes flying
3 over.

4 My issue now, I look at this EIR and I'm
5 totally disgusted by this. One of the things, why would
6 you put -- if we're so concerned about terrorism and
7 safety and security, why in the hell do you put it in
8 our neighborhood? You know, I mean, don't we count?
9 And the mere fact that, okay, we're having this hearing
10 now when the mayor, Los Angeles mayor is off on
11 vacation, some of our own citizens are off on vacation.
12 I mean, it's like the previous plan. It's like going
13 from bad to worse. That's what it is. There is no
14 consideration about us as citizens.

15 And I'm a union member. So I'm not going to
16 talk against my union brothers. I was vice president of
17 the Engineers and Architects Association for many years
18 until my retirement, but how many of those union members
19 actually reside in this flight path and are affected by
20 this plan? That's what I want to know. And I'm not mad
21 at them. I know they are looking out for their members
22 and they are looking out for money and everybody wants a
23 piece of the pie. Bottom line is, it's the citizens.

24 And another thing. Where are the damn --
25 where the hell are the health declarations? My father

1 lost his hearing and we can look back. My family lives
2 a long time. There is no nobody that has had any
3 hearing problems except when they moved to Inglewood in
4 Carlton Square and have been living there. He's the
5 only one out of ten children that has a hearing problem.
6 We have other health declarations. I saw them when they
7 were submitted. Where are they and why aren't they
8 addressed? What, are you waiting for the people just to
9 die off so you could just go ahead with your plan? It's
10 really disgusting that we're really, you know, dealing
11 with this now in this day and time.

12 And then, look, I'm not a mathematical genius,
13 but I can count. On your plan you don't take into
14 account the homes that you're going to have to move.
15 The people, where are they going to go? You're just
16 going to rollover them and that's not counted in the
17 plan? There is no financial planning? The figures
18 don't add up.

19 So I'm just going to leave you with that. I
20 think it's disgusting that, you know, you're doing this
21 to citizens, to people. My father served this country.
22 He's a declared veteran. I'm a grand-daughter of a
23 Native-American. Why am I being treated like this?

24 MR. WALL: Thank you for your comments, Ms. Sanders.

25 Is there anyone else who would like to submit

1 a speaker card at this time? Seeing no one, we'll
2 recess the public hearing.

3 (Recess was taken.)

4 MR. WALL: Ladies and gentlemen, we're going to
5 reconvene the public hearing.

6 MR. KESSLER: Is there anyone else that has not had
7 an opportunity to speak concerning the information in
8 the Supplement to the Draft EIS/EIR?

9 Not seeing anyone else, I'll remind you that
10 if you feel that you're uncomfortable about providing
11 comments verbally, you can provide them in writing using
12 a comment sheet.

13 At this time we'll still be accepting
14 comments, written comments, until 5:00 p.m. Pacific
15 Daylight Time, on Monday, August 25th, 2003. You can
16 mail your comments either to me at the FAA or to Jim
17 Ritchie at LAWA. The mailing addresses are listed on
18 the cover of the Supplement to the Draft EIS/EIR. I
19 would like to thank everyone for your comments today.

20 This public hearing for the Supplement to the
21 Draft EIS/EIR on the Los Angeles International Airport
22 Master Plan is now closed. Thank you.

23 (Whereupon the proceeding adjourned
24 at 9:00 o'clock p.m.)

ERRATA SHEET

I declare under penalty of perjury that I have read the foregoing _____ pages
of my deposition testimony, taken on _____ at
_____, California,
and that the same is a true record of the testimony given by me at the time and place hereinabove
set forth, with the following exceptions:

Page Line Should read:

Date: _____

Signature of the Witness

Name Typed or Printed

As your former airport commissioner, you told me, "We need a \$3 FLYAWAY to LAX just like what the Valley has!"

You^{also} asked, "Why doesn't the GREEN LINE go to LAX?" ^{make it} It would be so easy to get to work.

NOW the FLYAWAY IS REALLY GOING TO HAPPEN!But, how about the Green Line?

Instead of Alternative D, extend the GREEN LINE north 2.5 miles up Aviation, turning left on 98th St., ^{then} and it goes right to LAX at Sepulveda. Combine this change with ^a the north runway extension over Pershing Drive, not only is their more land space available for LAX passenger dispersion, but the 2 mile perimeter for shoulder firing missiles is also extended out over the ocean for shared protection by the Coast Guard. Construction on the runways should start NOW, not 2014.

~~Thus~~, Contrary to Alternative D, the plane & traffic noise levels and the congestion will be considerably less for the 105, 405, Sepulveda and Inglewood communities. There would be no need for a people mover; no disruption of Century Blvd. Manchester Squares would become a beautiful park for not only the tourists to enjoy, ^{but} also the community.

Seeing that there is to be a Green Line station, ^{planned} on Aviation, between 98th & Century, one could visualize the Retail/Recreation Center at this stop where tourists could enjoy a 6 hour layover. LAX could become the most tourist- friendly airport in the world, benefiting all Angelenos.

The GREEN LINE has the Right-of-Way to go north on Sepulveda Blvd., hooking up with Slauson for a **GREEN LINE LAX EXPRESS** to downtown Los Angeles Union Station. However, the community won't like the Green Line going through downtown Westchester & I certainly don't want it to go down MY street! THEN when I focus in on 20 years later, ^{I realize} I'll be almost 90. With just a short walk, I could go ANYWHERE. And best of all, our grandchildren will enjoy the positive environmental impact on our city.

~~Just as for the butterflies, there are inconveniences for EVERYONE.~~

Submitted by Former Airport Commission Mahala Walter 8/18/2003

**Official Hearing Transcript
Airtel Hotel Plaza
Van Nuys, California
Tuesday, August 19, 2003**

Following this page is the transcript of the oral testimony taken at the above hearing. Each speaker at the hearing has been assigned a unique identification number. The numbers assigned to each speaker for this hearing are:

Number	Speaker	Affiliation
SPHA00001	Shandor Winger	None Provided
SPHA00002	Robert Rodine	Polaris Group
SPHA00003	Steven Leffert	None Provided
SPHA00004	Don Schultz	Van Nuys Homeowner's Association
SPHA00005	Bart Reed	Transit Coalition
SPHA00006	John Spaulding	Operating Engineers
SPHA00007	Pete Gerber	Tile Marble Layers Local Union 18
SPHA00008	Charles Brink	None Provided
SPHA00009	Sergio Ramos	Laborers Local 300
SPHA00010	James Stewart	None Provided
SPHA00011	Mike Ayre	None Provided
SPHA00012	Dennis O'Sullivan	None Provided
SPHA00013	Mahala Walter	None Provided
SPHA00014	Charles Brink	None Provided

3
4 MS. SMITH: Good evening, ladies and gentlemen. On
5 behalf of the Federal Aviation Administration and
6 Los Angeles World Airports, I would like to welcome you
7 to one in a series of public hearings that we're holding
8 to receive your testimony on the Los Angeles Airport
9 Master Plan and Environmental Impact Statement and
10 Environmental Impact Report.

11 My name is Shauna Bain Smith, and I will be
12 your facilitator. The two gentlemen to my right will be
13 receiving your testimony this evening. They have a few
14 introductory remarks before we start your testimony.

15 I'll start with Mr. David Kessler here from
16 the Federal Aviation Administration.

17 Mr. Kessler.

18 MR. KESSLER: Thank you. Good evening, ladies and
19 gentlemen. My name is David Kessler. I'm the
20 Environmental Protection Specialist for the Airports
21 Division of the Federal Aviation Administration,
22 Western-Pacific region.

23 I would like to welcome you to the sixth of a
24 series of public hearings the FAA and Los Angeles World
25 Airports are conducting on the Supplement to the Draft

1 Environmental Impact Statement/Environmental Impact
2 Report, or EIS/EIR, for the proposed Master Plan at
3 Los Angeles International Airport.

4 The Supplement to the Draft EIS/EIR addresses
5 an additional Alternative, Alternative D, the Enhanced
6 Safety and Security Plan that was added in the fall of
7 2001. This new alternative was added as a result of
8 comments submitted on the 2001 Draft EIS/EIR and the
9 terrorist attacks that occurred on September 11th, 2001.

10 The Notice of Availability of the Supplement
11 to the Draft EIS/EIR was published in various local
12 newspapers and in the Federal Register on Friday, July
13 11, 2003. The FAA and LAVA are the authors of the
14 Supplement. The Federal Highway Administration is also
15 a cooperating agency in the preparation of the Draft
16 EIS/EIR that was published in January 2001.

17 The purpose of these hearings is to collect
18 comments from the general public on the adequacy of the
19 information disclosed in the Supplement to the Draft
20 EIS/EIR on the proposed Alternative D.

21 I would like to take this opportunity to make
22 sure that everyone understands that no decision will be
23 made today regarding the proposed project. Today's
24 hearing is not a question-and-answer type of forum. Our
25 job is to listen to what you have to say about the

1 adequacy of the information in the Supplement to the
2 Draft EIS/EIR. In other words, it's your turn to talk
3 to us. Since we are here to listen, we are not going to
4 respond to questions about the pros and cons of the
5 proposed project.

6 Since 6:00 this evening we have held a public
7 workshop just outside of this room for anyone to ask
8 questions about the Master Plan, the environmental
9 process and the various proposed projects.

10 Following publication of the Supplement to the
11 Draft EIS/EIR for review and comment, the next step in
12 the joint Federal and State environmental disclosure
13 process is holding this and the other public hearings
14 beginning last week and continuing through this week.

15 I would like to take the opportunity to recap
16 the environmental disclosure process for this project.
17 The environmental evaluation for the LAX Master Plan
18 began in 1997 with the publication of a Notice of Intent
19 to prepare the joint EIS/EIR in the Federal Register.
20 In July 1997 we held a series of meetings with members
21 of the public and governmental agencies to receive
22 comments on the scope of the Draft EIS/EIR. Following
23 those meetings, the Draft EIS/EIR was published in
24 January 2001.

25 Both the 2001 Draft EIS/EIR and the 2003

1 Supplement have been prepared pursuant the National
2 Environmental Policy Act of 1969, or NEPA, the Council
3 on Environmental Quality Regulations, which are the
4 implementing regulations for NEPA, the California
5 Environmental Quality Act of 1970, or CEQA, and the
6 Airport and Airway Improvement Act of 1982, as amended.

7 Following today's hearings and the close of
8 the comment period, we will then correct and revise the
9 EIS/EIR, as necessary, based on the comments received.
10 We will also prepare responses to the comments we
11 receive and include those responses along with those
12 that were submitted to the FAA and LAWA on the 2001
13 Draft EIS/EIR into the Final EIS/EIR. The information
14 contained in the Supplement will also be combined with
15 the information in the 2001 Draft EIS/EIR into the Final
16 EIS/EIR.

17 Before we begin receiving verbal comments, we
18 would like to let you know the ground rules of this
19 hearing. First, as I said earlier, we are not here to
20 respond to questions about this project. We are here
21 only to listen to your comments and take notes. We
22 also have a court reporter present to ensure that we
23 have an accurate transcript of this hearing.

24 For anyone who would like to speak, we ask
25 that you fill out a speaker card, like this one, that

1 are available and give it to one of the people at the
2 sign-in desk. The cards will then be brought up here to
3 our facilitator who will call the names of each speaker
4 so we can proceed in an orderly fashion.

5 So that everyone gets an opportunity to
6 provide verbal comments, everyone will get three minutes
7 to speak. To be fair to everyone, we are not going to
8 allow people to transfer their allotted time to someone
9 else. I ask that when you speak, you give us your name
10 and address for the record. We also have a Spanish
11 language translator for anyone wishing to provide
12 comments in Spanish.

13 If there is anyone who is uncomfortable
14 speaking in front of a group or if you need more than
15 three minutes to provide your comments, we ask that you
16 provide your comments in writing. We have comment
17 sheets, like this one, available for your use at the
18 sign-in desk. You can leave your comments at the
19 sign-in desk or you can mail your written comments using
20 the comment sheet or a letter to either address listed
21 on the cover of the EIS/EIR.

22 I would like you to understand that a verbal
23 comment is just as important as a written comment. So
24 please feel free to provide any comments on the document
25 you may have either to us verbally today or in writing.

1 On August 1, 2003, LAWA asked the FAA to
2 extend the public comment period to a total of 120 days.
3 FAA has agreed to LAWA's request. FAA has also asked
4 the U.S. Environmental Protection Agency to publish a
5 notice announcing the extension to the public comment
6 period in the Federal Register. FAA and LAWA will also
7 publish a notice of the extension in the local
8 newspapers of general circulation. Therefore, comments
9 on the Supplement to the Draft EIS/EIR are now due by
10 5:00 p.m., Pacific Standard Time, on Friday,
11 November 7, 2003.

12 Lastly, I would like everyone to know that
13 even though we have this hearing scheduled until 10:00
14 tonight, we will stay here as long as necessary for
15 everyone to get a chance to provide verbal comments on
16 the Supplement to the Draft EIS/EIR. As I said earlier,
17 our job here today is to listen to your comments.

18 At this time I would ask that everyone take a
19 moment and turn off your cell phones and pagers to be
20 courteous to those people making verbal comments at
21 tonight's hearing.

22 Now I will return our hearing back to our
23 facilitator who will introduce Mr. Jim Ritchie, who will
24 provide some introductory comments from LAWA. Following
25 Mr. Ritchie's comments, we will collect the speaker

1 cards and call the name of the first speaker.

2 Thank you.

3 MS. SMITH: Thank you, Mr. Kessler. Next, I would
4 now like to introduce Mr. Jim Ritchie, Deputy Executive
5 Director of Los Angeles World Airports.

6 Mr. Ritchie.

7 MR. RITCHIE: Thank you, Shauna. Good evening and
8 welcome to the Airtel Hotel for the purposes of this
9 evening's public hearing continuing a series of 12
10 public hearings. For the purposes of consistency, I'll
11 read a prepared introductory comment, as we will do at
12 the 12 public hearings as part of this alternative.

13 You may recall the public hearing process in
14 2001 while we were examining other alternatives for the
15 modernization of the LAX.

16 The tragic events of 2001 and the leadership
17 of Mayor Jim Hahn have reshaped our environmental
18 process. The Mayor's pressing concerns for safety and
19 security have provided new guidance along with the
20 public comments received during that public comment
21 period in 2001 that ran from January through November.

22 You are here tonight to comment, primarily to
23 provide on that new Alternative referred to as
24 Alternative D. This is a Supplement to the existing
25 environmental process, and it has undergone a rigorous

1 environmental review.

2 We are here tonight to receive your comments
3 on this new Safety and Security Plan and its impacts, as
4 disclosed in the Draft Environmental Impact
5 Statement/Environmental Impact Report we had released.

6 So with that, Shauna, let's go to work.

7 MS. SMITH: Thank you, Mr. Ritchie. Again, my name
8 is Shauna Bain Smith. As your facilitator, I'm only
9 here to ensure that you're able to make your comments in
10 a timely and orderly fashion. I'm your friend. And
11 this clock will be our best friend.

12 Everyone will get three minutes to speak. As
13 Mr. Kessler mentioned, if you filled out one of these
14 speaker cards and turned them into the sign-in table, it
15 will be given to me in the order in which you turned it
16 in. I will call out about three people at a time just
17 so you know when to expect your time to come up.

18 When you see the green light come on, your
19 three minutes will start. It will only start when you
20 give your name and address for the record. If you could
21 spell your last name for us, that would be helpful. And
22 if you could speak as slowly and clearly as possible,
23 that would help our court reporters as well.

24 When I start the clock, when you're down to
25 30 seconds, you'll see a yellow light appear on the

1 clock. At that time I suggest you start wrapping up
2 your remarks. When your time has expired, the red light
3 will go off and you'll hear a beep tone. At that time
4 I'll have to ask you to stop speaking.

5 If it looks like we have time, we would love
6 for you to be able to get all of your comments in. As
7 Mr. Kessler mentioned, you could also enter your
8 comments in writing, which they hold the same weight as
9 if you verbally comment.

10 But if there is time, we definitely want you
11 to be able to fill out another speaker card if you feel
12 the three minutes was not enough and are able to bring
13 it back up. Once everybody has had a chance to speak at
14 least once, we will call your name again.

15 With that said and everyone understands the
16 ground rules, I will call the first three speakers.
17 Mr. Shandor Winger. After Mr. Winger we'll have Robert
18 Rodine and then Margie Oldenkamp.

19 Mr. Winger.

20 MR. WINGER: Good evening.

21 MS. SMITH: Good evening.

22 MR. WINGER: My name is Shandor Winger. I'm here as
23 a citizen of San Fernando Valley tonight. I'm very
24 pleased to speak before you.

25 Los Angeles Master Plan is a combination of

1 many years of study in that it's been looked at in every
2 which way you could possibly think of. It has now been
3 fine-tuned to a level that can be readily accepted by
4 many. Readily accepted in the fashion because it now
5 meets the criteria, I think, of satisfying the needs of
6 the citizens and of the community and the security
7 needs.

8 In that, speaking to the Master Plan, the EIR
9 and the security item, I will address it in a nature of
10 the security in the nature of the Alternative -- I know
11 it's D.

12 I will firstly say that when it comes to the
13 EIR, which is really a portion of the Master Plan
14 itself, the EIR after reading it now meets the criteria
15 for supporting a full Master Plan.

16 The Alternative D is an item that has been
17 brought forth to us and pushed not only by the staff of
18 the Los Angeles World Airport, but pushed by the Mayor
19 himself.

20 The only thing I will say to that is it's time
21 for everyone to get together and support staff, support
22 the Mayor and push this thing through and get it done,
23 and get it done as presented tonight with Alternative D.
24 Thank you.

25 MS. SMITH: Thank you. Robert Rodine.

1 MR. RODINE: Before I begin, Mrs. Oldenkamp has
2 asked me to advise you that she won't be speaking
3 tonight.

4 MS. SMITH: Thank you.

5 Mr. Kessler, Mr. Ritchie, thank you for
6 allowing me to speak here tonight. My name is Robert
7 Rodine. My firm is the Polaris Group, and I live in
8 Sherman Oaks, California.

9 LAX medium growth demand embodied in the SCAG
10 Regional Transportation fund is driven by fundamental
11 regional demographics at 2020, it's 94.2 million annual
12 passengers and 4.2 million tons of cargo annually.

13 This is 59.8 percent of the forecasted
14 regional load of 157.4 MAP. Under Alternative D
15 emphasized to be part of a regional plan. The loads
16 planned for LAX are 78.9 MAP and 3.1 million annual tons
17 of cargo. This reduction in the LAX portion of the
18 regional volumes is 15.3 MAP and 1.1 million annual tons
19 of cargo. If this reduction in volume is retained
20 within the region through diversion to other regional
21 airports, there would be no net negative impact. If,
22 however, it is not, the negative impact is the loss of
23 approximately \$33 billion dollars of turnover annually
24 and some 220,000 jobs inclusive of the effects of the
25 induced economies.

1 If we were to avoid the above losses, it seems
2 that specific arrangements for diversion wouldn't
3 necessarily be in place before leaping off on a
4 \$9-billion-dollar public works project. However, the
5 EIR seems to be mute on this aspect of the plan.

6 What, if any, specific arrangements have been
7 made -- have been formalized to ensure that the proposed
8 diversion of traffic does not result in any negative
9 economic impacts of the region?

10 Absent of pre-arranged plan with specific
11 agreements to accommodate the displaced LAX passengers
12 within the region, I am abjectly opposed to such a plan
13 based on the supposition of such large phantom back-up
14 element.

15 I am also vitally concerned about security of
16 LAX for both passengers and employees. Using a very
17 simple blast radius analysis, it is clear that the
18 proposed CTA has a much higher concentration of
19 passengers on an hourly basis than does the current
20 dispersed terminal arrangement. Quantify the current
21 terminal arrangement results in a blast exposure factor
22 of approximately 1,509 passengers per hour while the
23 proposed passenger facility will result in an exposure
24 factor of 7,425 passengers per hour. I think that
25 increase in risk renders the proposed plan unacceptable

1 as defined. Thank you very much.

2 MS. SMITH: Steven Leffert, Don Schultz and Bart
3 Reed, please.

4 MR. LEFFERT: Good evening. My name is Steven
5 Leffert. I am a citizen, resident of Van Nuys. I live
6 approximately a half a mile of the other side of the
7 airport, of Van Nuys Airport.

8 I have been a frequent user and strong
9 supporter for the flyaway bus. I notice that that is
10 becoming an integral part of the plan. However, I have
11 not seen anything in the plan which does anything to
12 mitigate what will be the increased normal traffic on
13 the 405 from the San Fernando Valley to the airport.

14 Traffic gets worse every year. So even if
15 you're riding on a flyaway bus to the airport, it's
16 going to take longer and longer to get there. There
17 needs to be something in the part of the plan that will
18 mitigate some of that traffic on the 405 such as a
19 light-rail line, a monorail or completing the
20 carpool-buspool bus lane. Instead of having it end at
21 Wilshire Boulevard and creating monumental traffic jams
22 that back up into the Valley, complete that at least all
23 the way down to the airport. That's an issue that needs
24 to be addressed.

25 I also noticed in the plan it said something

1 about a clean burning fuel for the flyaway buses for 45
2 percent approximately. I think they should all be no
3 more diesels and all clean burning fuels for the buses
4 that are going to be used for the flyaway program.

5 Something that I couldn't get a clear answer
6 to here by going through all the charts, and all, had to
7 do with the safety issue and the checking in of the
8 luggage. I heard years ago that they were planning on
9 having the luggage check-in at the flyaway terminals and
10 putting it on secure buses, trucks, or whatever, to take
11 it to the airport, to separate the luggage from the
12 passengers at an earlier point.

13 That's not in the plan. Apparently what's in
14 the plan is just delivering the flyaway buses into the
15 CTA, or Central Terminal Area, with their suitcases
16 which would not have been screened prior, at least from
17 what I could tell in all the charts and graphs out
18 there.

19 So for the security issue I would like to see
20 something done with screening and checking the baggage
21 before you get on the bus.

22 And my other questions were answered by going
23 through the chart. Thank you.

24 MS. SMITH: Thank you.

25 Mr. Schultz, and then Mr. Reed. I would ask

1 you, Mr. Schultz, to spell your last name when you state
2 it, please. Thank you.

3 MR. SCHULTZ: Good evening, Don Schultz,
4 S-c-h-u-l-t-z, president of Van Nuys Homeowner's
5 Association, PO Box 3528 Van Nuys, 91407.

6 I would like to make it clear that I am
7 speaking for myself tonight as a community activist of
8 the San Fernando Valley.

9 Even though I am not a frequent LAX traveler
10 or visitor, I certainly understand Mayor Hahn's desire
11 to enhance safety and security needs for LAX.

12 Since 9-11, security for every major airport
13 in the U.S. must be emphasized. The Mayor needs support
14 and constructive input from all of us to ensure that
15 local airports are not easy prey for those cowardly
16 terrorists that are obsessed with destroying us.

17 That's all I have to say. Thank you.

18 MS. SMITH: Thank you.

19 Mr. Reed.

20 MR. REED: I'm Bart Reed, Executive Director of the
21 Transit Coalition, San Fernando Valley, Sylmar,
22 California. I'm going to pertain my remarks to traffic
23 and environmental mitigation issues.

24 One of the issues I do want to address, of
25 course, is the flyaway bus and the lack of connectivity

1 to public transportation in the San Fernando Valley.
2 Even though the flyaway bus exits the 405 Freeway at
3 Sherman Way, one, for example, from Sylmar would have to
4 take a bus for about two hours and four different buses.
5 However, buses don't run except for during 8:00 to 5:00
6 on the business day on Whitley, so you can't really get
7 there. That doesn't work. We need to do reworking of
8 the flyaway bus there. And in the future if you do any
9 flyaway terminal like in Sylmar, consult with the
10 community before you bring the plans out.

11 Also pertaining to the Green Line, I want to
12 suggest that the Green Line extension be north along
13 Aviation Boulevard, that it be included in the Final EIR
14 as an integral part of the locally preferred alternative
15 for real rail and traffic access to LAX.

16 We need intermodal solutions to traffic, not
17 just more freeway exits, not just more roadways. We
18 need to have a balance. By providing rail, we will
19 provide more of a balance and less of a need for some
20 amount of parking. I believe the airport has somewhere
21 around 58,000 employees that go. We need the mitigation
22 for the employees getting to the airport.

23 We would like to ask the FAA, Caltrans, the
24 LADOT and MTA to work together to approve in writing and
25 resolve all the issues on the Green Line route past the

1 airport.

2 We also urge that LAWA allocate enough funding
3 under the mitigation for preliminary design and
4 engineering to work on the Green Line alignment.

5 We'd also like to recommend that LAWA should
6 construct as part of its mitigation, including FAA
7 approval and oversight, the trench for the future Green
8 Line projected to be dedicated for the future of the
9 Green Line expansion along Aviation.

10 Also, while we're not exactly aware of the
11 exact security arrangements of the Intermodal
12 Transportation Center at Aviation and Imperial, if those
13 security arrangements are as good as those at the Ground
14 Transportation Center, we recommend that the Ground
15 Transportation Center be at the site that the Green Line
16 be extended to rather than constructing the people mover
17 from the Green Line Terminal to the Ground
18 Transportation Center.

19 And just to conclude. For cost-saving
20 purposes and true traffic pollution and environmental
21 mitigation, we recommend the Green Line continue all the
22 way to the Ground Transportation Center, which would
23 obviate the need for a separate and unnecessary
24 Intermodal Transit Center. Certainly a people mover can
25 be maintained on the east side of Aviation Boulevard

1 from the parking lots to the Ground Transportation
2 Center separate from the Green Line, and that we ask
3 that LAWA maintain --

4 (The timer beeped.)

5 MR. REED: -- well, LAWA may maintain that the
6 people mover could provide round-the-clock connections
7 from the Green Line to the central airport terminals via
8 an Intermodal Transit Center. We also mentioned the
9 rail service is available from 4:00 a.m. in the morning
10 and it concludes at 2:00 a.m. So we have a lot of rail
11 service. So we don't necessarily have to do the people
12 mover between the Green Line and the Ground
13 Transportation Center. Thank you.

14 MS. SMITH: Thank you, Mr. Reed.

15 John Spaulding. Pete Gerber after
16 Mr. Spaulding and then Mr. Brink.

17 MR. SPAULDING: My name is John Spaulding. That's
18 S-p-a-u-l-d-i-n-g. And I'm here on behalf of the
19 Operating Engineers. Our address is 150 East Corson,
20 C-o-r-s-o-n, Street, Pasadena, 91103. I'm also a
21 resident of Pasadena. But that's all right. I don't
22 think you need that address.

23 I'm here representing the Operating Engineers.
24 The Operating Engineers in Southern California represent
25 23,000 members. We are very supportive of Alternative

1 D. We are very appreciative of Mayor Hahn's position on
2 safety and security issues in Alternative D.

3 Our members want the assurance of LAX
4 continuing to be the most advanced and efficient airport
5 in this country. And, of course, the prospects of the
6 49,000 construction jobs is important. So is the
7 preservation of the 59,000 jobs that exist today at LAX.

8 The economic contributions to our economy is
9 enormous, so it behooves us to protect and expand our
10 position in the overall economics of our county.
11 Transportation in and around the airport are carefully
12 thought out and will solve a lot of the present problems
13 that exist.

14 In closing, the Operating Engineers are
15 supportive of Alternative D. Let's move forward.

16 Thank you.

17 MS. SMITH: Thank you.

18 Mr. Gerber. Did I pronounce that correctly?

19 MR. GERBER: That's correct. Good evening. My name
20 is Pete Gerber. I live at 2614 Greenleaf Court in
21 Simi Valley, California. I represent the Tile, Marble
22 Layers Local Union 18. And I'm here to show support for
23 our members and the progress of the expansion of the
24 airport.

25 Recently a trip that I made to LAX, the need

1 for safety and security right now is very important.
2 The people are walking up and down the curbs with the
3 traffic going by is a very dangerous situation and. I
4 believe there is the need for more safety. And I do
5 support LAWA's, along with the members, expansion of
6 this project and I'm looking forward to have it go
7 forward. Thank you.

8 MS. SMITH: Thank you.

9 Mr. Brink.

10 MR. BRINK: Charles Brink from Northridge,
11 California.

12 I have a problem with the design, basically,
13 because it creates a very threat-rich environment. By
14 concentrating all the people in one area, it creates a
15 horrendous biological threat problem because a small
16 amount of biological poison dispersed in the area to the
17 unchecked luggage arriving via the flyaway or the module
18 transportation areas could kill millions of people.

19 What needs to be done is expanding operations
20 like Van Nuys and providing security for the luggage and
21 security for the people and bring the material in in a
22 secured form already. This could reduce both traffic
23 congestion on the freeway and it would highly increase
24 safety because it would eliminate a threat-rich
25 environment where thousands and thousands of people are

1 exposed to unsecured material.

2 Even in the case of a monumental bus bomb,
3 we'll call that for lack of a better term, that could
4 even arrive within the clear area as a bus disguised.
5 Let's say a terrorist could sneak it in. They would
6 only damage one small terminal area. What you're
7 designing is an area for a maximum-kill area for people.
8 It's a bad design and should be immediately stopped.

9 I fully support the concept of extending the
10 Green Line into the point where people can arrive
11 because it is stupid not to bring it to the airport in
12 the first place. It was another monumental Los Angeles
13 failure in design.

14 But, again, I would urge you not to
15 concentrate the people in one place because that is a
16 disaster pending. And I would also urge you, even
17 though it's difficult, to add luggage check-in and
18 security to areas like Van Nuys flyaway and replicate
19 these all over the area. This way it would eliminate
20 the traffic on the freeway. It would eliminate the
21 parking around the airport, and it would substantially
22 eliminate the ability for a terrorist to bring a bomb or
23 a chemical weapon into the facilities that have been
24 through prescreening and check-in at that point.

25 I'm afraid that Mr. Hahn's idea to get this

1 working by providing this one monstrous place for people
2 to enter a killing field is one of the dumbest ideas I
3 have ever heard. Thank you.

4 MS. SMITH: Thank you.

5 Sergio Ramos. James Stewart after Mr. Ramos.

6 MR. RAMOS: Good evening. My name is Sergio Ramos.
7 And I'm a union representative of the laborers. I'm
8 here on behalf of my business manager of Laborer's Local
9 300. I'm here in support to make LAX safer.

10 Our 7,000 members that live here in the L.A.
11 area fly in and out of LAX. And it will create jobs for
12 our members and many other construction trade members.
13 And we're in support of the LAX Master Plan project.
14 Thank you.

15 MS. SMITH: Mr. Stewart.

16 MR. STEWART: Good evening. My name is James
17 Stewart. I live in Panorama City, and I'm vice chair of
18 the Van Nuys Airport Citizen's Advisory Council and
19 speaking only for myself tonight.

20 I agree with a lot of what is said. I think
21 this plan has some major flaws in the way it sits. The
22 safety issue of concentrating people, the many -- I
23 think the Green Line and also any other future mass
24 transit systems should go directly into the passenger
25 facility if you're going to have one.

1 And the passenger facility seems to me to be a
2 maximum inconvenience. You take your luggage out of
3 your car. You take it into the facility, put it on a
4 trolley. You take it on the train, take it off the
5 train, take it to check-in. It is a maximum
6 inconvenience, particularly for those who are elderly or
7 for the infirm, those that can't handle their own
8 luggage very well. This is a ridiculous idea. If we're
9 going to have a central terminal facility for passengers
10 to check in here, why don't we have a true remote
11 check-in at the GTC? So once you get to the GTC, you
12 dump your luggage and you're done with it.

13 The thing I'm most concerned about, however,
14 is the 78.9 annual passengers. This is part of a
15 regional plan. Well, not really because we don't have
16 any regional plan nor do we have any power to enforce a
17 regional plan if we had one. We have no ability to
18 force other airports to take more flights and we have no
19 ability to open new airports either in Orange County or
20 anywhere else around here. And we are going to have
21 some serious economic impact on this lack of activity at
22 LAX.

23 This facility should be designed for 100
24 million annual passengers, not 78.9. We should make
25 this a central facility on the West Coast. If that

1 means we have to do a lot more mitigation in the
2 communities, let's do it.

3 I grew up in Inglewood. I went to
4 Morningside High School. I lived with this airport for
5 the first 23 years of my life. It's a major economic
6 benefit, and we need to maximize it. Thank you.

7 MS. SMITH: Thank you.

8 Mr. Mike Ayre, Dennis O'Sullivan. And Mahala
9 Walter after that.

10 MR. AYRE: This is going to be short. My name is
11 Mike Ayre spelled A-y-r-e. I'm a resident of Van Nuys.

12 In short, I'm in full support of the Master
13 Plan Alternative D for the modernization of LAX. Thank
14 you.

15 MS. SMITH: Thank you. Dennis O'Sullivan, please.

16 MR. O'SULLIVAN: Good evening. Dennis O'Sullivan,
17 O, apostrophe, S-u, double L, i-v-a-n, Sherman Oaks,
18 California.

19 I want to speak in support of the
20 Alternative D. I, along with some of the other people
21 here who live in the Valley and have been spoiled by
22 flyaway for years, would suggest on mitigation of the
23 traffic, which we know grows worse daily on the 405,
24 would be to study the regional transportation that goes
25 into LAX, determine what ZIP Codes, what areas could

1 benefit from flyaway and create four or five additional
2 flyaways spread throughout the county. Those of us who
3 use it swear by it. It's the's easiest way to get into
4 the airport. And whether the baggage is scanned at the
5 flyaway or whether it's scanned at the preliminary
6 terminal, I think that we would mitigate some of the
7 safety concerns by doing it that way. Because to get
8 into a terminal where you have everybody coming in from
9 the flyaway from their car drop-offs, from the rental
10 car drop-offs, into one place does create an attractive
11 target.

12 But 9-11 has forced us to come up with this
13 plan versus A, B and C. And I think plan D meets the
14 needs. We want a world-class city and we're living in
15 an old-world infrastructure.

16 I fly, and I fly into airports and
17 transportation systems that really make us look like an
18 antique. The people movers work very well in Newark.
19 When you're going into there, it ties directly in with
20 port authority transportation. Yes, there is a lot of
21 people, but they seem to be able to deliver people to
22 the three airports there very effortlessly by tieing
23 together the public transportation and the people
24 movers.

25 So, again, I support Alternative D. Thank

1 you.

2 MS. SMITH: Thanks.

3 Mahala Walter. Did I pronounce it right at
4 that time?

5 MS. WALTER: Yes.

6 MS. SMITH: I'm so proud of myself.

7 MS. WALTER: Good evening. My name is Mahala
8 Walter, 7015 Sepulveda Boulevard, Westchester.

9 In reviewing the material for Alternative D,
10 the security improvements aren't nearly as substantial
11 as claimed by the proponents. Basically, it relocates
12 one spot to another.

13 If you were a terrorist wanting to shut down
14 Southern California's economy, what better target could
15 you be provided with than to change the airlines
16 passenger load, which is currently distributed around
17 nine different terminals. Change it to one site where
18 everyone for all flights are congregated for checking in
19 and dropping off at Manchester Square located one and a
20 half miles away from LAX, a huge facility called GTC, or
21 the Ground Transportation Center, adjacent to the 405
22 near the 105 exchange.

23 Passengers who do not use sky cap services may
24 carry their baggage on the automatic people mover to the
25 CTA, the Central Terminal Area, where screening is done

1 by the appropriate airline. Imagine spending all those
2 billions and have the luggage and the cargo arrive at
3 LAX without screening.

4 Last year I warned a couple of congressional
5 representatives that our own crazies could put timers on
6 the bombs in the luggage and send them through to the
7 CTA. Now, who would want to work there? This
8 underground luggage tunnel is due to start construction
9 in 2005. But the safety measures recommended by the FAA
10 for the runway and taxiways safety are not scheduled for
11 completion until 2015.

12 At the CTA the second level passengers'
13 security screening occurs. It is letting not only the
14 travelers, but meeters and greeters through to the CTA
15 without security screening. This is even less secure
16 than at LAX now where the meeters and greeters are not
17 allowed in secured areas.

18 Sounds like a Disneyland attraction to use the
19 people mover to funnel and increase the amount of people
20 into 200 additional businesses proposed by the Mayor
21 shifting money from existing businesses for the benefit
22 of increasing airport revenues. Thank you.

23 MS. SMITH: Thank you. At this time we don't have
24 any speaker cards filled out. We want to remind you,
25 we're here until 10:00 p.m. or longer, if necessary.

1 Please, if you have any comments you would like to make
2 orally, turn them in at the sign-in desk and we'll be
3 here to hear your testimony.

4 At this point we will take a ten-minute recess
5 and we will reconvene at 8:00 p.m.

6 (Recess was taken.)

7 MS. SMITH: We are about to reconvene this segment
8 of the public hearing. We have one speaker card in our
9 hands. If I could find that one speaker. Here he
10 comes. Give us a few seconds we're getting everybody
11 back up on the stage. I'm glad to hear you're back
12 here.

13 Our next speaker will be Mr. Charles Brink.

14 MR. BRINK: Again, I'm still from Northridge. My
15 comments now are relating to cargo jets, particularly
16 all cargo. I think they are an item that should be
17 pulled out of the LAX environment --

18 MS. SMITH: Excuse me, Mr. Brink. If I could ask
19 that the people in the back of the room hold their
20 conversation down. We're receiving public testimony
21 now. Excuse me, we're receiving public testimony right
22 now -- I'm going to allow you to start over Mr. Brink.
23 Thank you. I apologize.

24 MR. BRINK: No problem. Again, what I was saying is
25 to move the all-cargo aircraft operations to an airport

1 like Palmdale, for example. You'll be in Palmdale
2 tomorrow night. I'm sure you'll see lots of people
3 suggesting they could use a lot more traffic, and noise
4 isn't a problem for them.

5 But the cargo aircraft have no reason to land
6 in Inglewood, no reason to land in the west side because
7 cargo as it comes off the airplanes isn't used in the
8 area. It, for example, would fit better into an airport
9 like Palmdale or even San Bernardino or outlying points.
10 The cargo jets are the late night jets that tend to be
11 the noisiest. By moving that cargo aircraft out to the
12 area would have minimum impact, would still keep the
13 dollars in the L.A. County area and it would allow an
14 area that has an infinite room to expand to use its
15 airport.

16 Now, it seems the city does not want to expand
17 Palmdale because they claim there is no need for it.
18 But from my house in Northridge, I could get to Palmdale
19 any time of the day faster than I could get to LAX.
20 That's another issue.

21 I would like to encourage you to think cargo,
22 the big cargo planes, is to take them to Palmdale into
23 an area that they are not bothering the environment.
24 Their trucks aren't producing congestion. Their cargo
25 isn't a risk for, again, passengers because that cargo

1 even next to the cargo areas could contaminate cargo
2 loading into the passenger aircraft. Those are
3 bioterrorism issues.

4 So separate the cargo by loading it into a
5 safe place like Palmdale. It would be a solution to
6 reduce traffic and reduce terrorism issues, and it would
7 provide increased capacity for LAX because by removing
8 all the cargo-only aircraft from the facility, it could
9 add more traffic to the airport. Thank you.

10 MS. SMITH: Thank you. Are there any other audience
11 members wishing to speak?

12 At this time we don't have any completed
13 speaking cards in our possession, but we would like to
14 remind you that our workshop is still open. Please
15 visit the workshop and take the opportunity to speak
16 with our consultants if you have some questions that can
17 be answered before you fill out your speaking card.
18 Take the opportunity to do. So we will be here until
19 10:00 p.m., and we are here to take your testimony. We
20 will take another break until 8:15. Thank you.

21 (Recess was taken.)

22 MS. SMITH: Good evening, we still don't have any
23 speaker cards filled out. And we're until 10:00 p.m.
24 awaiting your speaker cards please take advantage of
25 this opportunity. We'll continue our recess and

1 reconvene at 8:45.

2 (Recess was taken.)

3 MS. SMITH: We're still in recess. We're waiting
4 for sign-in cards to be completed. We're here until
5 10:00 p.m. And until we get a sign-in card, we'll
6 remain in recess.

7 (Recess was taken.)

8 MR. KESSLER: Is there anyone else who has not had
9 an opportunity to speak concerning the information in
10 the Draft Environmental Impact Statement/Environmental
11 Impact Report?

12 Not seeing anyone else, I will remind you that
13 if you feel you are unable to provide us with verbal
14 comments today, we will be accepting written comments
15 now at 5:00 p.m. Pacific Standard Time, Friday, November
16 7th, 2003. You could mail your comments either to me at
17 the FAA or to Jim Ritchie with LAWA. The mailing
18 addresses are listed on the cover of the EIS/EIR.

19 I want to thank everyone for your comments
20 today. This public hearing for the Supplement to the
21 Draft EIS/EIR on the Los Angeles Airport Master Plan is
22 now closed. Thank you.

23 (Whereupon the proceeding adjourned
24 at 10:00 o'clock p.m.)

1 **APPEARANCES OF FACILITATORS:**

2 SHAUNA BAIN SMITH, Public Affairs Director for the
3 Lee Andrews Group

4 DAVID KESSLER, Airport Planner for the Federal Aviation
5 Administration

6 JIM RITCHIE, Deputy Executive Director for the
7 Los Angeles World Airports

8 **APPEARANCES OF PUBLIC SPEAKERS:**

- 9 1. MAYOR JIM ALDINGER, Mayor of the City of
10 Manhattan Beach
- 11 2. MIKE BONIN, Deputy Chief of Office Staff to
12 Congresswoman Jane Harman
- 13 3. FRED STEINER, Representing P.I.P.E.
- 14 4. BARRY KURTZ, Representing the County of Los Angeles
- 15 5. STEVE MORRIS, Representing Himself
- 16 6. E.E. WANG, Representing Herself
- 17 7. ROY HEFNER, Resident of L.A. Representing Himself
- 18 8. PETE MAKONI, Representing Himself
- 19 9. JOE SCAVO, Representing Pipe Fitters in the Community
- 20 10. JOSE LUIS ESPINOZA, Representing Himself
- 21 11. FREDDY CORREA, Representing Pipe Fitters Local 250
- 22 12. MS. CHRIS MILLER, El Segundo Resident
23 Representing Herself
- 24 13. JOHN RUIZ, American Airlines Aircraft Maintenance
25 Technician Representing Air Transport Local 564
14. JOHN BARRIAGE, General Counsel for Ground Passenger
Carrier's Association
15. CLEVELAND BROWN, With Inglewood Democratic Club,
Representing Himself

1 **APPEARANCES OF PUBLIC SPEAKERS CONTINUED:**

- 2 16. CECIL CARPIO, Resident of Inglewood
3 Representing Herself
- 4 17. MAYOR MIKE GORDON, Mayor of the City of El Segundo
- 5 18. RICHARD SLAWSON, Representing L.A. and Orange County
6 Building & Construction Trades Council
- 7 19. WILLIAM SPILMAN, Representing Himself
- 8 20. PIEDMONT BROWN, Representing Union Ironworkers of
9 Local 433
- 10 21. JAMES FERGUSON, Representing the Sands Complex
- 11 22. RANDALL HARTMAN, Quality Assurance Inspector for
12 American Airlines
- 13 23. TERRY MARTIN, Representing Local 250 Steamfitters
- 14 24. ELIZABETH KUNKEE, Representing Herself
- 15 25. JONATHAN WALRIGHT, Inglewood Resident
16 Representing Himself
- 17 26. ROBERT KROPP, Manhattan Beach Resident
18 Representing Himself
- 19 27. DIANE SAMBRANO, Resident of Inglewood
20 Representing Herself
- 21 28. ERIC JACKSON, Representing Himself
- 22 29. JACK KENTON, With LAXAAC Representing Himself
- 23 30. ROY HEFNER, Resident of L.A. Representing Himself
24 (Speaking a second time.)
- 25 31. BOBBY BLANKS, Office of Congresswoman Maxine Waters
- 26 32. BOBBY BLANKS, Office of Congresswoman Maxine Waters
27 (Speaking a second time.)
- 28 33. BRIAN WEIS, Resident of L.A. Representing Himself
- 29 34. BRIAN WEIS, Resident of L.A. Representing Himself

2 6:00 O'CLOCK P.M.

3 ---oOo---

4
5 MS. SMITH: Good evening, ladies and gentlemen. On
6 behalf of the Federal Aviation Administration and
7 the Los Angeles World Airports, I would like to welcome
8 you to the seventh in a series of public hearings that
9 we're holding to receive your testimony on the
10 Los Angeles Airport Master Plan, Environmental Impact
11 Statement and Environmental Report.

12 My name is Shauna Bain Smith. I will be your
13 facilitator this evening. These two gentlemen to my
14 right will be receiving your testimony. And before we
15 begin the formal process, they have a few introductory
16 remarks.

17 I will start with Mr. David Kessler. He's
18 here from the Federal Aviation Administration.

19 Mr. Kessler.

20 MR. KESSLER: Thank you. Good evening, ladies and
21 gentlemen. My name is David Kessler. I'm the
22 Environmental Protection Specialist for the Airports
23 Division of the Federal Aviation Administration,
24 Western-Pacific Region.

25 I would like to welcome you to the seventh of

1 a series of public hearings the FAA and Los Angeles
2 World Airports, or LAWA, are conducting on the
3 Supplement to the Draft Environmental Impact
4 Statement/Environmental Impact Report, or EIS/EIR, for
5 the proposed Master Plan at Los Angeles International
6 Airport.

7 The Supplement to the Draft EIS/EIR addresses
8 an additional Alternative, Alternative D, the Enhanced
9 Safety and Security Plan that was added in the fall of
10 2001. This new alternative was added as a result of
11 comments submitted on the 2001 Draft EIS/EIR and the
12 terrorist attacks that occurred on September 11th, 2001.

13 The Notice of Availability of the Supplement
14 to the Draft EIS/EIR was published in various local
15 newspapers and in the Federal Register on Friday, July
16 11, 2003. The FAA and LAWA are the authors of the
17 Supplement. The Federal Highway Administration is also
18 a cooperating agency in the preparation of the Draft
19 EIS/EIR that was published in January 2001.

20 The purpose of these hearings is to collect
21 comments from the general public concerning the adequacy
22 of the information disclosed in the Supplement to the
23 Draft EIS/EIR on the proposed Alternative D.

24 I would like to take this opportunity to make
25 sure that everyone understands that no decision will be

1 made today regarding the proposed project. Today's
2 hearing is not a question-and-answer type of forum. Our
3 job is to listen to what you have to say about the
4 adequacy of the information in the Supplement to the
5 Draft EIS/EIR. In other words, it's your turn to talk
6 to us. Since we are here to listen, we are not going to
7 respond to questions about the pros and cons of the
8 proposed project.

9 Since 5:00 this afternoon we have held a
10 public workshop down the hall outside of this room for
11 anyone to ask questions about the Master Plan, the
12 environmental process and the various proposed projects.

13 Following publication of the Supplement to the
14 Draft EIS/EIR for review and comment, the next step in
15 the joint Federal and State environmental disclosure
16 process is holding this and the other public hearings
17 beginning last week and continuing through this week.

18 I would like to take the opportunity to recap
19 the environmental disclosure process for this project.
20 The environmental evaluation for the LAX Master Plan
21 began in 1997 with the publication of a Notice of Intent
22 to prepare the joint EIS/EIR in the Federal Register.
23 In July of 1997 we held a series of meetings with
24 members of the public and governmental agencies to
25 receive comments on the scope of the Draft EIS/EIR.

1 Following those meetings, the Draft EIS/EIR was
2 published in January 2001.

3 Both the 2001 Draft EIS/EIR and the 2003
4 Supplement have been prepared pursuant the National
5 Environmental Policy Act of 1969, or NEPA, the Council
6 on Environmental Quality Regulations, which are the
7 implementing regulations for NEPA, the California
8 Environmental Quality Act of 1970, or CEQA, and the
9 Airport and Airway Improvement Act of 1982, as amended.

10 Following today's hearings and the close of
11 the comment period, we will then correct and revise the
12 EIS/EIR, as necessary, based on the comments received.
13 We will also prepare responses to the comments we
14 receive and include those responses along with those
15 that were submitted to the FAA and LAWA on the 2001
16 Draft EIS/EIR into the Final EIS/EIR. The information
17 contained in the Supplement will also be combined with
18 the information in the 2001 Draft EIS/EIR into the Final
19 EIS/EIR.

20 Before we begin receiving verbal comments, we
21 would like to let you know the ground rules of this
22 hearing. First, as I said earlier, we are not here to
23 respond to questions about this project. We are here
24 only to listen to your comments and take notes. We
25 also have a court reporter here to ensure that we have

1 an accurate transcript of this hearing.

2 For anyone who would like to speak, we ask
3 that you fill out a speaker card, like this one that is
4 available, and give it to one of the people at the
5 sign-in desk. The card will then be brought up here to
6 our facilitator who will call the names of each speaker
7 so we can proceed in an orderly fashion.

8 So that everyone has an opportunity to provide
9 verbal comments, everyone will get three minutes to
10 speak. To be fair to everyone, we are not going to
11 allow people to transfer their allotted time to someone
12 else. I ask that when you speak, you give us your name
13 and address for the record. We also have a Spanish
14 language translator available for anyone wishing to
15 provide comments in Spanish.

16 If there is anyone who is uncomfortable
17 speaking in front of a group or if you need more than
18 three minutes to provide your verbal comments, we ask
19 that you provide your comments in writing. We have
20 comment sheets available for your use at the sign-in
21 desk. You can leave your comments at the sign-in desk
22 or you can mail your written comments using the comment
23 sheet or a letter to either address listed on the cover
24 of the EIS/EIR.

25 I would like you to understand that a verbal

1 comment is just as important as a written comment. So
2 please feel free to provide any comments on the document
3 you may have to us either verbally today or in writing.

4 On August 1, 2003, LAWA asked the FAA to
5 extend the public comment period to a total of 120 days.
6 FAA has agreed to LAWA's request. FAA has asked the
7 U.S. Environmental Protection Agency to publish a notice
8 announcing the extension to the public comment period in
9 the Federal Register. FAA and LAWA will also publish a
10 notice of the extension in the local newspapers of
11 general circulation. Therefore, comments on the
12 Supplement to the Draft EIS/EIR are now due by
13 5:00 p.m. Pacific Standard Time, on Friday, November 7,
14 2003.

15 Lastly, I would like everyone to understand
16 that even though we have this hearing scheduled until
17 9:00 this evening, we will stay here as long as
18 necessary for everyone to get a chance to provide verbal
19 comments on the Supplement to the Draft EIS/EIR. As I
20 said earlier, our job here today is to listen to your
21 comments.

22 At this time I will ask that everyone in the
23 room take a moment and turn off your cell phones and
24 pagers to be courteous to those people making verbal
25 comments at tonight's hearing.

1 Now I will return the hearing back to our
2 facilitator who will introduce Mr. Jim Ritchie, who will
3 provide some introductory comments from LAWA. Following
4 Mr. Ritchie's comments, we will collect the speaker
5 cards and call the name of the first speaker.

6 Thank you.

7 MS. SMITH: Thank you, Mr. Kessler. Our next
8 speaker is Mr. Ritchie who is Deputy Executive Director
9 of Los Angeles World Airports.

10 Mr. Ritchie.

11 MR. RITCHIE: Thank you, Ms. Smith. I'm Jim Ritchie
12 from L.A. World Airports. And we welcome you here
13 tonight to Manhattan Beach for the purpose of this
14 public hearing. This is number 7 in a series of 12 and
15 for the purposes of consistency, I'll read my brief
16 comments into the record.

17 You may recall the public hearing process that
18 we were in in 2001 while we were re-examining other
19 alternatives for the modernization for LAX at that time.
20 The tragic events of 2001 and the leadership of Mayor
21 Jim Hahn have reshaped our environmental process. The
22 mayor's pressing concerns for safety and security have
23 provided new guidance along with the public comments
24 that we received during that time frame from January to
25 November of 2001.

1 You are here tonight primarily to provide
2 comments on that new Alternative referred to as
3 Alternative D. This is a supplement to the existing
4 environmental process, and it has undergone the same
5 rigorous environmental analysis as the others.

6 We are here tonight to receive your comments
7 on the new safety and security plan and its impact as
8 disclosed in the Draft EIS/EIR.

9 So with that, welcome again. And Shauna,
10 let's go to work.

11 MS. SMITH: Again, my name is Shauna Bain Smith. I
12 will be your facilitator this evening. As I'm battling
13 a cold, I'm going to need your help to do this. My
14 reflexes are kind of slow tonight.

15 We do have a time clock up here. And this is
16 going to help us to make sure that everyone gets to
17 enter their comments in a timely and orderly fashion.
18 While these two gentlemen will be receiving your
19 testimony, I'm just here to man the clock and make sure
20 everyone gets their comments in the same amount of time.

21 When you see the green light turn on, that's
22 when your three minutes will begin. It will not begin
23 until after I receive your name and address. So I ask
24 when you approach the mic after I called your name, you
25 give your name and address, if you wish, and you spell

1 your last name so the court reporters can have it
2 clearly in the record, and speak as slowly and clearly
3 as possible.

4 For those that are going to be using our
5 Spanish interpreter today, you will get six minutes
6 instead of the three, or as long as it takes for our
7 interpreter to interpret into English your comments to
8 us. I wanted to let everyone know that in case you
9 wonder why there is extra time on the clock.

10 When you see the yellow light blink, that
11 means you have 30 seconds left of your three minutes, or
12 six minutes. At that time I suggest you start wrapping
13 up your remarks. When the red light blinks, you'll also
14 hear a beep tone. At that time we're going to have to
15 ask you to close your remarks out. We won't be rude
16 about it, but at that time we'll need you to stop. I'll
17 call on three names at a time just so you know when to
18 start preparing. With that, we can begin.

19 Our first speakers will be Jim Aldinger, Mayor
20 Aldinger. Did I pronounce that correctly?

21 MR. ALDINGER: "Aldinger."

22 MS. SMITH: "Aldinger." And after Mayor Aldinger,
23 we'll have mayor Mike Gordon and David Fein.

24 MAYOR ALDINGER: Yes. Thank you. Welcome to
25 Manhattan Beach. I am the Mayor of Manhattan Beach.

1 Thank you guys for coming down here.

2 I have several concerns about the plan. The
3 first would be that I don't think there is enough
4 options on the table. I think there needs to be other
5 options. I think security, I think you guys are trying
6 address a security issue, but I don't think there is
7 enough options. I think with the normal EIR process
8 there would be three or four options. And some of those
9 would address security. And some would address other
10 things. But, obviously, security is a big issue.

11 My other question is, are other airports -- I
12 know I'm not supposed to ask questions, but are other
13 airports in the country doing this kind of thing, JFK,
14 other airports? Is the Federal Government involved with
15 this? Is the Homeland Security Department involved with
16 this? Have we consulted with them? Is this the right
17 thing to do? I know Harman's people have come out and
18 commissioned the report with RAND. And they've said
19 there was definitely problems with this as far as
20 security goes. So I think that definitely needs to be
21 addressed.

22 The issue of cost. For me \$9 billion dollars
23 and growing is a driver that we need to address. There
24 are a lot of other things we need to do around here as
25 far as with money. I think \$9 billion dollars is a

1 significant amount of money to be spending. There are
2 definitely traffic improvements we can do around the
3 airport as far as running the Green Line in there, doing
4 freeway interchanges, those kinds of things. I'm not
5 opposed to that kind of thing. I think those are good
6 things that we should be doing. But whether we need to
7 tear down three terminals is a big, big driver to me.

8 And then I think as far as the issue of
9 expansion and whether this will be expanding the airport
10 and increasing the capacity, I think ultimately it will
11 expand. I think you're doing some things that make it
12 easier to expand the airport. I think putting in the
13 bigger planes and separating the runways for bigger
14 planes is a concern that I know we have here in
15 Manhattan Beach as far -- because it generates so much
16 traffic and generates such an impact to our community.

17 And I think we had the same issues with the
18 traffic impacts and the fact that you guys didn't go far
19 enough south with your traffic. I mean, you guys have
20 not picked up Rosecrans. You guys have not picked up
21 several streets in our area on the 405 interchanges
22 further to the south that I think a lot of people come
23 up from Orange County. And if the impact -- if the
24 airport expands -- I know the mayor said it won't, but I
25 think we need to continue to look at that.

1 Overall, I think there needs to be more
2 options and more input from other people on security.
3 Thank you.

4 MS. SMITH: Thank you. Mayor Mike Gordon. David
5 Fein. Mr. Fein. Mike Bonin or "Bonin?"

6 MR. BONIN: "Bonin."

7 MS. SMITH: "Bonin."

8 MR. BONIN: Good evening. I'm Mike Bonin,
9 B-o-n-i-n. I'm Deputy Chief of Staff to Congresswoman
10 Harman. Do you need her office address? 2321 East
11 Rosecrans, El Segundo, 90245.

12 First of all, on behalf of the Congresswoman,
13 welcome the 36th District. We're glad to see you here
14 throughout the district. And congratulations to
15 everyone here from the various communities in the South
16 Bay who turned out tonight to give their voices to the
17 public process. We really appreciate that.

18 Just to be clear, I want to state from the
19 very beginning that Congresswoman Harman is very much in
20 favor, as many of the T-shirts say here, of fixing
21 Los Angeles International Airport. But she's very
22 determined that it be fixed right. That's as equally
23 important a factor as fixing it now. And Congresswoman
24 Harman applauds Mayor Hahn and applauds Los Angeles
25 World Airports for the intent of Alternative D, which is

1 to make Los Angeles International Airport safer and more
2 secure for the passengers, for the many people that work
3 there and for all the people that live in the South Bay
4 area.

5 Where she finds fault, however, is with the
6 execution of Alternative D. As most people know, she
7 commissioned the RAND report a few months ago, which
8 raised very serious concerns about the configuration
9 outlined in Alternative D. We'll submit a letter later.
10 And I'm sure you're quite familiar with the RAND report.
11 It's deeply concerned with the centralized features of
12 Alternative D and with what effectively we're afraid
13 puts a big red X on Los Angeles International Airport
14 and says to Al-Quida, "Attack here."

15 The RAND study, some of the concerns raised by
16 the RAND study, have been raised again by the concern of
17 the County Board of Supervisors, the study of the County
18 Board of Supervisors had before them earlier this week,
19 which we'll see again on Saturday, the study is by A.C.
20 Lazzaretto and Associates which that the security
21 proposals in Alternative D are short in detail and often
22 contradictory.

23 And I must say that Congresswoman Harman and
24 many of her constituents were alarmed by some of the
25 reports we saw this week in the press, the Daily News

1 story by Rick Orlove which indicated that many of the
2 security features key to Alternative D aren't in place
3 yet.

4 Congresswoman Harman is the member of the
5 Select Committee on the Intelligence in the House. As
6 in that capacity, she's very well aware of the various
7 threats to our national security. For her fixing LAX in
8 a way that we are not subject to attacks, and the safety
9 and security and the economic engine of Los Angeles and
10 Southern California are not in constant jeopardy, there
11 has got to be a number one priority. She is committed
12 to working with anybody in working on getting a plan
13 that does that. She's very concerned that so far
14 Alternative D is not that plan. Thank you.

15 MS. SMITH: Thank you. Mr. Fred Steiner. And after
16 that Andrew Shaddock, please.

17 MR. STEINER: Good evening. My name is Fred
18 Steiner, S-t-e-i-n-e-r. My address is 9778 Summer Hill
19 Road, Rancho Cucamonga, California. I'm the Assistant
20 Executive Director of P-i-p-e. Pipe is a labor -- Labor
21 Management Cooperative Committee who represents over
22 14,000 members, union members, and over 600 union
23 contractors in Southern California.

24 I'm here tonight in support of Alternative D,
25 improvements of LAX. The Pipe Trades of Southern

1 California would enjoy the benefits in taking part of
2 the work in the jobs that are projected with the 49,000
3 construction jobs for the expansion. But I would like
4 tonight to speak about -- speak from the perspective of
5 a consumer.

6 My family, my friends and myself and just
7 about everyone I know would rather take a beating right
8 now than to fly out of LAX. I know people, friends of
9 mine that would drive 50 miles plus, do two layovers to
10 fly back east than to fly out of LAX. And I think this
11 is indicative of what's happening right now. The major
12 concern of the people that I know are security,
13 especially since 9-11. I have reviewed the Alternative
14 D proposals, and I believe these issues are driving
15 customers away from LAX. And they would be addressed by
16 the completion of this project.

17 Also, again, I applaud Mayor Hahn and the
18 people from the World Airports for bringing forth these
19 proposals. And we are in favor of it. Contractors and
20 members of the Southern California Pipe Trade are in
21 favor of Alternative D. Thank you very much.

22 MS. SMITH: Thank you. Andrew Shaddock, please.
23 Barry Kurtz. Steve Morris. My batting average is not
24 doing well tonight.

25 MR. KURTZ: Good evening. I'm Barry Kurtz

1 representing the City of Los Angeles tonight. I work
2 for the County Department of Public Works, 900 South
3 Fremont, Alhambra, 91803.

4 Thank you for the opportunity of providing
5 input into the LAX Master Plan improvements. I've
6 submitted three copies of preliminary comments from A.C.
7 Lazzaretto & Associates. They are the consultant for
8 the County. Attachment I is Mr. Lazzaretto's comments,
9 and Attachment II are comments by the County Department
10 of Public Works.

11 (The document submitted for the
12 record was marked as Statement 1
13 and is attached hereto.)

14 MR. KURTZ: The Board of Supervisors has approved
15 these comments to be addressed to LAWA and FAA. For
16 brevity, I'll summarize these comments. The first set
17 of these comments are from A.C. Lazzaretto.

18 First, the proposed Master Plan Alternative D
19 may not constrain growth at LAX.

20 The second, airport security may not be fully
21 achieved by Alternative D. Environmental justice may
22 not be well-served by Alternative D. The baseline year
23 of 1996 is not adequate for 2003 assessment. The
24 no-project alternative does not offer a consistent
25 yardstick for measuring project impacts. Traffic, noise

1 and air quality impacts have been shifted eastward.
2 Major changes in the project may call for the
3 preparation of a comprehensive revised EIR/EIS.

4 And, finally, growth inducing impacts may be
5 significantly greater than stated.

6 The next two comments came from the County
7 Department of Public Works. First one; a new
8 interchange for the 405 Freeway at Lennox Boulevard is
9 recommended as a mitigation measure if Alternative D is
10 chosen. Additional traffic improvements may be needed
11 to fully mitigate the impact of Alternative D. There
12 may be some intersections that we believe should be
13 covered that weren't.

14 The county will formally submit these comments
15 by mail. And that concludes my presentation.

16 MS. SMITH: Thank you. Steve Morris, please.

17 MR. MORRIS: Steve Morris, M-o-r-r-i-s, 95 Crest
18 Drive, Manhattan Beach, 90266.

19 As a resident of South Bay and a frequent user
20 of LAX, I think we all remember pre-9-11 and the
21 congestion and the delays in the ability to get home to
22 our family back in the South Bay and also to depart. We
23 want to make sure those things don't happen again. As
24 we take the opportunity now to provide better efficiency
25 in a secured environment as a post 9-11, I think this is

1 a great opportunity.

2 I'm in support of the Alternative D. I think
3 it helps provide efficiency in an existing constrained
4 airport. It provides transportation, release for the
5 traffic jams that are now that provide access off the
6 105 and the 405. It spreads out. The access to the
7 airport through the people mover, which I think every
8 airport in the world has become more modernized with the
9 people mover, and it is time that LAX does that as well.

10 As well as the Green Line, mass transit, which
11 is a new concept, especially for the west side of L.A.
12 I think the opportunity to get on the Green Line on
13 Rosecrans and be able to get into the airport without
14 getting into a car I think is great for pollution and
15 traffic. I think those are opportunities that we need
16 to take right now.

17 And as traffic does come back, as post-9-11,
18 and the economy recovers, I think it's an opportunity we
19 should take right now to provide those services not only
20 to the South Bay, but to the whole economy of
21 Los Angeles. Again, I support Alternative D.

22 MS. SMITH: Thank you. E.E. Wang, Roy Hefner and
23 then Pete Makoni.

24 MS. WANG: Hi. My name is E.E. Wang. It's spelled
25 W-a-n-g. I live at 1821 Pacific Coast Highway, Number

1 47, Hermosa Beach, California 90254.

2 I am not totally in support of Alternative D.
3 I think that it is difficult for me to support it
4 because there is lack of alternatives that are
5 comparable to it at this point. It is basically being
6 compared to proposals that were made several years back.
7 And there has been no -- there has been nothing else
8 that has been put on the board. I think there are good
9 elements to it, but I am also concerned about several
10 factors that are being proposed. One is the cost. It
11 is going to cost us \$9 billion dollars to basically
12 achieve very little capacity gain, I mean, 200,000 more
13 passengers that we will be able to process a year
14 compared to if we did nothing.

15 The centralized design, which is deemed as
16 enhanced safety and security I think is unproven. As
17 far as I know, there is nothing out there that this has
18 been compared to where we could see there is really some
19 added benefit other than making my commute into the
20 airport probably about 30 minutes longer.

21 And, finally, I actually was walking around.
22 In the exhibits you have I noticed you put up a nice
23 board saying how it was going to be funded. I notice
24 one big word that put a red flag up for me was "Bonds."
25 I know that bonds don't come out of the sky. They come

1 from taxpayers voting on them.

2 I think before we proceed with Alternative D,
3 we need to look at what other options are out there that
4 are comparable to Alternative D and whether they are
5 more cost-effective, especially in an economy where the
6 airline industry is in financial crisis. If we want
7 them to pick up the tab, we better make sure it is
8 affordable for them. Thank you.

9 MS. SMITH: Thank you. Roy Hefner.

10 MR. HEFNER: Roy Hefner, H-e-f-n-e-r, 6548 West 80th
11 Place, Los Angeles 90045.

12 I spoke to the group Monday evening at
13 Inglewood and emphasized at that time the safety aspect
14 of the relocation of the runways. Tonight I have a
15 couple of other items. I'm not dealing with the total
16 picture. I'm dealing with certain individual activities
17 and information that is in the EIR.

18 Number one, I think you're aware for the first
19 time since the Berkeley decision that now we're talking
20 about single event noise as having an impact, and that
21 could also be used for the purpose of noise sound
22 insulation of various areas surrounding LAX even though
23 they may not be in the 65 CNEL contour.

24 One of the things that disturbs me about the
25 single event noise level is that they are talking about

1 94 DB as the outside factor that's going to wake
2 somebody up. According to your own particular diagram,
3 a 94 DB would be the same as being three feet away from
4 a gas lawn mower. I think you could indicate or you
5 will indicate that that certainly is going to be less
6 than is necessary to wake somebody up. The interior
7 noise was going to be 81. That's with the -- with the
8 windows open.

9 I would encourage you whether or not
10 Alternative D is accepted or not accepted you look very
11 seriously into the noise mitigation situation as far as
12 noise insulation is concerned.

13 Another specific item, it talks about the
14 various improvements that were made in facilities from
15 1997 to 2000. We happen to know that there were
16 improvements made from 1988 to 1997 because in 1986 that
17 was the end of the first EIR of 40 million annual
18 passengers. And then you started off with the -- with
19 the new EIR process, which took many side roads. But
20 you have seven listed there. I would like for you to
21 include in your EIR all the other improvements that were
22 made at LAX which assisted in allowing LAX to go from
23 40 million annual passengers to 67 and a half million
24 annual passengers.

25 Very important. We have remote gates set up.

1 This is one of the positive features of Alternative D.
2 You go from 163 to 153 as far as gates are concerned.
3 I'm not going to deal with that as such, but I want to
4 go ahead and point out that we have nothing in there
5 that deals with cargo planes, the elimination of cargo.
6 However, we plan on increasing the amount of cargo over
7 the period of time by 50 percent. So we want to be
8 alert to that.

9 I mentioned Monday night at the very end and
10 at the very end now. Phase I of your particular
11 program, you're going to construct the Ground
12 Transportation Center. You don't own it. How are you
13 going to do all of those things without owning and
14 building at Manchester Square? Thank you.

15 MS. SMITH: Thank you. Pete Makoni.

16 MR. MAKONI: Pete Makoni. Last name M-a-k-o-n-i,
17 4345 Rosecrans Avenue, Hawthorne. I live in this
18 community close to the airport.

19 First security, safety, security and economic
20 for the neighborhood, for L.A. It's not only for
21 construction workers, but for all people. Everybody
22 want to come to L.A. They want to come to the City of
23 Angel. That's why they want to come down. From Japan,
24 Korea, they all want to hit L.A. L.A. is the place
25 where everybody want to come into.

1 We hear the tragedy, people coming from
2 overseas. They try to get here, you know, on the cargo
3 plane, try to stow away to get here. That's not the
4 point. We need to expand LAX.

5 The runway is not big enough for all the
6 airplanes to take off and to land in it. Also, LAX we
7 need to expand. People can get a job. All the
8 community have a job for all race. They want to work in
9 there. They have a job. A lot of people, everybody to
10 work in LAX. Also, we need to fix LAX right now. Thank
11 you.

12 MS. SMITH: Thank you. Joe Scavo. And after
13 Mr. Scavo we're going to have Jose Luis Espinoza.

14 MR. SPEAKER: Good evening. My name is Joe Scavo.
15 The last name is spelled S-c-a-v-o. I'm one of the
16 business reps with the pipe fitters here in Los Angeles.
17 And I'm speaking on behalf of hundreds of pipe fitters
18 who live in and around this community. I'm taking the
19 microphone tonight to speak in favor of the LAX Master
20 Plan Alternative D for several reasons.

21 Number one, it's needed. I used LAX twice
22 last week. And anything they do to improve it, I'm
23 going to be 100 percent behind, anything. The
24 Alternative D is a vast improvement of what we have
25 there now.

1 Also, I strolled around outside and read some
2 of the brochures and I read other things before coming
3 here tonight. And I could see that safety and security
4 are one of the number one issues that is repeated time
5 and time again. And I believe it. Due to 9-11, I think
6 it's a no-brainer. LAX needs to be revised regarding
7 security and safety.

8 Also, one of the posters outside, a speaker
9 before me mentioned had to do with funding. There is
10 also something else on that poster that I saw that
11 looked promising to me. It said it's going to all be
12 done without general fund money. I think that's an
13 important note. So I support it for that reason, too.

14 Also, this facility, Alternative D has a lot
15 less congestion in mind. There is a fellow kind of
16 pointing out the charts out there giving an outline of
17 what they have in mind. I really support it.
18 Everything I saw takes what is there now and takes
19 congestion out of it. The idea of putting the parking
20 away from the airport and hooking up these monorails, I
21 think that's fantastic. We need modern things like that
22 in Los Angeles. Like this one gentlemen said, everybody
23 in the world wants to come here. I was in Detroit last
24 week. They've got those monorails in their airport. I
25 think L.A. needs those, too.

1 Also, efficiency. I think it's an important
2 point. Alternative D offers a lot more efficiency, a
3 much more efficient facility. Not just congestion for
4 people, cars, but for the smog levels. What I
5 understand, you take Alternative D versus what we have
6 now, the same amount of planes, the same amount of
7 traffic. With Alternative D you're going to end up with
8 less smog. And I support that.

9 Well, go read the papers that I read, and then
10 whatever you want to get up and say when it's your turn,
11 ma'am.

12 Lastly, I'm also up here to support
13 Alternative D and this whole LAX Master Plan because of
14 the 49,000 construction jobs that have been reported.
15 Since 9-11 the economy for pipe fitters in Los Angeles
16 has gone very bad. We need the work. We need the jobs.
17 We live in this community. We pay our taxes in this
18 community. We pay the bonds in this community. We
19 dreadfully need these construction jobs. And I
20 wholeheartedly support this Master Plan, Alternative D.
21 Thank you.

22 MS. SMITH: Thank you. Before we have our next
23 speaker come up, I wanted to mention a couple of things.
24 First of all, if you're reading from prepared remarks,
25 if you could turn those into our court reporters or you

1 could bring them up to me. I would appreciate it
2 because it would help us get those remarks on the
3 record. Or if you referenced some brochures or
4 something you were referencing when you were speaking,
5 if you could turn those in to me or the court reporters,
6 I would appreciate that as well so we could add that in
7 the record.

8 Also, when others are speaking, I would
9 appreciate it if we refrained from talking over them or
10 speaking. We want everyone to have a fair opportunity
11 to get their comments in. And, also, I wanted to remind
12 you to keep your pagers and cell phones off.

13 Mr. Espinoza, please.

14 (Mr. Espinoza's testimony is being translated
15 through the use of an interpreter.)

16 MR. ESPINOZA: Good afternoon. My name is Jose
17 Espinoza. I live at 10310 South Grevillea Avenue. My
18 point of view is the reason that I am here. We live
19 close to the airport, about five minutes away. I want
20 to expose my complaint.

21 I live exactly right on the flight path where
22 the airplanes land. The airplanes make too much noise
23 all day long and part of the evening. My wife is now
24 suffering from insomnia and she can't sleep. I am also
25 a person that works at the airport and I support my

1 family through that work. I am not in favor or against
2 the airport. I'm a neutral person because I work there.
3 The only thing I ask is that you look out for the people
4 that live close to the airport and protect them. And,
5 also, the airplanes leave a real bad odor in the
6 evening. So please do it for the people and the future
7 of all of our children. Thank you.

8 MS. SMITH: Glasius, Mr. Espinoza.

9 Freddy Correa. And after Mr. Correa, we'll
10 have Chris Miller.

11 MR. CORREA: Freddy Correa, 1840 west Pacific Coast
12 Highway, Long Beach California 90810. I'm speaking on
13 behalf of -- I'm a member of the Local 250, Pipe Fitters
14 Union.

15 I'm for the project. I think it would be good
16 for the economy. It is critical time that we are facing
17 in the region. And I am just talking on behalf of my
18 union. It would put L.A. on the world map.

19 MS. SMITH: Thank you. Mr. Chris Miller, or is it
20 Ms. Chris Miller. I apologize.

21 MS. MILLER: That's okay. My name is -- Miller is
22 M-i-l-l-e-r. And I am an El Segundo resident, and I
23 live somewhat off the flight path of the runway.

24 My concern as a resident is by moving the
25 runway 50 feet closer to my house, that I have some

1 reassurances that the planes will actually stay on
2 course. Routinely, daily, sometimes hourly at 3:00 in
3 the morning these planes take off and take off directly
4 over my house. And that's not the course that they are
5 supposed to stay on. And I understand that by
6 relocating the runway 50 feet and doing all this will
7 actually make it a safer runway. They won't have to
8 take measures to fly over my house.

9 I'm also concerned that the future of
10 Los Angeles is dependent on an interconnected
11 transportation system, not just at the airport without
12 an outreaching -- no one is going to utilize these
13 things. They are still going to be in their cars. They
14 are still going to try to get on the 405 to get to the
15 airport, and that doesn't change anything.

16 Another thing that seems to have gotten pushed
17 way way back. If you're going to spend \$9 billion
18 dollars, I would like to see Palmdale put back on the
19 map because I don't understand. I know this isn't about
20 Palmdale, but somewhere out there in our past we created
21 this alternative. If we're spending this much money, I
22 would like to see that as an alternative and see what
23 that would cost and where we might be able to create a
24 high-speed rail from Palmdale to downtown.

25 The other concern I have is the cost of paying

1 for this. And I know that one of the people paying for
2 this would be the airlines. The last time I checked the
3 financial conditions of the airlines, they are asking us
4 for that money. When it comes down to it,
5 \$9 billion dollars is a lot of money. If the
6 consideration of impacting our community, our
7 neighborhoods continually -- you know, that was another
8 concern I had. So thank you.

9 MS. SMITH: Thank you. John Ruiz. And after
10 Mr. Ruiz we'll have John Barriage.

11 MR. RUIZ: Hi. My name is John Ruiz. I'm a Redondo
12 Beach resident and I'm an American Airlines aircraft
13 maintenance technician based in Los Angeles.

14 Before you begin the timer, I think we have a
15 solution to the individuals' problems here. We could
16 put a hush kit on the engines. The problem with the
17 airline industry today is there is no money to purchase
18 that, but that's something to consider.

19 I'm also here in the capacity as a union
20 officer. I'm a vice chairman representing TW Local 564.

21 My concerns regarding what I've seen out there
22 is, American Airlines currently has three maintenance
23 hangars. And in the plan to expand, and I don't know if
24 it is economic reasons or what have you, but to expand
25 the International Airport runs directly in line of where

1 these three hangars are. I don't see anywhere in there
2 where these hangars existed.

3 American Airlines currently employs in those
4 hangars in excess of 600 people. And I'm glad to see
5 that there are other trade unions here that are -- that
6 may benefit from this. But as far as American Airlines,
7 I don't even need to mention the effects 9-11 has had.
8 I think this is more of an issue of trying to maintain
9 employment.

10 We have 400 people that are out on the street
11 trying to get back in. That's just in aircraft
12 maintenance. We're also dealing with pay cuts. I'm
13 making 30 percent less and I'm not any less a person.
14 I'm working just as hard. But I think these factors
15 need to be taken.

16 There are people that live away from the
17 airport for the sole fact they can't afford to live
18 around the South Bay cities. And anything we can do to
19 accommodate that, I would definitely like to see -- I
20 hear acronyms every day. I'm not sure -- you did
21 mention the EIS/EIR. I'm not sure. If this is about
22 the environment, we do have existing hangars that can be
23 refurbished and possibly look into that as opposed to
24 demolishing them and possibly relocating work and moving
25 work. I've heard everything from moving work to

1 maintenance work up to Palmdale, which would require
2 ferrying aircraft, which would require city taxes and
3 landing fees. We do have the facilities there to
4 accommodate the work.

5 And as American Airlines is trying to get back
6 on their feet, we're not in the capacity right now to go
7 out and demolish hangars and come up with money to
8 refurbish them. I would hope that -- I know I can't get
9 answers today, but I would hope that consideration would
10 be given to look into that matter. Thank you.

11 MS. SMITH: Thank you.

12 Mr. Barriage. Am I pronouncing that
13 correctly?

14 MR. BARRIAGE: The French pronunciation. You could
15 do it by "Barrage."

16 John Barriage, attorney at law, San Diego,
17 California. I'm general counsel for the California
18 Ground Passenger Carrier's Association, which is a new
19 association of members consisting of shuttle and livery
20 carriers operating from Southern California airports.

21 The membership of the organization supports
22 the proposed reduction of gates from 163 to 153. The
23 association agrees with the assessment that the
24 reduction of aircraft gates will divert passenger
25 traffic to other Southern California airports. And we

1 believe there would be a substantial benefit to both the
2 shuttle and livery operator companies as well as their
3 passengers by reducing congestion, which is obvious at
4 LAX, as well as reducing unnecessary travel time.

5 So we would support the reduction of the gates
6 from 163 to 153. Thank you.

7 MS. SMITH: Thank you. Cleveland Brown, please.

8 MR. BROWN: Yes. My name is Cleveland Brown. And I
9 live in the city of Inglewood.

10 As I have sat here this evening and listened
11 to my coworkers, I am a union man also and I'm a bit
12 concerned about the flight -- I mean, about this job
13 situation we are concerned about. But most of my
14 friends live in Orange County.

15 So my concern is that I live in the flight
16 path. And these planes fly overnight. They are flying
17 day and night, morning. It doesn't matter. They are
18 even taking off going east, which is directly over my
19 house. Now, I'm real concerned about that.

20 I know we need jobs. I know the airport needs
21 expansion. But we were turned down in Orange County by
22 John Wayne Airport, El Toro. And, yet, the voters out
23 there told them if they did, they would not be elected
24 again. We come here and we want to force this on the
25 City of Inglewood -- not only Inglewood, but L.A., which

1 is adjacent to Inglewood. And we are talking about more
2 cargo, more flights. And, yet, we don't have a solution
3 to the problem. So I'm real concerned.

4 They said they will soundproof our homes. You
5 know, they told me my home, it would probably be 2020
6 before they could get to it. You know I'm concerned.
7 They would do one home within an X-amount of square
8 miles per you might say six months to a year. That's a
9 real concern of mine. I'm not just here to say that the
10 job market is what we're looking for. We need the work,
11 but we do not need to exploit the citizens that live
12 there.

13 Now, I'm really disappointed in the union.
14 We're concerned of public safety, which is the airline
15 situation, yet, we're not concerned about the health of
16 the citizens living in that area. Also, we're concerned
17 about where they come from as far as Japan, wherever
18 they come from. We are not saying that they shouldn't
19 arrive here in California, but they can do it somewhere
20 else with less cargo and less traffic. I'm really
21 concerned about that. Thank you very much.

22 MS. SMITH: Thank you. Our next speaker is Cecil
23 Carpio. And after that I'd like to call Mayor Mike
24 Gordon again and David Fein, if they are available.

25 MS. CARPIO: Well, I'm glad you're going to call

1 Mike Gordon again. I didn't hear him the first time.
2 I'd like to hear what he has to say.

3 But in the meantime, yes, you know, LAX needs
4 to be revised as someone said. It needs to respect the
5 surrounding communities. It needs to enforce penalties
6 for overflights and nighttime operations. LAX needs to
7 follow procedures and agreements that it has agreed to
8 perform for the Noise Variance Contract with the
9 Department of Transportation.

10 It's telling the union members to not -- don't
11 support those speakers who speak about quality of life.
12 Where is the applause there? We're supposed to be
13 addressing the environmental reports tonight. Do these
14 union workers understand that homes, businesses and
15 schools will be adversely affected by expanded
16 operations? We lose our sleep. We breathe toxic fumes
17 from the jets. Why aren't they supporting Mayor Hahn's
18 plan for El Toro? I haven't heard one of them speak
19 about that tonight.

20 The other thing just for fun. I think it is
21 reprehensible that the elderly in Manchester Square,
22 that transportation center, that -- that processing
23 center are being terrorized into giving up their homes.
24 And, you know, I'm even further disgusted that the City
25 of L.A. decided they are going to place the name

1 Manchester Square on a community south of Inglewood --
2 excuse me, east of Inglewood. That's ridiculous.

3 According to a memorandum from the Association
4 of Governments of Southern California, is the proposed
5 project, Alternative D, consistent with facility
6 capacity constraints adopted for LAX in our 2001 RTP
7 Aviation Plan which limits its service to 78 million
8 annual passengers and 3 million tons of cargo?

9 From a system-wide standpoint, does the
10 proposed project promote a decentralized aviation
11 system? And may I say decentralized is the only way to
12 go. This expansion stuff is ridiculous. Anybody who
13 would think it through with terrorism in their mind
14 would know you do not expand an airport to have safety
15 and security. Please. Get a job at El Toro.

16 Does the proposed project have action steps
17 designed to promote the use of other LAWA-owned airports
18 as part of the decentralized aviation strategy including
19 the support of stakeholders from the aviation community?
20 Oh, yes, perhaps it does, but there is no support from
21 the City of Los Angeles to do that very thing.

22 There was a SCRA, for the people who
23 understand that little whatever it is, SCRA -- ha ha ha.
24 It's about the regional airports getting together and
25 talking about, okay, we're going to put this together

1 and we're going to have a regional system of airports.
2 The only problem was L.A. City never showed up at that.
3 So the sucker probably -- just basically dies.

4 Does the proposed project discuss potential
5 relationships with non LAWA-owned airports designed to
6 encourage decentralization? Well, maybe it does, but
7 the fact L.A. City doesn't show up at the Aviation Task
8 Force to discuss this stuff. So what happens, all of
9 this decentralization stuff is a bunch of BS.

10 MS. SMITH: Thank you. Mayor Mike Gordon.

11 MR. GORDON: Gosh, usually I'm the guy that's the
12 most worked up at these meetings. So it's great to
13 always follow Cecil.

14 Good evening. I am Mayor Mike Gordon
15 representing the City of El Segundo. Given the length
16 and complexity of the Master Plan and environmental
17 documents, our full comments on technical issues will
18 not be ready for some time, therefore, the City's
19 comments tonight are preliminary.

20 The City of El Segundo continues to oppose the
21 LAX Master Plan Alternatives A, B and C for the many
22 reasons the City expressed orally and in writing during
23 the public review and comment period for the initial
24 Draft EIS/EIR in 2002.

25 While we feel the stated objectives of the new

1 plan supports a regional aviation approach -- an issue
2 Mayor Hahn and I continue to work side by side on -- the
3 City of El Segundo has not yet taken the official
4 position on Alternative D, nor have I.

5 Specifically the City supports a regional
6 approach alternative that makes proper use of Inland
7 Empire airports.

8 The City supports an alternative with fewer
9 environmental impacts. We would like to see the adverse
10 impacts of the airport minimized and mitigated to the
11 greatest extent feasible. The City of El Segundo
12 supports enhanced safety and security at LAX.

13 And the City supports an alternative that by
14 design will accommodate passenger and cargo levels no
15 greater than the physical capacity of the airport as it
16 exists today, approximately 78 million annual
17 passengers.

18 Limiting LAX capacity to its current capacity
19 has always been our number one goal. We believe
20 limiting LAX's capacity will allow other airports in the
21 region to develop and handle a fair share of future
22 regional aviation demand. This approach will result in
23 fewer environmental impacts and will improve safety and
24 security at the airport.

25 However, the City is greatly concerned about

1 the impacts of the proposed south side airfield changes
2 that moves the southernmost runway 50 feet closer to
3 El Segundo. LAWA has stated that it believes these
4 changes are necessary to improve runway safety.

5 However, we are currently studying the impacts
6 of a reconfiguration and other options for the southern
7 runway complex. In particular, we urge a full public
8 consideration of end-around taxiways as an alternative
9 that could provide greater safety sooner, at lower cost
10 and with fewer new burdens on local communities.

11 Safety at LAX must be a priority for all of
12 us. The city is prepared to support measures necessary
13 to enhance safety, even if those measures increase our
14 burden, but only if we are assured through an
15 independent expert that our other alternatives are not
16 equally effective.

17 In conclusion, we are grateful for Mayor
18 Hahn's responsive leadership and his pledge to constrain
19 growth at LAX and foster the regional approach to
20 meeting future aviation demand. It is our hope that the
21 ultimate outcome of this Master Plan will be a regional
22 airport approach that ensures that LAX does not exceed
23 its current capacity. Thank you.

24 MS. SMITH: Thank you, Mayor. Mayor, are these
25 comments that you referred to -- may we have them?

1 Thank you very much.

2 (The statement submitted for the
3 record was marked as Statement 2
4 and is attached hereto.)

5 MS. SMITH: David Fein. Andrew Shaddock, Richard
6 Slawson. Mr. Slawson. Okay.

7 MR. SLAWSON: Good evening. My name is Richard
8 Slawson. I'm the Executive Secretary of the Los Angeles
9 and Orange County Building and Construction Trades
10 Council. I've given testimony at the other hearings,
11 but I wanted to comment on some of the things that we've
12 seen and reviewed in the Environmental Impact Reports as
13 well as some of the commentary that we've heard at the
14 various hearings that have been held throughout the
15 greater Los Angeles area.

16 I might add that the people that are here
17 tonight also attended the hearings in Ontario, downtown
18 Los Angeles and all of the other areas where they've had
19 an opportunity to speak as well as many others.

20 The members that are here tonight of the
21 various unions also live in each community. We have
22 members that live in every community along the beach and
23 surrounding LAX. We have members in Inglewood,
24 El Segundo, Westchester, all of those areas that are
25 impacted.

1 My home address, by the way, is 4634 Deelane
2 Street in Torrance. I am not affected by the noise
3 there. But as many in the South Bay, we perceive that
4 part of the problem of LAX has been traffic.

5 I know what the reports say and I know that a
6 very minimal amount of the impact of traffic comes from
7 the airport in most of the South Bay cities. For sure
8 in El Segundo, Westchester and Inglewood there is some
9 impact from airport traffic arriving and leaving.

10 But we believe that can be mitigated by the
11 design of Alternative D. We have an alternative that
12 includes a stop at the airport for the Green Line, which
13 people from all over the region will be able to utilize
14 and should assist in reducing overall traffic impacts on
15 all of our cities and especially in those cities
16 surrounding the airport.

17 Also I wanted to address the issue of the
18 regional plan. From the onset, and it's been going on
19 for over four years now, we have been studying,
20 discussing and reviewing all of the alternatives that
21 have been offered at the airport. We always supported a
22 regional plan. We believe in the trades that El Toro
23 should have taken its load.

24 In fact, our members that live in Orange
25 County and many from Los Angeles County participated in

1 the debate in Orange County, supported the issue
2 wholeheartedly. And I'm sorry to say, many in Orange
3 County, as many that live around this airport, do not
4 want to see any airport in their area. I also believe
5 that many of the speakers would like to see LAX leave
6 and go to some other area totally. They forget about
7 not only the construction jobs, but the permanent jobs
8 and how these cities were built up over the years.

9 In fact, one of the supervisors in Orange
10 County lost their job as a supervisor by supporting the
11 El Toro idea of building an airport at El Toro Air Base.

12 So these are very concerned people that are
13 here tonight. We've been involved in all of the issues.
14 We do support a regional plan. We want to see Palmdale
15 eventually built. It is going to take some time for the
16 powers that be in this area, SCAG and the cities in the
17 area to come up with a final plan for that as well.
18 Meanwhile, LAX does need to be fixed. Without a plan,
19 we will continue to grow here with all of the problems
20 that we see now. And we want it fixed now. We want
21 Alternative D. Thank you very much.

22 MS. SMITH: Thank you. Next is William Spilman.

23 MR. SPILMAN: Good evening. My name is Bill
24 Spilman. I live in Manhattan Beach. I'm a businessman,
25 a frequent traveler. And like thousands in the

1 Los Angeles area, I depend on affordable and convenient
2 travel to do my -- to conduct my business.

3 First, I support the modernization of LAX,
4 however, I oppose this specific plan. My first point is
5 I think the economic forecasts in here are not
6 realistic. I believe there will be a negative L.A.
7 economy due to reduced air capacity and higher fares.
8 This will occur by reduced tourism. It will occur by
9 reduction in businesses both that are located here and
10 that are not located here, but try to operate here. And
11 it will occur by the inability to grow our economy with
12 the growth of both the country and the world economy.

13 Thirdly, I think that the fare and capacities,
14 the fair will increase and the capacity will not be able
15 to meet demand because of a couple of reasons. One is,
16 you're putting the financial burden of the project on
17 the airlines. The airlines cannot afford this any way
18 you put it. This burden will be placed on the traveling
19 consumer or the airlines will simply choose they cannot
20 operate certain markets at that expense. So what that
21 will do is it will decrease capacity, and that will
22 increase fares. All of the people understand the
23 economics of fares. For every price a dollar goes up,
24 people do not travel. And I would be one of those in
25 the business I'm in.

1 The second point is, you're talking about
2 capacity controlling Los Angeles Airport. We need to
3 look at those airports around the country that do have
4 capacity controls. Let's compare O'Hare to Midway,
5 LaGuardia to JFK and Newark. Let's compare Orange
6 County to LAX, the fair structure, the service
7 availability at those airports compared to the other
8 airports.

9 Now, fortunately those metro areas have other
10 airport options. We talk about the other airport
11 options in L.A., but air travel is going to grow at four
12 percent a year irrespective of the economy. In Long
13 Beach, Burbank and Orange County simply cannot even keep
14 up with the growth of that. The fourth point -- that is
15 the fourth point I would like to make.

16 The fifth point I would like to make is there
17 is going to be a much greater demand placed on putting
18 people in cars. You're going to see a carrier like
19 Southwest simply decide they cannot do business at LAX.
20 People will be driving to Las Vegas, Phoenix, Sacramento
21 and San Francisco. They will be doing so because you'll
22 be adding them hours to travel time. It simply will be
23 more convenient to travel.

24 I don't believe the impact to vehicle travel
25 has been properly analyzed in this study. I thank you

1 for your time and I hope you have a good evening.

2 MS. SMITH: Thank you.

3 Mr. Brown.

4 MR. BROWN: My name is Piedmont Brown. I live at
5 7019 North Britton Drive, Long Beach, California. I
6 represent the Union Ironworkers of Local 433 in Los
7 Angeles. We are in support of Alternative D.

8 I'd like to lay this aside and talk to you as
9 a private citizen, which I am, and I live over the
10 airport, which is in Long Beach. I live right over the
11 flight pattern. And I understand what these people are
12 talking about, but it was my choice to live there. I
13 liked it. I put up with the noise. The planes come
14 over my house. That was my choice to live there.

15 The other issues are, we have serious issues
16 and we need serious people to take care of these issues.
17 We need to stop talking about them and we need to move
18 forward and pursue these issues before something does
19 happen like 9-11. And then everybody goes, "What
20 happened? We didn't do anything. We just sat in these
21 rooms and we talked about it."

22 The other issue I want to talk to you about is
23 family. My family is back east. I've been here since
24 1979. My parents are elderly. They can't drive now and
25 they are afraid to fly. So I look at my parent's

1 situation, and I'm sure there hundreds and thousands of
2 parents the same way that their children have relocated
3 and want to fly here, which would boost our economy.

4 The other issue I want to talk about is
5 location. Who wants to fly to Palmdale? I worked out
6 there years ago. I don't choose to live there. I
7 choose to live over here. LAX is where I choose to fly
8 in and out of, not Long Beach, but LAX because it has
9 more frequent flyers out there and more flight times
10 that fit my schedule and the people that I need to fly
11 here to see me.

12 The fifth thing I would like to talk about is
13 they say that LAX is going to grow. Well, if the
14 economy of Los Angeles needs to grow, it is going grow.
15 The airport needs to grow, and we need this growth and
16 expansion.

17 And the last thing I would like to talk about
18 is talk about the cost. The cost in our life to live
19 for the freedom that we freely use comes with a price.
20 And everyone in this room understands it. And this is
21 the price that we have to pay to be the great nation we
22 are. And with that I would like to close my statement.
23 Thank you.

24 MS. SMITH: Thank you.

25 James Ferguson. And after Mr. Ferguson we'll

1 have Randall Hartman.

2 MR. FERGUSON: My name is Jim Ferguson. I live at
3 770 West Imperial. I live in a 100-unit complex there,
4 Pacific Sands.

5 Now, you don't know me and you don't care, but
6 we have put up with 30 years of being modified. I am 82
7 years old. You come up now and offer a plan which, as
8 far as I can find out, if we talk only about Alternative
9 D, since I assume even though these other gentlemen
10 talked about B, have taken precedent because of your
11 great sales job on safety. It was marvelous. Whoever
12 brings all that really should get a raise.

13 Now, as far as that goes, if you look at the
14 problem we're talking about now is 18 years worth of
15 work, more or less, to do this. With people saying no
16 cost to the government, to county, federal. Baloney.
17 All the traffic modifications ought to be paid for, not
18 from airport funds. Look it up. That is true.

19 Number two. I don't know how you're going to
20 sell this to the legal beavers. In fact, you probably
21 tried it 12 years ago when the airport had a surplus of
22 funds. And some brilliant politician in the L.A. City
23 said, "Oh, we'll just transfer that to the government
24 general fund." And, of course, I understand it was
25 stopped. But this program shines brightly as to what

1 the same thing is happening.

2 The other point is, I went to the reading room
3 over at the airport, Imperial Airport. I asked, "How do
4 I get answers to a question?" Well, I'd like anybody to
5 answer that.

6 I've asked people, "How do you get answers to
7 the present traffic and the expected 2008 traffic?"
8 There isn't any. There is none. It is separated. It
9 is in 14 different places. There is no comparison a lay
10 person can go to.

11 You get the problems of noise. They talk
12 about average noise. Who cares about average noise. If
13 I'm kept awake at 2:00 a.m. by a cargo plane landing, I
14 don't want it. I'm sorry.

15 MS. SMITH: Thank you, Mr. Ferguson.

16 Randall Hartman, please. And after Randall
17 Hartman we'll have Terry Martin.

18 MR. HARTMAN: Yeah, I'm Randall Hartman. I live in
19 Torrance, California. I work at LAX. I'm a quality
20 assurance inspector for American Airlines, and I've
21 worked at LAX for the last 20 years.

22 I looked at Hahn's plan. When I looked at it,
23 I thought this is utter lunacy. I can't believe they
24 are even considering this. The only thing that makes
25 sense is for construction workers on this job. That is

1 the only thing that can possibly make sense.

2 They talk about safety. How is this going to
3 improve safety? Just go out there at the ocean and
4 watch. Every 20 seconds a plane takes off. That's
5 where the safety problem is. There is too much traffic.
6 This is not going to do anything to relieve traffic.
7 They are not adding a runway. They are separating the
8 runways. That has nothing to do with traffic. The only
9 way to make this place safer is to put more of the
10 traffic at the regional airports.

11 Most of the people I work with live out at
12 these areas. Some people drive two hours to work. They
13 would love to have jobs out there. Construction workers
14 would love to have jobs out there. I mean, it just
15 doesn't make sense. First they want to put all the --
16 just imagine all the people at LAX checking in at one
17 location and being transported to the terminal. I mean,
18 this is a terrorist's dream to put everybody in one
19 place where they could just easily do a terrorist
20 attack. I just -- and it's just going to cause a
21 nightmare.

22 How many years of it, 11 years of
23 construction. What are they going to do in the meantime
24 when they are doing all this? They are going to have
25 half of the terminal just moved, all the gates moved

1 over. It's just going to be utter chaos for the next
2 ten years. It's going to hurt the airlines. It's going
3 to cost the airlines.

4 I work for American. We were, you know, the
5 number one airline in the world. Now we're on the verge
6 of bankruptcy. Now they are going to hit it with this.
7 This whole plan is utter lunacy. We should just -- how
8 come we don't hear anything about San Bernardino
9 Airport? It's an international airport. It's not even
10 mentioned. We should open up Ontario. There is plenty
11 of other places. We don't have to go to Palmdale. I
12 mean, just common sense. I've been going to these
13 hearings on all kinds of things. It's just a charade.
14 I mean, 90 percent of the people will be against the
15 project, and you'll still put it through because of
16 politics. I mean, come on. Get a clue people.

17 MS. SMITH: Thank you. Terry Martin.

18 MR. MARTIN: Terry Martin. I'm one of those
19 individuals from Orange County. I live in Anaheim,
20 M-a-r-t-i-n. I'm a union representative Local 250
21 Steamfitters.

22 I know it seems like with all the fitters
23 speaking in attendance at all the meetings, we would
24 have so much work. But we have a small percentage of
25 the work. I know this isn't a question-and-answer

1 session either, but the lady who is so concerned, and
2 rightfully so, I respect that. I respect everybody's
3 opinion. And you have to respect -- and I respect you
4 probably won't clap for me.

5 But living in Orange County and sitting on the
6 Orange County Central Labor Council as Vice President,
7 we did all we could to get El Toro going. And if you're
8 familiar with Measure V or Measure W, the great park,
9 which we called the great plank -- or prank, it turns
10 out the great park is really a bunch of homes being
11 developed by developers, you know. It's a lot of work
12 like that. I don't see a lot of -- there is a golf
13 course that's already existing that they'll update.

14 But I'd like to compliment Mayor Hahn on this
15 Alternative D. I'm in full support of it. I know he
16 made every attempt to agree to expand and, of course, to
17 register. And, well, the developers made sure that that
18 didn't happen.

19 I will again support Alternative D. I do
20 support unions. Unions do care about the community. We
21 do so much to help. It's not just work. It's not just
22 about jobs. We give back. We've got Harbor Interface
23 Shelter. We've got Children's Institute International
24 over here, the Eli home. We do our fair share in
25 helping, which we need to do. We've been doing that

1 since 1947.

2 Again, I'm in support. I live in Orange
3 County, but we have 5,000 members. 600 of them live
4 within a ten-mile radius of this building here. And I
5 do respect your concerns. I got a little troubled there
6 at San Pedro.

7 I did apologize to the Palos Verdes Estate
8 residents who had the same problem you had. And I
9 brought up that commercial. And I didn't mean to be
10 smart-alec about it, but it's true. That guy, the
11 father and son sitting on the porch saying, "You make
12 sure you get a good real estate agent." About that time
13 the plane flies over and that piece of the plane falls
14 off. And he says, "Trust me." Well, I didn't get any
15 claps for that neither, but I did talk to them
16 afterwards. And believe me, we're on good terms. And I
17 do, again, want to say I respect you, and you don't have
18 to clap for me. Thank you.

19 MS. SMITH: Thank you, Mr. Martin.

20 Elizabeth Kunkee. And after Elizabeth Kunkee
21 we'll have Jonathan Walright, please.

22 MS. KUNKEE: Good evening. My name is Elizabeth
23 Kunkee. And I'm a resident of Manhattan Beach. I
24 appreciate the opportunity to come talk. I'm also here
25 with my son John and daughter Lea.

1 I'm simply an interested citizen. And I'd
2 like to tell you my impressions of what I've been
3 reading in the newspaper and hearing about.

4 What I see is that a very expensive -- a very
5 expensive plan is being put before the citizenship. And
6 I see very little of value that we're going to get from
7 it. I don't believe that it's going to be any safer.
8 RAND Corporation has said they don't think it's going to
9 be safer. I haven't seen airline security experts
10 consulted. I don't believe it's going to be any more
11 convenient.

12 I was back in the -- in the room talking with
13 an engineer. And ground transportation when I added up,
14 well, it would probably take at least 20 minutes longer
15 than it currently does to drop someone off and pick
16 someone up. Remember when it used to be 60 minutes
17 before your flight left when you checked in? Do you
18 remember that? Wouldn't it be nice to get to that.
19 Could we get to that with this airport renovation
20 instead of moving to 90 or 120 minutes?

21 I believe I would like to see the money that's
22 saved by not pouring it into LAX, putting it to our
23 other regional airports. I think there is a better
24 solution. I'm not opposed to expansion of the
25 Los Angeles International, but I'd like part of the

1 burden and the pride of our air travel to be spread
2 around. Thank you for your attention.

3 MS. SMITH: Thank you. Mr. Walright, please.

4 MR. WALRIGHT: Good evening. Jonathan Walright,
5 American citizen. Nobody cares where I live. Suddenly
6 LAX doesn't. Los Angeles International Airport
7 directors, officials, have engaged in domestic,
8 emotional terrorism. They have turned a deaf ear to the
9 complaints, to the prayers and to the petitions of the
10 citizens of Inglewood to have a peaceful and quiet night
11 of sleep and rest. I have three minutes. That's a
12 limited amount of time.

13 The airlines were grounded for three days and
14 three nights. The airlines have demonstrated that they
15 have no moral courage to do what is right for the people
16 of Inglewood. It is morally wrong to build and expand
17 an airport inside the boundaries of any American city.
18 The evidence is clear that it pollutes the air, it has
19 an adverse impact upon the learning of children.
20 Studies conducted at Cornell University and in Germany
21 verifies that conclusion. Whatever is morally right
22 should be politically right.

23 It is morally wrong to expand an airport
24 inside the boundaries of a heavily populated residential
25 community. Since it is morally wrong, it should be

1 politically wrong. Repeat those words, will you please,
2 often. The American Airlines, the industry as a whole
3 was pushed on September 11th. Many families suffered
4 great loss. I only have 18 more seconds. I can't say
5 everything that I want to say here, but I would
6 encourage those who have any faith to make decisions to
7 protect the water, the air and the people on the ground.

8 MS. SMITH: Thank you.

9 Next we'll have Robert Kropp, Diane Sambrano.
10 I apologize. She is after Mr. Kropp.

11 MR. KROPP: Good evening. I'm Bob Kropp and I've
12 been a resident of Manhattan Beach since 1956. I also
13 was an airline employee for 36 years. The airline is no
14 longer in business, but one of the airlines took us
15 over. So I guess it's okay.

16 I would like to comment on one thing about
17 that with the present check-in system, which everyone
18 likes to believe it's a big, safe situation. I can fly
19 free. And I refuse to go out to the airport and fly
20 anywhere because of the hassle. It is a big hassle.
21 Now, if the people here or in your travels believe that
22 it isn't, wait until the day that they get the entry
23 built over two miles away and you have to go through
24 your check-in there, get on a tram, go over to the
25 airport, check in. It's going to take two, two and a

1 half, three hours to board an airplane.

2 Also, there will be parking problems. And
3 with that situation going on, you're chasing the
4 traveler who would fly between here and a short
5 distance, Phoenix, San Diego, San Francisco, Seattle,
6 are going to get in their car and they are going to
7 drive rather than to fly. The airlines can't afford to
8 go to outlying airports if they can't fill the airplane.
9 The thought that we can force people to go out there,
10 people will travel by another mode. And what you're
11 doing is penalizing an industry known as the airline
12 industry.

13 The airport, the airport at the present time,
14 I could have drawn the picture six years ago when they
15 decided to build a bigger airplane than the Boeing 747.
16 The truth being is that they are tearing the runways up,
17 moving them, spreading them further apart because you
18 can't land the airplane being built by the French on
19 this airport and get it into position and park it at a
20 gate. So, therefore, we are going to tear down three
21 buildings so we can make room to put in these airplanes
22 that fly non-stop from Singapore, Australia, from
23 London, from Paris and the likes. We're going to make
24 room for that. So what we're going to have is basically
25 strictly an international airport. The people who live

1 here will hear the noise.

2 I don't complain about the noise. I don't
3 hear the noise. And I'm not deaf. But I would like to
4 say that I've got friends here who complain about the
5 noise and the same noise I don't hear. I guess I've
6 gotten used to it and I accept it. Back in the prop
7 days we had the same noise over the top of Manhattan
8 Beach.

9 The building of the new airport, I'm for
10 advancement. I think it's a great idea. I think having
11 the method that they are going to use two miles away to
12 get people to the airport is ridiculous. The reason we
13 don't have the Green Line going to the airport today is
14 because they envisioned putting this thing out at the
15 end of the runway and having to transport the people in.
16 That's why they never finished the Green Line. Okay.
17 Thank you very much.

18 MS. SMITH: Thank you. Diane Sambrano.

19 MS. SAMBRANO: Good evening. My name is Diane
20 Sambrano. I'm one of those pesky people who lives in
21 Inglewood. I see LAWA made that wonderful agreement
22 with my community for, what was it, sound insulation
23 that was suspended.

24 So we have that understanding that safety and
25 security really means expansion. We've been there, done

1 that before, misrepresentational terms. But to us
2 safety and security by any other name is simply
3 expansion, not only in the amount of land which is
4 acquired, meaning, what was it, 2,568 homes. We call
5 them homes. I think you all call them dwelling units.
6 We actually have families that live there as opposed to
7 simply entities that dwell. You've already wiped out
8 several of our schools. Our children tolerate
9 pollution, the planes fly over their heads.

10 Now, I know one of the greatest supporters
11 earlier this evening was one of the pipe fitters who
12 said everyone would rather drive farther than to have to
13 wait in those lines. And you know what, I support that
14 concept. If he really believes it, let's leave the
15 airport just as it is, and we'll have our regional
16 solution, won't we. No one will want to, as he says,
17 wait in line. But if in fact we believe that we are
18 about a regional solution, then we have to take into
19 account the concept of air quality. It isn't just
20 employees who are entitled to breathe comfortably and
21 safely and have long lives. Homeowners and children
22 should have that opportunity as well.

23 As I looked at many of the documents, and of
24 course 8,000 pages is a little tough to read in 45 days,
25 it seems the only concern we had was about that auto

1 bomb, explosives loaded into a car. And that's the only
2 thing we seem to be addressing. And I'll bet you there
3 is a terrorist out there who could think of two or three
4 other ways. Gosh, that you all had to move that little
5 sign that said, "You can't go under Sepulveda" because
6 some of us brought that up at a public hearing. By the
7 way, it's still not far enough away. You can't really
8 do that if you're in the wrong lane.

9 Someone said we want LAX to leave. No, we
10 didn't, but we certainly should not bear all of the
11 burdens so that a few people could have some benefits of
12 having quiet time.

13 There was a comment made about that
14 commercial. And I bet people thought it was funny. But
15 in my neighborhood, all kinds of stuff spills out of the
16 air. And it usually is not from flying birds. They are
17 engine parts, wing parts, not to mention that
18 unmentionable liquid.

19 It seems some people want to say I want what I
20 want now. Anything worth having is worth studying and
21 waiting for. And we'd like to have a quality of life.
22 Ours has been destroyed for many years by LAWA.

23 MS. SMITH: Thank you. Again, I would like to call
24 David Fein. Is David Fein available? Andrew Shaddock.
25 Mr. Shaddock and Mr. Jackson. I believe it's

1 Eric Jackson. Are you available, Mr. Jackson? Coming
2 up to the podium now.

3 MR. JACKSON: Good evening. Eric Jackson of
4 Los Angeles/Orange County, and most of all an American
5 citizen. This is America. We have to continue to move
6 forward. We have to stop the corporate greed.

7 And I wasn't going to speak on this matter
8 tonight because I spoke earlier -- earlier this week.
9 But the previous speaker mentioned the French aircraft.
10 That's why we have to increase the airport runways.
11 This is necessary to increase the airport runways if we
12 continue to buy these French aircrafts. And that's the
13 price you pay when you don't want to put Americans to
14 work. I never believed NAFTA. I believe in used to.
15 The United States of America and our citizens need to be
16 put to work. When you pay \$45 for a shirt, if you wear
17 it between medium, large and extra large, if you wear
18 2X, 3X and have to go to Rochester and pay \$90 for a
19 shirt that's made in Indonesia, something is wrong.

20 There is no way possible somebody can tell me
21 they are going to drive six hours to San Francisco,
22 Phoenix, Oakland, 17 hours to Seattle or more and they
23 can fly for \$39. That's ludicrous.

24 I am in favor of proposition D, plan D, not
25 because I'm a pipe fitter, because I'm an American

1 citizen. We can't afford to stop the progress. The
2 environment is important. If we could afford to stop
3 progress, why are our boys in Iraq today?

4 MS. SMITH: Thank you. At this time I don't have
5 any other speaker cards filled out. We will take a
6 15-minute recess. We encourage you to please visit the
7 sign-in desk and fill out speaker cards if you wish to
8 register your comments today. If you don't want to
9 speak out loud, you're welcome to fill out a written
10 form. They are just as valuable to us as oral comments.
11 We will reconvene at 7:50. Thank you.

12 (Recess was taken.)

13 MS. SMITH: Again, my name is Shauna Bain Smith.
14 I'll be your facilitator this evening. I don't see many
15 new faces in the house, so we probably don't have to go
16 over our introductory remarks. But I want to introduce
17 you to Mr. David Kessler. He's representing the Federal
18 Aviation Administration and Mr. Jim Ritchie to my
19 farthest right, who is to the Deputy Executive Director
20 of Los Angeles World Airports. And they will be taking
21 your testimony this evening along with our court
22 reporters.

23 I'd like to call Jack Kenton. And after
24 Mr. Kenton we'll have Roy Hefner again. Thank you. And
25 can you spell your name, your last name for the court

1 reporters, please.

2 MR. KENTON: Yes. It's K-e-n-t-o-n. I'm at 835
3 Dune Street in El Segundo.

4 I've commented previously about the idea of
5 having a midway -- midfield taxiway between runways on
6 the north and south sides of the runway. And I still
7 would like to make my point that I feel that the expense
8 of creating extra runways and taxiways is not necessary
9 based on the safety issue, that the safety issue can be
10 handled by having a taxiway off the ends of the runway
11 going around the inboard runway should that truly be
12 such a problem. And I also disagree with it because I
13 feel it facilitates movement of a greater number of
14 aircraft in and out of LAX, and the frequency that the
15 noise goes over the houses are part of the things that
16 makes it hard to live close to the airport.

17 Also, I would like to have someone convince me
18 that moving all the check-in points away from the
19 airport is truly beneficial simply because the idea is
20 that we're going to eliminate the terrorist threat at
21 the Central Terminal Area by moving all the vehicles
22 away. However, there will still be vehicles at the
23 other check-in points, which to me could be just as much
24 a hazard. It won't be a hazard to the terminal and the
25 aircraft parked at the terminal, but it would still be a

1 hazard to the people. And it's -- you start just
2 looking at it and wondering whether there is really
3 cost-effectiveness in producing all this extra
4 construction.

5 Now, I like the idea of having a link to the
6 Green Line to facilitate people getting into the
7 airport. That alone is a point that's well worth
8 constructing, but I'm not sure about all these other
9 items that we've planned to build. Thank you.

10 MS. SMITH: Thank you.

11 Mr. Hefner, please.

12 MR. HEFNER: Roy Hefner, H-e-f-n-e-r, 6548 West 80th
13 Place, L.A., 90045.

14 I just hated to see you people close up
15 without somebody going ahead and talking. So I thought
16 I would come up for a second round. What I'm attempting
17 to do is I'm not dealing with the overall Alternative D
18 plus or minus. I'm trying to take certain things in
19 that alternative and bring it to your attention.

20 Number one, I talked earlier tonight about the
21 single event noise and how one of the mitigation
22 measures that they plan to incorporate as far as schools
23 were concerned is they wanted to conduct a survey and a
24 test to go ahead and determine whether or not noise does
25 have an impact upon the education program. And they are

1 referring primarily to the area of Lennox.

2 And my question is, how are you going to have
3 a test of the students in Lennox about noise and no
4 noise when they always have airplanes flying over?
5 There is never a time that they don't. So you cannot
6 make a comparison on that particular basis.

7 Another thing is in the EIR itself on the --
8 on the summary comparisons, you make excellent summary
9 comparisons of Alternative A, B, C and D, but you do not
10 make the comparisons on those charts in the executive
11 summary of the no-action, no-project. However, during
12 the -- in the written aspect of your particular report,
13 while you do go ahead and invariably, so far what I've
14 read, without exception the Alternative D in your
15 unbiased opinion is always superior to the no-action,
16 no-project, which leads me to believe that there is
17 something that is lacking there.

18 You also include in Phase I the building of a
19 tunnel, but yet all -- for baggage, for luggage. But in
20 all of your other aspects, that building of a tunnel is
21 not included and I think probably has been eliminated as
22 a possibility. And the only place I know of that you
23 might be tunneling is from Bradley to the new west
24 terminal.

25 The disruption that will take place with the

1 development of the runways. As you know, there will be
2 three runways eventually developed in one way or another
3 either by moving and/or by extending, both to the east
4 and/or to the west. I don't think there is adequate
5 coverage left in the EIR to express the amount of
6 disruption and the shifting of noise during that
7 particular process. When you have to close down a
8 runway, that means that there is three runways that are
9 going to handle what normally four runways are going to
10 do. So we have to be concerned about that.

11 As far as the Green Line is concerned, I
12 remember when the Green Line before it was ever
13 constructed, it was really going to be a big boon for
14 carrying people to the airport. It has carried a lot of
15 employees to the airport, but very few travelers utilize
16 the Green Line as such. And maybe they will go ahead
17 and expand that.

18 One point, though. The Green Line must
19 provide some type of space for luggage to be
20 transported. Thank you.

21 MS. SMITH: Thank you. Bobby Blanks. Bobby Blanks,
22 come on up.

23 MR. BLANKS: First of all, let me say good evening
24 to everyone. My name is Bobby Blanks, field
25 representative to Congressman Maxine Waters. And I

1 have a statement she'd like me to read this evening.

2 Thank you for the opportunity to speak and
3 submit a statement regarding the Draft Environmental
4 Impact Statement/Environmental Impact Report for
5 Alternative D Enhanced Safety and Security.

6 "As a member of Congress for the 35th
7 Congressional District, I represent over 638,000
8 constituents who live in the cities and communities of
9 Inglewood, Westchester, Playa del Rey, Gardena,
10 Hawthorne, Lawndale and portions of South Los Angeles.
11 Since the release of the prior Master Plan in January
12 2001 and the release of the new Supplement to the Master
13 Plan, Alternative D, the views and concerns of my
14 constituents have not changed.

15 Thousands of residents are still heavily
16 impacted by airplane noise on a constant basis.
17 Thousands of residents are still impacted by pollutants
18 and toxins from aircraft emissions that fly overhead.
19 Thousands of residents have suffered the consequences of
20 increased traffic congestion in their neighborhoods.
21 Thousands of residents are still suffering from hearing
22 loss, sleep deprivation, hypertension, respiratory
23 ailments, anxiety and stress. Residents should not have
24 to live under such conditions.

25 With the release of Alternative D, new issues

1 of concern have arisen. I have talked to many residents
2 and elected officials regarding Alternative D. The
3 primary focus of the plan is enhanced safety and
4 security imposed as a result of the possible threat of
5 terrorism in the aftermath of the September 11th
6 attacks.

7 Although I am highly in favor of ensuring all
8 passengers and employees at LAX and other airports are
9 as safe as possible, there are evident flaws in
10 Alternative D. Specifically my objections to the
11 proposed plan hinge on the following:

12 One, the new alternative increases the
13 passenger cap from 78 million annual passengers to
14 78.9 MAP, as illustrated in the Table ES-1 of the
15 Executive Summary, Supplement to the Draft EIS/EIR
16 Volume 1. This is a clear deviation and violation of
17 the Mayor's promise and pledge to constrain passenger
18 capacity within LAX to the existing facilities which he
19 signed on March 26, 2001.

20 On July 16, 2002, I introduced The Careful
21 Airport Planning for Southern California Act,
22 H.R. 5144. This legislation would cap LAX traffic at
23 78 million annual passengers a year and prevent LAX from
24 expanding beyond its current capacity. The County Board
25 of Supervisors and the Los Angeles City Council has

1 supported this legislation which is currently pending.

2 Two, Alternative D sounds more like expansion
3 than safety and security given the fact that part of the
4 plan is to utilize Manchester Square as the Ground
5 Transportation Center. If LAWA is relocating residents
6 out of the Manchester Square area and clearing the land
7 over 568 properties to build this new center, I would
8 definitely call that expansion. This site has been
9 opposed by the community, elected officials. And there
10 is no substantive proof that it will make the airport
11 more secure.

12 Three, based on a recent analysis completed
13 earlier this year by the RAND Corporation, to simply
14 reconfigure the airport does not mean the airport is
15 safer than before. It would actually make the airport
16 less safe in certain instances. The RAND analysis
17 states that, "The great risks are in high density areas
18 such as lines for ticketing, baggage claim and the
19 security check points. These risks are not likely to be
20 reduced by Alternative D, which simply moves these
21 targets of opportunity to the Ground Transportation
22 Center and the people mover."

23 Four, during tough economic times, it is not
24 prudent to increase passenger facilities charges and to
25 use any surplus funds on untested ideas. We must take a

1 lesson from the State of California not to allow
2 ourselves to create a deficit in the billions of dollars
3 on plans and ideas of uncertainty.

4 There are major airlines who are also opposing
5 Alternative D due to the current decline in air travel
6 and the increased costs that will be incurred such as
7 landing fees to pay for much of the project.

8 Alternative D is simply a ploy and a
9 continuation of former Mayor Richard Riordan's plan to
10 expand the airport in the name of safety and security.
11 In addition, Alternative D provides Los Angeles World
12 Airport Commission President Ted Stein and Mayor Hahn an
13 opportunity to assist their fat cat developer friends in
14 securing large city contracts in return for re-election
15 campaign contributions. I am opposed to Alternative D.
16 I believe that now is the time to seriously look at --

17 MS. SMITH: I'm sorry, can you submit the rest of
18 that into the record because -- we'll take the written
19 comments. I have to ask you to stop. I apologize.
20 Thank you very much.

21 MR. BLANKS: I have a copy of the statement.

22 MS. SMITH: Perfect. If you could take those to our
23 court reporters. We'll submit all of that into the
24 record. Thank you.

25 ////

1 (The statement submitted for the
2 record was marked as Statement 3
3 and is attached hereto.)

4 MS. SMITH: Again, I'll call Andrew Shaddock. He
5 disappeared. Mr. Shaddock and David Fein.

6 At this time I don't have any other speaker
7 cards in my possession. If you'd like to go to the
8 sign-in desk, please, we encourage you to fill out a
9 speaker card. We're here until 9:00 p.m. and we're here
10 to hear your testimony.

11 In the meantime we'll take another recess
12 until 8:20. Thank you.

13 (Recess was taken.)

14 MR. KESSLER: We will reconvene. We have another
15 speaker to present some more information. So I've asked
16 everyone that is still interested to please take a seat.
17 We'll restart in just a moment. I've asked Mr. Blanks
18 to finish out the last portion of his letter. He had
19 another paragraph to read and I've asked him to complete
20 that.

21 MR. BLANKS: Thank you very much. The last thing I
22 would just like to mention in the congressman's
23 statement, it goes on to say that I am opposed to
24 Alternative D. I believe that now is the time to
25 seriously look at developing a more regional approach to

1 air travel so that airports such as Ontario
2 International and Palmdale Regional can begin to accept
3 their fair share of air traffic.

4 I am asking all constituents of the 35th
5 Congressional District and the South Bay communities to
6 oppose Alternative D. Thank you.

7 MS. SMITH: Thank you, Mr. Blanks.

8 MR. KESSLER: Thank you, Mr. Blanks.

9 MS. SMITH: At this time do we have any other
10 speaker cards, gentlemen? Again, we don't have any
11 other completed speaker cards awaiting acceptance. So
12 if we could take another recess, we will reconvene at
13 8:40. Thank you.

14 (Recess was taken.)

15 MS. SMITH: We encourage you to go to the sign-in
16 desk and fill out a speaker card. We'll be here until
17 9:00 p.m. Until then we will stay in recess. Thank
18 you.

19 (Recess was taken).

20 MS. SMITH: I want everyone to take their seats.

21 MR. RITCHIE: Let me say one quick thing. I have to
22 thank everybody for -- I was trying to keep my birthday
23 a secret, but certain people in the audience took
24 advantage of that. So, nonetheless, I appreciate -- it
25 is kind of unique to have a public hearing and have some

1 sort of celebration tied to it. So thank you for your
2 kindness and your thoughtfulness. I'm not supposed to
3 talk. I'm only supposed to listen. Thanks.

4 MS. SMITH: Thank you, Mr. Ritchie.

5 We're going to reconvene. And Mr. Weis,
6 Brian Weis.

7 MR. WEIS: Yes.

8 MS. SMITH: If you could spell your name for the
9 court reporters, please, and state your address.

10 MR. WEIS: Brian, B-r-i-a-n, last name Weis,
11 W-e-i-s. And I live at 8836 Croydon Avenue in
12 Westchester, California.

13 It seems that the major focus recently has
14 been on converting the expansion plan to now a need for
15 better security at LAX. And oftentimes when there is
16 projects that are being planned or developed, the
17 planners try to take advantage of possible angles to
18 help sell their ideas. And the 9-11 tragedy has really
19 served the purpose for LAX to really try to make that
20 their cornerstone with Mayor Hahn's new plan.

21 Unfortunately, LAX has some very interesting
22 security problems that no other airports in the world
23 seem to have. One is the fact that it's -- it's so
24 geographically limited in all the -- all the traffic and
25 planes, and access is just jammed in on top of each

1 other. There is very little security that is afforded
2 by geographic space.

3 Security, by definition, comes from having
4 limited access. I mean, it's just -- it's -- it's kind
5 of inconceivable to -- to considering you have a secure
6 area and then you have access that anybody can get to,
7 as in the case of the runways in the Sepulveda tunnel.
8 Basically, anybody that gets in this concrete can be
9 within 15 feet of the runway by virtually driving down
10 the state highway, or whatever that is, Sepulveda
11 Boulevard.

12 I understand this is a long-standing, you
13 know, problem that LAX has always had this tunnel since
14 the last big remodel job, but it doesn't -- it doesn't
15 really -- just because somebody, you know, made the
16 tunnel a project before doesn't mean that it shouldn't
17 be addressed in a security environment that we have
18 today.

19 If you -- if you want to take all the airport
20 designers of the world or maybe the top 100 and said to
21 them, "Here is my blank sheet of paper, LAX 3,500 acres,
22 or whatever it is, "design me an airport," there isn't a
23 one of them that would advocate running a highway under
24 the middle of those runways.

25 Now, I know that people think that just

1 because that concrete is thick and there is a lot of
2 steel in it, that it could possibly withstand a large --
3 a large truck-type bomb like was used by either in the
4 Oklahoma City Bombing or in the World Trade Center back
5 in '92. But both of those truck bombs, I don't think
6 they were all that large from what I heard on the news,
7 not in comparison to what could potentially happen. And
8 I just don't see -- I don't see any point in trying to
9 build a \$12-billion-dollar remodel job when it doesn't
10 address the very biggest security problem that LAX could
11 possibly have.

12 You know, there isn't -- virtually every
13 airport in the world has the same sort of layout as LAX.
14 You've got roads that run around, and people get out of
15 the cars and they walk into the terminal with their
16 bags. I don't see that every other airport in the world
17 is jumping to do some remodel job to make it some remote
18 check-in facility. I think the real issue ought to be
19 addressed so that we don't spend ten years and
20 \$10 billion dollars or \$12 billion dollars, or however
21 many billion dollars, only to end up with the potential
22 of still having a major terrorist problem that blows up
23 the tunnel, and then you lose half of your runway
24 capacity and 85 percent roughly, according to my rough
25 guesstimate of where all the cargo facilities are

1 located. Pretty much everybody seems to be east of the
2 tunnel. And, you know, all that will be cut off. There
3 won't be an avenue for these people to -- all these
4 businesses to be able to operate cargo, and half the
5 runways will be gone.

6 MS. SMITH: Thank you, Mr. Weis. Thank you.

7 Are there any other speakers that are ready to
8 speak that have filled out a speaker card? We are here
9 for at least another ten minutes. We will take a short
10 recess.

11 (Recess was taken.)

12 MS. SMITH: At this time we'll reconvene. Mr. Weis
13 would like to continue his comments. You have three
14 minutes, Mr. Weis.

15 MR. WEIS: One of the questions I have is how the
16 funding would be guaranteed to not get tied into the
17 city as revenue. I mean, we've got a \$38-billion-dollar
18 deficit in the State of California. And people think
19 that's a huge burden, but it's spread out over
20 35 million people. It's a big problem. What's going to
21 happen with a 12 billion or 10 billion dollar project
22 that's going to be funded by partially, I guess,
23 bondholders? And if there is some sort of a disaster,
24 either some air-type disaster like 9-11, that will have
25 a bad fallout on airline traffic, or if there is, God

1 forbid, some terrible disaster at LAX and we're in a
2 middle of a 12 billion dollar program, the airlines can
3 hardly afford to fund it now. How is that going to
4 get -- how is that going to get paid for?

5 Myself, as a taxpayer, I hope somehow it's not
6 going to backfire so I have to pay for this. How is
7 this project going to be guaranteed to be paid for out
8 of somebody else's money other than my tax money.

9 And if it is like service by bonds, how is
10 that going to be guaranteed that that's not going to
11 come back to get LAWA or the City of Los Angeles. I
12 understand that United Airlines is having problems where
13 they are not making payments on their bonds to the
14 bondholders right now at either LAX or San Francisco
15 because of the Chapter 11 situation. And it seems to me
16 that the City of Los Angeles should be guaranteed that
17 no matter what, it's not going to be a problem that the
18 bondholders -- or that the city taxpayers are going to
19 have to pay. Orange County had a project where they
20 built the massive freeway and it was going to be paid by
21 bondholders who are going to be paid back by tolls on
22 the toll road. That project went belly-up and Caltrans
23 is bailing them out. How is it that the people that
24 live in Los Angeles are going to be protected from
25 having to foot the bill from this if there is some sort

1 of a problem?

2 The other comment I have relates to just
3 having all the eggs in one basket at LAX. I mean, it's
4 unfortunate that there hasn't been better utilization of
5 regional airlines. But, you know, I think that the
6 overwhelming security problem with trying to fix the
7 tunnel, which I see is a real security problem just
8 because of the nature of how it is constructed and how
9 there is no prevention of large truck bombs or whatever
10 from going into there.

11 The utilization of the other airports, there
12 just isn't -- there isn't any way they could immediately
13 take up the capacity that would be reduced by something
14 that happened to that tunnel. And it seems to me that
15 it's LAWA's responsibility to help ensure that there is
16 a safe operating airport system for people of the
17 greater Los Angeles and Southern California area and to
18 not have provisions for that and to continually put all
19 the eggs in one basket when there is a real weak spot,
20 in my opinion, in the bottom corner of that basket.
21 It's a gross negligence on the part of LAWA.

22 MS. SMITH: Thank you, Mr. Weis.

23 Are there any other members of our audience
24 who care to speak this evening? Any other speaker cards
25 filled out? Do we have any other speaker cards, Evelyn?

1 MR. KESSLER: Is there anyone else who has not had
2 an opportunity to speak concerning the information in
3 the Supplement to the Draft EIS/EIR?

4 Not seeing anyone else, I will remind everyone
5 that if you feel you are unable to provide us comments
6 verbally today, we will be accepting written comments
7 now until 5:00 p.m. Pacific Standard Time, Friday,
8 November 7th, 2003. You could mail your comments either
9 to me at the FAA or to Jim Ritchie at LAWA. The mailing
10 addresses are listed on the cover of the Supplement to
11 the Draft EIS/EIR.

12 I want to thank everyone for your comments
13 today. This public hearing to the Supplement to the
14 Draft EIS/EIR on the Los Angeles International Airport
15 Master Plan is now closed. Thank you.

16 MS. SMITH: Thank you.

17 (Whereupon the proceeding adjourned
18 at 9:00 o'clock p.m.)

A Preliminary Review of Issues Associated with the LAX Master Plan Supplement to the Draft EIS/EIR

*Prepared for the Los Angeles County Board of Supervisors
by A.C. Lazzaretto and Associates
August 2003*

INTRODUCTION

The Federal Aviation Administration (FAA) and Los Angeles World Airports (LAWA) made available for public comment in early 2001 a Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) addressing three build alternatives, a no-build alternative, and the existing setting for the Los Angeles International Airport (LAX) Master Plan. In response to considerable public comment and the terrorist attacks that occurred on September 11, 2001, a fourth alternative -- Alternative D, the Enhanced Safety and Security Plan -- has been added to the LAX Master Plan. A Supplement to the Draft EIS/EIR was made available for public comment in July of 2003 to update information presented in the Draft EIS/EIR and to integrate Alternative D into the environmental review process.

Alternative D includes a number of airfield facility modifications. Although LAX would continue to operate with 4 runways, 2 of the existing runways would be moved, two would be lengthened, and all would be further separated from one another. The existing parking structures would be relocated and replaced by new centralized passenger terminals. The existing Terminals 1 through 7 would be reconfigured, including a new north/south linear concourse at the Tom Bradley International Terminal, flanked on the west by a new satellite concourse. A new ground transportation center and intermodal transportation center to be built east of Aviation Blvd. would serve as the primary access for all passenger drop-off and pick-up and vehicle parking. Some cargo facilities would be modified, although overall square footage would be equivalent to the No Action/No Project Alternative.

A brief preliminary review has been conducted to assess changes between the original Draft EIS/EIR and the 2003 Supplement to the Draft EIS/EIR for the LAX Master Plan, as well as consistency and accuracy of information within the documents. The initial review points to several issues requiring further comment and discussion.

One of these issues was central to County comments on the earlier LAX Master Plan review, and remains an area of potential concern for the current document: although LAWA indicates that its goal is to limit growth, improvements proposed as part of Alternative D would in reality serve to reinforce LAX as the preeminent airport of the southern California region, and may undermine attempts to strengthen the role of outlying airports. In addition to this thematic concern, there are a number of additional points that merit further consideration. The preliminary findings are outlined briefly in the discussion below.

DISCUSSION

1. The Proposed Master Plan Alternative D May Not Constrain Growth at LAX

The stated goal of Alternative D is to limit growth at LAX to 78 Million Annual Passengers (MAP) and induce growth at other regional airports. The primary means to accomplish this is to limit aircraft gates to 153 which is the same number of gates that exist in the No Project Alternative (NPA). However, the NPA includes 48 remote gates that are simply aircraft parking spaces on concrete. Alternative D provides 153 fully

County comments - LAX [Attach I]

functional and high capacity gates and does not remove the concrete which will remain available for aircraft parking. The true number of gates is therefore over 200. Furthermore, the design of the new gates is a linear configuration as opposed to the existing cul-de-sac configuration. The linear configuration is more flexible and has more capacity. Also, space in the western portion of the airport will remain available for future consideration of a new west terminal, as proposed in Alternatives A, B and C. Therefore, the gate limitation is not an effective constraint on passenger levels.

Alternative D includes other improvements that would support growth beyond the 78 MAP level. In particular, the new remote terminal in the Manchester Square area provides 6.5 million square feet of terminal space -- more than 50% greater than the 4 million square feet proposed in the 98 MAP Alternatives A, B and C. Further, many of the proposed improvements to the north airfield are designed to accommodate the new generation of larger aircraft.

Orientation of new LAX facilities to the new larger aircraft could have long-term, pervasive effects. Because the new larger aircraft require many smaller connecting flights to fill its 600 seats, these improvements will strengthen the "confluence of connections" that reinforce LAX as the preeminent airport of the southern California region, and at the same time reduce the incentive for airlines to utilize other regional facilities. A true constraint on the growth of LAX would be to make it inhospitable towards the new larger aircraft, coupled with improvements to serve new larger aircraft at another regional airport, and transit links to join the two facilities.

2. Airport Security May Not be Fully Achieved by Alternative D

Preliminary review suggests that the Supplement to the Draft EIS/EIR may fall short of an adequate review of airport security issues. Although the Executive Summary to the Addendum refers the reader to Appendix I 'for a detailed assessment of the security and safety features of Alternative D,' Appendix I offers a heavily conceptual and theoretical document that falls significantly short on detail. Anomalies include contradictory content and a lack of clarity expected of a public information document.

3. Environmental Justice May Not be Well Served by Alternative D

Presidential Executive Order 12898, issued in February 1994, requires all federal agencies to analyze environmental justice impacts when proposing public projects. The analysis is intended to determine whether minority and low-income communities are unfairly burdened by project impacts, with the goal of using mitigation measures to create a level playing field. In 1999, Senate Bill 115 was passed making environmental justice a requirement of CEQA as well.

Despite the importance of this subject, the original Draft EIS/EIR was found to lack even the most elementary NEPA requirements for environmental justice. Preliminary review suggests that the Supplement to the Draft EIS/EIR has corrected some but not all of the earlier deficiencies. In particular, the Supplement to the Draft EIS/EIR again limits the area of analysis (reviewing only those census tracts surrounding LAX), improperly omits assessment of many effects due to the preparers' inability to quantify or analyze the impacts, and defers a determination of significance pending completion of the mitigation program.

The assessment does not appear to consider the trade-offs between environmental protection and environmental justice pertaining to the placement and length of LAX runways: runway extension to the west would have significant adverse impacts on biological resources (particularly the El Segundo Blue Butterfly), but would serve

County comments - LAX [Attach I]

environmental justice through a significant lessening of noise, air quality and traffic impacts on Lennox, Inglewood and other disadvantaged communities around LAX. Nor does the assessment apply rigorous standards in assessing the proportionality of impacts and mitigation measures between the wealthier northside area and communities east of LAX including Lennox and Inglewood. These relevant issues require further review as part of the Supplement to the Draft EIS/EIR.

4. The Baseline Year of 1996 is Not Adequate for a 2003 Impact Assessment

It appears that the Supplement to the Draft EIS/EIR continues to use 1996 data to establish baseline conditions for a number of topical issues. This outdated reference point was considered inadequate for the original EIS/EIR, and remains unsuitable for use in the current Supplement to the Draft EIS/EIR.

5. The No Project Alternative does not offer a Consistent Yardstick for Measuring Project Impacts

The original EIS/EIR provided an incomplete discussion of the No Project Alternative by incorporating improvements that were then only in the "planning stages" and overstating the service levels and capacity of the existing facilities. This approach made it difficult to draw meaningful comparisons with project alternatives. Preliminary review indicates that the Supplement to the Draft EIS/EIR may also provide an incomplete picture of impacts associated with the No Project Alternative. In particular, the Supplement to the Draft EIS/EIR appears to substantially overstate passenger and cargo handling capacity under the no-build scenario, while understating both for the build scenarios.

Additionally, the No Project Alternative has not represented passenger capacity in a consistent manner. In the original 1997 Notice of Preparation, the No Project Alternative was linked to a range of 68-72 MAP whereas the 2001 and 2003 EIS/EIR documents increased this estimate to 71.2-78.7 MAP. Based on communications provided by LAWA at the Environmental Justice Workshop held in Inglewood, the increase between 1997 and 2001 reflected actual increases in passenger demand during that period. However, there was no equivalent adjustment for the period from 2001-2003, when passenger demand has fallen by almost one-third.

The Supplement to the Draft EIS/EIR states that the No Project Alternative is provided as a benchmark for comparison of the four build alternatives. However, use of a higher baseline passenger number minimizes the extent of the difference between existing and future conditions at LAX, which in turn affects comparative impact assessments throughout the EIS/EIR. Use of a *worst-case scenario*, in which the baseline was based on a low estimate of existing passenger demand, would have better served the goals of CEQA and NEPA, and given a more realistic picture of the changes between current and future conditions at LAX. The County believes that LAWA should revisit key impact findings in light of actual 2003 passenger demand, instead of the estimates developed for 2001.

6. Traffic, Noise and Air Quality Impacts have been Shifted Eastward

The revised Master Plan represents a major shift of improvements away from neighboring areas north and south of LAX and toward communities to the east. The unincorporated community of Lennox and the City of Inglewood now appear to bear the brunt of added traffic, while Manchester will be the primary location for passenger processing. This shift heightens the need for close scrutiny of the proposed mitigation plan and the analysis of Environmental Justice.

County comments - LAX [Attach I]

7. **Major Changes in the Project Call for Preparation of a Comprehensive Revised Draft EIS/EIR**

CEQA Guidelines require that a Subsequent EIR for a project must be completed if the Lead Agency determines that changes in a project will require major revisions to a previous EIR; a Supplement to an EIR may be prepared if changes in the project are not considered major (§15162(a)). Both Subsequent and Supplemental EIRs are subject to the same notice and public review requirements as the original EIR, but Subsequent EIRs must make available all the information in the environmental evaluation, whereas Supplemental EIRs only need circulate new or revised information. Discussion provided in the CEQA Guidelines indicates that both types of review are intended for use in connection with *previously certified or approved* environmental documents.

In the present case, there is no previously certified or approved document. Furthermore, preliminary review of the Supplement to the Draft EIS/EIR indicates that changes to the proposed project are major. Thus, even an adaptation of the Guidelines (i.e., to encompass a document that has not been previously certified or approved) would indicate the project should have been addressed through preparation of a comprehensive revised Draft EIS/EIR, in which the full record of information was consolidated in an effort to facilitate public review.

Public review and lead agency decision-making would also have been better served by providing copies of the comment letters submitted during public review of the original EIS/EIR. Instead, the Supplement to the Draft EIS/EIR makes no effort to present or even summarize the earlier comment letters. This approach creates a process that is confusing and cumbersome for reviewing agencies and organizations, and thwarts an opportunity to advance public participation.

8. **Growth-Inducing Impacts May Be Significantly Greater than Stated**

The Supplement to the Draft EIS/EIR bases its analysis of growth inducement on projected cargo and passenger activity. It concludes that by 2015, Alternative D would yield a direct economic output of \$63.7 billion and 350,500 jobs, plus an indirect economic output of \$93.8 billion and 629,000 jobs through a multiplier effect of 1.5. The EIS/EIR assumes that all of the jobs would be within the 5-County SCAG region, 78% of the jobs would be within a 20-mile radius, and 40% within a 10-mile radius of LAX. Finally, it concludes that Alternative D would be similar in terms of job formation to the No Action/No Project Alternative, differing by an increase of about 1%. With respect to collateral development, the EIS/EIR finds Alternative D impacts equivalent to the No Project Alternative for LAX Northside¹, Westchester Southside and Belford, and less than the No Project Alternative for Continental City and Manchester South.

In taking this approach, the document ignores the cumulative synergistic effects that would result if LAX Northside is constructed in tandem with the LAX improvements. The increase in cargo will create corresponding increases in off-airport services and place extraordinary pressures on commercial and residential land uses in the immediate neighborhood. The Growth-Inducing Impact Analysis does not appear to address these more localized impacts at all, even though the past history of LAX shows them to be potentially significant.

¹ LAX Northside is approximately 330-acres of land located on the north side of LAX (bisected by Westchester Parkway) and owned by LAWA. Tentative Map #34836, approved for this site during the mid-1980s, would allow development of about 4.5 million square feet of office, hotel, restaurant, retail, research and airport-related land uses.

ATTACHMENT II

LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS

**LAX MASTER PLAN DRAFT EIS/EIR
COMMENTS FOR ON-AIRPORT AND OFF-AIRPORT SURFACE TRANSPORTATION
JULY 2003**

The supplement to the Draft EIS/EIR serves to integrate Alternative D into the existing environmental review process for the LAX Master Plan, providing a level of analysis comparable to that which was previously prepared for the other alternatives addressed in the January 2001 Draft EIS/EIR.

Under the new plan, the projected passenger activity in the planning year of 2015 is 78.9 million annual passengers (MAP), which is reduced from the previous alternatives. The 78.9 MAP would be substantially the same as the No Action/No Project alternative and the passenger ground access trips would also be similar to the No Action/No Project alternative.

Alternative D, also known as "The Enhanced Safety and Security Plan," is in response to public comments received during the review period for the Draft EIS/EIR in January 2001. Its lower MAP aims to encourage a long-term regional approach to serving air traffic demand in the Los Angeles basin. The lowered MAP is designed to encourage other airports to accommodate future air travel demand in the region. The report indicates Alternative D would enhance security by limiting access by private vehicles to the main airport infrastructure to reduce the risk to airport users.

Alternative D significantly changes surface transportation access to LAX. Vehicular access is planned on the east and south sides of airport property via La Cienega Boulevard and the I-105 Freeway/Imperial Highway, respectively. Public Works staff conceived and advanced a proposal for new interchange for the I-405 Freeway at Lennox Boulevard and install a cul-de-sac on Lennox Boulevard just east of the freeway. The interchange would provide direct access between the I-405 Freeway and LAX. It would help mitigate the traffic impact at several intersections in the unincorporated Lennox community, reduce the amount of airport-related traffic in the Lennox community, and significantly reduce the travel time for airport-related traffic. Public Works coordinated the proposal with Supervisorial Districts 2 and 4 and presented it to the Lennox Coordinating Council. The Board offices and the Lennox Coordinating Council strongly support the new interchange for the I-405 Freeway at Lennox Boulevard should Alternative D be chosen for LAX.

LAX Master Plan Draft EIS/EIR
July 24, 2003
Page 2

The following comments are generic and apply to various mitigation measures recommended in the Draft EIS/EIR:

The document indicated mitigation measures may include fair-share contributions to certain projects, such as the Marina Expressway (SR 90) Connector Road to Admiralty Way project. The document should indicate which transportation projects have committed funds programmed and which projects, such as the SR 90 project, have not yet completed the EIR process and have not been funded.

The document should indicate that if a transportation project does not get approved and constructed, mitigation may not be feasible and the LAX Master Plan would have to be approved by overriding considerations.

The document should indicate that the Lincoln Corridor Task Force (LCTF) is studying transportation enhancements and aesthetic improvements along the Lincoln Boulevard corridor from the Santa Monica Freeway to Manchester Boulevard. It should indicate that the LAX project should pay its fair share of traffic mitigation measures recommended by the LCTF in order to mitigate project impacts that are not otherwise able to be mitigated.

A traffic impact analysis was not conducted per the Caltrans Guide for the Preparation for the Traffic Impact Studies. The Guide indicates that a traffic impact study should be performed when a project adds one or more vehicle trips during the peak hour for a freeway segment that is operating at level of service (LOS) E or F.

The following comments pertain to specific information pertaining to traffic and transportation in the Draft EIS/EIR:

Executive Summary

4-282 At the intersection of Lincoln Boulevard/Washington Boulevard, Improvements for 2015 indicates mitigation is performed in 2008. The County's Marina Expressway (SR 90) Connector Road to Admiralty Way project is targeted for completion in 2011, pending approval by all jurisdictions and funds (\$15 million) are in place. A footnote should be placed by this and all other transportation projects specified as mitigation not approved and funded.

4-288 The document states "Y Lennox Boulevard will terminate east of I-405 at Redfern Avenue, resulting in the elimination of access to Lennox Boulevard from La Cienega Boulevard." It should state that pedestrian access between Lennox Boulevard and La Cienega Boulevard will be maintained and sufficient right of way will be made available for community needs in the vicinity.

4-290 The document indicates signal synchronization (ATSAC, ATCS, or equivalent) for segments of La Cienega Boulevard in the County's jurisdiction is recommended as

LAX Master Plan Draft EIS/EIR
 July 24, 2003
 Page 3

a mitigation. Since the County does not participate in the City of Los Angeles= ATSAC program, the possible traffic signal synchronization improvements should be to integrate the intersections into the County Traffic Control System (TCS) as part of the Traffic Management Center (TMC).

- 4-293 We agree with the statement "Along the northbound side of I-405 near Lennox Boulevard, elevated roadways would extend from the I-405 interchange to Lennox Boulevard. These roadways would run adjacent to two local schools and along residences. Sound walls would need to be placed along these stretches of the roadway to reduce the amount of noise impact to the schools and residences."

Technical Report S-2a: On-Airport Surface Transportation

- 11 The capacity for main access roads (Century Boulevard and Sepulveda Boulevard) assumed in the study of 1,500 to 1,700 vehicles per hour per lane (vphpl) appears to be high. HCM 2000 (page 10-10) suggests around 1,140 for these types of roadways which are classified as Class I Urban Streets. For transitions from main access roads to curb approaches, a capacity of approximately 850 vphpl is suggested in HCM 2000. The capacities for other road types appear to be on the high side as well. Justifications for these capacity assumptions should be provided or reduced to a more realistic capacities suggested in HCM 2000.

Technical Report 2b: Off-Airport Surface Transportation

- 4 Figure S1 shows the study area and key study locations. Figure S4 shows increase in traffic due to the airport expansion project along Lincoln Boulevard and La Cienega Boulevard, north of the I-405. Also, traffic in the Lincoln Boulevard corridor uses Admiralty Way as an alternate to Lincoln Boulevard. Approximately 35 to 40 percent of traffic on Admiralty Way is bypass traffic, some of which is from Lincoln Boulevard. Therefore, the traffic analysis should include all the intersections along Admiralty Way and the Washington Boulevard/Via Marina intersection. In addition, the following intersections in the unincorporated Baldwin Hills area should be analyzed:

- La Cienega Boulevard at Stocker Street
- La Cienega Boulevard at Slauson Avenue ramps
- Stocker Street at La Brea Avenue
- Slauson Avenue at La Brea Avenue

- 30 Figure S3, Differences in LAX Passenger Trips B 2015 PM Peak Hour B Alternative D B Adjusted Environmental Baseline, shows decrease in traffic along Pershing Drive with the project. This does not make sense since employee parking structure for 12,400 stalls is proposed east of Pershing Drive north of Imperial Hwy. There should be an increase in airport traffic due to the proposed parking structure.

LAX Master Plan Draft EIS/EIR
July 24, 2003
Page 4

- 35 Additional Fly-Away sites are proposed and assumed in the traffic impact analysis. Specific locations should be identified and some level of commitment must be made to ensure these additional sites will be implemented. It should also state that a separate environmental impact analysis will be conducted for any additional sites.
- 36 Sufficient capacity should be provided for the intersection of the ITC and GTC connector road and the new access road proposed with the Lennox Boulevard/I-405 interchange. Free right-turn lanes should be provided to ensure sufficient turning movement capacity. The level of service should be conducted to ensure that adequate capacity exists.
- 47 Project fair share estimates for the impacted Congestion Management Program (CMP) routes and intersections are based on the growth between 1996 (Environmental Baseline) and 2015. This seems inconsistent with the impact analysis since the project impact was evaluated based on comparing to the 2015 Adjusted Environmental Baseline.
- 62 The haul and detour routes for any airport construction near the unincorporated areas should also be submitted to the County of Los Angeles Department of Public Works for review.

Mayor Mike Gordon
City of El Segundo
Comments on the
LAX Master Plan Draft EIS/EIR Supplement
August 20, 2003

- **Good Evening. I am Mayor Mike Gordon, representing the City of El Segundo.**
- **Given the length and complexity of the Master Plan and environmental documents, our full comments on technical issues will not be ready for some time, therefore the City's comments tonight are preliminary.**
- **The City of El Segundo continues to oppose LAX Master Plan Alternatives A, B, and C for the many reasons the City expressed orally and in writing during the public review and comment period for the initial Draft EIS/EIR in 2002.**
- **While we feel the stated objectives of the new plan supports a regional aviation approach — an issue that Mayor Hahn and I continue to work side by side on—the City of El Segundo has not yet taken an official position on Alternative D, nor have I.**
- **Specifically, the City supports a regional approach alternative that makes proper use of Inland Empire airports.**
- **The City supports an alternative with fewer environmental impacts. We would like to see the adverse impacts of the airport minimized and mitigated to the greatest extent feasible.**
- **The City of El Segundo supports enhanced safety and security at LAX.**
- **And the City supports an alternative that by design will accommodate passenger and cargo levels no greater than the physical capacity of the airport as it exists today, approximately 78 million annual passengers.**
- **Limiting LAX's capacity to its current capacity has always been our number one goal. We believe limiting LAX's capacity will allow other**

airports in the region to develop and handle a fair share of future regional aviation demand.

- . This approach will result in fewer environmental impacts,**
- . and will improve safety and security at the airport.**
- . However, the City is greatly concerned about the impacts of proposed southside airfield changes that move the southernmost runway 50 feet closer to El Segundo.**
- . LAWA has stated that it believes these changes are necessary to improve runway safety.**
- . However, we are currently studying the impacts of the reconfiguration, and other options for the southern runway complex.**
- . In particular, we urge a full public consideration of end-around taxiways as an alternative that could provide greater safety sooner, at lower cost and with fewer new burdens on local communities.**
- . Safety at LAX must be a priority for all of us.**
- . The City is prepared to support measures necessary to enhance safety, even if those measures increase our burden, but only if we are assured, through an independent expert, that other alternatives are not equally effective.**
- . In conclusion, we are grateful for Mayor Hahn's responsive leadership and his pledge to constrain growth at LAX and foster a regional approach to meeting future aviation demand.**
- . It is our hope that the ultimate outcome of this Master Plan process will be a regional airport approach that ensures that LAX does not exceed its current capacity.**
- . Thank you.**

Statement of
Congresswoman Maxine Waters
August 20, 2003

Public hearing held by Los Angeles World Airports and the Federal Aviation Administration

Joslyn Community Center Auditorium
1601 Valley Drive
Manhattan Beach, CA

Thank you for the opportunity to speak and submit a statement regarding the Draft Environmental Impact Statement/Environmental Impact Report for Alternative D Enhanced Safety and Security.

As the Member of Congress for the 35th Congressional District, I represent over 638,000 constituents who live in the cities and communities of Inglewood, Westchester, Playa del Rey, Gardena, Hawthorne, Lawndale and portions of South Los Angeles. Since the release of the prior Master Plan in January 2001 and the release of the new Supplement to the Master Plan Alternative D, the views and concerns of my constituents have not changed.

Thousands of residents are still heavily impacted by airplane noise on a constant basis. Thousands of residents are still impacted by pollutants and toxins from aircraft emissions that fly overhead. Thousands of residents have suffered the consequences of increased traffic congestion in their neighborhoods. Thousands of residents are still suffering from hearing loss, sleep deprivation, hypertension, respiratory ailments, anxiety and stress. Residents should not have to live under such conditions.

With the release of Alternative D, new issues of concern have arisen. I have talked to many residents and elected officials regarding Alternative D. The primary focus of the plan is enhanced safety and security imposed as a result of the possible threat of terrorism in the aftermath of the September 11th attacks.

Although I am highly in favor of ensuring all passengers and employees at LAX and other airports are as safe as possible, there are evident flaws in Alternative D. Specifically, my objections to the proposed plan hinge on the following:

1) The new alternative increases the passenger cap from 78 million annual passengers (MAP) to 78.9 MAP as illustrated in the Table ES-1 of the Executive Summary, Supplement to the Draft EIS/EIR Volume 1. This is a clear deviation and violation of the Mayor's promise and pledge to constrain passenger capacity within LAX to the existing facilities which he signed on March 26, 2001.

On July 16, 2002, I introduced The Careful Airport Planning (CAP) for Southern California Act (H.R. 5144). This legislation would cap LAX traffic at 78 million passengers a year and prevent LAX from expanding beyond its current capacity. The County Board of Supervisors and the Los Angeles City Council has supported this legislation which is currently pending.

2) Alternative D sounds more like expansion than safety and security given the fact part of the plan is to utilize the Manchester Square area as a Ground Transportation Center (GTC). If LAWA is relocating residents out of the Manchester Square area and clearing the land of over 568 properties to build this new Center, I would definitely call that expansion. This site has been opposed by the community, elected officials and there is no substantive proof that it will make the airport more secure.

3) Based on a recent analysis completed earlier this year by the RAND Corporation, to simply reconfigure the airport does not mean the airport is safer than before. It would actually make the airport less safe in certain instances. The RAND analysis states that "The greatest risks are in high density areas such as lines for ticketing, baggage claim and the security check points. These risks are not likely to be reduced by Alternative D, which simply moves these targets of opportunity to the Ground Transportation Center (Manchester Square) and the people mover."

4) During these tough economic times, it is not prudent to increase passenger facilities charges and to use any surplus funds on untested ideas. We must take a lesson from the State of California and not allow ourselves to create a deficit in the billions of dollars on plans and ideas of uncertainty.

There are major airlines who are also opposing Alternative D due to the current decline in air travel and the increased costs that would be incurred such as landing fees, to pay for much of the project.

Alternative D is simply a ploy and continuation of former Mayor Richard Riordan's plan to expand the airport under the name of safety and security. In addition, Alternative D provides Los Angeles World Airport (LAWA) Commission President Ted Stein and Mayor Hahn an opportunity to assist their fat cat developer friends in securing large city contracts in return for re-election campaign contributions.

I am opposed to Alternative D. I believe that now is the time to seriously look at developing a more regional approach to air travel so that airports such as Ontario International and Palmdale Regional can begin to accept their fair share of air traffic.

I am asking all constituents of the 35th Congressional District and the South Bay communities to oppose Alternative D.

**Official Hearing Transcript
Palmdale Regional Airport Terminal
Palmdale, California
Thursday, August 21, 2003**

Following this page is the transcript of the oral testimony taken at the above hearing. Each speaker at the hearing has been assigned a unique identification number. The numbers assigned to each speaker for this hearing are:

Number	Speaker	Affiliation
SPHPD00001	Allen Baumann	None Provided
SPHPD00002	Bob Schack	None Provided
SPHPD00003	Kathleen Burr	Los Angeles County Farm Bureau
SPHPD00004	Norm Hickling	Supervisor Mike Antonovich's Office
SPHPD00005	D. C. Snyder	None Provided
SPHPD00006	Garry Cope	Oldtown Homeowners Group, Inc.
SPHPD00007	Doug Williams	Ironworkers Local 433
SPHPD00008	Paul Valdovinos	Laborers Local 300
SPHPD00009	Sam Hawkins	Ironworkers Local 433
SPHPD00010	Rick Norris	City of Palmdale
SPHPD00011	Ramon Gomez	Laborers Local 300
SPHPD00012	Jeff Schaefer	None Provided
SPHPD00013	Juan Blanco	None Provided
SPHPD00014	Raymond Hill	None Provided
SPHPD00015	Juan Blanco	None Provided
SPHPD00016	Lewis Trout	Palmdale Regional Airport

Any exhibits attached to this hearing transcript have been previously reproduced in this Final EIS/EIR as individual public comment letters.

3 ---oOo---

4
5 MR. WALL: Thank you for coming this evening and
6 welcome you to the public hearing on the Los Angeles
7 World Airport LAX Master Plan and Environmental Impact
8 Report and Environmental Impact Statement.

9 Let me begin by introducing the gentlemen to
10 my right who will make brief statements. The first is
11 David Kessler from the Federal Aviation Administration.

12 Mr. Kessler.

13 MR. KESSLER: Good evening, ladies and gentlemen.
14 My name is David Kessler. I'm an Environmental
15 Protection Specialist for the Airports Division of the
16 Federal Aviation Administration, Western-Pacific Region.

17 I would like to welcome you to the eighth of a
18 series of public hearings the FAA and the Los Angeles
19 World Airports, or LAWA, are conducting on the
20 Supplement to the Draft Environmental Impact
21 Statement/Environmental Impact Report, or EIS/EIR, for
22 the proposed Master Plan at Los Angeles International
23 Airport.

24 The Supplement to the Draft EIS/EIR addresses
25 an additional Alternative, Alternative D, the Enhanced

1 Safety and Security Plan that was added in the fall of
2 2001. This new Alternative was added as a result of
3 comments submitted on the 2001 Draft EIS/EIR and the
4 terrorist attacks that occurred on September 11th, 2001.

5 The Notice of Availability of the Supplement
6 to the Draft EIS/EIR was published in various local
7 newspapers and in the Federal Register on Friday, July
8 11, 2003. The FAA and LAWA are the authors of the
9 Supplement. The Federal Highway Administration is also
10 a cooperating agency in the preparation of the Draft
11 EIS/EIR that was published in January of 2001.

12 The purpose of these hearings is to collect
13 the comments from the general public concerning the
14 adequacy of the information disclosed in the Supplement
15 to the Draft EIS/EIR on the proposed Alternative D.

16 I would like to take this opportunity to make
17 sure that everyone understands that no decision will be
18 made today regarding the proposed project. Today's
19 hearing is not a question-and-answer type of forum. Our
20 job is to listen to what you have to say about the
21 adequacy of the information in the Supplement to the
22 Draft EIS/EIR. In other words, it's your turn to talk
23 to us. Since we are here to listen, we are not going to
24 respond to questions about the pros and cons of the
25 proposed project.

1 Since 5:00 this afternoon we have held a
2 public workshop in this room for anyone to ask questions
3 about the Master Plan, the environmental process and the
4 various proposed projects.

5 Following publication of the Supplement to the
6 Draft EIS/EIR for review and comment, the next step in
7 the joint Federal and State environmental disclosure
8 process is holding this and the other public hearings
9 beginning last week and continuing through this week.

10 I would like to take the opportunity to recap
11 the environmental disclosure process for this project.
12 The environmental evaluation for the LAX Master Plan
13 began in 1997 with the publication of a Notice of Intent
14 to prepare the joint EIS/EIR in the Federal Register.
15 In July 1997 we held a series of meetings with members
16 of the public and governmental agencies to receive
17 comments on the scope of the Draft EIS/EIR. Following
18 those meetings, the Draft EIS/EIR was published in
19 January 2001.

20 Both the 2001 Draft EIS/EIR and the 2003
21 Supplement have been prepared pursuant the National
22 Environmental Policy Act of 1969, or NEPA, the Council
23 on Environmental Quality Regulations, which are the
24 implementing regulations for NEPA, the California
25 Environmental Quality Act of 1970, or CEQA, and the

1 Airport and Airway Improvement Act of 1982, as amended.

2 Following today's hearings and the close of
3 the comment period, we will then correct and revise the
4 EIS/EIR, as necessary, based on the comments received.
5 We will also prepare responses to the comments that we
6 receive and include those responses along with those
7 that were submitted to the FAA and LAWA on the 2001
8 Draft EIS/EIR into the Final EIS/EIR. The information
9 contained in the Supplement will also be combined with
10 the information in the 2001 Draft into the Final
11 EIS/EIR.

12 Before we begin receiving verbal comments, we
13 would like to let you know the ground rules of this
14 hearing. First, as I said earlier, we are not here to
15 respond to questions about this project. We are only
16 here to listen and take notes. We have a court reporter
17 behind me here to ensure that we have an accurate
18 transcript of this hearing.

19 For anyone who would like to speak, we ask
20 that you fill out a speaker card, like this one, which
21 is available at the sign-in desk. The cards after they
22 are filled out will then be brought up here to our
23 facilitator who will call the names of each speaker so
24 we can proceed in an orderly fashion.

25 So that everyone gets an opportunity to

1 provide verbal comments, everyone will be given three
2 minutes to speak. To be fair to everyone, we are not
3 going to allow people to transfer their allotted time to
4 someone else. I ask that when you speak, you give us
5 your name and address for the record. We also have a
6 Spanish language translator for anyone wishing to
7 provide their comments in Spanish.

8 If there is anyone who is uncomfortable
9 speaking in front of a group or if you need more than
10 three minutes to provide your comments, we ask that you
11 provide your comments in writing. We have comment
12 sheets, like this one, also available for your use at
13 the sign-in desk. You can leave your comments at the
14 sign-in desk or you may mail your written comments using
15 either the comment sheet or a letter to either address
16 listed on the cover of the Supplement to the Draft
17 EIS/EIR.

18 I would like you to understand that a verbal
19 comment is just as important as a written comment. So
20 please feel free to provide any comments on the document
21 you may have either to us verbally today or in writing.

22 On August 1st, 2003, LAWA asked the FAA to
23 extend the public comment period to a total of 120 days.
24 FAA has agreed to LAWA's request. The FAA has asked the
25 U.S. Environmental Protection Agency to publish a notice

1 announcing the extension to the public comment period in
2 the Federal Register. FAA and LAWA will also publish a
3 notice of the extension in the local newspapers of
4 general circulation. Therefore, comments on the
5 Supplement to the Draft EIS/EIR are now due by
6 5:00 p.m. Pacific Standard Time, on Friday,
7 November 7, 2003.

8 Lastly, I would like everyone to know that
9 even though we have this hearing scheduled until 9:00
10 this evening, we will stay here as long as necessary for
11 everyone to get a chance to provide verbal comments on
12 the Supplement to the Draft EIS/EIR. As I said earlier,
13 our job here today is to listen to your comments.

14 At this time I will ask everyone in the room
15 to take a moment and turn off your cell phones and
16 pagers to be courteous to those people making verbal
17 comments at tonight's hearing.

18 Now I will return our hearing back to our
19 facilitator who will introduce Mr. Jim Ritchie, who will
20 provide some introductory comments from LAWA. Following
21 Mr. Ritchie's comments, we will then collect the speaker
22 cards and call the name of the first speaker.

23 Thank you.

24 MR. WALL: Thank you, Mr. Kessler. Also receiving
25 testimony tonight is Mr. Jim Ritchie, who is the

1 Los Angeles World Airports Deputy Executive Director for
2 long-range planning.

3 Mr. Ritchie.

4 MR. RITCHIE: Thank you, Tom. I appreciate the
5 interest tonight. On behalf of Los Angeles World
6 Airports, we certainly welcome you tonight to this great
7 airport to take a look at the LAX Master Plan and to
8 receive your comments.

9 I should make a comment, however, I see, of
10 course, the strong interest in the Palmdale Regional
11 Airport. And I will tell as tonight we will take your
12 comments on the LAX Master Plan, it is not going to be
13 too far of distance in time that we will be back here
14 for the Palmdale Master Plan. That is an effort
15 underway. It is in its formative stages. We have some
16 of our consultants here that many of you talked with
17 tonight. So thank you for your interest.

18 Thank you for your representatives in the form
19 of Councilman Rick Norris, your Aerospace Commission.
20 It's a strong signal to us as we form a tight bond as we
21 not only develop the airports of LAX and Ontario, but
22 Palmdale together.

23 So with that, welcome again. And for the
24 consistency of this public hearing process I will read
25 into the record my introductory comments as we go

1 through a total of these 12 public comment periods.

2 You may recall the public hearing process in
3 2001 while we were examining other alternatives toward
4 the modernization of LAX. The tragic events of 2001 and
5 the leadership of Mayor Jim Hahn have reshaped our
6 environmental process. The Mayor's pressing concerns
7 for safety and security have provided new guidance along
8 with the public comments received during that period
9 from January to November of 2001 when we were going
10 through the similar process.

11 You are here tonight primarily to provide
12 comments on that new Alternative referred to as
13 Alternative D. This is a supplement to the existing
14 environmental process. And the Alternative, as you have
15 seen on the boards in the back of the room, has
16 undergone the same strict, rigorous environmental
17 analysis.

18 We are here tonight to receive your comments
19 on this new safety and security plan and its impacts as
20 disclosed tonight.

21 With that, again, welcome. And Mr. Wall, if
22 you could proceed.

23 MR. WALL: Thank you, Mr. Ritchie. We want everyone
24 to be comfortable this evening when making their
25 comments. So I will explain the process for you.

1 I will call three names, and those three
2 people will be the first three speakers. We would like
3 you to come up to the podium. The microphone is on. We
4 would like you to state again your name and address and
5 spell your name and state your address clearly so that
6 Kim and Lisa, the court reporters behind me, could get
7 your complete and accurate testimony.

8 I ask that you speak slowly and clearly so we
9 get every word in the record.

10 I have in front of me a time clock. I'll show
11 you how the clock works. When I hit the play button,
12 the green light illuminates and you have three minutes
13 counting down to zero. When it get to 30 seconds, the
14 orange light will illuminate, and that gives you 30
15 seconds to close. When it gets down to the bottom of
16 the three-minute timing, the red light goes off and a
17 horn sounds. So let's be careful and not be surprised
18 when that happens this evening.

19 I'll stop the clock now and I'll ask the first
20 three speakers to come forward. First, Mr. Allen
21 Baumann followed by Mr. Bob Schack followed by
22 Ms. Kathleen Burr.

23 Mr. Baumann, welcome.

24 MR. BAUMANN: Good evening everyone here.

25 Regarding --

1 MR. WALL: Sir, may I ask you to state your name and
2 address.

3 MR. BAUMANN: Oh, yeah, you're right. Allen A.
4 Baumann, B-a-u-m-a-n-n, 36435 Ironhorse Drive, Palmdale,
5 93550.

6 Regarding Alternative D, it seems to me that a
7 better approach than the approach, which is being
8 envisioned at this time, would be a diffusion of the
9 density of the population for security reasons.

10 The 405 and the 105 are easy targets for
11 terrorist activities. And we all know the glut of
12 activity of passengers that are transporting themselves
13 down to LAX.

14 LAX itself sees or understands the problem of
15 a lot of people being in one area at one time. That's
16 why the security, if I'm correct, is envisioned to be
17 offset and then brought to the various terminals.

18 The airlines, I'm reading in current doctrine,
19 are looking at regional airport concepts. They no
20 longer are looking at the large aircraft carrying 300,
21 400 people. They are now looking at what they call the
22 regional airplane itself. The 7E7 is being specifically
23 built for that.

24 The airlines doubled the number of smaller
25 aircraft that they put in their fleet last year. This

1 year they are planning to triple it. That gives us, at
2 least in my opinion, the impression that the airlines
3 are planning not to have all this going into one large
4 area, but a diffusion across the countryside.

5 It would seem to me that a better plan, a
6 better alternative would be to look at utilizing three
7 regional area concepts, LAX, Ontario and Palmdale. That
8 would diffuse not only the people, but it would diffuse
9 the cargo and it would also give us the opportunity to
10 provide better security. That's the essence of what I
11 have to say about Alternative D.

12 I would like to make a comment that I'm on the
13 Palmdale Aviation Aerospace Commission. We meet the
14 first and third Tuesdays of every month. We very much
15 would like to see the public at these meetings because
16 currently it is five of us trying to drive forward
17 conceptually what is going to be given to the City
18 Council. We would appreciate very much the public
19 coming to our meetings and giving us the opportunity to
20 hear their input and give us a better perspective. And
21 I thank you all very much.

22 MR. WALL: Thank you, sir.

23 Next, Mr. Bob Shack.

24 MR. SCHACK: Good evening, Bob Schack, S-c-h-a-c-k,
25 38647 25th Street East, Apartment Number 2, Palmdale,

1 California.

2 I've been a resident of the Palmdale area
3 since 1965. I've served on many committees in support
4 of the Palmdale Airport. I was interested in what the
5 gentleman had to say about coming to Palmdale in the
6 near future to talk about our Palmdale Airport here; is
7 that correct?

8 MR. RITCHIE: (Nods head.)

9 MR. SCHACK: So we are looking forward to that
10 meeting. I'll keep my remarks very short, then, because
11 we'll be looking forward to talking to you again soon.

12 We would like to see that some of the air
13 travel and some of the luggage and some of the cargo
14 being shipped to Palmdale -- or transferred up to
15 Palmdale and also transferred to Ontario and taking the
16 pressure off of LAX. Relieving the pressure that's
17 being put on the folks down there, you need this
18 \$9 billion dollars to expand the airport. And through
19 that, even through the construction, you're going to do
20 your remodeling down there, through the construction
21 period transferring some of that up here to Palmdale and
22 to Ontario. And that would relieve a lot.

23 Thank you very much for your time. And,
24 again, we will look forward to talking to you.

25 MR. WALL: Thank you, sir.

1 MR. RITCHIE: Excuse me, Tom, I'm not supposed to
2 talk, but I can't resist. I will tell you, we will be
3 in Allen's commission in about 30 days. So make sure
4 you support Allen.

5 MR. WALL: Next will be Ms. Kathleen Burr followed
6 by Mr. Norm Hickling and Mr. D.C. Snyder.

7 MS. BURR: My name is Kathleen Burr. I'm the
8 Executive Director of the Los Angeles County Farm
9 Bureau, 1006 West Lancaster Boulevard, Lancaster.

10 Mr. Ritchie and staff, thank you for the
11 opportunity to again stand here. It's been a couple of
12 years. And I realize that agriculture is not a top
13 priority of the LAWA, but as an interim land use here up
14 in Palmdale, I think it should be one of the top
15 priorities.

16 Currently I've identified 2,080 acres that has
17 the potential of being an ag-land. This is located
18 between 40th and east of 80th. When we get closer to
19 90th, we're encroaching on the SCA that has been
20 designated for the LAWA property.

21 The revenue for the first year on this 2,080
22 acres at \$25 an acre would be about \$52,000. That's for
23 soil preparation and everything. Currently after that
24 if we're leasing this land to the vegetable growers,
25 we're looking at approximately \$250,000 in income per

1 year. That's not including the sod which generates \$200
2 an acre. Both of our large carrot groves up here are
3 each looking for an additional 5,000 acres each to put
4 into carrot-potato production.

5 At that land, that would be an additional 1.2
6 million in revenue for the airport with that 10,000
7 acres. That's not even including DM Camp from
8 Bakersfield and the current lessees on the airport
9 property.

10 We're going to take all this and we're going
11 to add the Mohave Desert ground squirrel to this issue.
12 And currently the Sanitation District has finished their
13 EIR of their section. I believe it was 15, no ground
14 squirrels were found. This is going to be put into
15 alfalfa production.

16 What's going to happen if the Mohave Desert
17 ground squirrel gets federally listed? LAWA is going to
18 be up a creek without a paddle. And now we're going to
19 throw Fish and Game into this, which I know Fish and
20 Game is already on the scene. One other way to remedy
21 this is to do the EIR and let ag come in as an interim
22 use.

23 Mitigation, what is that going to be from Fish
24 and Game, two to one or seven to one? Seven to one
25 dollars is going to run in the billions to LAWA. And I

1 don't think that's going to be a sound science in
2 business.

3 Adjudication of water rights, there is another
4 issue we have out here. If you have ag come in, they
5 are going to pump a lot more ground water out. It is
6 going to be re-used. They can recharge the ground water
7 with some of it, but adjudication rights on the airport
8 and the water rights are going to increase.

9 So with the added issue of the Mohave Desert
10 ground squirrel and Fish and Game, I would like to talk
11 to someone and find out why there has been a large
12 holdup in using this land as interim lease for ag.

13 We're looking over the next 10 to 15 years
14 with this additional ag land leases, \$12 million dollars
15 in revenue. And I'm not sure why LAWA is turning down
16 \$12 million dollars in revenue from our farmers.

17 Thank you very much.

18 MR. WALL: Thank you, ma'am.

19 Next Mr. Norm Hickling.

20 MR. HICKLING. Norm Hickling. It's H-i-c-k-l-i-n-g.
21 Address is 1113 M-4, Palmdale, California. And it's a
22 pleasure to be here on behalf of Supervisor Mike
23 Antonovich.

24 And Supervisor Antonovich has a great deal of
25 concern with this current plan. He finds fault in the

1 current LAX Master Plan for its failure to adequately
2 address Southern California's future air transit needs.

3 Supervisor Antonovich feels it is vital for
4 the future of air transit needs of our County that we
5 adopt a regional approach that includes the full
6 utilization of both Palmdale and Ontario Airports.

7 Additionally, he is concerned that the
8 proposed Master Plan does not really limit the growth of
9 LAX to 78 million annual passengers, nor does it provide
10 adequate security in light of all the recent events
11 after 9-11, nor does it adequately address environmental
12 concerns or of the shifting traffic, noise and air
13 quality impacts that will go eastward, especially
14 affecting the communities of Lennox and the City of
15 Inglewood, does not use up-to-date data for the
16 Supplemental EIS or EIR. The data is from 1996. Nor
17 does it include a rail component on how to move
18 passengers between regional airports. Also, it doesn't
19 deal with the fact that growth-inducing impacts may be
20 significantly greater than stated in the current plan.

21 As we all know, LAX currently serves about
22 56 million annual passengers and about 2 million annual
23 tons of cargo. The region, as it's been purported to
24 say, it will need to accommodate up to 98 million annual
25 passengers and 4.2 million annual tons of cargo by the

1 year 2015. We can do that if we start utilizing
2 Palmdale today.

3 LAX annual economic impact to the region is
4 estimated at \$60 billion dollars. An estimate of 59,000
5 jobs are directly attributed to LAX at or near the
6 airport with 408,000 jobs throughout -- 408,000 jobs
7 spread throughout Southern California.

8 40 years ago Los Angeles City fathers
9 envisioned the regional airport system instead of
10 reliance on one single airport. The City of Los Angeles
11 bought more than 17,000 acres here in Palmdale and still
12 sits here empty today. This could alleviate the future
13 overcrowding of LAX.

14 We have a current contract with the air force
15 at Plant 42 to use the terminal and use the runways.
16 And today we could take up to 50 flights starting right
17 away. And Supervisor urges the regional transport
18 method is the solution to the problems and not the plan
19 that we have before us. Thank you.

20 MR. WALL: Thank you, sir.

21 Next will be Mr. Snyder, followed by
22 Mr. George Cope followed by Mr. Norman Jacobson,
23 followed by Mr. Doug Williams.

24 Welcome sir.

25 MR. SNYDER: Thank you. D.C. Snyder, D, period, C,

1 period, S-n-y-d-e-r, 3125 Lantana Court, Palmdale,
2 93551.

3 I've been a resident since 1981. I'm in favor
4 of the regional plan for airports. I'm against the
5 development of LAX and all the resources thereof.

6 Ever since I've moved to this region, there
7 has been continual talk and meetings and on and on about
8 the development and possibility of the Palmdale Regional
9 Airport. And it basically has been just that, talk.
10 I'm here in support of a regional plan. Thank you.

11 MR. WALL: Thank you, sir. Mr. George Cope.

12 MR. COPE: My name is Garry Cope, C-o-p-e. My legal
13 name is George, but I go by Garry. I am representing
14 Old Town Homeowner's Group.

15 I also favor the regional approach, but I'm
16 glad somebody mentioned that you have the U.S.
17 Transportation Department in on this, that we need to
18 work with them and the state. If you come out to
19 Palmdale to widen the 14 Freeway, you're going to
20 strangle any efforts of using a regional concept out
21 here by the couple of few lanes that we have for the 14
22 Freeway to accommodate traffic coming into the area from
23 outside to relieve LAX and the San Fernando Valley areas
24 of -- for making use of an airport.

25 We need the jobs. We need the industries that

1 such a regional airport would bring to Palmdale, but we
2 also need to be cautionary on the environmental impacts
3 it will have. One of the community -- local community
4 environmentalists in the community is worried that with
5 50 flights a day might fill up the valley with a lot of
6 pollution. And even though we do get
7 a lot of wind not only from our politicians, but from
8 nature, we may not be able to fully be blown out when
9 the airplanes start flying here in Palmdale.

10 So that is a major concern that I have myself
11 because -- especially with my concern of being on the
12 Environmental Restoration Advisory Board of Plant 42,
13 we're worried that you will really need -- and the part
14 we don't have any control of are looking into, there are
15 still sites of contamination that may be out there that
16 nobody is aware of yet that will need to be cleaned up
17 so the people using this airport will not be getting
18 sick just coming to Palmdale.

19 We don't want that on our heads, "Come to
20 Palmdale and get sick." We want it to be a place to
21 call home and we need the industry also. Thank you.

22 MR. WALL: Thank you, sir.

23 Next Mr. Norman Jacobson. Mr. Jacobson. Are
24 you here? I don't see anyone approaching.

25 Mr. Doug Williams. Mr. Williams will be

1 followed by Mr. Paul Valdovinos and Mr. Sam Hawkins.

2 Welcome, sir.

3 MR. WILLIAMS: My name is Doug Williams,
4 W-i-l-l-i-a-m-s. I live at 42437 West 56th Street in
5 Lancaster.

6 I'm a business agent for Ironworkers Local
7 433. And we represent 4,200 union members in the
8 general area.

9 We would love to see Plan D go through, me
10 personally because I'm a frequent flyer and I fly
11 overseas. That airport, LAX, is not rated for the big
12 jumbo jets. And they are only going to get bigger for
13 the oversea traffic.

14 We also support the security plan. I think it
15 is masterfully done. Unfortunately, with our current
16 world structure of our politics, we need it. I do think
17 it is the thing to do. As ironworkers, we would benefit
18 naturally from jobs. That is a hell of an engine for
19 the L.A. area. A lot of our people up here work down in
20 that area. It would need -- it would be the boost that
21 California needs right now in the work picture. We also
22 support this being a regional airport as soon as we
23 could get that. We would like to see that.

24 I miss the old terminal. I used to use it
25 quite a bit. With that I'll end my speech. Thank you.

1 MR. WALL: Thank you, sir. Mr. Paul Valdovinos.

2 MR. VALDOVINOS: Good evening. My name is Paul
3 Valdovinos. It's V-a-l-d-o-v-i-n-o-s. I'm a resident
4 1210 East Avenue Q-10. I'm a member of our Laborer's
5 Local 300. We're here to support the Master Plan
6 Alternative Plan D. We're also here to support the
7 proposed expansion of the Palmdale Regional Airport.
8 And, also, we represent our Laborer's Local 300.
9 Thank you.

10 MR. WALL: Thank you, sir.

11 Next is Mr. Sam Hawkins and then
12 Mr. Rick Norris.

13 MR. HAWKINS: Hi. My name is Sam Hawkins,
14 H-a-w-k-i-n-s. I live at 37744 Birch Tree Lane. That's
15 Palmdale.

16 I'm a member of Ironworkers Local 433. I'm
17 here in support of Plan D and also of the security plan.
18 As also someone that has lived here for 20-plus years, I
19 support the Palmdale Regional Airport also. And that's
20 it.

21 MR. WALL: Thank you, sir. Mr. Norris, I have two
22 cards for Mr. Norris. Did you fill out two cards?

23 MR. NORRIS: No, but I'll only take three minutes.

24 MR. WALL: All right, sir. Thank you.

25 MR. NORRIS: Rick Norris, Palmdale City

1 Councilmember, 383 100 Sierra Highway, Palmdale, 93550.

2 First thing I want to do is, Mr. Ritchie is
3 well aware of my efforts to bring an airline to
4 Palmdale. And the message that we want to send is the
5 Council is together.

6 Palmdale is the regional solution to the L.A.
7 congestion. In fact, we're part of the congestion that
8 you're suffering at L.A., at Burbank and Ontario in that
9 we have to travel the freeway in our efforts to get to
10 the other places and utilize those airlines that we so
11 desperately need here in the City of Palmdale.

12 Also, a part of the regional solution for
13 homeland security, in the event there is an event in
14 Southern California, LAX will be shutdown. Ontario will
15 be shutdown. Burbank will be shutdown. And we have a
16 mountain range that separates us from it. And we become
17 the metropolitan and bypass for all of Southern
18 California. That's critical in our future needs of this
19 country, the future needs of Palmdale and the future
20 needs in the event there is an event.

21 We feel and felt relatively secure that had
22 9-11 not occurred, that we were getting close to getting
23 an airline. It was financially devastating to the
24 airlines. And as a result, many of those airliners that
25 we could be using are parked at Mohave in dry storage.

1 The other thing that I wanted to point out is
2 if something happens in Southern California, we have
3 been to Long Beach. Long Beach cannot have any
4 additional flights. American was there. American left
5 there. JetBlue became very successful. Now American is
6 suing to get back into Long Beach. And I went to the
7 City Council in Long Beach. And they voted nine to zero
8 to support Palmdale Regional Airport.

9 So what we are is the true regional solution,
10 the economic engine of an airline operating out of
11 Palmdale in addition to the numbers that Norm indicated
12 from Supervisor Antonovich's office is that it means
13 about \$70 million dollars to us. It means thousands of
14 jobs. And we're sitting here in one of the few
15 communities in the United States that is saying, "Bring
16 us an airline." We are ready, willing and able. We
17 have a terminal in place, and we're in a position to be
18 able to start flights tomorrow with the assistance of
19 LAWA and the assistance of not having additional gates
20 at LAX and Ontario. If there is no additional gates
21 down at those airports, they will come to Palmdale
22 because we are the only viable alternative.

23 So I just wanted to make a couple of points.
24 Then what I want to also point out is that LAWA controls
25 thousands of acres out here. Thousands of acres close

1 to this airport with an airline, there will be
2 industrial development just outside the borders of this
3 airport. We need those additional jobs. So we're going
4 to continue to fight for it and deliver an airline to
5 the City of Palmdale. Thank you very much.

6 MR. WALL: Thank you, sir.

7 Next is Mr. Ramon Gomez. And that's the last
8 speaker card that I have.

9 Is there anyone else in the audience that
10 would like to submit a speaker card and make your
11 comments? If so, if you would please report to the
12 registration table and fill out a card.

13 Yes, sir, welcome.

14 MR. GOMEZ: Yes, good evening. My name is Ramon
15 Gomez of Laborer's Local 300. I'm the union rep and I
16 am also a resident of Palmdale. I would like to ask the
17 membership of this area to stand up at this moment.

18 (A group of people stands up in the audience.)

19 MR. GOMEZ: Okay. Also, we as union members and as
20 residents, we also are in support of Alternative D. We
21 would like this to happen. We believe not only for
22 national security but also for job and creation in this
23 area that we also need this, not only in L.A. but in
24 Palmdale. So hopefully this passes, and thank you.

25 MR. WALL: Thank you, sir, for your comments.

1 Ladies and gentlemen, do we have any other
2 speaker cards coming forward? I see that we do.

3 If there is anyone else who would like to make
4 comments this evening, if you could report to the
5 registration desk and submit your card, we'd be happy to
6 hear your testimony.

7 Mr. Jeff Schaefer, welcome.

8 MR. SCHAEFER: Thank you. I'm Jeff Schaefer,
9 S-c-h-a-e-f-e-r, 40653 158th Street East, Lancaster,
10 95395.

11 I just want to state as a resident out here, I
12 have previously commuted to Van Nuys and recently began
13 working here at Plant 42. I do want to say that the
14 regional solution is that, a solution. The residents up
15 here, the economics up here need to have this solution
16 in place. The LAX area is too congested to allow the
17 new generation of long hull aircraft. And by developing
18 this site in a master-planned environment, we can
19 provide that solution for all of Southern California.

20 And I just want to say that I'm in support of
21 the regional plan and that maybe that money from Plan D
22 or any of those other efforts should concentrate up here
23 in Palmdale rather than in L.A. They've had the funds
24 down there. They've had the opportunities down there
25 long enough. And the people here in Palmdale are tired

1 of commuting and tired of taxing the state funds to
2 improve that freeway. It's time to have it here.
3 Thank you.

4 MR. WALL: Thank you, sir.

5 Mr. Juan Blanco.

6 MR. BLANCO: Good evening my name is Juan Blanco.
7 I'm a resident of Palmdale, 38256 Hillcrest Drive.

8 I just viewed the video a few moments ago.
9 The terminal looks really nice, but I'm kind of
10 wondering and reading the statement about the security
11 checks. Apparently that video doesn't deal with rush
12 hour traffic. So it's kind of light traffic, and I
13 don't see how the relevance is at 8:00 a.m. being a
14 traveler and all.

15 But I'm just kind wondering, the funding for
16 that terminal, is it developed out of any of county
17 moneys? Can some of this money be diverted to a rail
18 connection from Palmdale Regional and LAX to lighten
19 that burden because it doesn't seem that we're taking
20 into consideration the alternatives? I appreciate
21 security. But building this massive transportation
22 center or modal center at LAX doesn't seem to be the
23 answer to the solution, or the solution to the answer I
24 should say. We really need to build out towards
25 Palmdale Regional.

1 Now, funding seems to be quite important. And
2 there is going to be a lot of money spent on this new
3 improvement, and a lot of relocation of people's homes
4 and of people. I appreciate the fact that work will be
5 developed from this, but can we share this fountain of
6 wealth with Palmdale and the Antelope Valley?

7 Thank you.

8 MR. WALL: Thank you, sir. Is there anyone else in
9 the audience who would like to speak this evening?

10 Seeing no speaker cards coming forward, we'll
11 take a recess at this time.

12 (Recess was taken.)

13 MR. KESSLER: Could I have your attention for just a
14 moment? If there is anyone that would like to make
15 verbal comments tonight, we will be here until 9:00 p.m.
16 tonight. So please feel free to fill out a speaker card
17 like this one. We have them available at the sign-in
18 desk.

19 If you would like to provide written comments,
20 you're welcome to do that as well. We also have sign-in
21 sheets available for your use. You could leave a
22 comment here tonight or you could mail them to us at
23 either address listed on the cover of the Supplement to
24 the Draft EIS/EIR. We will be accepting comments until
25 5:00 p.m. Pacific Standard Time, November 7th, 2003.

1 Again, if anyone would like to make verbal
2 comments tonight, we will be here until 9:00 and just
3 ask that you please fill out a speaker card. We'll be
4 here to accept any comments you might have. Thank you.

5 (Recess was taken.)

6 MR. WALL: Ladies and gentlemen, we will reconvene
7 the public hearing. We have a speaker I'd like to
8 invite to the podium, Mr. Raymond Hill.

9 Mr. Hill, if you would come forward, sir. And
10 you can stand right at the microphone. Are you familiar
11 with the timer?

12 MR. HILL: No, I'm not.

13 MR. WALL: All right, sir. You'll have three
14 minutes, and I'll start the timer. You'll see a green
15 light. The green light will progress. With 30 seconds
16 left, the yellow light will come on, and then the red
17 light at the end of the three minutes. If you state for
18 the record, please, your name and address before you
19 begin.

20 MR. HILL: My name is Raymond Hill. My address is
21 38539 36th Street East, City of Palmdale.

22 MR. WALL: Thank you, sir.

23 MR. HILL: Sure. My question is, I have heard in
24 the past that Palmdale was trying to get an airport up
25 here in the area. And a few years back I'm quite sure

1 we all know that the economy kind of fell down.
2 Everybody was kind of anticipating on that, the Palmdale
3 Airport would come into existence.

4 My question is this. How positive at this
5 point in time is -- you know, is all this going to occur
6 or is it still under negotiation? I'm kind of foggy in
7 that area.

8 Also, like I said, I'm new in the area. I
9 just purchased a home here in the Palmdale area, and I'm
10 kind of close to it. So I'm kind of concerned about the
11 neighborhood that I just bought a home in and how it's
12 going to affect me as far as a new homeowner. That's
13 the only question I wanted to ask.

14 MR. WALL: Thank you, sir. We appreciate your
15 comments tonight.

16 Do we have any other speaker cards at this
17 time? I see we have one more card coming up.

18 The next speaker will be Mr. Juan Blanco.

19 MR. BLANCO: Good evening. Again, Juan Blanco,
20 38256 Hillcrest Drive. I would like to just add to my
21 earlier comment concerning the project on Item D.

22 As speaking earlier this evening, I mentioned
23 that I'm a New York City -- ex New York City commuter.
24 So I have some personal experience with crowd and
25 traffic and people controlling people movement. And

1 looking at the video again, I see the design is a
2 beautiful design, but it doesn't seem to be -- I guess
3 this comment is directly to Mayor Hahn because this
4 project is not focused on moving people as it is. It is
5 going to congest. It is going to bottleneck. It is
6 going to create more of a havoc than it will eliminate
7 havoc.

8 All we're doing is replacing the bus system
9 with the rail system. If the rail system is automated,
10 what security do we have on the automation? So are we
11 really moving in a positive fashion or are we taking a
12 step backwards for the sake of spending cash on, I
13 guess, an attractive proposal.

14 Moving people, especially on rush hour in LAX
15 is problematic, to say the least. That proposal -- or
16 according to that film if this is what it is intending
17 to do, take people out of their vehicles what used to be
18 parking lot C, shuttle them into a people moving rail
19 system whereas they have to now go through security
20 check. You have a bottleneck number one.

21 Number two, in any given day between Monday
22 through Friday between 6:00 a.m. and 9:00 a.m. you have
23 hundreds and thousands of people, commuters, business
24 people who are in a rush trying to get to their
25 destinations. This I do not see as extra added. What

1 they probably would want to do then is push the Southern
2 California Regional Rail System for a bullet train
3 because it will have less security.

4 But in looking at this I don't see that it's
5 going to aid the commuter. I don't see it aiding in
6 security because you're going to bottleneck through
7 these points. You put them on a rail that if automated,
8 can be subject to electrical problems, mechanical
9 problems. And then you still have a bulk of travelers
10 that you may think that you're eliminating, but you
11 really are not. They are still going to be there. You
12 have to move them to that terminal in and out.

13 To eliminate the vehicle, that will work if
14 you don't want vehicles within the terminal. As far as
15 moving people, I don't see this as a viable solution.
16 It doesn't look like it is a viable solution and it was
17 designed according to the video to handle traffic
18 between midnight and 4:00 a.m. That's what I see the
19 video portraying. I do not see it portraying the actual
20 traffic from 6:00 a.m. to 9:00 a.m. or from 2:00 p.m. to
21 7:00 p.m. when traffic is heavy, especially during the
22 holidays. Thank you very much.

23 MR. WALL: Thank you, Mr. Blanco.

24 Do we have any other speakers at this time?
25 Seeing none, we will recess the hearing.

MR. TROUT: I live at my name is Lewis L-e-w-i-s, Trout, T-r-o-u-t. I live at 930 Crescent Drive in the City of Barstow.

On behalf of the employees of Palmdale Regional Airport, I would like to say, we greatly appreciate the opportunity you've extended to the citizens of Palmdale and the Antelope Valley to provide input into the process. And we appreciate you having stayed here until 9:00 o'clock this evening to provide that opportunity to the community. Thank you.

MR. WALL: Thank you, Mr. Trout.

MR. KESSLER: Is there anyone else who has not had an opportunity to speak concerning the information in the Supplement to the Draft EIS/EIR? Not seeing anyone else, I will remind everyone that if you feel you are unable to provide us with verbal comments today, we will be accepting written comments until 5:00 p.m. Pacific Standard Time, Friday, November 7, 2003. You can mail your comments either to me at the FAA or to Jim Ritchie with LAWA. The mailing addresses are listed on the cover of the Supplement to the Draft EIS/EIR.

I want to thank everyone for your comments today. This public hearing for the Supplement to the Draft EIS/EIR on the Los Angeles International Airport

1 LOS ANGELES, CALIFORNIA, SATURDAY, AUGUST 23, 2003

2 10:00 O'CLOCK A.M.

3 ---oOo---

4
5 MR. WALL: Good morning, ladies and gentlemen. On
6 behalf of the Federal Aviation Administration of the
7 Los Angeles World Airports and the City of Los Angeles,
8 I want to welcome you to the ninth public hearing to
9 hear public testimony on the Los Angeles Airport
10 Supplemental Environmental Impact Report and
11 Environmental Impact Statement.

12 Let me begin by introducing the two gentlemen
13 to my right who will receive your testimony today.

14 First, representing the Federal Aviation
15 Administration, Mr. David Kessler.

16 MR. KESSLER: Thank you. Good morning, ladies and
17 gentlemen. My name is David Kessler. I'm the Airport
18 Environmental Protection Specialist for the Airports
19 Division of the Federal Aviation Administration,
20 Western-Pacific Region.

21 I would like to welcome you to the ninth of a
22 series of public hearings the FAA and the Los Angeles
23 World Airports, or LAWA, are conducting on the
24 Supplement to the Draft Environmental Impact
25 Statement/Environmental Impact Report, or EIS/EIR, for

1 the proposed Master Plan at Los Angeles International
2 Airport.

3 The Supplement to the Draft EIS/EIR addresses
4 an additional alternative, Alternative D, the Enhanced
5 Safety and Security Plan that was added in the fall of
6 2001. This new alternative was added as a result of
7 comments submitted on the 2001 Draft EIS/EIR and the
8 terrorist attacks that occurred on September 11th, 2001.

9 The Notice of Availability of the Supplement
10 to the Draft EIS/EIR was published in various local
11 newspapers and in the Federal Register on Friday, July
12 11, 2003. The FAA and LAWA are the authors of the
13 Supplement. The Federal Highway Administration is also
14 a cooperating agency in the preparation of the Draft
15 EIS/EIR that was published in January 2001.

16 The purpose of these hearings is to collect
17 the comments from the general public concerning the
18 adequacy of the information disclosed in the Supplement
19 to the Draft EIS/EIR on the proposed Alternative D.

20 I would like to take this opportunity to make
21 sure that everyone understands that no decision will be
22 made today regarding the proposed project. Today's
23 hearing is not a question-and-answer type of forum. Our
24 job is to listen to what you have to say about the
25 adequacy of the information in the Supplement to the

1 Draft EIS/EIR. In other words, it's your turn to talk
2 to us. Since we are here to listen, we are not going to
3 respond to questions about the pros and cons of the
4 proposed project.

5 Since 9:00 o'clock this morning, we have held
6 a public workshop just outside of this room for anyone
7 to ask questions about the Master Plan and the
8 environmental process and the various proposed projects.

9 Following publication of the Supplement to the
10 Draft EIS/EIR for review and comment, the next step in
11 the joint Federal and State environmental disclosure
12 process is holding this and the other public hearings
13 beginning last week and continuing through this week.

14 I would like to take this opportunity to recap
15 the environmental disclosure process for this project.
16 The environmental evaluation of the LAX Master Plan
17 began in 1997 with the publication of a Notice of Intent
18 to prepare the joint EIS/EIR in the Federal Register.

19 In July of 1997, we held a series of meetings
20 with members of the public and governmental agencies to
21 receive comments on the scope of the Draft EIS/EIR.
22 Following those meetings, the Draft EIS/EIR was
23 published in January 2001.

24 Both the 2001 Draft EIS/EIR and the 2003
25 Supplement have been prepared pursuant to the National

1 Environmental Policy Act of 1969 or NEPA, the California
2 Environmental Quality Act of 1970 or CEQA, and the
3 Airport and Airway Improvement Act of 1982, as amended.

4 Following today's hearings and the close of
5 the comment period, we will then correct and revise the
6 EIS/EIR as necessary, based on the comments received.
7 We will also prepare responses to comments we receive
8 and include those responses along with those that were
9 submitted to the FAA and LAWA on the 2001 Draft EIS/EIR
10 in the Final EIS/EIR. The information contained in the
11 Supplement will also be combined with the information in
12 the 2001 Draft EIS/EIR into the Final EIS/EIR.

13 Before we begin receiving verbal comments, we
14 would like to let you know the ground rules of this
15 hearing. First, as I said earlier, we are not here to
16 respond to questions about this project. We are here
17 only to listen and take notes. We also have a court
18 reporter here present to ensure that we have an accurate
19 transcript of this hearing.

20 For anyone wishing to speak, we ask that you
21 fill out a speaker card, like this one, and give it to
22 one of the people at the sign-in desk. These cards will
23 then be brought up here to our facilitator, who will
24 call the names of each speaker so we can proceed in an
25 orderly fashion.

1 So that everyone gets an opportunity to
2 provide verbal comments, everyone will be given three
3 minutes to speak. To be fair to everyone, we are not
4 going to allow people to transfer their allotted time to
5 someone else. I ask that when you speak, you give us
6 your name and address for the record. We also have a
7 Spanish language translator here available for anyone
8 wishing to provide their comments in Spanish.

9 If there is anyone who is uncomfortable
10 speaking in front of a group or if you need more than
11 three minutes to provide your comments, we ask that you
12 provide your comments in writing. We have comment
13 sheets, like this one, also available for your use at
14 the sign-in desk. You can leave your comments at the
15 sign-in desk or you may mail your comments either using
16 the comment sheet or a letter to either address listed
17 on the cover of the Supplement to the Draft EIS/EIR.

18 I would like you to understand that a verbal
19 comment is just as important as a written comment. So
20 please feel free to provide any comments on the
21 information in the document you may have to us either
22 verbally today or in writing.

23 On August 1, 2003, LAWA asked the FAA to
24 extend the public comment period to a total of 120 days.
25 FAA has agreed to LAWA's request. FAA has asked the

1 U.S. Environmental Protection Agency to publish a notice
2 announcing the extension to the public comment period in
3 the Federal Register. FAA and LAWA will also publish a
4 notice of the extension in the local newspapers of
5 general circulation. Therefore, comments on the
6 Supplement to the Draft EIS/EIR are now due by
7 5:00 p.m. Pacific Standard Time, on Friday,
8 November 7, 2003.

9 Lastly, I would like everyone to know that
10 even though we have this hearing scheduled until
11 one o'clock this afternoon, we will stay here as long as
12 necessary for everyone to get a chance to provide verbal
13 comments on the Supplement to the Draft EIS/EIR. As I
14 said earlier, our job here today is to listen to your
15 comments.

16 At this time I would ask that everyone in the
17 room take just a moment and turn off your cell phones
18 and pagers to be courteous to those people making verbal
19 comments at today's hearing.

20 Now, I will return the hearing back to our
21 facilitator who will introduce Mr. Jim Ritchie, who will
22 provide some introductory comments from LAWA. Following
23 Mr. Ritchie's comments, we will then collect the speaker
24 cards and call the name of the first speaker.

25 Thank you.

1 MR. WALL: Thank you, Mr. Kessler.

2 Representing Los Angeles World Airports today
3 is the Deputy Executive Director for long-range
4 planning, Mr. Jim Ritchie.

5 MR. RITCHIE: Good morning, ladies and gentlemen.

6 THE AUDIENCE: Good morning.

7 MR. RITCHIE: Hope you could hear me in the back.

8 On behalf of the City of Los Angeles and
9 Los Angeles World Airports, welcome to the Furama Hotel
10 for this public hearing. This is the ninth in a series
11 of twelve that we will continue through that time frame
12 that Mr. Kessler has described that will end on November
13 the 7th.

14 You may recall the public hearing process in
15 2001 while we were examining the expansion alternatives
16 referred to as A, B and C for the modernization of LAX.
17 During that time frame in this forum or this type of
18 forum, we listened to your comments, we went back to the
19 drawing board.

20 Also during that time frame, you will recall,
21 we had a new mayor. He pledged to constrain the growth
22 of LAX, and he stuck to his pledge and sent us back to
23 the drawing board.

24 Third, the tragic events of September the 11th
25 and the leadership of Mayor Jim Hahn has reshaped the

1 environmental process, sent us back yet again to the
2 drawing board and to address security issues. The
3 Mayor's pressing concerns for safety and security have
4 provided new guidance along with your comments that we
5 received during that time frame from January to November
6 of 2001.

7 You're here today primarily to comment on that
8 alternative referred to as Alternative D. This is a
9 supplement to the existing environmental process. It
10 has undergone the same rigorous environmental analysis
11 that Alternatives A, B and C have undergone.

12 We are here today to receive your comments on
13 the new Safety and Security Plan and its impacts as
14 disclosed in the Supplement to Draft Environment Impact
15 Report/Draft Environmental Impact Statement.

16 So thank you again very much for your
17 attendance. And Tom, let's go to work.

18 MR. WALL: Thank you, Mr. Ritchie.

19 To describe the process today, I have
20 approximately 70 speaker cards at this time. That means
21 that we will be able to have about 17 speakers per hour.
22 We'll go for one hour, take a ten-minute break, and then
23 resume for an hour, take a ten-minute break until we're
24 completed today.

25 I have in front of me an electronic clock.

1 Each speaker will have three minutes to speak. I'll
2 demonstrate how it works. When I hit the play button,
3 it starts counting down from three minutes to zero.
4 When it gets to 30 seconds, the amber light will light
5 on the top of the clock indicating 30 seconds remaining.
6 When it gets to zero, the red light comes on and a horn
7 sounds, and that will be the end of the three-minute
8 period. I can pause the clock, if I need to, and
9 restart. It's a very simple process and so far it has
10 worked very well.

11 We have a court reporter here today. Both
12 Lisa and Kim will be recording your comments. I ask
13 that when you come to the microphone, please state and
14 spell your name and your address for the record.

15 When you've done that, then I will start the
16 timer. Please speak slowly and clearly so that we could
17 get an accurate and complete record of your testimony.

18 The first speaker today will be Congresswoman
19 Maxine Waters, followed by Councilwoman Cindy
20 Miscikowski, followed by Supervisor Yvonne Burke.

21 Ladies, if you would come to either microphone
22 at your convenience.

23 MS. WATERS: Thank you very much. And good morning
24 to everyone.

25 THE AUDIENCE: Good morning.

1 MS. WATERS: Thank you very much and good morning to
2 everyone. Welcome to the 35th Congressional District.
3 I'm delighted you're here, and I'm delighted that I have
4 the opportunity this morning to testify before you. I'm
5 going to try and do this in three minutes.

6 Let me just say that I thought this was an
7 issue that we had put behind us, expansion of LAX. When
8 the mayor was running to be elected mayor of this city,
9 he signed an agreement that said we would seek a
10 regional solution, that we would indeed not try and
11 expand to LAX. Little did we know that there would be
12 an attempt to expand to LAX under another name and under
13 another banner. And I think this is what this is all
14 about.

15 I'm opposed to Alternative D because I do not
16 think it is needed. It is costly. It is unnecessary
17 and it is disruptive. I represent an area that's had to
18 suffer the noise and pollution of these flights over the
19 homes of this community for many years.

20 In this community, we have the cities of
21 Inglewood and Hawthorne and Gardena, and we have
22 Westchester and we have Lawndale. And we have many
23 people who have not only suffered noise, pollution and
24 congestion, we have promises that have not been kept.

25 We have had retrofitting that was promised to

1 be done, people's homes have cracks in their windows.
2 Their doors are not fitting. They have walls that are
3 cracked. This retrofitting that has been promised has
4 not been carried through. We've been through enough
5 here. We don't need this additional disruption. To
6 remove all of these homes in Manchester Square is a sin
7 and a shame when we have a housing crisis. We need the
8 housing.

9 I'm absolutely concerned about this
10 9-billion-dollar expenditure. We have a
11 38-billion-dollar deficit in the State of California.
12 We need to save money for a rainy day. The airport is
13 not secured. We have not secured it yet. There are
14 many things that we should be doing now.

15 I was just there in the cargo sections, and I
16 have a whole list of things that should be done and they
17 don't cost 9 billion dollars, and you don't have to
18 clean out Manchester Square to do it.

19 We do not want this plan. We do not want this
20 congestion. We're asking that consideration be given to
21 the residents of the area. All of the elected officials
22 of the area are opposed to this plan. We believe,
23 again, it's too costly. It's too disruptive. It's
24 unneeded. Let's do the things that can be done now to
25 help make the airport more secure, not launch into a

1 plan where we think only the fat cat developers and
2 contractors are going to benefit from.

3 For those people who are here today, all my
4 friends in labor, I respect you. I've worked with you
5 for many years. I've given you much support. We have
6 got a lot that we need to be doing about compensation
7 and benefits and better working conditions. Let's
8 concentrate on that. Let's not get tricked into fattening
9 the pockets of the big developers in the name of elected
10 Hahn again.

11 MR. WALL: Thank you, Councilwoman Waters.

12 Councilwoman Cindy Miscikowski. Ma'am, if
13 you'd state your name and address, please, for the
14 record.

15 MS. MISCIKOWSKI: Cindy Miscikowski, 200 North
16 Spring Street, Los Angeles, City Hall. And I am the
17 councilmember for this area and pleased to represent
18 this -- pleased to represent this community.

19 Although the statement was that there is no
20 decision that could be made today, there can be a
21 conclusion reached that additional environmental
22 analysis and an alternative draft with a real cap of 78
23 million airline passengers needs to be done. I have
24 turned into LAWA a multi-page letter critiquing the EIR,
25 which is what this hearing is about. I will try to

1 summarize very quickly the details of that letter which
2 goes into detailed analysis.

3 There are six major things that are flawed, I
4 believe, in the EIR. First, the issue dealing with
5 transportation. The mitigation measures that are
6 proposed in the EIR are unfunded, uncertain and
7 under-evaluated. The whole thrust of this plan is that
8 traffic is going to be reduced as a consequence of
9 focusing it all in one area, in one area that is going
10 to be dealt with by one access to the 405.

11 Today we know there are three access points to
12 LAX, at least, from the 405. To say you're going to
13 concentrate it on one and deal with the traffic is not
14 adequate, particularly when that is put forward as a
15 mitigation measure and, yet, acknowledge that the full
16 funding is not available.

17 So the whole environmental analysis is based
18 on the fact that a traffic system can work, but it's a
19 traffic system that the project itself cannot support,
20 cannot pay for and is going to be dependent on state and
21 federal funds. And we all know what the situation the
22 State and the Federal Government are in today. So the
23 whole process of the transportation is flawed.

24 The issue of security is the second issue that
25 I've addressed, particularly since this is called the

1 "Enhanced Safety and Security Analysis." It is also
2 based on technologies that don't exist, on processes
3 that are not clear and, in fact, are going to be
4 duplicative and problematic for people going through the
5 systems. In fact, it may make, as we've learned from
6 RAND, easier target of a mass of people at one location,
7 and is something I think has not been addressed fairly
8 and frankly.

9 It is also further noted that the current
10 environmental documents which put forward these
11 suggestions do not fully elaborate that the technology
12 and construction are not yet available. They are
13 dependent on future technology that don't exist today.

14 My third concern, as itemized in detail, is
15 the concern over the growth potential. This has been
16 put forward as a Master Plan that has a cap. But, in
17 fact, if you look at the Ground Transportation Center,
18 the corps of this, the capacity of that Ground
19 Transportation Center is huge, is huge, over 78 million
20 airline passengers. That growth could occur afterwards
21 and be seriously problematic and not a growth plan at
22 all.

23 I will skip to the end of this since my time
24 is running out, and just say that the Supplemental Draft
25 EIR is fatally flawed in that it does not offer a true

1 mitigation plan for a 78-million-airline-passenger
2 alternative within the existing LAX framework. We need
3 to see an environmentally sound, economically viable and
4 current security capability alternative in this
5 environmental process. Without that alternative, this
6 environmental document is -- is, as I say, fatally
7 flawed, and I think would be challengeable. So we need
8 to really come up with a new alternative that works
9 within the existing system, that can deal with some of
10 these measures and not disrupt the community.

11 MR. WALL: Thank you, Councilwoman. My assumption
12 is, ma'am, that you -- did you submit those -- did you
13 submit your comments in writing?

14 MS. MISCIKOWSKI: Yes.

15 MR. WALL: Thank you.

16 (The statement submitted for the
17 record was marked as Statement 1
18 and attached hereto.)

19 MR. WALL: For anyone who feels the need to provide
20 comments that would be in excess of three minutes,
21 please submit them in writing as well, and those will be
22 entered into the record.

23 Our next speaker will be supervisor Yvonne
24 Burke representing the County of Los Angeles.

25 MS. BURKE: I'm Yvonne Burke, Chair of the

1 Los Angeles County Board of Supervisors. My position is
2 one that is the official position of the County of
3 Los Angeles Board of Supervisors. We have serious
4 concerns about this plan as it is presented, and the
5 proposed Master Plan has inadequacies in the Supplement
6 to the Draft. We recognize everyone has worked hard,
7 but there is some specific things.

8 Number one, traffic, noise and air quality
9 impacts have been shifted eastward. What has happened
10 is that the unincorporated communities Lennox, the City
11 of Inglewood will now bear the brunt of additional
12 traffic. The community adjacent to Manchester will now
13 face a host of impacts as a result of the new passenger
14 processing facility.

15 Compared with the Alternative C, this places a
16 heavier burden on the communities to the north and the
17 east. The City of Inglewood and incorporated
18 communities of Lennox will continue to be the most
19 impacted.

20 We understood that this was going to be an
21 attempt to constrain passenger growth to 78.9 million.

22 The proposal sets up a possibility in
23 Alternative D with a footprint larger than the prior
24 alternatives. This footprint, along with the new air
25 terminal layout, provides the opportunity for future

1 expansion beyond the 78.9.

2 The residents of these communities are already
3 impacted, and as a result, we're going to see
4 intolerable air quality, noise, traffic and safety
5 impacts.

6 I would like to say that our position is for
7 regional airports. We thought that was going to be the
8 emphasis in this new plan. Rather it's minimized. We
9 wanted to see Ontario and Palmdale as the alternatives
10 to increase their use within the entire regional plan.

11 One of the things, though, of greatest concern
12 to me, environmental justice may not be well served by
13 this EIS/EIR evaluation. This is a requirement that's
14 been in the law for ten years. Signed in 1994, the
15 original draft, which was in 2001 seven years later,
16 lacked an elementary analysis of environmental justice.

17 Alternative D appears to shift the burden of
18 improvement away from wealthier communities toward the
19 most economically disadvantaged communities east and
20 northwest of LAX.

21 I believe that the EIS/EIR will not be
22 adequate until it provides an honest assessment of the
23 trade-offs. Now, they say they'll make the
24 environmental justice assessments later. This should be
25 part of the present EIR.

1 I'm a real environmentalist. But I have to
2 tell you, in designing runway extensions and facilities
3 to the east, this appears to protect biological
4 resources, the El Segundo blue butterfly at the expense
5 of residents, children and families in the communities
6 Lennox, Inglewood and Manchester.

7 Can you justify such an assessment? What we
8 have to do is to have an analysis of environmental
9 justice prior to the time that this is presented. We
10 want to know what's actually going to be done. We want
11 to be sure that this processing facility compared with
12 the previous Alternative C does not impact those
13 communities to the north and the east.

14 It is important to us that there be additional
15 hearings here in this community. These are the
16 communities that will suffer. And these are the
17 communities that must be considered in terms of enhanced
18 mitigation.

19 Noise has not been mitigated. Today the
20 airport is providing more noise on those communities
21 than it did before. What this plan will propose is
22 beyond any level, the amount of noise and impact and
23 traffic that may result. Thank you very much.

24 (The statement submitted for the
25 record was marked as Statement 2

1 and is attached hereto) .

2 MR. WALL: Thank you, Supervisor Burke.

3 Next will be Supervisor Don Knabe, followed by
4 Commissioner Miguel Contreras, followed by Councilman
5 Kelly McDowell.

6 MR. KNABE: Good morning. I'm Don Knabe,
7 Los Angeles County Board of Supervisors, Kenneth Hahn
8 Hall of Administration.

9 I appreciate Supervisor Burke's comments and
10 support her concerns about the environmental justice
11 issues. I'd like to begin by saying that I agree with
12 Mayor Hahn that something must be done to make LAX more
13 secure, more efficient in handling passengers while
14 balancing the concerns of the local community and
15 obviously the need to create additional jobs.

16 Alternative D indicates it is designed to
17 accommodate a passenger activity level of 78.9 million
18 by reducing the number of existing gates and by
19 foregoing the creation of new terminal facilities and
20 runway extensions.

21 I support the Mayor's stated goal of providing
22 for more manageable limits on the passenger volumes at
23 LAX given the well-documented impacts that the airport
24 has had on surrounding communities and the surrounding
25 infrastructure.

1 The County of Los Angeles is in the process of
2 ongoing review of the LAX Master Plan and your new
3 ideas, and just how the Mayor intends to assure the
4 region that the 78.9 MAP will not be exceeded once
5 Alternative D is implemented.

6 In May of this year, our County Council
7 provided us with their opinion that the City and
8 Los Angeles World Airports could legally place deed
9 restrictions on the LAX property restricting the future
10 development of the airport in order to benefit nearby
11 properties owned by the public near public entities and
12 private parties.

13 I believe limiting development is a way to
14 keep a passenger cap in place. I have submitted a
15 motion yesterday for consideration by my colleagues to
16 call on the City of Los Angeles and LAWA to deed
17 restrict the land until 2020 to ensure LAX does not
18 exceed the 78.9 MAP.

19 I encourage Mayor Hahn and LAWA to follow
20 through on the efforts to limit the growth to a
21 manageable level to the greatest extent possible through
22 a commitment to place deed restrictions on certain
23 portions of LAX property, to prevent those portions from
24 being used to expand facilities to serve passenger
25 volumes beyond the 78.9.

1 Specifically, it would be appropriate for LAWA
2 and the City to commit that portion of LAX generally
3 located on the west side of the airport easterly of
4 Pershing Drive, between the north and south pairs of
5 runways, and westerly of the proposed redevelopment
6 Central Terminal Area, Area 1, and the portion generally
7 located on the northeast corner quadrant of the LAX
8 property currently used for parking lot and rental car
9 purposes, and depicted as the site of the proposed
10 consolidated rental car facility in the Area 2. Those
11 two areas would be deed restricted through 2020.

12 These deed restrictions should provide that
13 those two areas will not be developed with airport
14 passenger terminal, airport runways, or other
15 improvements intended to increase airport passenger
16 capacities beyond the Mayor Hahn's 78.9 million target
17 levels.

18 Such a firm commitment may be crucial in
19 obtaining the support of Mayor Hahn's Alternative D from
20 at least some of the significant interested agencies and
21 groups who will be so directly affected by the
22 development of LAX.

23 And while I have spoken this morning about
24 limiting growth, I do want to say that the security
25 aspect of this plan, it continues to be a major concern

1 of mine. While the County is reviewing the security
2 aspects of this plan -- and we will comment in written
3 form as part of your official record -- I still have
4 very strong security concerns with the Manchester Square
5 passenger check-in facility. I want to make sure that
6 we give the same safety concerns to the passengers and
7 consideration to the passengers as we do the
8 infrastructure of the airport.

9 Again, thank you for the opportunity to speak
10 with you today, and I hope that we could move forward in
11 a very productive way at achieving our common goals for
12 the redevelopment of LAX; limiting growth and protecting
13 people through viable safety enhancements. Thank you.

14 (The statement submitted for the
15 record was marked as Statement 3
16 and is attached hereto.

17 MR. WALL: The next speaker will be Commissioner
18 Miguel Contreras.

19 MR. CONTREAS: Good morning.

20 MR. WALL: Good morning, sir.

21 MR. CONTRERAS: Miguel Contreras at 2130 James Woods
22 Boulevard, Los Angeles, California.

23 I wear a series of hats today. One is I sit
24 as the airport commissioner for LAWA, but also serve
25 as -- I'm here in the capacity of the executive

1 secretary of treasurer of the Los Angeles County
2 Federation Laborer, AFLCIO, that we're here today.

3 I want to start off thanking the hundreds of
4 men and women here from the trade union movement to show
5 their concern and the interest in this Master Plan, who
6 gave up their Saturday morning to be here and have their
7 comments heard by the hearing panel.

8 I'm pleased today that Mayor Hahn has
9 announced over the last few weeks that he will pledge to
10 do everything in his power to move forward the Master
11 Plan and begin construction at LAX utilizing the
12 existing project labor agreement between LAWA and the
13 various labor unions, some of who are represented in
14 this room, including the AFLCIO, the building and
15 construction trades, the -- the Building Trades Council
16 of California and the -- and the L.A. Orange County
17 Building Construction Trades Council here in L.A.

18 The purpose of the project labor agreement at
19 LAX is to establish labor practices and standards for
20 modernization for years to come at LAX. It's been near
21 20 years -- it's been nearly 20 years since the last
22 measure construction program was completed here at LAX.
23 We are very well aware that LAX needs modernization
24 immediately for safety reasons, for security reasons and
25 for economic reasons.

1 On economic reasons, the idea of having 40,000
2 new jobs that will be involved in the building of the
3 improvements at LAX over 11 years is quite significant
4 for the economy here in this region. 49,000 jobs
5 provides billions of dollars into the economy here in
6 Southern California. It will generate many economic
7 activities for the L.A. County alone.

8 But not just on the building construction
9 jobs, we're also -- we also have a big interest in the
10 service jobs that will come after this is built,
11 thousands of new service jobs for workers in the service
12 industry, many of them who live in Inglewood and Lennox
13 and the surrounding communities. You know, so we want
14 to make sure that those jobs are good jobs, make sure
15 that those jobs are living wage jobs and people can
16 afford to raise a family on them.

17 While the jobs and economic benefits are
18 important, it's just as important to the labor union
19 movement to take care of the affected communities
20 adjacent to the airports. These benefits should include
21 environmental mitigation, education improvements and
22 enhancements to local schools such as Inglewood and
23 Lennox, service improvements to the noise and traffic
24 pollution in the area and do serious community
25 development to the impacted areas.

1 So these community benefits coupled with the
2 large scale job creations make this plan the right
3 approach for Los Angeles and the region.

4 Our City and the entire Southern California
5 should get behind this Master Plan. And our last words
6 is, let's get to work.

7 MR. WALL: Thank you, Mr. Contreras.

8 Our next speaker -- ladies and gentlemen,
9 please. Ladies and gentlemen. Our next speaker -- our
10 next speaker will be Councilman Kelly McDowell. Ladies
11 and gentlemen, please.

12 In respect to other speakers, ladies and
13 gentlemen, we have a long day and we want everyone to
14 have a chance to speak today.

15 After Mr. Councilman Kelly McDowell, will be
16 Councilman John McTaggart followed by Mr. John Miller.

17 Councilman McDowell.

18 COUNCILMAN MCDOWELL: Good morning. I'm Councilman
19 Kelly McDowell representing the City of El Segundo, 350
20 Main Street, El Segundo.

21 Given the length and complexity of the Master
22 Plan and its environmental documents, our full comments
23 on technical issues won't be ready for some time and my
24 city's comments today are preliminary.

25 El Segundo continues to oppose Alternatives A,

1 -B and C for the many reasons we expressed during the
2 review process in 2002.

3 El Segundo has not endorsed Alternative D, but
4 we feel that its stated objectives are consistent with a
5 regional aviation approach.

6 Specifically, we support a regional approach
7 alternative that makes proper use of Inland Empire
8 airports.

9 We support an alternative with fewer
10 environmental impacts, and we'd like to see the adverse
11 impacts of the airport minimized and mitigated to the
12 greatest extent possible.

13 El Segundo supports enhanced safety and
14 security at LAX. But limiting LAX to its current
15 capacity has always been our number one goal, and we
16 believe that limiting LAX's capacity will allow other
17 airports in the region to develop and handle a fair
18 share of future regional aviation demands, result in
19 fewer environmental impacts and improve safety and
20 security at the airport.

21 But my city is greatly concerned about the
22 impacts of proposed south side airfield changes that
23 would move the southernmost runway 50 feet closer to
24 El Segundo.

25 LAWA has stated that it believes these changes

1 are necessary to improve runway safety. However, we are
2 currently studying the impacts of the proposed
3 reconfiguration and the options for the southern runway
4 complex.

5 In particular, we urge full public
6 consideration of end-around taxiways as an alternative
7 that could provide greater safety at lower cost and with
8 fewer added burdens on nearby communities such as mine.

9 Clearly, safety at LAX must be a priority for
10 all of us. El Segundo is prepared to support measures
11 necessary to enhance safety, even if those measures
12 increase our burden, but only if we are assured by an
13 independent expert that other alternatives would not be
14 equally effective.

15 In conclusion, we're grateful for Mayor Hahn's
16 responsive leadership and continuing pledge to constrain
17 growth at LAX and to foster a regional approach to meet
18 future aviation demand.

19 And it is our hope that the ultimate outcome
20 of this Master Plan process will be a truly regional
21 airport approach that ensures that LAX does not exceed
22 its current capacity. Thank you.

23 (The statement submitted for the
24 record was marked as Statement 4
25 and is attached hereto) .

1 MR. WALL: Thank you, Councilman McDowell.

2 The next speaker will be Councilman John
3 McTaggart.

4 MR. MCTAGGART: Thank you for holding this hearing.
5 I do have -- my name is John McTaggart, M-c,
6 capital T, a-g-g-a-r-t. And I'm here not representing
7 the South Bay coop where I'm the aviation subcommittee
8 chair or the LAX roundtable on noise. I'm here
9 representing myself as a person in the trenches that was
10 set on the FAA Task Force --

11 MR. WALL: Your address, please.

12 MR. MCTAGGART: Okay. My address I don't have to
13 give. I gave it on the sheet. Rancho Palos Verdes.

14 First, I'd like to say that parking at this
15 facility is totally inadequate, although I'm happy
16 you're having the hearing.

17 My comments are based on what's not in this --
18 in this document and what is in this document. And I
19 think our comments today are supposed to be to the
20 document. I'm not going to make a political speech.
21 I'm here to say that the peninsula in the South Bay was
22 left out of this supplement. Any changes in routing are
23 going to affect us. And we'd like to know what they
24 might be. They are not addressed in this document.

25 I'd like to also speak to gates and how they

1 constrain 78.9 MAP, million annual passengers. Freight
2 does not need gates. So what we're talking about is how
3 much more than 78 million point 9 would generate with
4 all the freight traffic.

5 I have long supported the regional solution as
6 previous speakers have mentioned. I think it's the
7 answer. I think it would create more jobs than this
8 thing.

9 The threshold of significance in this document
10 need to be defined to a single event noise level that is
11 meaningful. It's set way too high. We're happy it's in
12 there, but it's not where it ought to be.

13 The people who live under the flight paths --
14 and I mean all the flight paths, when the heavy laden
15 jets take off after midnight and fly to the east, they
16 wake up thousands and thousands of people, and -- and
17 this has not been addressed. We're hopeful that
18 Part 161 will have some affect on that. You know,
19 that's still a figment.

20 At no place can we find in this document the
21 term "will" or "shall." It says "should." And that
22 doesn't mean that it will. So we'd like to have the
23 document say meaningful things that mean something to
24 the people who have to live with this airport.

25 Traffic is another thing that I won't get

1 into. I will make extended comments at a later time. I
2 don't want to take your time. But, frankly, I think
3 that we do need to improve the security of the airport,
4 and we can do that on site without all the changes that
5 are being proposed. Thank you.

6 MR. WALL: Thank you, sir, for your comments.

7 Ladies and gentlemen, I want to remind you
8 that there are empty seats if you'd like to sit. Those
9 standing in the back, we have seats throughout the
10 auditorium. Please make yourself comfortable.

11 Our next speaker will be Mr. John Miller,
12 followed by Mr. Jim Aldinger, followed by Ms. Sandra
13 Bauer.

14 Mr. Miller.

15 MR. MILLER: Thank you, Mr. Kessler, Mr. Ritchie. I
16 appreciate your having me here and giving me this time.

17 I'm John Miller, Chief of the Counter
18 Terrorism Bureau of the Los Angeles Police Department.
19 At the request of -- that would be 150 North Los Angeles
20 Street, Los Angeles, California.

21 At the request of Councilman Smith and the
22 Mayor's office and Commissioner Ted Stein of the
23 airport, we were asked to review Alternative Plan D for
24 a security consideration.

25 So I want to preface my comment by saying, the

1 Los Angeles Police Department takes no position on the
2 expansion, its costs or any other aspect of this plan
3 pro or con in any way, other than to discuss our review
4 of this particular plan, vis-a-vis, its enhancement of
5 airport security against potential acts of terrorism.

6 What we found in reviewing Alternate Plan D
7 was that in four major ways, and a large number of
8 smaller ways, it improves security vastly over the
9 current plan at LAX. It increases screening by 100
10 percent by adding a passenger and luggage screening area
11 that screens people before they get to the people movers
12 that take them into the terminal areas on the interior
13 of the airport.

14 What we know is screening works. There have
15 been critics who have talked about the lack of ability
16 to pick up the possible chemical or biological agents
17 that could be introduced by using this type of
18 screening. But what we found worldwide, particularly in
19 the recent incidents in Gatwick Airport where explosives
20 were found hidden inside an electronic back massager,
21 looking where they are supposed to be looking at can be
22 very effective, doubling that from one screening area
23 before the boarding area to two screening areas. One
24 before you actually enter the airport complex is
25 significant because currently screening is now

1 constituted in most airports. And LAX as it is now is
2 designed to prevent people with dangerous items or
3 weapons from getting onto aircraft as opposed to getting
4 into the airport complex itself.

5 We know since 1980 there have been
6 approximately 75 attacks on airports worldwide that
7 involved guns and explosives in the prescreening areas.

8 The second part of the plan we find attractive
9 from a security standpoint is that it introduces a plan
10 that makes LAX essentially a careless airport, meaning
11 that cars are parked at a central facility, rent-a-cars
12 are taken to another central facility, and people are
13 moved through the airport by the people mover and other
14 modes of public transportation. That gives us two
15 things in terms of security.

16 One, it removes the random introduction by any
17 vehicle allowed into the airport of explosives
18 contained in a vehicle-borne bomb, a large vehicle bomb.
19 Trucks -- and this is the third point -- are screened
20 before they come into the airport. This would be trucks
21 making deliveries and servicing the commercial entities
22 there. We have suggested that they add to that, a
23 screening of the actual truck drivers. So there will be
24 a series of drivers who are actually airport certified
25 to make those deliveries.

1 MR. WALL: Mr. Miller, I'm sorry to interrupt, but
2 the three-minute time frame is up. Do you have your
3 comments in writing that you can submit or --

4 MR. MILLER: I do not at this time, although, I
5 would be happy to prepare some if you thought it would
6 be helpful.

7 MR. WALL: Yes, sir.

8 MR. MILLER: But those are eventually the four
9 points we found that are an improvement on this
10 particular plan. We have not seen any other plan or
11 reviewed any other plan, but we are in favor of these
12 improvements. Thank you.

13 MR. WALL: Thank you, sir.

14 Our next speaker will be Mayor Jim Aldinger.
15 Mayor Aldinger.

16 MR. ALDINGER: Yes. Thank you. Again, my name is
17 Jim Aldinger. I'm the mayor of Manhattan Beach. And I
18 have a few comments here.

19 First, I'd like to say that I think this EIR
20 is fatally flawed from the beginning. I think the
21 number of options we have here, trying to add one more
22 option on top of three other options that we've looked
23 at before and had many problems with before is not a
24 good path to go down.

25 And the main reason for that is because of the

1 security issues. I think what I would like to see is
2 three -- if we're going to do options, let's do three
3 options. Let's look at the options on security. Let's
4 look at three options and see what those three options
5 are as far as security goes.

6 And, you know, having cars in the Central
7 Terminal Area, is that a big deal? There is many, many
8 other airports in this country that have the same
9 situation. We are talking about spending \$10 billion
10 dollars to do this. I think a lot more time and effort
11 needs to be put into it.

12 Jane Harman with her RAND study basically said
13 the same thing. And I think we need to take a step
14 back, look at the -- we all think that security is a big
15 issue, obviously, at LAX. But how we go about solving
16 that problem is something that I think needs a lot more
17 input.

18 The cost issue, again --

19 MR. WALL: Sir, let me pause for a second. Your
20 microphone is not working now. There we go. All right,
21 sir.

22 MR. ALDINGER: Okay. Do I get my ten seconds back?

23 MR. WALL: Yes, sir. I paused it. You're okay.

24 MR. ALDINGER: As far as the cost goes, \$10 billion
25 dollars is a lot of money to spend, and there are so

1 many other things that need to be done in this town and
2 around here. I'm not opposed. If we could find the
3 \$10 billion dollars, that's a big question for me as
4 well. But I'm not opposed to spending \$10 billion
5 dollars on infrastructure needs. We have a lot of
6 infrastructure needs, and those should be spent.

7 All the people from labor that are here, you
8 know, if we could expand Palmdale, do the work at other
9 places, that seems to be -- it seems to be a much better
10 way to spend our money than it does to spend it here on
11 LAX.

12 The improvements, traffic improvements in the
13 area and the impacts in the area are huge, too. Doing
14 something like this, the neighborhoods around Manchester
15 Square, they definitely need to be listened to. I don't
16 think they are being listened to with this report.

17 And as far as Manhattan Beach goes further
18 south, there are impacts on the 405. The impacts in the
19 original EIR and this EIR stop, do not include
20 Rosecrans, do not include other intersections on the 405
21 further south. And the number of people that come up
22 from Orange County will continue to grow.

23 And I'll say -- and the last thing, you know,
24 tying the 78 MAP, which I think is a great idea. I
25 think if we can do that, that's great. But something

1 needs to be done to come up with a way to tie it to the
2 deeds. But I think it needs to be tied to expansion at
3 Palmdale.

4 I think, you know, 78 MAP is great, but they
5 need to expand Palmdale, and they need to expand other
6 airports, Orange County especially as well. So thank
7 you.

8 MR. WALL: Thank you, Mayor Aldinger.

9 Our next speaker will be Ms. Sandra Bauer,
10 followed by Mr. David Voss, followed by Mr. Eric Bass.

11 Ms. Bauer.

12 MS. BAUER: Sandra Bauer. And I am here in
13 Association with A.C. Lazzarretto and speaking on behalf
14 of Los Angeles County. I wanted to speak briefly about
15 the use of a supplement, the baseline data and the
16 security analysis.

17 A CEQA guideline states that a supplement is
18 the appropriate type of document where you have a
19 project that does not have significant changes, where
20 major revisions occur in a project. The proper type of
21 CEQA document is a subsequent EIR that presents all the
22 information in new, not just the changed information.

23 Both types of review, by the way, are
24 typically used in conjunction with certified or approved
25 documents. In the present case, there is no certified

1 or approved EIR and, in fact, we do have major changes.
2 We have an entirely new alternative that's being
3 presented as the preferred project.

4 Even an adaptation of CEQA to include a
5 document that has not yet been certified would suggest
6 that we should have, in fact, a document that is
7 providing a comprehensive revised Draft EIR.

8 We have a second serious concern with respect
9 to the process used. In 2001, the County of Los Angeles
10 devoted a great deal of time and effort to the
11 preparation of detailed comments on the Draft EIR that
12 was released. I'm sure that that statement would apply
13 to many people who are here in this room today.

14 There is no question that if you had prepared
15 responses to those comments, to all of the comments
16 received, it would have advanced the public discourse,
17 it would have facilitated the current review that we're
18 preparing. It would have strengthened the environmental
19 protection, and it would have also provided us with
20 important insight into the thinking of decision makers
21 with respect to key issues.

22 So we do ask why you didn't take the
23 opportunity to present or even summarize the comments
24 that had been presented back in 2001.

25 With respect to the baseline data, the 2003

1 Supplement makes widespread use of 1996 baseline data.
2 That was also the case in the 2001 document. And the
3 data was outdated even then in 2001. And, yet, what we
4 don't see in the current document is an analysis of the
5 significant baseline shift that occurred following 9-11,
6 and how that shift changed the operations at the airport
7 and the benchmark for understanding project impacts.

8 Given that conditions at LAX have changed so
9 dramatically since 2000 and given that LAWA developed an
10 entirely new Alternative D, why did LAWA not consider it
11 worthwhile to provide the public and its own decision
12 makers with a baseline reflecting conditions at LAX as
13 it exists today.

14 Finally, with respect to security, we do have
15 significant concerns. I can see that my time is out.
16 I'll just point out that we believe that the security
17 plan is emphasizing the Gateway elements at the expense
18 of some of the backside elements, and we do look forward
19 to providing more detailed review of that as the review
20 goes forward.

21 I thank you for the opportunity to speak.

22 MR. WALL: And thank you for coming today.

23 (The statement submitted for the
24 record was marked as Statement 5
25 and is attached hereto.)

1 MR. WALL: We'll take three more speakers before our
2 first break. They'll be David Voss, Eric Bass and Sid
3 Stolper.

4 First, Mr. David Voss. Mr. Voss.

5 MR. VOSS: Good morning. My name is David Voss.
6 I'm the President of the Westchester/LAX Marina del Rey
7 Chamber of Commerce. I'm a resident here and live in
8 this community in Playa Del Rey.

9 Our Chamber of Commerce represents the
10 communities both greatly impacted both positively and
11 negatively by Los Angeles International Airport. On
12 Thursday the Board of Directors of the Chamber of
13 Commerce voted to support Mayor Hahn's Alternative D.

14 The significance -- the significance of this
15 vote is that, unlike any other group that will probably
16 come before you through this process, our chamber is on
17 record in opposition the last time around. We opposed
18 Alternatives A, B and C that were previously submitted
19 by Mayor Riordon.

20 And I hear today a comparison to Alternative C
21 suggesting that we should maybe still be looking at that
22 and remind everyone that that amounted to growth to 89
23 million annual passengers at the same time as saying
24 that we want to have less growth that the chamber is in
25 favor of.

1 It is not acceptable to grow without planning
2 and mitigation of impacts. We have to do something or
3 gridlock will be the constraint. Alternative D presents
4 a framework for modernization that moves us in the right
5 direction, that balances modernization with community
6 concerns and it provides jobs.

7 The chamber did not take lightly its reversal
8 of position. Prior to reaching our conclusions, we
9 participated in the Blue Ribbon Commission, Councilwoman
10 Miscikowski's workshops. We have read the over 5,000
11 pages of new information. We have met both of the
12 authors of the RAND study and the SAIC study and had
13 them at chamber meetings at the same time to confront
14 each other.

15 It's important to remember that the comments
16 here are on the Draft EIR/EIS, yet few of the people
17 that are actually making comments have so thoroughly
18 studied the proposal and actually read the document they
19 are commenting on. These plans, the Riordon plans would
20 have brought the wrecking ball to the Westchester
21 business district and driven traffic through Westchester
22 and Playa del Rey.

23 The plan that the Mayor now presents by
24 contrast solves those problems and constrains growth
25 permanently by moving that north runway further south

1 and using up real estate that would otherwise be
2 occupied by gates in the future.

3 It's a question of where you want the
4 bottleneck. Do you want it on the airfield or do you
5 want it in your communities with traffic?

6 On security, and hearing from RAND and SAIC,
7 and we did have them in the room at the same time, the
8 bottom line is that we heard the RAND author state
9 unequivocally that he did not disagree with any of the
10 conclusions in the SAIC study.

11 Those studies show that a simple car bomb in
12 the current Central Terminal Area would shut down LAX.
13 And I asked Jack Kaiser the other day, an economist that
14 would know what the cost of that would be. The cost
15 would be over a billion dollars a day. If you don't
16 spend \$9 billion and it happens, heaven forbid, a
17 billion dollars a day is the cost.

18 The Mayor's office should be commended for
19 listening and adapting his design to our concerns and to
20 remember that Alternative D is the only plan that can
21 handle security when we're at a red level condition when
22 we most need it.

23 The RAND study was based on a green level
24 condition. Remember, LAX has never been at red level,
25 and only Alternative D can solve those problems. Thank

1 you.

2 MR. WALL: Thank you, Mr. Voss.

3 Our next speaker will be Mr. Eric Bass.

4 Mr. Bass. Mr. Eric Bass. Either microphone,
5 sir.

6 MR. BASS: My name is Eric Bass, 4840 York Boulevard
7 in Los Angeles.

8 We're a certified small business here in the
9 City of Los Angeles. We work with the Mayor's office of
10 small business. We work -- we're working with the
11 Department of Water and Power and the L.A. Housing
12 Authority.

13 What our company does is we specialize in
14 green buildings sustainable fixtures. One of our
15 products is called chroma, which originated in
16 Australia. It is a dual flush technology for water
17 closets and urinals. It utilizes 50 percent less water
18 than what the conventional water fixtures use.

19 So we're in favor of the airport. We feel
20 that it would be good for local business. We also want
21 to minimize the traffic flow. That is a challenge now
22 for us, and it appears that in the overall overview that
23 I just got, that the plan would facilitate that.

24 So as a small local business, it certainly
25 would facilitate more work for us, and we could

1 contribute also to the diminishing of the use of water,
2 which is not a renewable resource. And that's something
3 we specialize in is ecological-type fixtures for these
4 kinds of facilities.

5 I just want to say, I appreciate the
6 opportunity, and I know it's an area where many people
7 are impacted. I live in Burbank. And so I'm not in
8 favor of the expansion that's been going on there. But
9 it appears that we're -- L.A. is growing, and it's going
10 to continue to grow. And if we don't make any plans to
11 accommodate the continued growth, then the traffic
12 levels within our city are going to get worse than they
13 already are.

14 So I feel we need to do something to address
15 that. And I'm sensitive to the people that live in the
16 area, but we have to do something to accommodate the
17 growth that's coming into our county. Thank you very
18 much.

19 MR. WALL: Thank you for your comments, sir.

20 Our next speaker and the final speaker before
21 our break will be Mr. Sid Stolper.

22 MR. STOLPER: Good morning. My name is Sid Stolper.
23 I live at 7822 Stewart Street, about six blocks from
24 here.

25 Actually, I have been a long-term resident of

1 the area. I went to El Segundo High School. For most
2 of my adult life I have lived on one side or the other
3 side of the airport.

4 I am the business manager financial secretary
5 and treasurer of the Southern California Pipe Trades
6 here representing about 15,000 members in Southern
7 California. We rise to support the plan for
8 Alternative D. We believe that the Mayor has done a
9 great job in putting together a plan that's long overdue
10 in being executed.

11 I am also a very frequent flyer. Last year I
12 logged 132,000 miles on three different carriers, all
13 originating out of LAX. I chose the proximity of my
14 base to be able to make frequent airport trips. As a
15 resident and as a frequent flyer, I think the first
16 thing we need to think about here is the need for
17 national security.

18 I was unfortunately last week a part of a
19 blackout. I was in Detroit when the lights went down.
20 And I will tell you, I don't know if anyone else in the
21 room was affected by that. But these are real things,
22 people. These are not things that just pass by and we
23 can sweep under the carpet as being things we don't need
24 to pay attention to.

25 The upgrade modernization of this airport is

1 way overdue. I have hundreds and hundreds of tickets
2 that I paid a surcharge on to look for a modernization
3 of the LAX to execute better passenger participation and
4 free flow of the traffic to be able to come in and out
5 of the airport. It's important that we look at this
6 with the safeguards to all of our community and all of
7 the passengers, and what it would do economically to
8 this area if this airport is down.

9 For the 29 hours that the airport was out of
10 commission in the east coast last week of which I was a
11 part of, it actually cost about 7 billion dollars for 28
12 hours of being down. Now, that's a reality. Now, we
13 heard that from a previous speaker here today. I lived
14 it last week, unfortunately.

15 We in -- one part of that airport where I was
16 at in Detroit, half the airport is renewed, the north
17 west terminal is renewed. Unfortunately, I don't
18 frequent that particular airline.

19 But in the other half, it is an old airport.
20 It's antiquated, just like this is. While we keep
21 putting facelifts on this airport, we have done little
22 or nothing to really increase the ability to contend
23 with -- first of all, any kind of problems as far as
24 terrorist problems, ingress and egress to the airport or
25 the problem with smog and air mitigation measures.

1 And right now, today, security is probably the
2 most important thing that we ought to be all looking at.
3 If we delay this any longer, we are number one on the
4 list of being the most probable site for the next strike
5 if it's possible for them to attack us. Los Angeles
6 cannot afford to sit here and not be prepared. Thank
7 you.

8 MR. WALL: Thank you, Mr. Stolper. Thank you, sir.

9 Ladies and gentlemen, we are now going to take
10 a ten-minute break. The first three speakers after the
11 break will be Mr. Shu Kwan Woo, Mr. Andrew Stefanski and
12 Mr. Erney Bowdre. We'll return in ten minutes.

13 (Recess was taken.)

14 MR. WALL: We want to remind everyone that in order
15 to speak today, you must complete a speaker card at the
16 registration table on this floor. If there were those
17 who thought they were registering downstairs, that was
18 not the registration table that allowed you to complete
19 a speaker card. I need to make certain that everyone
20 who wants to speak completed a speaker card.

21 Again, if you are uncomfortable speaking in
22 public or you have comments that would extend past three
23 minutes, we would encourage you to write those comments
24 down and submit them. Public verbal comments are just
25 as important as written comments. We accept both, and

1 they will both be considered equally in the deliberation
2 of this alternative and environmental impact process.

3 I would like to call now our first three
4 speakers. The first will be Mr. Shu Kwan Woo, followed
5 by Mr. Andrew Stefanski, followed by Mr. Erney Bowdre.

6 Mr. Woo. Mr. Woo.

7 MR. WOO: Hi. Good morning. My name is Shu Kwan
8 Woo. I'm a resident of Mar Vista neighborhood and the
9 adjacent area for the past 30 years. My son Christopher
10 Woo, he went to Westchester neighborhood school right
11 here for the past nine years since kindergarten. So
12 between the two airports, I know how it is to live
13 around airports.

14 I'm speaking here today in support of it. As
15 far as I can see, the Mayor's plan, Alternative D is the
16 most neighborhood-friendly plan I have seen so far for
17 the following reason.

18 That -- that is a safety, security and
19 efficiency plan, other than an expansion plan. The
20 airport the way it is now with different terminals, with
21 duplicated functions, some of them are very crowded.
22 And when one of them is crowded, it create a bottleneck
23 and just jam up the whole airport in the surrounding
24 area. The new plan will spread things out.

25 People say it will concentrate some operation,

1 but actually it's quite opposite. It does centralize
2 some area. But since it's spread over a wider area,
3 things flow through. Now, the problem we have now is
4 congestion. The solution is to make it not congested.
5 But when you do that, you increase efficiency. And that
6 is a good solution to the problem, but then some people
7 accuse that of being -- when you find solution, you're
8 being accused of creating a problem, but it's not.

9 So since you spread things out so not one
10 single area is crowded at certain times, things keep on
11 flowing through even though you can handle the same
12 amount of passengers, but it's less of a target for any
13 terrorist activities.

14 The whole plan, the whole idea is to keep
15 passenger moving, keep planes moving. You don't want to
16 wait a whole hour when you arrive -- when you are
17 approaching L.A., you don't want to spend a whole hour
18 cueing up in the sky or taxiing on the runway before you
19 can get out of the airport. And you don't want to spend
20 two hours just trying to get through the airport.

21 If that is the case, passenger or visitor in
22 the future might skip L.A. and go to Las Vegas and go to
23 San Diego or San Francisco, and Los Angeles will miss
24 greatly.

25 So for this reason, I strongly support the

1 expansion plan, and I think it is very important for the
2 future of Los Angeles, particularly for all the
3 different diverse multicultural groups and the residents
4 because we are connected to the world. And the airport
5 is a very important infrastructure to do that. Thank
6 you very much.

7 MR. WALL: Thank you, Mr. Woo.

8 Next will be Mr. Andrew Stefanski. Welcome,
9 sir.

10 MR. STEFANSKI: Andrew Stefanski, 7296 West 85th
11 Street, 90045, Westchester.

12 The State of California does not have a
13 comprehensive air transportation master plan that would
14 reach for some 30 or 50 years ahead. The volume of
15 passengers is projected to 150 million passengers,
16 annual passengers by year 2025. And, also, we're going
17 to have substantial increase in the cargo.

18 Where do they go? Nobody knows. Some people
19 say put as much as possible into this airport. Some
20 people say cap it, put it somewhere else. But we don't
21 know where and what.

22 I am opposing to the present plan as written.
23 I realize that the airport needs modernization, needs
24 security, needs everything, but the present plan is too
25 expensive and provides too little of the increased

1 capacity. It is not cost-effective. Two of the
2 prominent members of the L.A. City Council made the same
3 points that they would spend too many money for
4 increasing the capacity of the airport just little.

5 Consider building -- consider taking a little
6 lot with a little house and making a little addition to
7 it at a tremendous cost of \$1,000, \$2,000 per square
8 foot. It would not be cost-effective. It would provide
9 job, it would provide expenditure, but it would not be
10 cost-effective and should be avoided.

11 Trying to expand the present airport is a bad
12 deal because it provides hardly any extra passenger
13 capacity at a tremendous cost. Common sense says we
14 should modernize the present airport, but the bulk of
15 the money in the area where you can get big increase in
16 the passengers, that's the Palmdale, the
17 \$9-billion-dollar expenditure.

18 Well, whoever is familiar with the government
19 project realizes this is not the final figure. Probably
20 is the down payment because the cost go up and up and
21 up.

22 If you want to spend the money, spend it
23 wisely because you will end up where California is in a
24 big deficit. And, finally, all the costs are coming
25 from the taxpayer's pocket no matter what the name of

1 the source is.

2 So my final recommendation is, yes, modernize
3 this airport, restrict the cost and put all the labor
4 and all the money into Palmdale when you could have a
5 big increase in the capacity of the passengers and the
6 cargo at this small cost. That's what the reasonable
7 thing is.

8 MR. WALL: Thank you very much for your comments,
9 sir.

10 Our next speaker will be Mr. Erney Bowdre,
11 followed by Mr. Charles Woo and Mr. Arthur Guzman.

12 Mr. Bowdre.

13 MR. BOWDRE: My name is Erney Bowdre. I live at 627
14 West Acacia in El Segundo. I have been at that address
15 for 50 years. I have seen Los Angeles Airport from when
16 it was mines field.

17 I live one block off of Imperial Avenue. I
18 have a very, very close unhappy physical relationship
19 with LAX. These people are getting ready to put the
20 runway, which is closest to El Segundo, 50 feet closer
21 to El Segundo.

22 Now, I'm not going to say that the guys who
23 fly the airplanes don't know how to fly. I'm sure they
24 do or they wouldn't be up there, but they sure don't
25 know how to steer them. If they did, they wouldn't be

1 flying over El Segundo all the time. I could spend two
2 hours a day talking to the line at LAWA about flight
3 incursions over El Segundo, but it really doesn't do any
4 good because it still keeps happening.

5 I have a stack of probably 150 squawks that I
6 have made over the past three to four years, and it
7 doesn't make any difference. It just keeps happening.
8 I don't know if that's LAWA or if that's FAA or both.
9 But for God's sake, let's do something. We're going to
10 have an accident one day. And I'm going to tell you, if
11 you think it's going to be very, very nice to see a 747
12 pancake over an area which is increasing in population
13 all the time, and I don't think for once that we should
14 be making corrections after we have a tragedy like we're
15 trying to do after 9-11. Let's get it right beforehand.

16 A couple of little things that I noticed on
17 your plan here, you're going to have -- there is an
18 employee parking lot which is planned on the back end on
19 the southwest corner of the airport. You've got 12,400
20 spaces. That's an awful lot of people. I don't see any
21 increases in the size of the highways that are going to
22 get those employees there either on the north side or on
23 the south side. I think it's something that should
24 probably be looked at.

25 And I do have to scratch my head about the

1 fact that the so-called the Environmental Report is
2 nothing more than just a continuation of what happened
3 when we first started this thing, and times have
4 changed. Things have changed. And I would certainly
5 strongly recommend that the FAA look very, very hard at
6 making sure that that Environmental Report still is as
7 it should be. Thank you.

8 MR. WALL: Thank you, Mr. Bowdre.

9 Mr. Charles Woo. Welcome, Mr. Woo.

10 MR. WOO: Good morning. My name is Charley Woo.
11 I'm a business owner in Los Angeles for the last 35
12 years and resident and business together. I love this
13 city because of its opportunity provides for citizen. I
14 think of all the positive thing you could say about a
15 city because it is really the hub of the Pacific rim.

16 It's a very important capital of the -- of the
17 future global economy. And the reason it has that
18 advantage is because of access such as the airport. And
19 if you ask traveler of the world one of the most
20 recognizable symbol of Los Angeles, they are probably
21 going to tell you the circular building with arches
22 supporting it. I think that's more recognizable as
23 anything else.

24 The reason it is important is because we pride
25 ourself on diversity, a place where east meets the west,

1 north meets the south. A place like the airport is
2 important. It really represents a city, and is
3 something that is well worth investment.

4 Of course, it's important for the local
5 economy because of the goods flowing through. I'm not
6 talking about just any goods. This is goods that
7 require expensive transportation. Timing is important,
8 which means it create high-paying jobs, high value
9 goods, and is very important to our economy.

10 And we need an airport that is efficient, that
11 is friendly, that give people a positive impression when
12 they use it, and most important of all in this era,
13 people have a sense of safe and security. I think
14 that's is very, very important.

15 And when you talk about the money invested,
16 the amount of money invested, yes, it is a lot of money.
17 But this is money that is not wasted. It is going to
18 the economy. It create jobs. It creates work. It has
19 indirect impacts to people's income, to the tax revenue
20 of the region.

21 And then if you divide the number of people
22 flowing through the next 20, 30 years by the amount of
23 money we invest, we are talking about a few dollar a
24 passenger. And I think when you look at that and when
25 we look at the plan, that it include all the other

1 considerations and balance of all the interest, I think
2 it's well worth to spend a few dollar per passenger.

3 I think as a use of the airport, I'm glad its
4 willing to spend that because it gave me a sense of
5 efficiency, again, security and safe and friendly. And
6 for that reason, I think it's important for the City.
7 It's important for our rich culture, our diverse culture
8 as well as the economy that I think not doing something,
9 not supporting the Master Plan would be a really big
10 mistake. For that reason I wholeheartedly support it.
11 Thank you very much.

12 MR. WALL: Thank you, Mr. Woo. Next will be
13 Mr. Arthur Guzman.

14 MR. GUZMAN: Art Guzman, 17111 Steven Street,
15 S-t-e-v-e-n, in Gardena, California 90247.

16 I'm a member and a business rep out of Local
17 250. It's an air conditioning and refrigeration
18 pipe fitters local and we're approximately 5,000 strong.
19 We have many of our members who live in the impacted
20 areas.

21 But I'm not going to speak to you as a union
22 rep. I'm going to speak to you as a concerned citizen,
23 and as a concerned father who lives in the impacted
24 communities and is happily married with three children.

25 These concerns that have been voiced here this

1 morning are also my concerns, traffic congestion, air
2 pollution and excessive noise. But isn't that why
3 technology is a wonderful and beautiful thing, because
4 it enhances the quality of life for all of us, be it
5 through communication, be it through education, be it
6 through creating a cleaner environment, and even through
7 the progress as in the advancements in medicine which
8 prolongs the life of all of us.

9 The new technology will meet the challenges of
10 traffic congestion, air pollution and excessive noise.
11 That being said, let me make a statement as I stand
12 before you here and now. If LAX does not go through
13 with this project and does not incorporate the advances
14 of the new technology into its operation, then within
15 ten years, LAX and the surrounding communities will
16 become our next ghettos.

17 There will be an increase in crime, an
18 increase in welfare lines, an increase in illegal drug
19 sales, and those things that come with property;
20 therefore, LAX must approve this project.

21 In addition, we must stimulate the economy
22 because in Los Angeles the state of the economy is in a
23 downward slump. You don't do it by giving tax relief to
24 a few people or a few groups that don't need it. You do
25 it by giving it to organizations that are going to

1 stimulate economic development and growth; therefore, we
2 must proceed forward with this project. If not, we are
3 going to suffer all the negative consequences because of
4 it.

5 MR. WALL: Thank you, Mr. Guzman.

6 Our next speaker will be Mr. Saeed Argon,
7 followed by Mr. Freddy Correa, followed by Mr. Peter
8 Barrera.

9 Mr. Saeed Argon. Are you here, sir?

10 Mr. Freddy Correa. He'll be followed by
11 Mr. Peter Barrera, I believe it is. I'm having
12 difficulty reading your handwriting, sir.

13 MR. BARRERA: It's Barrera.

14 MR. WALL: Barrera, yes, sir. And he'll be followed
15 by Mr. Gerald Moret.

16 Mr. Correa.

17 MR. CORREA: Good morning. Thank you for letting me
18 speak.

19 MR. WALL: And your name and address, sir?

20 MR. CORREA: My name is Freddy Correa, spelled
21 C-o-r-r-e-a, 1840 West Pacific Coast Highway, Long
22 Beach, California 90810.

23 I'm a mechanical engineer, and I'm also a
24 member of the Local 250, the Steamfitters Local. My
25 point of view is I approve Alternative D. I feel that

1 it's imperative that LAX be renovated due to all the
2 gridlock and congestion and unnecessary problems that
3 this airport is affected.

4 Also, it would stimulate these stagnant local
5 economy, and it will put -- it will put LAX on the top
6 airport in the world. Thank you.

7 (The statement submitted for the
8 record was marked as Statement 6
9 and is attached hereto.)

10 MR. WALL: Thank you, sir, for your comments today.

11 Mr. Peter Barrera, followed by Mr. Gerald
12 Moret, followed by Mr. Will Herada.

13 Welcome, sir.

14 MR. BARRERA: Good morning. My name is Peter
15 Barrera. Know you had Correa cards. Just put a B.
16 It's Barrera.

17 MR. WALL: Sorry about that, sir.

18 MR. BARRERA: No problem. I live in the city of
19 Redondo Beach at 1908 Belmont Lanes. ZIP Code is 90278.
20 I lived in the South Bay all my life. As a matter of
21 fact, my family has been in California for over 150
22 years.

23 We had discussed the new airport design and
24 listened to area residents complaints for over six
25 years. I want to see the LAX Master Plan move ahead.

1 The reassignment of the entire airport has addressed the
2 security and needs of the airline passengers and the
3 general public and the area residents and the design to
4 include the ground transportation system and the people
5 movers and trans, like most of new airports around the
6 world, around the country, too.

7 The LAX Alternate D design will do that, bring
8 the ground transportation system of LAX into the 21st
9 Century. Every major airport in the world has rail
10 access, lines with trans and people mover.

11 I heard people talking about Palmdale and
12 Ontario. I've been hearing that since 1970. People
13 around here are not going to travel right now to
14 Palmdale or Ontario. They are going to LAX. It's
15 close. Let's make it security safe.

16 But as the population of L.A. grows, I mean,
17 I've been here all my life and I see it growing more and
18 more. I saw the smog come and now it's going away, like
19 you see the mountains in the morning when I was a kid.
20 We got to approve the Alternative D plan to see LAX move
21 into the 21st Century. Thank you very much.

22 MR. WALL: Thank you, sir, for your comment.

23 Mr. Gerald Moret.

24 MR. MORET: Good morning. My name is Jerry Moret,
25 and I just thank you for the time to speak. I only have

1 a few points I would like to make.

2 Number one, I support very much the idea of
3 regional airports, which in Southern California already
4 have the ability and the capacity to support heavy jet
5 traffic, and those would be Palmdale, Ontario, Long
6 Beach, San Bernardino International, Oxnard, Camarillo,
7 El Toro, Point Magoo, Burbank, Van Nuys. There are
8 other airports that could handle smaller regional
9 aircraft.

10 I think the idea of putting large crowds of
11 people into one small location is not in our best
12 interest. I think we're looking for safety. I think
13 that is what makes the perfect opportunity for
14 terrorists that we're trying to protect ourselves from.

15 Also the idea of moving runways to separate
16 them a little bit, all this really does is allow air
17 traffic controllers to authorize more approaches at the
18 same time, simultaneous approaches, which in effect
19 could increase the number of aircraft landing as much as
20 double.

21 From my own point of view, from my own
22 personal feeling, the things that have affected me,
23 Plan D has not yet been approved, but it has begun
24 implementation.

25 In the guise of security and safety, my rental

1 car company, which operates a seven-passenger minivan,
2 is denied access to the airport because of safety,
3 denied access to the airport because of traffic. My one
4 seven-passenger minivan that has served this airport
5 since 1963. I thank you very much.

6 MR. WALL: Thank you, sir.

7 Mr. Will Herada. Mr. Herada will be followed
8 by Mr. James Donaldson and Mr. Tom Moxley.

9 Mr. Herada, are you here, sir?

10 Mr. James Donaldson.

11 MR. DONALDSON: My name is James Donaldson. I would
12 like to say that I go along with what Jerry said just
13 before me. I live in the approach to Santa Monica
14 Airport.

15 When I first came to these meetings, I think
16 four years ago, the people sitting up here that said
17 that they were going to do everything in their power to
18 discourage the small business jets from coming to LAX.
19 They would have them circle around and around so they
20 could make way for the big cargo jets. That's what they
21 wanted to get here.

22 Now, since Mayor Hahn took office, he stopped
23 that plan. And one of the things that I see -- I saw
24 today in the rooms over there is that currently it had
25 one fixed based operator, which is Garrett Corporation

1 over here that worked on your small business jets. One
2 of the things I saw in the plan over there is you're
3 going to add a brand-new fixed based operator, which is
4 going to have 121,000 square feet, which is good.

5 What I would hope that maybe you could do is
6 either add a third fixed based operator to handle these
7 small business jets. You've got a lot of these
8 fractional jets so they could come to the airport.

9 What happens is if you get some of these
10 smaller jets to come in here, that's going to take the
11 time slot up from the big jet. If you don't have any
12 small business jets coming in here, what's going to
13 happen is you're going to have all of the large jets
14 coming into LAX.

15 What I would like to see is if you could maybe
16 increase the footage from 121,000, if you can't put any
17 more fixed based operators to increase it a little bit
18 bigger from 121,000.

19 Also at the same time, I don't know about
20 Garrett Corporation if you've talked to them about
21 letting them enlarge their -- where they are currently
22 at, in other words, enlarge the areas so where they
23 could service some more business jets.

24 And let me see. I've got a couple of other
25 things. Here is, from what I could see from Mayor

1 Hahn's plan is that you're not going to push any jets
2 off to the surrounding communities. I know you tried to
3 put jets over -- not you guys, but originally they were
4 going to put them in Hawthorne. They told the mayor
5 they were going to put them in here. He stopped them
6 from doing that.

7 So what I like to see is -- is if you can
8 continue not to push any of the jets off to the
9 surrounding airports. If you do, then I would like to
10 see you do an impact of what that would be to the Santa
11 Monica, City of Santa Monica and its residents and the
12 residents that I represent in West Los Angeles. I'm
13 with the North Westdale Neighborhood Association.

14 I go along with the safety. I think that's a
15 good idea to have an area off of the airport. But then
16 at the same time, I've heard some people come up here
17 and they've said some things, like Cindy Miscikowski.
18 So I go along with that. So you've got to kind of
19 listen to the -- what these people have to say because
20 they live over here. I live further north.

21 So I think that's about it. So thank you very
22 much.

23 MR. WALL: Thank you, sir, for your comments today.

24 Next, Mr. Tom Moxley. While Mr. Moxley is
25 coming up, I would remind everyone, let's turn off our

1 cell phones and pagers if they are on.

2 Mr. Moxley will be followed by Mr. Curt Curtis
3 and Mr. Carlos Porras.

4 Mr. Moxley, welcome.

5 MR. MOXLEY: Thank you. Tom Moxley, M-o-x-l-e-y,
6 2057 South Atlantic Avenue, Los Angeles, 90040.

7 I'm a business agent for Ironworkers Local 433
8 who represents -- and I represent over 4,000 members.
9 That does not include their families, their wives and
10 children and significant others. They live in every
11 community in the L.A. basin, every city, every
12 community. And I'm here to represent them in favor of
13 Plan D, Mayor Hahn's insight to modernizing LAX.

14 LAX was designed and built for 707s. It was
15 ahead of its time at that time and it has degenerated
16 backwards. We have consistently put band-aids on it,
17 and now is the time to bring it back in ahead of its
18 time to show the world what kind of place L.A. is.

19 Safety is a concern in the construction
20 industry. It's job one. It doesn't stop when we leave
21 the construction site. We implement it in our daily
22 lives. Safety is needed and moving of the runway and
23 making the bigger jets being able to negotiate around
24 the airport and come in and out.

25 Security goes with safety. Security is an

1 issue that all of us after 9-11 became very aware of. I
2 applaud the LAPD in their terrorism task force for
3 looking at this and seeing what the needs are and
4 reporting back to the Mayor.

5 And then jobs. This is not just jobs for
6 construction. Those are short-term. These are good
7 paying jobs for L.A. citizens around the community here
8 in manufacturing, hotel workers, employees, the janitor
9 and all those others.

10 I heard the comment about technology that
11 wasn't developed. And I remember when I was a young
12 man, or a young boy actually, President John F. Kennedy
13 said, "We're going to put a man on the moon." That
14 technology was not there. I remember in 1969, sitting
15 at home and watching that man step on the moon.

16 I'm disappointed that our representatives did
17 not stay around to listen to the public comment session.
18 And I applaud them and would encourage them to use
19 Ontario and Palmdale every time they travel because they
20 are frequent flyers, and see what it takes to get there.
21 They use LAX as a convenience. I use LAX as a
22 convenience for where I live. If I live next to
23 Palmdale or Ontario, I would use it. I can guarantee I
24 wouldn't drive there.

25 Don Knabe lives right by me. He comes to LAX.

1 When I see him in the neighborhood, I'm going to ask him
2 to go to Ontario when he flies out. Thank you for your
3 time.

4 MR. WALL: Thank you, sir.

5 Next will be Mr. Curt Curtis.

6 Mr. Curtis. Welcome, sir.

7 MR. CURTIS: My name is D.A. Curt Curtis. I reside
8 at 7880 Vicksburg Avenue. I've lived there for 49
9 years. I'm a former airport commissioner.

10 When I was on the commission, we had an
11 absolute limit of 40 million annual passengers. As far
12 as I know, that limit has never been changed. We still
13 have a limit of 40 million annual passengers. And so
14 much for what that 78 million annual passengers limit
15 means. I do not think that the Draft EIR adequately
16 addresses the capacity, the air capacity or the ground
17 capacity for aircraft movements.

18 Enhanced safety and security, what a misnomer.
19 There is neither enhanced security nor enhanced safety.
20 RAND's think tank study is far more believable than a
21 self-styled expert from Canada or the Mayor Hahn's
22 police department.

23 Common sense dictates that one huge target,
24 Manchester Square, is far more vulnerable for attack
25 than eight different terminals in the current central

1 terminal area. Runway incursions are practically
2 nonexistent this past year. There is really about two
3 things for this expansion.

4 One, so that the -- so the European Airbus, a
5 larger aircraft, can land. What is stated is for the
6 modern aircraft. It doesn't mention that it's the
7 European Airbus. That's why you have to move the
8 runways apart. If you didn't move them apart, you
9 wouldn't be able to have the same capacity on your
10 runways.

11 The second reason is \$10-billion-dollars worth
12 of jobs. And you can see the yellow shirts and blue
13 shirts out here. As the Chamber of Commerce made their
14 remarks, what is their name? Westchester, LAX, Marina
15 del Rey Chamber of Commerce. Is Mayor Hahn paying off
16 his fund raising obligations? A million -- a million --

17 (The audience began loudly booing.)

18 MR. WALL: Ladies and gentlemen, please.

19 MR. CURTIS: A million people living in San Fernando
20 Valley can get to Palmdale a lot easier than they could
21 get to LAX. Ditto for the Inland Empire, that they can
22 reach Ontario far easier than they could drive into LAX.
23 Thank you.

24 MR. WALL: Thank you, sir.

25 Our next speaker will be Mr. Carlos Porras,

1 followed by Mr. Walter Moore, followed by Mr. Morty Kay.

2 Sir, before you begin, ladies and gentlemen,
3 let's please be respectful of the speakers. We may
4 disagree with them, but let's give them their full three
5 minutes. Thank you.

6 Go ahead, sir.

7 MR. PORRAS: Good morning. My name is Carlos
8 Porras. I am executive director of a non-profit
9 organization in the State of California, communities for
10 a better environment. My office is based in Huntington
11 Park, California, 5610 Pacific Boulevard, 90255.

12 I am here to speak on the issue of the
13 environmental justice, the mission and purpose and goal
14 of my organization, and to talk a little bit about the
15 history.

16 The patterns and the trends in Southern
17 California, in particular in the Los Angeles region, a
18 pattern of racism and a pattern of disproportionately
19 burdening people of color, working class people, low
20 income people with the health burdens of progress.

21 Working class people who are struggling and
22 fighting for a right to collective bargaining, low
23 income people who are struggling and fighting for the
24 decency of a living wage, people of color struggling and
25 fighting for equal opportunity.

1 While progress, development and projects
2 quickly quantify benefits. The burdens and the costs
3 are those that are not so readily quantifiable in EIR
4 and EIS. This is a pattern of impacts that must be
5 taken into consideration.

6 I want to note that while the EIR/EIS and the
7 supplemental point to incremental increases of the
8 baseline, the baseline is unjust. The cancer burden is
9 unjust. The cancer, respiratory, asthma, all of these
10 health effects, at the baseline is unjust. The
11 marginalized education of our people and the
12 developmental problems at the baseline is unjust. And,
13 yes, the baseline is racist.

14 People who live in the impacted community
15 demand a voice. We demand equal access, full disclosure
16 and a full and meaningful decision-making role.

17 Environmental justice is for all. Where we play,
18 where we go to school, where we worship. I implore that
19 this agency include the voice of the people who will
20 live with the project. Thank you.

21 MR. WALL: Thank you, sir, for your comments.

22 Our next speaker is Mr. Walter Moore, followed
23 by Mr. Morty Kay, followed by Ms. Mary Hollifield.

24 Welcome, sir.

25 MR. MOORE: Thank you. My name is Walter Moore. I

1 live and work in Westchester. My mailing address is
2 Post Office Box 45705.

3 I studied public policy at Princeton, and this
4 proposal is such bad public policy. I'm not just going
5 to talk out against it today. I'm going to replace the
6 Mayor who is pushing for it. I filed the papers with
7 the City Ethics Commission to run for mayor. I've set
8 up a committee, and I've formed a website,
9 mayorforyou.com.

10 Let me tell you why this proposal is the worst
11 idea in security since the French built the Maginot
12 Line. The Maginot Line, you may recall, was a series of
13 tunnels, or as we call them now, people movers. The
14 idea was they were going to stop the Germans from
15 invading by building these tunnels. Well, guess what?
16 Invaders aren't stupid. Terrorists aren't stupid.

17 If you move the parking a mile away, they are
18 going to attack a mile away. You're not going to make
19 anyone safer. Read the RAND Corporation study and
20 you'll see.

21 Let's assume it does make the airport safer.
22 Let's assume that they don't sneak a bomb into a truck
23 going to the main terminal. Does that make any of us
24 safer? No, because the next time the terrorists will go
25 to the Third Street Promenade and they'll machine gun

1 everybody there, or they'll park a truck bomb by a
2 skyscraper downtown. It doesn't make anyone safer.

3 I see the people here with the yellow T-shirts
4 and the red T-shirts. I know you want jobs. I know
5 you'd like a cut of the \$9 billion. But you know what,
6 there are other things you could build. I myself have
7 not written any checks for \$9 billion dollars, so I had
8 to think about how much money that is.

9 With \$9 billion dollars, you could buy 26,000
10 houses at the median price in this town. You could buy
11 450,000 Toyotas at \$20,000 each. Or if you're really
12 concerned about security and you want to hire police
13 officers at \$85,000 a year, do you know how many police
14 officers we could add? Ten thousand every year for ten
15 years. You want security, spend \$9 billion on that
16 instead of moving a parking lot down the hall.

17 The RAND Corporation study also shows that in
18 the past 23 years, you know how many people have been
19 killed by bombs at airports? Four. That's a slow night
20 in South Central. Why don't we apply some troops where
21 people are dying in droves every day? Why don't we send
22 some police there with our \$9 billion?

23 I'm here to tell you the emperor has no
24 clothes, and he has no suit of armor. This security is
25 not enhanced, and I want you after the meeting to come

1 up and talk with me. I'll give you my card because when
2 this meeting ends, our battle begins. Thank you.

3 MR. WALL: Thank you, Mr. Moore.

4 Mr. Morty Kay, followed by Mr. -- I'm sorry,
5 it looks like Ms. Mary Hollifield, and then Mr. Denny
6 Schneider.

7 Welcome, sir.

8 MR. KAY: Thank you gentlemen. My name is Morty
9 Kay. I live here in Westchester.

10 The implementation of Proposal D and the other
11 airport proposals are realistically about two things:
12 Political power and making money. The incomplete cost
13 estimate of Alternative D is \$9 billion dollars. The
14 realistic cost estimate is between \$11- and \$15 billion
15 dollars. Who is going to pay for the majority of this?
16 Where is the money going to come from? Don't we have
17 anything better to do with this money?

18 There are basically two groups of people here.
19 One group is comprised of people who wish to maintain
20 their homes, their health and the quality of life. They
21 are against added pollution from increased air and road
22 traffic and increased congestion. The other group
23 generally is comprised of persons who one way or another
24 will make money from this expensive and poorly conceived
25 airport plan.

1 Seventy-eight million passenger cap, will
2 anyone here as a private citizen stand up, raise their
3 hand and guarantee to me as a private citizen that the
4 passenger load at LAX will not at any time in the future
5 exceed 78 million passenger cap? I don't see anybody
6 standing.

7 MR. WALL: Thank you, sir.

8 Ms. Mary Hollifield? Ms. Hollifield?

9 Mr. Denny Schneider, followed by Mr. Eddie
10 Barnes and Mr. Thomas Brands.

11 MR. SCHNEIDER: I'm Denny Schneider, 7929 Breen,
12 Westchester. I thank you for the opportunity to speak
13 again today. I come before you as the vice president
14 for ARSAC, Alliance for Regional Solution of Airport
15 Congestion, and as an active participant in numerous
16 community oriented organizations here in Southern
17 California, including our neighborhood council as Osage
18 Neighborhoods Association, Intermodal Planning, all
19 kinds of environmental planning, et cetera.

20 I want to first state that every one of the
21 four alternatives the Mayor's plan has done is an
22 expansion, and he has not met his pledge. And that is
23 what we were told and all of the 10,000 people who voted
24 for him when he made that pledge.

25 I oppose Alternative D on several different

1 levels. And it's not that it's -- and I just want to
2 make sure that everybody understands that it's certainly
3 not as onerous as A, B and C, but it still isn't good
4 enough. It's very expensive. What it costs, we really
5 don't know because the way Alternative D is set up, it
6 has a whole lot of options for every facet of
7 Alternative D.

8 And so we don't know which one of those facets
9 is going to be chosen. So it could be \$9 billion. It
10 could be \$25 billion. And that does not include all of
11 the other organizations such as Caltrans, DOT, Federal
12 Highways, et cetera, that also have projects that have
13 to support this.

14 This continues to perpetuate the concentration
15 of all air commerce at LAX as opposed to -- or the
16 majority of it, I should say, instead of spreading it
17 out around the entire region.

18 If anything happens to LAX, this economy is
19 going to tank, even according to the EIR figures that
20 are presented to us here. It says that one out of every
21 20 people in this Southern California area is tied to
22 the business of LAX. So think about what that's going
23 to do to all of us.

24 In terms of jobs, every one of us is concerned
25 about jobs. And if we were to take the same building

1 that we're doing now or attempting to do at LAX, and
2 it's not to say that there isn't something that needs to
3 be done at LAX, but the majority of it could be done at
4 the other airports such as Ontario, Palmdale and many of
5 the other airports. And this will help not only us as a
6 community at large, but it actually adds better jobs for
7 the unions. They are going to have more infrastructure.
8 And that's where the growth we're being told from the
9 census is occurring. So let's get on with it.

10 Now, this plan also adds many more
11 environmental impacts locally. And that is another
12 issue.

13 MR. WALL: Thank you, Mr. Schneider. I appreciate
14 your comments today. Thank you.

15 Mr. Eddie Barnes, followed by Mr. Thomas
16 Brands, followed by Mr. Jose Acosta.

17 MR. BARNES: Still morning. Good morning.

18 MR. WALL: Good morning, sir.

19 MR. BARNES: My name is Eddie Barnes. I'm the
20 business manager of Steam/Refrigeration/Air Conditioning
21 and Pipe Fitters and Welders and Apprentices of the
22 United Association of the Piping Industry. We're
23 located at 18355 South Figueroa Street, Gardena, 90248.

24 I'm here speaking on behalf of 5,000 members
25 that I represent, Pipe Fitters Local Union in

1 Los Angeles inside the area with borders of Manchester
2 and Firestone to north of the 710 Freeway to the east
3 Imperial Highway to the south of Pacific Coast Highway
4 to the west, which includes the following ZIP Codes,
5 9001, 9002, 3, 44, 45, 47, 59, 61, 301, 304, 305. There
6 is over 640 members in the flight path in a ten-mile
7 radius.

8 This time I'd like the UA members that are
9 here today to support Alternative D to please stand up.
10 I would also like to discuss with the speaker, if you'll
11 notice, our color is neutral. We're very diversified,
12 and we have no discrimination against anybody. Thank
13 you brothers and sisters.

14 We believe it is important to maintain and
15 support Alternative D. It's a 78 million limit that
16 they proposed. It is maintained. We believe that
17 creating 351,000 jobs by 2015 is essential for the
18 future of Los Angeles and its people. We believe that
19 the 49,000 construction jobs are essential for the
20 future of the people of Los Angeles.

21 It will create \$64 billion dollars to the
22 regional areas. It will create \$22 billion dollars to
23 the City of Los Angeles. It will create 102 direct --
24 or indirect jobs. The total construction-related output
25 for Los Angeles County will be \$11.3 billion dollars.

1 I don't know if anybody's been watching lately
2 for the last few years, but the stock markets are down,
3 the infrastructure is going south. It's not up to par.
4 The jobs and the people, there is more on welfare and
5 there is more on unemployment. These jobs are needed
6 for Los Angeles.

7 And I'm speaking just at this point to jobs
8 simply because we need the health and welfare. Nobody
9 has mentioned that. If anybody has looked at the rising
10 cost of health and welfare today, you can't afford it.
11 The unions today have been able to do that as well as
12 the commerce that's here today have been able to give
13 health and welfare for our women, children and our
14 families. And that to us is important.

15 The concern that we have today on the regional
16 plan is the 9-11 and safety. I was in the blackout in
17 Michigan. It took me three days to get home on a
18 flight. We had people passing out in the airport
19 because the air conditioning didn't work. It was
20 terrible.

21 We believe, as members -- and I represent
22 Local 250 as well as a citizen of Los Angeles, that
23 Alternative D, through the past five years we've been
24 trying to get somewhere, is the only way to give a
25 chance to our working families in the service as well as

1 the construction industry an opportunity to survive for
2 their health and welfare. Thank you.

3 MR. WALL: Thank you, sir.

4 Our next speaker will be Mr. Thomas Brands.
5 Mr. Brands will be followed by Mr. Jose Acosta, and
6 Ms. Emma Worthington. Those will be the last three
7 speakers before our next break.

8 Mr. Brands. Mr. Thomas Brands first.
9 Welcome, Sir.

10 MR. BRANDS: My name is Tom Brands. I've lived in
11 Westchester for 40 years at 6739 West 87th Place, which
12 is just a couple of blocks north of the north runway.

13 The new plan for LAX upgrading is still faulty
14 for much the same reasons as the old one is. Even
15 though safety has required a new dimension since
16 September 11th, 2001, the safety hazards that existed
17 prior to that time have yet to be addressed.

18 The air space around LAX is already
19 oversaturated, witnessed the Cerritos accident a few
20 years ago and various near misses of midair collisions
21 over the Los Angeles area.

22 LAX should be limited to the traffic for which
23 it was designed, about 48 MAP, not the 78 MAP that
24 currently exists and is being used for the security
25 plan, even though these numbers are a roll back from the

1 98 MAP that was proposed previously.

2 Development of the Palmdale facility would
3 alleviate the currently existing safety hazard. The
4 safety problem is not just a LAX problem. It's an L.A.
5 and vicinity problem. Airplane crashes are equal
6 opportunity killers, both for passengers and those on
7 the ground regardless of which part of town gets
8 devastated. These have nothing to do with terrorism,
9 could be just as devastating.

10 Now, the existing ground transportation
11 congestion has a potential for real gridlock. I've
12 recently been driving to Claremont from Westchester
13 about once per week in the early morning. And each time
14 I see the traffic crawling west of the I-105 and I-210,
15 I'm thankful I'm headed east.

16 Expansion of various venues around LAX such as
17 Playa Vista can only make these traffic jams worse all
18 over town, not just in the vicinity of LAX and not just
19 on those particular freeways. The proposed traffic
20 mitigation plans do not address these situations.

21 Now, how many businesses will get displaced by
22 LAX acquiring additional real estate for the planned
23 security improvement? That's job loss. However, as
24 Palmdale jobs are -- at Palmdale jobs are just as
25 important as they are around LAX and the potential for

1 growth is much greater.

2 A significance of the population and business
3 in Los Angeles is north of the Santa Monica mountains.
4 And recent projections show the fastest growth in the
5 near future is north of that in the Santa Clarita
6 Valley. People in these areas can get to Palmdale just
7 as easily, if not easier than to LAX. This will get
8 even more true as traffic congestion increases and
9 Palmdale access improves.

10 Now, L.A. already cannot meet Federal Air
11 Quality standards. Pollution is a problem for the
12 entire city of L.A. since the prevailing wind has
13 descended west-side pollution to other parts of town.
14 Development of Palmdale should decrease overall
15 pollution by reducing traffic congestion both on the
16 ground and in the air.

17 Now, the proposed security plan I hear is
18 estimated at about nine and a half billion. The new
19 facility of Palmdale can be designed from the ground up
20 for maximum safety and security and still save money
21 over any existing LAX upgrade proposal.

22 Besides, when we hear an estimate as high as
23 nine and a half billion dollars based on virtually all
24 previous experience, that number is just for starters.
25 But it will inevitably go up from there. How much more

1 money will then be required to alleviate the problems
2 caused by additional traffic jams and pollution?

3 MR. WALL: Thank you, sir. Please submit your
4 comments in writing as well, if you would.

5 MR. BRANDS: I did.

6 MR. WALL: Yes, sir. Thank you.

7 Our next speaker will be Mr. Jose Acosta.

8 MR. ACOSTA: Hello everyone. My name is Jose Luis
9 Acosta. 10120 Firmona Avenue, Lennox, California 90304.

10 I have lived in the area of Lennox and
11 Inglewood for 23 years in the flight path of LAX.
12 Together, my wife and I raised two children in Lennox.
13 My sons are 13 and 17 years old. I've worked in tourism
14 for 17 years as a bartender in Manhattan Beach Marriott.

15 It is not easy to live in Lennox and raise
16 children here. Our community is poor. We have traffic.
17 Our schools are crowded and noisy from the planes flying
18 overhead. But one thing that makes it worthwhile for me
19 to raise my family here is that I have a good, stable
20 job in the tourism industry.

21 Modernization will affect us in Lennox. It
22 can hurt us, or it can help us. Modernization could
23 cause more traffic, more noise, more pollution without
24 giving anything in return, or the City can do everything
25 possible to make sure modernization benefits our

1 community and provides good jobs with living wages and
2 health care.

3 If modernization can benefit our community,
4 then we are willing to support it. Thank you.

5 (The statement submitted for the
6 record was marked as Statement 7
7 and is attached hereto.)

8 MR. WALL: Thank you, sir.

9 Our next speaker is Emma Worthington.
10 Ms. Worthington.

11 And this will be our last speaker before our
12 next break.

13 Welcome, ma'am.

14 MS. WORTHINGTON: My name is Emma Worthington. It's
15 E-m-m-a, W-o-r-t-h-i-n-g-t-o-n. I live at 710 South Fir
16 Avenue, Inglewood, California 90301.

17 I live in Inglewood. I also work at the
18 airport, and I have worked there for almost 30 years.
19 Like myself, many people who work at the airport live in
20 the surrounding communities. We live in Inglewood,
21 Lennox, Hawthorne, El Segundo and Westchester.

22 We understand the connection between good
23 quality jobs and quality life. We need more jobs, but
24 we don't need minimum wage jobs. What we need is jobs
25 that provide a livable wage and affordable family health

1 coverage. The companies at the airport provide those
2 types of jobs. And that is how I as a single mom have
3 been able to raise my family and not be on welfare.

4 We need to ensure this modernization plan
5 provides good employment opportunities for our
6 communities. We encourage the mayor to include in his
7 plan a local hiring program so that others in my
8 community can also raise their family, and that our
9 youths can strive to emulate their parents.

10 When we talk about modernization, we say we
11 are bringing the airport and Los Angeles into the 21st
12 Century. Well, we the workers would like to be able to
13 bring our communities into the 21st Century along with
14 the airport and the rest of Los Angeles.

15 That is why we urge the Mayor to ensure that
16 his plan provides good paying jobs with good benefits
17 and a community package that will ensure we are all
18 along for the ride and not left behind. Thank you.

19 (The statement submitted for the
20 record was marked as Statement 8
21 and is attached hereto.)

22 MR. WALL: Thank you, ma'am.

23 Ladies and gentlemen, with those comments, we
24 will now take a short recess. The first speakers when
25 we return, the first three speakers will be Mr. Thom

1 Davis, Ms. Liz Garnholz and Mr. Victor Crawford.

2 (Recess was taken.)

3 MR. WALL: Welcome again, ladies and gentlemen. I'm
4 just going to make a few announcements. Welcome ladies
5 and gentlemen. Thanks again for coming to provide your
6 public testimony for the Supplemental Environmental
7 Impact Report and Environmental Impact Statement.

8 If we've had individuals who have just joined
9 us, please come in and find a seat. We're taking public
10 comments today. Each speaker has three minutes, as
11 recorded by the electronic time clock.

12 I want to remind everyone that we will take
13 comment cards, speaker cards, until 1:00 o'clock today.
14 After that, we will let everyone who has provided us a
15 speaker card prior to 1:00 o'clock an opportunity for
16 their three-minute presentation.

17 I also want to remind you that written
18 comments are equal in importance to verbal comments. If
19 you do not feel that three minutes is enough time for
20 you to state your position, please feel free to fill in
21 a written comment card and submit that as well with
22 additional facts as you feel comfortable.

23 Our first speaker will be Mr. Thom Davis,
24 followed by Ms. Liz Garnholz, followed by Mr. Victor
25 Crawford. And I would ask you to start moving toward

1 the lectern as soon as you see the clock winding down
2 for the previous speaker.

3 Are you ready, Mr. Davis?

4 MR. DAVIS: Yes, I am. Thank you. Thom Davis,
5 Camarillo, California, offices in Burbank, California.
6 And Thom is spelled T-h-o-m, D-a-v-i-s.

7 I represent the IATSE, which is the union that
8 represents the motion picture and television
9 technicians. And I'm here to express our support for
10 the measure. This project is important to the people I
11 represent in a number of ways. LAX and the Master Plan
12 is vital to the entertainment industry, the jobs that
13 are sustained and the further creation of future jobs.

14 This plan goes a long way in mitigating the
15 potential impacts of the various proposals. For my
16 members who live in the immediate area, there is an
17 understanding that the benefits will have a real and
18 positive impact on their neighborhoods, their community
19 and the entire region.

20 Modernization of the airport is critical not
21 only to the industries that are normally associated with
22 the airport, but also to those industries within the
23 entire region such as the entertainment industry and,
24 also, to the entire economy of the entire region.

25 So with that, thank you very much.

1 MR. WALL: Thank you very much, sir, for your
2 comments.

3 Ms. Liz Garnholz. Welcome, ma'am.

4 MS. GARNHOLZ: My name is Liz Garnholz. I live in
5 the City of El Segundo. Garnholz is G-a-r-n-h-o-l-z,
6 and my address is on my sign-up sheet. I have my
7 comments already written, and I will submit them. It
8 was ready by the August 25th date.

9 I'm here to dispel the comments made by the
10 Mayor of El Segundo, who by the way is a telemarketer
11 and running for higher office, that the City of
12 El Segundo supports Mayor Hahn's Alternative D.

13 When the Mayor, our telemarketer mayor made
14 this comment, there was no public input. There was no
15 City Council discussion. There was no City Council. He
16 was king for a day. He made the statement and many of
17 us in El Segundo are absolutely irate.

18 The Mayor on -- Mayor Gordon, our telemarketer
19 mayor, on July 9th made the following speech. It
20 consists of 32 lines. The first sentence or sentences I
21 should say, is a good morning. Sentence two, three,
22 four and five and six are your basic telemarketer
23 dribble.

24 Number 7 is very important. It says, "But
25 Mayor Jim Hahn brought a new vision and a new style of

1 leadership to Los Angeles City Hall and Los Angeles
2 airways." That's absolutely true. I agree with this
3 statement. He's a democrat. And my mayor is a
4 democrat, and he's running for the 53rd assembly seat as
5 a democrat.

6 Let me see here. As for the Hahn signing a
7 pledge, all five candidates signed a pledge, republicans
8 and democrats, equal opportunity pledge. Let me see.
9 Right here he -- the Mayor says on Sentence 12, "And I
10 am pleased to announce today that the City of
11 El Segundo, Mayor Hahn, the World Airports have reached
12 an agreement in principal" -- that means a cup with a
13 hole in it -- "and are committed to finalize a formal
14 agreement with the City of El Segundo that will
15 absolutely limit growth at LAX to the capacity that
16 exists today through the year 2020."

17 The date is July 9th and the capacity is 54 to
18 55,000. Boy, time really goes. I'm going to have to
19 sum up a bunch of stuff here.

20 The City -- the El Segundo residents are
21 against Mayor Hahn's plan. It supports a region. We
22 are for a regional approach. The residents are against
23 moving the runway further south.

24 The Airport Noise and Capacity Act of 1990
25 says an airport proprietor cannot restrict capacity.

1 Why is after spending millions of dollars, actually 55K
2 a month for consultants to protect us from LAX, why is
3 the Mayor supporting it? Very simple. He wants
4 democrat Mayor Hahn's support when he runs for assembly,
5 and he wants the union votes.

6 And I would like to remind the unions that the
7 function of an airport is airport service, not jobs.
8 Thank you very much.

9 MR. WALL: Thank you, ma'am. My next speaker is
10 Mr. Victor Crawford, followed by Mr. Marvin Kropke,
11 followed by Mr. Juan Vasquez.

12 Mr. Crawford.

13 MR. CRAWFORD: Good afternoon, ladies and gentlemen.
14 My name is Victor Crawford. I live at 416 East Regent
15 Street in the city of Inglewood, California. I'm a
16 member of Local 250. I wanted to give my support to the
17 proposal for Alternative D of the airport Master Plan.

18 Alternative D provides facilities for 78
19 million annual passengers and 3.1 million tons of cargo
20 a year. It supports the idea of regional airports. In
21 past plans, LAX was expected to handle as many as 98
22 passengers a year. And this was totally unacceptable to
23 residents of the surrounding cities.

24 Mayor Hahn has lived up to the commitment that
25 he made before he was elected, that the modernization

1 plan would limit airport usage.

2 Alternative D, according to the Environmental
3 Impact Report, will provide the best design, including
4 safety and security concerns with the less impact on
5 residents, and I support that idea. Thank you for
6 listening to my statements.

7 (The statement submitted for the
8 record was marked as Statement 9
9 and is attached hereto.)

10 MR. WALL: Thank you, sir.

11 Mr. Marvin Kropke, followed by Mr. Juan
12 Vasquez and Mr. James Hopkins.

13 Welcome, sir.

14 MR. KROPKE: Thank you. Good morning. My name is
15 Marvin Kropke. It's spelled K-r-o-p-k-e, 297 North
16 Marengo Avenue, Pasadena. I am currently executive
17 secretary of the California State Association of
18 Electrical Workers which represents 90,000 electrical
19 workers across California and privileged to be a
20 business manager of IBEW Local 11 of Los Angeles, which
21 represents 7,000 electrical workers that live in the
22 area of the airport, use the airport and work at jobs
23 like the airport.

24 We simply wish to state that we stand in
25 strong support of the mayor's enhancements for safety

1 and security. We believe it has the best possible
2 chance of addressing serious concerns with the airport
3 in those areas and believe this can help our communities
4 for the years to come. We strongly support it. Thank
5 you very much.

6 MR. WALL: Thank you, sir.

7 Mr. Juan Vasquez, followed by Mr. James
8 Hopkins.

9 Juan Vasquez.

10 Mr. James Hopkins, followed by Mr. Kevin
11 Norton.

12 Mr. Hopkins. Okay. Don't see Mr. Hopkins
13 here.

14 All right, Mr. Norton, you'll be followed by
15 Mr. Jack Kenton.

16 MR. NORTON: My name is Kevin Norton. I'm a
17 business representative with International Brotherhood
18 of Electrical Workers, 833 Airport Boulevard,
19 Los Angeles, California.

20 I came today to let you know I support
21 modernization of LAX. Mayor Hahn's design with
22 Alternative D will fulfill the concerns that many area
23 residents have had, especially in regard to the number
24 of passengers that will be able to use the airport.

25 Mayor Hahn signed a letter that he would not

1 support any airport design that allowed more than 78
2 million passengers a year to fly in and out of LAX.
3 Alternative D by design caps the number of passenger and
4 cargo as well. This will push other airport sites to
5 build airport facilities and redirect flights there.

6 A regional approach to air travel and cargo
7 handling will be required when Alternative D is
8 constructed and all other area residents will realize
9 they should provide airport sites. This is a great
10 plan, and it should move forward as soon as possible.
11 Thank you very much.

12 MR. WALL: Thank you, sir.

13 (The statement submitted for the
14 record was marked as Statement 10
15 and is attached hereto.)

16 MR. WALL: Thank you, sir.

17 Mr. Jack Kenton, followed by Mr. Robert
18 Watkins and Ms. Maria Verduzco-Smith.

19 MR. KENTON: My name is Jack Kenton. That is
20 K-e-n-t-o-n, 835 Dune Street in El Segundo, also on the
21 LAX Airport Advisory Committee.

22 El Toro was shot down pretty much because the
23 people around there were upset with noise. Today I
24 think there is no one here that isn't either looking for
25 a job or here because of noise.

1 The EIR/EIS says that my house is under a
2 single event noise impact of 94 DB. The averaged out
3 thing comes to a CNEL of only 74. With the reduced
4 number of operations since 9-11, this is actually
5 livable, but now we're talking about moving the runways
6 closer. And even now when we have one of those rush
7 hours with an airplane going off every minute or every
8 two or three minutes, it gets unbearable because you
9 never get relief from the noise.

10 When you get the runway closer, that gets just
11 that little bit more extra noise. Now, we're talking
12 about moving it so that we can put a taxiway in between.
13 Now, that's supposed to be because of safety. And, yet,
14 the incursion statistics show that those are not
15 significant, and we can get around it by going off the
16 end of the runway with a taxiway.

17 What it does do is put an infrastructure in
18 place that should we have a mayor that says, "Well,
19 Mayor Hahn's 78 MAP is not my MAP," the infrastructure
20 is going to be there and he can expand. And I disagree
21 with that concept of putting that kind of
22 infrastructure. It provides the ability for more
23 operations per hour by having that taxiway down the
24 middle.

25 Okay. So beyond spending a lot of money to

1 move a runway 50 feet and put a taxiway in and
2 everything, what do we got? Well, we've got
3 infastructure for more movement. I don't think the
4 gates will resolve that at all.

5 Moving the secured areas out further to the
6 remote parking, to the Green Line Transportation Center,
7 to the general transportation check in point, you're
8 still going to have areas where people congregate and
9 still be targets for security.

10 With all this expense and moving of
11 everything, yes, safety, security, those are magic
12 words, but will we really get the safety, security that
13 we are after with all these millions and billions of
14 dollars. I'm not sure that we will. And I'd like to be
15 more sure before I see all these dollars spent for this
16 project. Thank you.

17 MR. WALL: Thank you, sir, for your comment.

18 Mr. Robert Watkins, followed by Ms. Maria
19 Verduzco-Smith, followed by Mr. William Conlin.

20 Welcome, sir.

21 MR. WATKINS: Good morning. My name is Robert
22 Watkins. I live at 400 East 65th Street, Los Angeles,
23 California. Thank you for the opportunity to speak
24 today.

25 Well, I came to say that Mayor Hahn has

1 provided an excellent proposal for the LAX. And with
2 his commitment to cap off the airport passengers at 78
3 million a year, I think he has satisfied many of the
4 concerns of the residents who live and work in the
5 airport.

6 The idea that other areas like Palmdale and
7 Orange County will need to take some of the future
8 airline passengers burden is a good one. Mayor Hahn's
9 support for a regional approach should be commended as
10 well.

11 We absolutely need to modernize LAX, not only
12 for the economic and safety concerns that we have, but
13 also so that the area residents will find solutions to
14 their quality of life issues. I think that
15 Alternative D provides that solution. Thank you.

16 MR. WALL: Thank you, sir.

17 Ms. Maria Verduzco-Smith.

18 MS. VERDUZCO-SMITH: My name is Maria
19 Verduzco-Smith. It's V-e-r-d-u-z-c-o, Smith, S-m-i-t-h.
20 My address is 10926 Grevillea Avenue in Lennox. I serve
21 as President of the Lennox Coordinating Council.

22 The community of Lennox is severely impacted
23 by airport operations. And we feel that we are mainly
24 neglected. We have schools that jets fly directly over
25 on their approach to the airport and most homes have not

1 been soundproofed by the projected -- or protected
2 against the jet noise as part of the sound mitigation.
3 Many of our residents can feel the oil and see the soot
4 from the jets.

5 Our children lose hours of education time
6 yearly due to the interruption caused each time a plane
7 is landing. There are many things to be taken into
8 consideration when a community is located as close to
9 the airport as Lennox. There is the health of our
10 children, the quality of life for the residents and the
11 impact of the noise and traffic the airport causes.

12 If the airport is going to modernize, then it
13 is time for our community to modernize also. This plan
14 must have some real community benefit if it is in it so
15 that the future health problems can be alleviated, our
16 schools can be safer, our communities can be protected.
17 And measures are put in place to ensure that the people
18 of Lennox are treated fairly.

19 Community benefit means that our community is
20 not forgotten in the modernization program. It means
21 that with \$9 billion dollars being spent for airport
22 modernization, there is money actually being spent in
23 our community to make those infrastructure changes
24 needed to accommodate the expected increase of noise and
25 traffic. While there is a push for modernization, we

1 also want to push for increased and visible benefits in
2 our community. Thank you.

3 (The statement submitted for the
4 record was marked as Statement 11
5 and is attached hereto.)

6 MR. WALL: Thank you, ma'am for your comments.

7 Mr. William Conlin, followed by Mr. Mel
8 Pereira, followed by Mr. Wellington Poindexter.

9 Mr. Conlin.

10 Mr. Mel Pereira. He'll be followed by
11 Mr. Wellington Poindexter, Mr. Dean Lindstrom and
12 Mr. Richard Slawson. Welcome, sir.

13 MR. PEREIRA: Thank you. My name is Mel Pereira.
14 That's Pereira spelled with a P-e-r-e-i-r-a. I'm a
15 16-year resident of Westchester. And my address is 7811
16 Fordham Road, 90045.

17 I'm coming here as a resident. And I feel
18 that all my brothers in yellow shirts, the yellow shirts
19 have one letter missing, one word missing. They are
20 "Safety Security." I think we need to add the word
21 "Sanity," because what's missing in all this planning is
22 basic common sense.

23 We talked about security, safety, and I'm
24 totally in unison with Maxine Waters. And nobody said
25 it better. But I talked to -- and she's going to add it

1 to her report. They are not addressing the safety and
2 security of the tunnel. It's not fiction. It's a fact
3 that just on the eve of the millennium at Canada we
4 stopped some terrorist who had some explosives headed
5 for LAX.

6 This is a prime target, and we have an open
7 tunnel with no security. One truck bomb, one suicide
8 bomber shuts down the whole tunnel. And with the new
9 positioning of the runways, we have only one runway.
10 And that will knock off all the jobs of our friend here.
11 They will have jobs, but it will be to reconstruct LAX.
12 So I really think that we need to address the security of
13 the tunnel, even if it's forced to close the tunnel.

14 The other thing I would like to address is
15 what Mr. Schneider said. And I don't want to repeat
16 what he said, but basically we need to strengthen the
17 planning of the regional airports. That's all bologna
18 that people don't fly from other airports. We live near
19 Westchester, and all my neighbors will attest to the
20 fact that a lot of our friends park at our house when
21 they go from LAX.

22 This year the number of friends who parked at
23 our house was only two because they flew out of Long
24 Beach. They flew out of Ontario. There are some better
25 rates available. So in the planning I would suggest

1 that the government give them some aid or some -- some
2 subsidy so that the other airlines that move out from
3 other airports, they can give cheaper ride fares and
4 people will fly out of Long Beach.

5 The last thing is traffic. We can't even go
6 down the freeway from Brentwood to my office in
7 Westchester even on a Sunday. The traffic is just
8 horrendous. I don't know how you're going to handle
9 traffic. And traffic is a major, major concern. We
10 can't go down Lincoln Boulevard.

11 And all the planners that spoke at the outset
12 of meeting, none of them live in Westchester or Lennox
13 or Inglewood or El Segundo. They all live in the
14 boondocks, you know, in Pasadena or Rancho Palos Verdes.
15 They need to travel on these freeways. Even on a Sunday
16 you can't even travel on Lincoln Boulevard. Thank you.

17 (The statement submitted for the
18 record was marked as Statement 12
19 and is attached hereto.)

20 MR. WALL: Yes, sir. Thank you.

21 Mr. Wellington Poindexter, followed by
22 Mr. Dean Lindstrom, Mr. Richard Slawson.

23 Mr. Poindexter, are you here?

24 Mr. Dean Lindstrom.

25 Mr. Richard Slawson. Welcome, sir.

1 MR. SLAWSON: Thank you. Good afternoon. Is that
2 microphone any better?

3 MR. WALL: No, sir, that one works fine. Just don't
4 get too close to it.

5 MR. SLAWSON: That's different?

6 MR. WALL: Yes, sir.

7 MR. SLAWSON: My name is Richard Slawson. I'm the
8 Executive Secretary of the L.A. and Orange County
9 Building and Construction Trades Council. Our council
10 represents workers in the construction industry for the
11 various trade unions. We represent approximately
12 130,000 craft workers living and raising their families
13 in every community around the airport and other areas of
14 Los Angeles and Orange County. I live at 4634 Deelane
15 Street in Torrance, California 90503.

16 Many of the speakers here today have suggested
17 that they have a better plan. I'm here to say it isn't
18 true, including the area officials who want to start
19 over again. These speakers aren't interested in a
20 better plan. They don't want an airport at all. Taking
21 apart of the Draft Environmental Impact Report is only a
22 delay in tactic to stop the improvements at LAX. This
23 will be a disaster for our economy and for jobs.

24 These discussions have gone on for nine years,
25 and not one of those that are against the plan have come

1 up with their own plan.

2 Now, what happens if we don't move forward
3 with the Master Plan and Alternative D? You have an
4 airport with no growth restrictions. LAX unrestricted
5 could grow to 98 million annual passengers according to
6 the Southern California Association of Governments,
7 Aviation Subcommittee, which most of the area cities had
8 representatives sitting on over the last four years.
9 And that's not what any of us want.

10 Without Alternative D, we won't have an
11 upgraded security system to handle passengers and
12 baggage. We won't have an intermodal transportation
13 center to connect the Green Line. We won't have people
14 movers and trams to move people around the airport. And
15 everyone knows how difficult it is to access the
16 terminal now.

17 Without a modern and secure airport, we will
18 lose business to other areas and other airports around
19 the country, and especially to west coast cities.
20 Alternative D fulfills Mayor Hahn's commitment to the
21 residents of this area in capping annual passengers to
22 78 million.

23 With the security designs that have been
24 added, like passenger and baggage drop-off buildings, we
25 have a plan that offers more than was promised. I say

1 we move on and build an airport we can all be proud of.
2 Thank you very much.

3 MR. WALL: Thank you, sir.

4 Mr. Marvin Walter, please. Marvin Walter,
5 followed by Mr. Marcus Hough and Mr. Romeo Gonzalez.

6 Mr. Walter.

7 MR. WALTER: I'm Marvin Walter. I reside at 7015
8 Sepulveda Boulevard in Los Angeles.

9 In prior hearings such as this, in numerous
10 newspaper articles regarding Alternative D, many factors
11 as passenger caps, traffic, noise, jobs and security
12 have been raised. Yet, the major impetus behind
13 Alternative D continues to be security regardless of the
14 more recently raised slant toward modernization. So I'd
15 like to address that particular issue.

16 And, frankly, it's not easy to assess the
17 value of Alternative D in that light by reviewing the
18 EIR document. And I offer these direct quotes from
19 various sections of that document.

20 From the comparative analysis Section of D
21 Versus No Action, "Vehicular traffic in the Central
22 Terminal Area results in crowded terminal areas that
23 create attractive targets for terrorists and allows
24 baggage containing potentially significant explosive
25 devices into passenger congregation areas" and "People

1 approach all facilities with unsecured baggage until
2 they reach the TSA checks."

3 "Security screening stations at the Ground
4 Transportation Center and Intermodal Transportation
5 Center will protect the Central Terminal Area from
6 attack by persons armed with weapons."

7 By moving arrival and departure passengers
8 rapidly through the single entry point, only a small
9 number of people would be clustered as a potential
10 terrorist target.

11 From the Development and Refinement Section,
12 paragraph 2.2.8, "First level screening at the Ground
13 Transportation Center will be random baggage and
14 passenger checking and use of video surveillance and
15 sniffing dogs."

16 Same Section, 2.2.8, "The architectural design
17 intent of the GTC is to create a partially climate
18 controlled open-air structures to help diffuse potential
19 blast impacts at the curb front by eliminating glass
20 curtain walls."

21 Again, from the comparative analysis section,
22 "The people mover presents a problem as it is unsecured
23 and subject to attack, but this can be partially
24 mitigated by use of technology."

25 Again, from the Development and Refinement

1 Section, paragraph 2.2.8.1. "Passengers not using sky
2 cap services may carry baggage on the automated people
3 mover to the Central Terminal Area where screening will
4 be made by the appropriate airline."

5 So if unsecured baggage in the central
6 terminal is currently a problem, and it probably is, it
7 doesn't appear this multi-million-dollar alternative
8 solves that at all.

9 All passengers spread out through eight
10 terminals currently, and you've seen the lines all down
11 the sidewalk. Here all the passengers will be funneled
12 through this one entry point, but they are going to move
13 rapidly so as to only present a small number of a
14 potential terrorist target.

15 The six-car people mover really sounds like an
16 exciting entry to a world-class airport, baggage carts,
17 passengers rolled in and out, meeters and greeters who
18 are going to be allowed in that terminal area. Of
19 course, in case of a blast, partially climate air
20 controlled is exactly what I would want between me.
21 Security solution, no, this is a joke.

22 MR. WALL: Thank you, sir. I see you're submitting
23 your comments in writing. Thank you, sir.

24 (The statement submitted for the
25 record was marked as Statement 13

1 and is attached hereto.)

2 MR. WALL: Mr. Marcus Hough, followed by Mr. Romeo
3 Gonzalez and Ms. Patti MacJennett.

4 Mr. Hough.

5 And I would invite people to start moving up
6 as you hear your name called.

7 Mr. Hough. Oh, Mr. Hough is not here
8 apparently.

9 Romeo Gonzalez, yes, sir.

10 MR. GONZALEZ: Good afternoon. My name is Romeo
11 Gonzalez. I'm union member of the IBEW Local 11
12 District 3. I live at 712 6th Avenue, Number 1, Venice,
13 California 90291.

14 I would like to show my support for the LAX
15 Master Plan and Alternative D. After almost eight years
16 of planning and dozens of hearings and testimony, Mayor
17 Hahn has introduced a plan that takes into account of
18 all the concerns that have been raised.

19 With the heightened awareness of the
20 possibility of airport disaster, either by accident or
21 by human hands, this plan would reduce all consequences.
22 With the remote passenger and baggage handling facility,
23 the flying public should have more confidence in L.A.
24 security. This design, with the early scanning of
25 passengers, carry-ons and baggage makes the Central

1 Terminal Area and airline gates more safe.

2 I also like the use of people movers and trams
3 in the design. Moving around LAX today is very
4 difficult. The only way to get from airline to airline
5 or different terminals is to walk or wait for a bus.
6 Alternative D's transportation system saves time and
7 confusion. I hope Alternative D is adopted soon. Thank
8 you very much.

9 (The statement submitted for the
10 record was marked as Statement 14
11 and is attached hereto.)

12 MR. WALL: Thank you, sir. Next is Ms. Patti
13 MacJennett.

14 Trini Jimenez.

15 Mr. Homer Anderson. Following Mr. Anderson
16 will be Mr. Harry Rose and Ms. Carole Hossan. I want to
17 remind everyone before you start, sir, that we will be
18 accepting speaker cards until 1:00 o'clock. That's just
19 a few minutes from now. After that, we will stay here
20 until we have heard from everyone. I'm on card number
21 51. And I have 95 cards.

22 Are you ready, sir?

23 MR. ANDERSON: Yes. Good afternoon. My name is
24 Homer Anderson. I live at 15824 South Western Avenue,
25 Gardena, California 90247.

1 All of us here today use airports at some time
2 or another. And if you've ever been at LAX lately, you
3 know how difficult it can be to get through the check-in
4 procedures or even pick up someone. That's why I
5 support the new proposal for the Master Plan.

6 As it is indicated on the boards that are set
7 up outside, there will be new passenger ticketing and a
8 baggage handling building built away from the central
9 terminal and gates. With the larger area for passenger
10 drop-off and pick up and the baggage check-in facilities
11 being expanded, passengers should be processed much
12 faster.

13 Getting the people in and out of the drop-off
14 area faster will also give us a safer and more secure
15 airport. The chances that someone will be injured and
16 in a disaster will be greatly reduced with the new
17 design. Any idea that the existing security level at
18 the current airport will be more secure than the
19 expanding airport is ludicrous and damn near stupid.

20 And to the gentleman that is aspiring to
21 become a mayor, he is already 500,000 votes behind.
22 Anyone with common sense, because with all your
23 Princeton education, you have none.

24 (The statement submitted for the
25 record was marked as Statement 15

1 and is attached hereto.)

2 MR. WALL: Thank you, sir, for your comments.

3 Mr. Harry Rose, followed by Carole Hossan,
4 followed by Malcolm Joseph.

5 MR. ROSE: Good afternoon, gentlemen. Welcome to
6 Westchester. My name is Harry Rose, 7725 Hindry Avenue,
7 Westchester, 90045. I am not running for mayor.

8 I come before you today on behalf of Osage
9 Neighbors Association. We represent approximately 3,600
10 homes in East Westchester. And because it would seem
11 that none of our city officials have noticed, we would
12 like to point out that most modern airports operate on a
13 much larger footprint than LAX and are not located in
14 densely populated urban areas.

15 Denver had the vision to build a world-class
16 airport on 53 square miles in a rural area and actually
17 closed their old airport. Total cost, less than half
18 the price of Alternative D. Los Angeles, where is the
19 vision?

20 We love -- while we love a good public works
21 boondoggle just as much as anyone else, this one is
22 ill-conceived and a violation of Mayor Hahn's election
23 pledge to our community. Airport use of residential
24 property violates his pledge to operate the airport
25 within its current boundaries. And the capacity of 78.9

1 MAP stated in the EIS violates the Mayor's election
2 pledge to us by nearly 1 million annual passengers.

3 Alternative D would dramatically enhance the
4 flight field throughput and lay the groundwork for
5 vastly increased ground transportation infrastructure
6 setting the stage for future expansion of LAX
7 operations.

8 We have heard that FAA is currently studying
9 the feasibility of simultaneous landings on three
10 runways under the new configuration. Do LAWA and FAA
11 plan to visit this practice upon us in the near future?

12 Alternative D would move airport bound traffic
13 two miles to the east subjecting East Westchester,
14 Lennox and Inglewood to increased vehicular air
15 pollution and noise. How does this even begin to comply
16 with the environmental justice provisions of CEQA?

17 Alternative D locates a Ground Transportation
18 Center in a tract of land currently zoned R1. The EIS
19 clearly states that no residential property is to be
20 acquired for the project. This leads us to assume that
21 LAWA plans to use property acquired through an ongoing
22 and supposedly voluntary noise mitigation acquisition
23 program.

24 This method of residential property
25 acquisition for airport use ignores FAA guidelines in

1 Order 5100.37A, Chapter 3, Section 9 implementing the
2 Uniform Act of 1970. We would like a complete
3 explanation as to how LAWA's acquisition and conversion
4 of this property to airport use approaches any semblance
5 of legality. Thank you.

6 (The statement submitted for the
7 record was marked as Statement 16
8 and is attached hereto.)

9 MR. WALL: Thank you, Mr. Rose.

10 Ms. Carole Hossan, followed by Mr. Malcomb
11 Joseph, followed by Mr. Joseph Geben.

12 MS. HOSSAN: Carole Hossan, Westchester. And I'm
13 against Mayor Hahn's unsafe and unsecure Alternative D
14 debacle. Debacle in terms of money for what it
15 achieves, and as we've been hearing today, a debacle in
16 safety and security.

17 Again, I get so tired of saying it, but it
18 just doesn't seem to sink in. How safe and secure is it
19 for Los Angeles International Airport to be the only
20 major airport from Central California to the Mexican
21 border. Los Angeles City should be sued for planning
22 negligence because they have had Palmdale and Ontario
23 for decades.

24 What was Palmdale bought for? To wait for the
25 desert community to develop into another city of

1 Los Angeles to utilize it? Wasn't it intended to be an
2 international airport with transportation provided for
3 people to go to it? How can you have that facility
4 sitting out there unused, and then say we need to make
5 LAX accommodate more plane traffic? It doesn't make
6 sense.

7 But then it does make dollars for contractors,
8 doesn't it? I want to see the unions have jobs. I want
9 to see them have jobs out there in Palmdale. They would
10 get a time differential. They would be building
11 something that needs to be built instead of something --
12 if something happens to Los Angeles, LAX, an earthquake
13 or something, we'll lose the \$1 billion dollars a day,
14 as he said. And how would you feel, then, having no
15 alternative?

16 Now, some specific things for my neighborhood.
17 If the traffic on the 405 is backed up and traffic is
18 coming from the north and they get off on La Tierra, how
19 are they going to get to the Ground Transportation
20 Center? What routes are they going to take?

21 And what is the signage on the freeway going
22 to be? Is it going to be directing only to a certain
23 interchange, or is it going to be saying like it does
24 now, "5 Exits to LAX?" How is traffic if they get off
25 at Sepulveda going to be routed to the Ground

1 Transportation Center? Have these intersections been
2 implemented or studied?

3 I want to see results of that study. You say
4 fewer gates. Well, how many planes can these gates
5 accommodate if we're having simultaneous landings? And
6 is there amplification problem with noise with
7 simultaneous landings and takeoffs? These are things
8 that need to be addressed.

9 I don't know, there are so many things to say.
10 But I wanted to add something for a man. He says,
11 "During the construction phase, the current LAX capacity
12 will be reduced as existing runway and terminals are
13 raised."

14 What kind of safety and other problems will
15 that situation engender? Please show some sense and
16 some consideration and really plan for the region, not
17 just for the greedy city of Los Angeles. Thank you.

18 MR. WALL: Thank you, ma'am.

19 Mr. Malcolm Joseph. Mr. Joseph.

20 And Mr. Joseph Geben, followed by Mr. John
21 Ferruccio.

22 Mr. Joseph.

23 MR. JOSEPH: My name is Malcolm Joseph, and I live
24 at 1076 Raymond Avenue, Long Beach, California 90804.

25 LAX has been a very large factor in the daily

1 lives of all of us in Los Angeles County. Those who
2 live near the airport have special concerns, even though
3 the airport is an economic boom to us all. Obviously,
4 traffic and noise have to be dealt with. And I think
5 that the LAX Master Plan with Alternative D does that.

6 The traffic plan, with improvements being
7 proposed for the intersections, extra lanes on
8 La Cienega Boulevard and the improvement to the cargo
9 delivery access roads will aid the flow of traffic in
10 the airport's immediate area. But the greatest change
11 to increased traffic will be the connection to the Green
12 Line light rail transportation center.

13 Finally, a public transportation system would
14 be available from flyaway parking facilities or stations
15 where passengers will be dropped off at over 50 sites
16 throughout Los Angeles County. Alternative D is my
17 choice, and I hope the FAA and the City will approve the
18 plan. Thank you.

19 (The statement submitted for the
20 record was marked as Statement 17
21 and is attached hereto.)

22 MR. WALL: Thank you, sir.

23 Mr. Joseph Geben followed, by Mr. John
24 Ferruccio and Mr. Joe McFadden.

25 Is Mr. Geben not here?

1 Mr. Ferruccio on -- oh, I'm sorry. Take your
2 time, sir.

3 MR. GEBEN: Mr. Joseph Geben; Rogers, Geben and
4 Christensen. We're environmental community planners,
5 Westchester, 40 years worth.

6 First of all, before I even start, I
7 understand that the airport commissioners have
8 rubber-stamped voluntarily taking land. I told them a
9 year ago, two years ago they couldn't take no land
10 because there is laws in the State of California that
11 says they cannot say I'm going to take the land.

12 The airport comes after the people, after the
13 people, after the businesses. Somebody lied. And I
14 don't know where it was. I'd like to ask Mr. Stein who
15 lied. Volunteered, none of the people volunteered.
16 They had scalawags and carpet baggers run right through
17 the lawns of these people's houses, and they gave them
18 the old bologna, B.S.

19 The thing is is most of the people did not
20 really volunteer. They volunteered under duress. And
21 I'd like to -- they absolutely volunteered under duress.
22 And we have to have an investigation of the city
23 attorney who knew about it. And I told him about it
24 that they couldn't take any land.

25 So they turned around and they went underneath

1 the ceiling and said they volunteered. The people
2 didn't volunteer. They had to say they volunteered
3 because I told them they couldn't do it. It's illegal.
4 Illegal to take land from people. And I'd like you to
5 investigate it.

6 Maybe the district attorney might investigate
7 it because something happened in the commissioner's
8 office. They lied to the people. It is the people's
9 land, for the people, by the people, so help you God.
10 Patrick Henry said it. Lincoln said it. He gave up his
11 life. Franklin D. Roosevelt.

12 You see, somebody lied in the commissioner's
13 office, and I don't know whether the president or
14 anybody else. They rubber-stamped volunteer. People
15 didn't volunteer to sell the land. That's bologna. But
16 I told them almost a year ago that it was illegal to
17 take land. I want to know what's going to happen with
18 that.

19 I mean, why does Mr. Stein turn around and say
20 these people volunteered. These people didn't
21 volunteer. They volunteered under duress. It's wrong.

22 MR. WALL: Thank you, sir, for your comments today.

23 MR. GEBEN: I'm finished?

24 MR. WALL: Yes, sir.

25 MR. GEBEN: I've got more to say.

1 MR. WALL: Sir, we'd encourage you to put those in
2 writing and send those in to us.

3 Mr. John Ferruccio, followed by Mr. Joe
4 McFadden and Mrs. Cheryl Parisi.

5 MR. FERRUCCIO: Good afternoon. My name is John
6 Ferruccio. That's F-e-r-r-u-c-c-i-o. I have lived in
7 the city of Gardena for nearly 50 years.

8 LAX has provided a safe and efficient
9 transportation for me and my family to other parts of
10 the country and the world for many years. And I feel
11 that most of the people here in this room have received
12 the same service.

13 But improvements are overdue. Safety,
14 security and the threat of terrorism are the most
15 important concerns we all have in what happens at the
16 airport. However, I also believe that jobs and the
17 economy are equally important. Without a strong
18 economy, Americans would be at the mercy of foreign
19 interest and would be vulnerable to more attacks.

20 California and Los Angeles are important parts
21 of our overall economic viability. And LAX has always
22 been a large part of the regional economy. Over 300,000
23 jobs will be supported by the modernization plan for
24 LAX. And it will generate billions of dollars into the
25 regional economy and tens of thousands of dollars into

1 the City of Los Angeles economy.

2 That is why I hope the recommendations to move
3 forward on the Master Plan and Alternative D can be made
4 soon. Waiting another six years for more rounds of
5 hearings over redesign after redesign will hurt many
6 working families in this area's economy.

7 I presently serve as a union pipe trades
8 organizer, hopefully providing good working jobs for the
9 Southern California area. I feel that this project
10 would create a great opportunity for all the working
11 people of our community. Thank you for listening.

12 MR. WALL: Thank you, sir.

13 Mr. Joe McFadden. Joe McFadden?

14 Ms. Cheryl Parisi, followed by Mr. Tony Kom,
15 Mr. Joe Garcia.

16 Cheryl Parisi?

17 Tony Kom? Yes, sir. You'll be followed by
18 Mr. Joe Garcia and Mr. Mike Bonin.

19 MR. KOM: My name is Tony Kom. I'm an environmental
20 planner. I live at 3639 Roseview Avenue, Los Angeles
21 90065.

22 The LAX Master Plan spends \$9 billion dollars
23 plus to tear down airport structures that are possibly
24 not even yet paid for, concentrates airport congestion
25 in a single vulnerable location, promotes traffic

1 gridlock and provides no new rail transit access to LAX,
2 and would make LAX the most inconvenient airport in the
3 world.

4 Tokyo, Seoul Korea, Hong Kong and even
5 Washington, D.C. built new international airports far
6 out from the city and kept their old airports for
7 domestic airports only. That is a solution for
8 Los Angeles as well.

9 We could have a new secure Los Angeles
10 International Airport at Palmdale with all the built-in
11 security features that are now proposed for LAX. You
12 could have a tram from the Palmdale station into a
13 security center and onto terminals and a tram back into
14 parking areas and provide a lot of parking, 500 acres,
15 50- to 70,000 cars, 180 acres for bus and terminals and
16 car rental lots. And we already have the existing
17 Metrolink Line that goes from Los Angeles to Palmdale.

18 LAX could become the Los Angeles-Westchester
19 domestic airport at LAX. Take no homes, that should
20 reduce the number of flights. We could even have the
21 same security facilities that are proposed in the
22 current D Plan.

23 You could have a security building outside of
24 LAX near Century and Aviation and the trams going in.
25 If you're going to have inspections for vehicles, for

1 truck vehicles, why not have inspections for all cars
2 entering LAX and not have to tear down airport parking
3 garages that are probably not even yet paid for.

4 We could have transit -- rail transit to all
5 Los Angeles airports for much less money than this
6 scheme proposes. Only 15 miles of new Metrolink,
7 Metrorail would connect the Green Line to LAX all the
8 way to Burbank and to the Antelope Valley line.

9 Only 12 miles to bring the Metrorail that now
10 ends at Wilshire and Western down Crenshaw and then on
11 the MTA owned right-of-way directly to a station at
12 Aviation and Century, and then go on down and tie into
13 the Green Line. We haven't been able to get the Green
14 Line in. We shouldn't even try.

15 On the other end we could go from the end of
16 the red line two miles --

17 MR. WALL: Thank you, sir. We want to make sure you
18 submit your written comments as well, sir.

19 (The statement submitted for the
20 record was marked as Statement 18
21 and is attached hereto.)

22 MR. WALL: Mr. Joe Garcia, followed by Mr. Mike
23 Bonin and Mr. Nimrod.

24 Mr. Garcia.

25 MR. GARCIA: Good afternoon. My name is Joe Garcia.

1 I'm a consulting engineer. I live at 23445 Glenridge
2 Drive, Newhall, California.

3 I'm here as a citizen to just express my
4 support of Alternative D for the following three
5 reasons. One, it is consistent with a plan that Mayor
6 Hahn committed to and the limitations that the LAWA
7 staff had to adhere to.

8 Two, it, as indicated earlier by the
9 representatives of the police department, represents and
10 provides for significant security improvements that are
11 sorely needed here.

12 And, three, it provides an efficient movement
13 of passengers and vehicles. As a passenger in and out
14 of LAX for over 30 years and having flown, like a number
15 of speakers in the area in and out of other airports, I
16 think we can all agree that these improvements are
17 sorely needed here. It's time to stop waiting, stop
18 stalling and let's get on with improving our airport.

19 Finally, as a principal of a small local
20 minority owned consulting firm, I'm here to say to you
21 that this project is significantly needed right now as a
22 boost to our local economy and the business
23 opportunities that will result from that. Thank you
24 very much.

25 MR. WALL: Thank you, sir.

1 Mr. Mike Bonin.

2 Mr. Nimrod.

3 Ms. Elece Otten.

4 Mr. Roger Graham.

5 Ms. Andrea Davis. Yes, ma'am, if you'd come
6 forward. After Ms. Davis will be Mr. Chuck LeFever,
7 followed by Mr. Daniel Walker.

8 Welcome.

9 MS. DAVIS: Hi. My name is Andrea Davis. And my
10 husband and I are both residents and homeowners in Playa
11 del Rey.

12 I'm coming here to tell you that I believe
13 that creating jobs is a wonderful thing, and I think
14 this airport, for all of our U.S. airports, we should
15 have them as modern and maintained as possible. That's
16 certainly wonderful.

17 My husband is a heavy consumer of air travel.
18 He flies all the time. We bought the house in Playa
19 because it was at the time very convenient. I don't
20 know about the future, but I have to say that I must say
21 no emphatically to Alternative D.

22 Mayor Hahn's PR machine keeps repeating that
23 the \$9-billion-dollar plus Alternative D will be safer
24 and more secure. However, experts from the RAND
25 Corporation and a study requested by Congresswoman Jane

1 Harman disagree. After studying the plan, they found
2 the airport would, in fact, be less safe and less secure
3 than the existing LAX.

4 In fact, the study concluded, modernization
5 could be accomplished at a much lower cost than
6 Alternative D. Concentrating all the travelers into one
7 remote check-in just creates an even more attractive
8 target for any terrorist activities.

9 We, the residents that surround LAX, we the
10 travelers, we all will be put at tremendous risk if we
11 allow Mayor Hahn to create one giant bull's-eye at what
12 was once Manchester Square. It's not safer. It's not
13 more secure. It's certainly not more convenient and
14 it's unnecessarily expensive. Alternative D is not
15 community planning, Mr. Mayor, and it's not good
16 governance. Thank you.

17 (The statement submitted for the
18 record was marked as Statement
19 19 and is attached hereto.)

20 MR. WALL: Thank you, ma'am.

21 Mr. Chuck LeFever, followed by Mr. Daniel
22 Walker and Ms. Danna Cope.

23 Mr. LeFever.

24 Mr. Daniel Walker.

25 Ms. Danna Cope.

1 MS. COPE: I'm here.

2 MR. WALL: Yes, ma'am, if you'd come forward,
3 followed by Ms. Ellie Holm and Mr. Jim McCutcheon.

4 MS. COPE: Good afternoon. I'm Danna Cope,
5 D-a-n-n-a, C-o-p-e, in Westchester. I'll hand in the
6 thing with the address.

7 While Alternative D is a definite improvement
8 over Alternatives A, B and C, it does not achieve its
9 stated purpose to provide safety and security.
10 Alternative D would cost over \$9 billion dollars,
11 exacerbate the traffic and air pollution problems,
12 expand the boundaries of LAX and provide very little in
13 mitigation measures.

14 By expanding LAX into the Manchester Square
15 area, Alternative D would merely transfer the dangers
16 from the facilities in the Central Terminal Area out
17 into the community, thereby leaving the traveling public
18 and the residents still at risk.

19 Gathering a large number of people into one
20 area would create a terrorist target, and that is what a
21 Ground Transportation Center in Manchester Square would
22 be. Concrete, metal and plastic would get protection,
23 people would not.

24 Extending LAX boundaries into Manchester
25 Square sends the message that LAWA intends to just keep

1 expanding LAX, and it can handle all the Southern
2 California traffic, no regional approach is needed.
3 Other counties and communities should be taking on their
4 share of air traffic, not told they can rely on LAX.

5 There have been very few Category A runway
6 incursions at LAX, certainly not enough to warrant a
7 \$9-billion-dollar renovation which includes moving
8 runways. Adequate safety precautions could be
9 instituted with the cooperation of FAA, LAWA and the
10 airlines.

11 Air traffic has not rebounded to pre-9-11
12 levels. This gives us the luxury of taking time to
13 reexamine the assumptions previously made that air
14 traffic would return to and increase from those levels.
15 There is no reason to rush to prejudgment. There is
16 time to explore more options on bringing other airports
17 into compliance with a regional approach to air traffic.

18 As to jobs, we fully support jobs. We wish to
19 keep the union strong here, but the jobs would be
20 created at any regional airport or all regional
21 airports. We do not have to jam everything into LAX and
22 into our communities. Thank you.

23 (The statement submitted for the
24 record was marked as Statement 20
25 and is attached hereto.)

1 MR. WALL: Thank you, ma'am.

2 Ms. Ellie Holm, followed by Mr. James
3 McCutcheon and Mr. Roy Hefner.

4 Ms. Holm, are you here?

5 Mr. James McCutcheon. Yes, sir. You'll be
6 followed, sir, by Mr. Roy Hefner and Ms. Mina Bharadawa.

7 MR. MCCUTCHEON: My name is Jim McCutcheon. I'm a
8 resident of Westchester. And I am the Chairman of the
9 Republican Central Committee here, a member of the
10 Democrat Central Committee here also is in opposition to
11 this airport, a big opposing organization.

12 So we have both republicans and democrat
13 central committees in opposition to the airport. The
14 reason is that is a big boondoggle. It is not necessary
15 when we could regionalize the airports for the same
16 money and put in mass transit at the same time, or we
17 could get you at the federal level joining the state and
18 local officials to take over El Toro Air Force Base,
19 which has a 10,000-foot runway eight and a half feet
20 deep which would be ground up into concrete, sawdust or
21 whatever you want to call it, dust.

22 If -- it was built over 50 years by us
23 taxpayers to defend America. It's a good airport.
24 However, it was to be abandoned by the Navy and at that
25 time republican for civil service as an airport. And I

1 can't understand why we destroy, grind up the best
2 airport in this area, five times larger than LAX, 38
3 miles before you go into the first house going east.

4 And not like LAX where you have all of the
5 schools and the people living under the airport, the
6 noise and other pollution, because there you've got to
7 go 5,000 feet up into air and go in the wrong direction
8 before you go to the first house.

9 So that would be a perfect airport and within
10 the purview of the Federal Government who owns the
11 airport, which is giving it to Irvine who says they want
12 to turn it into a great park, which will spend billions
13 of dollars cleaning it up because of what's underneath
14 of it, which could be cleaned up over a longer period of
15 time a lot cheaper.

16 And so it's a travesty on the taxpayers and
17 it's a big boondoggle, and it's an insult to the
18 intelligence of Americans to think we have to expand
19 this airport when we can't move traffic up and down the
20 freeway now.

21 I guess last year it was 56 million
22 passengers. We're talking about going to 78. And we're
23 realistically thinking what it is, is it is going to be
24 over 100 million passengers. And you can't move them
25 now, and there is no plan for mass transit. And it

1 could all be done with the 9 million -- probably with 4
2 or 5 of the 9 billion, I mean.

3 And so what we need to do is get on with the
4 plan that's good for the taxpayers as well as everybody
5 else.

6 MR. WALL: Thank you, sir.

7 Mr. Roy Hefner, followed by Ms. Mina Bharadawa
8 and Ms. Elizabeth McKinney.

9 Mr. Hefner.

10 MR. HEFNER: Roy Hefner, H-e-f-n-e-r, 6548 West 80th
11 Place, Westchester, 90045. Gentlemen, we meet again.

12 I would like to correct the gentleman from
13 Princeton. Wearing a red shirt does not affiliate me
14 with any particular organization. The people in yellow
15 probably do not want me to belong to their organization.

16 The other item was the executive secretary who
17 from a labor union lived in Torrance indicated there has
18 been no attempt made by any other city group to try to
19 improve upon the possible EIR of the airport.

20 And we take issue with that because there is a
21 strong group of residents in Westchester and Playa del
22 Rey that composed what we call Alternative E. And it
23 was presented to the blue ribbon committee of the Mayor
24 and request they investigate that, but they chose not to
25 do so for various reasons. So I did want to clarify

1 that.

2 The other thing, the Mayor has come out and
3 has said on more than one occasion that LAX is safe.
4 The board of airport commissioners has come out and said
5 LAX is safe. However, in every single comparison in the
6 EIR that compares the no action, no project with
7 Alternative D, Alternative D is obviously superior.

8 So I assume we must be operating in an unsafe
9 neighborhood and an unsafe airport. The word "enhanced
10 security" that word "enhanced," I don't really know what
11 it means. However, it is something that can be used
12 both pro and con.

13 The A, B, C -- in fact, we have five
14 alternatives. We have the NANP, Alternative A,
15 Alternative B, Alternative C and now Alternative D. We
16 have a tendency on occasion to forget the NANP
17 particular alternative. I think most of the residents,
18 certainly not all, but most of the residents are
19 supporting the concept of Alternative NA and NP.

20 But Mr. Stein at the neighborhood council
21 meeting made a statement that he possibly regrets
22 because he said under that particular proposal we could
23 go ahead and expand the 82 and 83 million annual
24 passengers, which is certainly different from what the
25 EIR indicates and what all the publications are here,

1 Mr. Stein is the President of the Board of Airport
2 Commissioners.

3 One of the difficulties in the -- in the
4 Alternative D proposal is the use of percentages. They
5 indicate -- I'll give one example. They indicate as an
6 example that 53,000 individuals might be impacted by a
7 single event noise, but only 10 percent of them are
8 really impacted enough to wake them up.

9 Well, 10 percent comes out, as you could
10 figure out, to 5,300. I would much prefer and request
11 that the EIR include actual figures instead of
12 percentages.

13 MR. WALL: Thank you, sir, for your comments.

14 Ms. Mina Bharadawa. Ms. Bharadawa.

15 Ms. Elizabeth McKinney, followed by Ms. Linda
16 Peterson.

17 Ms. McKinney, are you here?

18 Ms. Peterson? Yes, come forward, please.

19 Linda Peterson followed by Ms. Sparky Carpio and
20 Ms. Virginia Bharadina.

21 MS. PETERSON: Good afternoon. My name is Linda
22 Peterson. I'm a resident and homeowner in Playa del
23 Rey.

24 Although I commend Mr. Hahn for making
25 improvements over the prior plans, I agree with the

1 prior comments that there has been insufficient
2 consideration of other alternatives for handling safety
3 and security. You should have more thoroughly analyzed
4 other options than just Alternative D, including
5 Alternative E. And you should have been considering
6 data more recent than 1996.

7 I also want to take issue with the person who
8 made the comment that the neighbors of the airport want
9 to see it closed down. The neighbors of the airport are
10 not totally opposed to the airport. We are not just
11 nimbus. I, in fact, like living near the airport in
12 some respects. It's very convenient. I travel a lot on
13 business.

14 But it is also very problematic in other
15 respects, the noise, the pollution, the soot on my
16 house, my car and my patio. No, what the neighbors of
17 the airport are opposed to is the expansion of the
18 airport. And Mayor Hahn has promised us it won't
19 expand, but Alternative D will enable that expansion.
20 And we are opposed to that.

21 To limit the security risks, you really need
22 to disperse air traffic throughout the region instead of
23 giving terrorists a spruced up, more compact, more
24 inviting target. I agree that a terrorist taking LAX
25 out would be devastating to the region, but it would be

1 less devastating if there were other airports that were
2 already equipped to handle that traffic.

3 To respond to those people who say Palmdale is
4 too far away for people to travel to or too far away to
5 develop, I say look at the experience of Dulles Airport.
6 When Dulles was built, there was nothing near there. In
7 fact, I wish I would have bought property in that area
8 at the time. Now, it's the center of a thriving
9 commercial district, and building it brought substantial
10 numbers of jobs to that area. So if the point -- the
11 point I want to make with Palmdale is, if you build it,
12 they will come.

13 I also have very substantial concerns about
14 the 12-year construction project that is envisioned with
15 Alternative D and the impact of that project on the
16 surrounding neighborhoods. And part of my concern comes
17 from the fact that the airport cannot even finish a
18 small landscaping project like the one they started two
19 years ago on Waterview. If they can't do that, how can
20 we expect the airport to do this job properly and on
21 time? Thank you.

22 MR. WALL: Thank you, ma'am. We will take two more
23 speakers and then we'll have another short recess. This
24 will be Ms. Sparky Carpio and Ms. Virginia Bharadina.

25 MS. CARPIO: Sparky Carpio, 407 Exten, Inglewood

1 90302. I'm quoting from the Supplement to the Draft
2 EIR/EIS.

3 "As of October 31st, 2002, progress in
4 acquiring properties under the Voluntary Residential
5 Acquisition/Relocation Program for Manchester Square and
6 Belford indicates that 62 percent of the property owners
7 (351 properties and 1130 dwelling units) have
8 volunteered to participate in Acquisition Program."

9 But what about the other 38 percent? What
10 about the people who have lived there for over 50 years
11 and don't want to move? I guess no one from Los Angeles
12 World Airports or L.A. City really cares, but then, I
13 guess, why should they?"

14 Then as I was randomly leafing through the
15 EIR/EIS, I found an interesting report on the residences
16 which will be most impacted with the plans. Guess which
17 city is impacted most? Inglewood, of course.

18 At more than 120 newly exposed residential and
19 noise sensitive uses outside of the 1992 CNEL noise
20 contour for the Alternative D and over 2,000 listed
21 under Alternative D 2015 DBA SEL noise contours listing
22 of newly exposed residential uses outside of the 1992 65
23 CNEL noise contour, we, Inglewood, are the most impacted
24 area in the community surrounding LAX.

25 But I guess that really doesn't matter. We,

1 Inglewood residents are just low income communities who
2 want to stop this modernization or is it expansion plan?
3 Also in the Supplement to the Draft EIR/EIS was that
4 wonderful interchange on Arbor Vitae Street, which our
5 beloved L.A. City -- I mean our L.A. County supervisor
6 pushed for under the title, "Model Update Information
7 Regional Roadway Improvements."

8 Our county supervisor had once mentioned that
9 Arbor Vitae Interchange has nothing to do with
10 airport-related issues. At least that is what I
11 remember. Even worse, though, LAWA staff person had
12 once said it was for our nonexistent K-Mart. I don't
13 think so. Thank you.

14 (The statement submitted for the
15 record was marked as Statement 21
16 and is attached hereto.)

17 MR. WALL: Thank you. Next will be Mr. Virginia
18 Bharadina.

19 Mr. Richard Silva.

20 Mr. Clarence Daniels. Welcome, Mr. Daniels.
21 After Mr. Daniels, we'll take a short break.

22 MR. DANIELS: Good afternoon. My name is Clarence
23 Daniels, and I'm the President and CEO of Concessions
24 Management Services. We operate food and beverage
25 concessions at LAX and for the airports throughout the

1 country.

2 I also serve as the President of the greater
3 Los Angeles African-American Chamber and as the western
4 regional representative to the Board of Directors for
5 the Airport Minority Advisory Council, which is a trade
6 association for minority and women who do business and
7 who work at airports throughout the United States.

8 And I'm here today to speak in favor of
9 Alternative D. I don't think any of us, if we were
10 planning LAX today, would choose the current location.
11 However, I think all of us would have to admit that the
12 current location is a strategic location for all of us
13 who use the airport.

14 LAX is one of the leading entry points into
15 the United States for Pacific Rim passengers as well as
16 cargo. We operate four concessions at international
17 terminal, and we know that the use of LAX is very
18 important -- the location of LAX is very important to
19 international travelers who are accessing our downtown
20 area and our other corridors of business.

21 So we think it's very important we move
22 forward with Alternative D if LAX is going to remain
23 competitive with the other airports that serve the
24 Pacific Rim nations. I can tell you from personal
25 experience that San Francisco, Seattle would love to

1 have the competitive position that LAX has. And a lot
2 of it has to do with the current location of our
3 airport.

4 I also think that although LAX is safe, I can
5 tell you of someone who has either worked there or has
6 been an employer there since 1986 that there are a
7 number of safety considerations that are addressed in
8 Alternative D that would make all of us more secure as
9 citizens here in LAX.

10 One thing I didn't mention at the beginning is
11 my offices are in Westchester. I've been in Westchester
12 since early 1990. We employ 70 people who live in the
13 Inglewood/Hawthorne area. I don't presume to speak for
14 my employees. I think their union and others have
15 spoken well on their behalf.

16 But I can tell you that all of us are in favor
17 of it. It's not simply jobs. It's that we realize the
18 importance of LAX as an economic generator for this
19 region. Besides the Harbor, there is nothing more
20 important to our economy than LAX.

21 And I think the plan that is currently
22 proposed, and I won't use the word "enhanced" since that
23 word has been negatively spoken to, but it is going to
24 improve, I think, the quality of life for all of us, and
25 it will certainly improve our economy. Thank you very

1 much.

2 MR. WALL: Thank you, sir.

3 Now, we will take a ten-minute recess.

4 (Recess was taken.)

5 MR. WALL: Gordon Michael Mego.

6 MR. MEGO: Good evening. My name is Gordon Michael
7 Mego, 4535 West 141st Street. I've been a resident
8 since October of 1952.

9 I've seen a lot of changes in the South Bay
10 area and in the Los Angeles region. And I -- you know,
11 being an aerospace engineer working at various companies
12 including here at nearby El Segundo, Rockwell
13 International during the 1980s on the B 1 program there
14 and Weapons Systems Division and, of course, also
15 mentioning that my father worked at American Airlines as
16 the senior lead mechanic and thus he was a union member.

17 There are four aspects I really want to kind
18 of touch on in that really the Hahn proposal does not
19 really satisfy those so-called goals that they are
20 trying to achieve. One is the convenience factor for
21 the passengers, airport visitors and so forth.

22 Essentially, the airport plan is not
23 user-friendly. You have the people that go from one
24 point -- you know, transportation center check-in point,
25 going in to from there to a people mover to another

1 intermediary check-in facility and finally into the
2 airport terminal and finally onto the airplane. It just
3 makes, you know, it much more difficult for people to
4 get from point A to point B. And people are already
5 getting turned off as it is. And we need to make it
6 easier, not more difficult.

7 And one other one that I really want to deal
8 with is it talks so much about the level of safety,
9 security, threat of terrorism and that the Hahn plan
10 fails to achieve that. And one thing I just want to
11 show you right here, and I'd like to show the audience.
12 I also have some smaller reproductions here of the
13 impact zones, potential fallout from detonation of
14 explosive device or devices in these areas that you see
15 in red, the current layout and even with the Hahn
16 proposal. If an explosion were to happen in the current
17 location of the airport, the fallout would be eventually
18 in the airport region only.

19 But if you add, under the Hahn proposal, the
20 area where you have a Ground Transportation Center,
21 you're not only going to impact passengers that are
22 checking in to eventually go to the main part of the
23 airport, but you're also going to be impacting the
24 residential neighborhoods of -- areas where people could
25 be killed, businesses that --

1 MR. WALL: Thank you.

2 MR. MEGO: -- where people could be killed and most
3 important is this major artery (pointing).

4 MR. WALL: Thank you. If you would, sir, submit
5 your comments in writing. I would appreciate that. We
6 appreciate your cooperation today. Thank you.

7 MR. MEGO: That's what I need to have you
8 consider --

9 MR. WALL: Mr. Sergio Rascon, please, followed by
10 Mr. David Stephan and Mr. Bill Eisen.

11 MR. RASCON: Thank you, Mr. Chairman. Good
12 afternoon. My name is Sergio Rascon. I'm the business
13 manager of Laborer's Local 300, and I represent 7,000
14 members within the L.A. County and the surroundings.

15 We strongly support the safety and security
16 Alternative D that the Mayor has put out. This is a --
17 this is long time overdue. This is -- we must do this
18 to keep up with the needs in order to better service the
19 passengers and the community, especially when it comes
20 to safety and security.

21 And, of course, perhaps as it has been
22 repeated that, you know, there is many, many jobs, not
23 only permanent -- I mean, not only temporary jobs of
24 which I represent and our other sister trades out there,
25 but permanent jobs.

1 If we want to keep our L.A. economically
2 strong, then we better think about it. With all due
3 respect to the concerns of other people, believe me, we
4 do respect their concerns. But, nevertheless, we must
5 see the future of what is upon us when it comes to L.A.
6 And, yes, we also support later on the one in Palmdale.
7 Thank you very much.

8 MR. WALL: Thank you, sir.

9 Mr. David Stephan, Mr. David Stephan, followed
10 by Mr. Bill Eisen and Mr. -- or Ms. Hamilton.

11 Mr. Stephan.

12 Mr. Bill Eisen. And he'll be followed by --
13 and I'm not sure if it's Ms. or Mrs. Hamilton. Welcome,
14 sir.

15 MR. EISEN: Welcome. Good afternoon. My name is
16 Bill Eisen. I'm a resident of Manhattan Beach. I agree
17 with a recently released county report finding that
18 Mayor Hahn's new Alternative D plan misrepresents a
19 number of gates that would be available for aircraft.

20 And according to the county report, Hahn's
21 plan would redesign the gates to allow more capacity and
22 improve the airfield to accommodate larger aircraft. It
23 doesn't take a rocket scientist to figure out that
24 Hahn's plan is laying the groundwork for a massive
25 expansion of LAX in order to accommodate twice as many

1 passengers as the airport accommodates today.

2 There are, of course, alternatives to the
3 massive expansion of LAX. For example, some of the
4 \$9 billion dollars that Hahn proposes to spend on the
5 expansion could instead be used to purchase all or a
6 portion of the El Toro Marine Air Base in order to
7 accommodate the hundreds and thousands of Orange County
8 residents that are currently using LAX.

9 Common sense tells us that a project should
10 make sense other than to provide construction jobs and a
11 doubtful increase in airport security. And common sense
12 tells us that our community is better served by a
13 regional transportation plan which enables airport
14 service to be distributed among more than one airport;
15 and, therefore, making air travel more convenient to the
16 community.

17 Moreover, expanding LAX beyond its current
18 capacity forces an unmitigated environmental disaster on
19 those of us currently living near the airport. Recent
20 studies recently conducted by the Texas Transportation
21 Institute shows that the portion of the 405 Freeway near
22 the airport is currently the busiest section of freeway
23 in the entire country.

24 Obviously, more passengers accessing LAX will
25 mean even more automobile traffic on the 405 and local

1 streets. And it will mean more air pollution and even
2 more congestion of already congested air space around
3 LAX.

4 Not long ago LAX was certified for only 40
5 million annual passengers. Since that time, the
6 surrounding streets and freeways have become even more
7 congested. There is absolutely no logical reason to
8 expand LAX beyond its current capacity, especially when
9 viable alternatives exist.

10 If Mayor Hahn thinks otherwise, I suggest that
11 he put the issue to a vote of the people. Thank you.

12 MR. WALL: Thank you, sir, for your comments today.

13 Ms. or Mrs. Hamilton, yes, ma'am, followed by
14 Cresia Davis and Cecil Carpio.

15 MS. HAMILTON: You don't have the cards that we
16 filled out?

17 MR. WALL: Yes, ma'am, I do.

18 MS. HAMILTON: Well, I wrote Patricia Hamilton on
19 there.

20 MR. WALL: I'm sorry, ma'am, I can't read your
21 writing. I apologize.

22 MS. HAMILTON: Okay. Greetings, gentlemen. The
23 topic, L.A.'s current plan for expansion.

24 MR. WALL: I'm sorry, could you give us your name
25 and address, please, for the record.

1 MS. HAMILTON: Los Angeles, 90045.

2 MR. WALL: Thank you.

3 MS. HAMILTON: Okay. Technology for the future
4 cannot be predicted at this time. So the cost involved
5 to build the new airport plan cannot be estimated today,
6 which is only a rough estimate.

7 Our life here in the United States changed on
8 9-11. Security and time is of the essence. The RAND
9 Corporation and the airlines have given some helpful
10 information for modernizing the airport.

11 Nine years and millions of dollars have
12 already been spent on non-practical plans without taking
13 into consideration the big picture, a regional solution.
14 To enlarge LAX on the small and confined acreage,
15 including off-site check-in facility in the metropolitan
16 area should not be an option.

17 For serious safety, security, efficiency,
18 convenience, the City of Los Angeles should follow the
19 lead of the major cities in the United States, Europe
20 and Asia by using larger acreages outside of the
21 metropolitan areas.

22 Los Angeles already owns larger acreages in
23 Palmdale and Ontario. These air fields should be
24 developed and enlarged with connecting Metrolink Rail
25 Transportation systems to accommodate the new jumbo jets

1 that will hold 500 passengers that are already in the
2 planning stages.

3 More people's lives could be spared in the
4 event of the type of catastrophe that has already
5 occurred on 9-11 in New York City. Thank you.

6 MR. WALL: Thank you, ma'am.

7 Cresia Davis.

8 MS. DAVIS: Good afternoon.

9 MR. WALL: Yes, ma'am, welcome.

10 MS. DAVIS: My name is Cresia Green Davis. My
11 address is 930 South 3rd Avenue, City of Inglewood. And
12 I am also a member of the Inglewood Unified School
13 District, Board of Directors, even though I'm not here
14 in the official capacity, I'm here as a community
15 resident.

16 But before I start speaking, today I just
17 happened to be breezing the Daily Breeze and it says
18 coming up tomorrow, Sunday, 100 miles north of
19 Los Angeles the airport in Mohave reflects the
20 continuing slump at LAX, and the sad state of the United
21 States airline industry in general. So maybe we should
22 read that tomorrow.

23 I am here because LAX expansion will greatly,
24 greatly impact the city of Inglewood. We have 18,000
25 students who attend our schools in Inglewood. One of

1 our schools sits right here on the slow-05 Freeway.
2 It's called Oak Street. That's one of the proposals
3 that the previous report wanted to take out and put in
4 an on-ramp for people coming down the slow-05 so they
5 could get to the airport.

6 I'm telling you, if I had known that the
7 unions were going to show up in force today -- and I do
8 appreciate unions, my dad is in a union. I have ten
9 brothers, eight of them are union guys. I would have
10 had the students from Inglewood Unified School District
11 come here in T-shirts saying, "Let us get a fair
12 education."

13 They have airplanes that are flying over their
14 heads. We are losing instructional time. For every ten
15 minutes, we are losing four minutes of instructional
16 time for our kids. That's not fair for our kids.

17 What the pros say that the most wanted jobs
18 will be needed in the future? They are airline
19 mechanics, airline pilots. They have to do with the
20 industry. Let us educate our kids. It's not fair that
21 our kids will be impacted and not get the education.
22 They are already talking about our schools -- most of
23 the employees, I dare to say, do not let their kids go
24 to school in Inglewood because they have such a negative
25 connotation to our schools, but our children graduate

1 and matriculate at colleges such as Berkeley, such as
2 Harvard, Yale, all over this United States. Give our
3 kids a chance to have a fair education.

4 I'm going say a nimbi for Inglewood Unified
5 School District. Not in our backyard. We don't want
6 the traffic. We don't want the pollution. We don't
7 want the illnesses that's going to be caused by major
8 traffic. Take it to Palmdale. Take it to Ontario.
9 Take it to El Toro. They will have jobs. They will
10 have to travel to those jobs. Let them go there. Let
11 our kids have a future.

12 Let them build some of these airports. Let
13 them work on the proposed -- on traffic that -- traffic
14 lines that you're going to be building around to make
15 sure the airports are there for the other people in the
16 community.

17 Do not hold the City of Inglewood hostage. Do
18 not hold the kids who cannot vote, who do not have a
19 job. Most of them come from single parent families.
20 Our kids qualify for free lunches because their income
21 in their family is not high. Give them a chance to
22 become something in the society. Do not impact our
23 schools. Thank you.

24 MR. WALL: Thank you, ma'am.

25 Next speaker is Cecil Carpio, followed by

1 Michele Grumet, followed by Robert Reed.

2 MS. CARPIO: Cecil Carpio from Inglewood.

3 "LAX noise variance, Number 1, 11 minutes
4 after midnight; weird landing flight path into the south
5 complex; downwind east leg of route followed by short
6 turnover the new Manchester Square."

7 Did you all know there is a new Manchester
8 Square east of Crenshaw? Pretty interesting how the
9 planes are making that short turn right over that
10 square. "Continued on a sharp downslope to south
11 complex."

12 I'm impacted by the operations of the north
13 complex. I'm on the north side of Florence about two
14 blocks away from La Brea.

15 "12:16:00" -- we're still talking midnight --
16 "Landing jet loud comes in through to the south
17 complex." I can hear operations from the south complex.
18 Okay?

19 Number 3, "Midnight 38:37 another short turn
20 over the new Manchester Square." What are you all
21 doing? "Midnight 39:12, wrap it up baby as the airline
22 pilot comes in to arrive at the north complex gunning
23 it. Must be cargo."

24 Number 5, "Midnight 41:41, another jet
25 landing. Noise not so loud, but that's because it's

1 heading to the south complex." Okay. This is after
2 midnight. When are we supposed to get our sleep? Damn
3 it.

4 Number 6, "Midnight 49:45, another jet jars my
5 peace."

6 Number 7, "So I skipped a while, like an hour
7 because I wanted to have sex and I didn't want coitus
8 interruptus. Okay. But around 2:00 o'clock in the
9 morning, I got back to it. And I hear the jet as it
10 makes a short turn over new Manchester Square to the
11 south complex."

12 So, okay, I'm logging all these things sitting
13 in my driveway. All right. And I'm watching the flight
14 path so that it's not just about me in my house hearing
15 this, but I'm watching it. I'm at an advantage in that
16 respect.

17 MR. WALL: Thank you, ma'am.

18 Michele Grumet. Michele Grumet.

19 Robert Rhee.

20 Nancy-Gene Morrison. Come forward, ma'am,
21 please, followed by Ross Moen and C.L. Parrish.

22 MS. MORRISON: Thank you, gentlemen. I'm Nancy-Gene
23 W. Morrison. I am one person and I am a woman. The
24 last time I spoke to you, I have been receiving mail
25 that's all addressed with part of my name as mister.

1 But I am here to remind everyone that at the
2 millennium, LAX was the number one target for the United
3 States and the world for terrorism. Why? Because all
4 our eggs are in one basket. We seem to have a very
5 short memory about this. We need to do something about
6 a regional approach, and not continue to put even more
7 eggs in one basket.

8 If security and TSA inspection is going to be
9 random at the site at Alternative D for the Ground
10 Transportation Center, if there is random inspection
11 there, then there is really no safety there. And,
12 again, all passengers are going to be in one area,
13 again, even more passengers and they are -- we are,
14 again, going to have all our eggs in one basket.

15 We need to work toward a regional plan, and we
16 need to -- we have the time now since the airline
17 traffic is down, as the article that's coming out in the
18 Daily Breeze tomorrow is going to state, according to
19 the teaser that was quoted earlier.

20 So please think about a regional plan and
21 overall safety and not having all our eggs in one
22 basket. Thank you.

23 MR. WALL: Thank you, ma'am.

24 Mr. Ross Moen. Mr. Moen, are you here?

25 C.L. Parrish. Come forward, please,

1 Ms. Parrish, followed by Mike Stevens and Diane
2 Sambrano.

3 Welcome, ma'am.

4 MS. PARRISH: Thank you. My name is C.L. Parrish.
5 I live at 9606 Hindry Avenue. I'm one of the last
6 survivors of the persons in Manchester Square.

7 I'm a laborer. I've held three union cards in
8 my time, but I have to tell you that my constitutional
9 rights and those of my neighbors in Manchester Square
10 are paramount to anything.

11 The mayor would have you believe that the
12 Manchester Square persons and those of Belford have
13 voluntarily left their homes. The Mayor would have you
14 believe that 9,000 people voluntarily gave up their
15 homes in order to accommodate noise from the jets.

16 Nine thousand people were willing to walk away
17 according to the Mayor. Nine thousand people were lined
18 up and stripped of their constitutional rights. Their
19 constitutional rights is that of the 5th Amendment and
20 the 14th Amendment, those who guarantee that the state
21 would not take private property for public use. The
22 Mayor had lied to you, the FAA, to the citizens of
23 Manchester Square. The community is now vaporized, and
24 to the public.

25 He said that this is a voluntarily

1 acquisition, and under that voluntary acquisition there
2 are no rights. LAX sealed the fate of Manchester Square
3 residents by having their hit man, the Board of Airport
4 Commissioners, headed by President Stein, deny those
5 same targeted 9,000 people in Manchester Square and
6 Belford areas, denied them soundproofing for what was
7 supposed to be a voluntary noise mitigation process,
8 noise mitigation by jet noise, but yet those Belford
9 people in that geographical area, Manchester Square, was
10 denied soundproofing by LAX.

11 How can this happen in the United States of
12 America when we're fighting abroad for the rights of
13 others, when the Mayor can run rough shod over the
14 citizens of Westchester, those existing, formerly
15 existing in Manchester Square. I'm the last survivor
16 and I'm here. I don't have 9,000 people behind me
17 because they are gone.

18 Our rights as citizens are paramount to any
19 Master Plan. If the Mayor can lie and say that 9,000
20 people were willing to go away, because this was not
21 part of the Master Plan. He said Manchester Square was
22 not -- Jack Graham from LAX said it; Manchester Square
23 is not part of the Master Plan. Therefore, the Mayor
24 could not say he needed this land.

25 If you look at the EIR study, Manchester

1 Square is the focal point. It is the most integral part
2 of Alternative D and the Master Plan. That was the lie
3 by the Mayor.

4 LAX knew this. Mr. Ritchie knew this. This
5 is why President Stein would laugh when the residents of
6 Manchester Square appealed to him for their rights,
7 their constitutional rights. He laughed. Now we know
8 why.

9 MR. WALL: Thank you, ma'am, for your comments
10 today.

11 Mr. Mike Stevens. Mr. Stevens, are you here?

12 Ms. Diane Sambrano.

13 MS. SAMBRANO: Good afternoon. My name is Diane
14 Sambrano. Today we heard an assortment of
15 presentations. We had the unions with their great
16 backers say "Yeah, yeah, we love jobs." And yet it
17 struck me as that young lady just sat down. Somehow I
18 don't remember the great American dream is to have a
19 job.

20 The great American dream that we promote
21 everywhere is to have a home and a house you can call
22 your own. So our unions are saying, and one of them so
23 boldly told me, "I don't give a rip about your home. I
24 want a job."

25 So I'd have to ask what profit of man to have

1 a job if he loses his home? Where is he going to go
2 home and lay his head? You heard from Ms. Carpio. She
3 gets the north runway traffic. Her pains are from
4 midnight on. I'm on the south runway. I have the same
5 kinds of logs, except mine are from 3:05, 3:15, 3:18,
6 3:29, 3:45, 4:05, 4:15, 4:19, 4:26, and on and on.

7 We get no sleep. Our quality of life has been
8 reduced to nothing. And you wonder why we're cranky.
9 Try going a couple of years without consistent sleep.
10 It will do it to you.

11 But you know, someone had a great phrase they
12 didn't get to use. So I'll take the liberty. This plan
13 is building the airport of tomorrow based on yesterday's
14 traffic. Isn't that great? How far did you think
15 Disney would go if you said there is a great big
16 beautiful tomorrow. We're just building on the plans of
17 yesterday. Safety, security, jobs, there is no safety.
18 There is no security in this plan. It's a few jobs.

19 At the end of building time, those jobs will
20 vaporize. And in the meantime, just as this young
21 lady's home and all of her neighbors were vaporized, our
22 quality of life will, too.

23 It's really kind of sad we're at a point where
24 everyone is going toward emotionalism. Thank goodness
25 we have young people still coming up like Sparky who

1 will deal with the EIR and what is actually in it,
2 because only then can you see what we've been pointing
3 out.

4 It's the residents of Westchester with their
5 assorted degrees came out here and said, as a civil
6 engineer, as a planning person, as an aerospace techno
7 person, I've looked at the plan and it has serious
8 flaws.

9 I would hope that when we look at the EIR/EIS,
10 we will look at those serious flaws. We want to impose
11 upon the people of this community because we aren't
12 about 5- or 6,000 who work. We are about 120,000 who
13 live or try to, another 100,000 over here who try to
14 live under the control of a noisy and greedy
15 administration.

16 MR. WALL: Thank you, ma'am, for your comments.

17 I have no other speaker cards at this time.
18 Is there anyone in the audience who submitted a speaker
19 card prior to 1:00 o'clock who has not had an
20 opportunity to be heard?

21 Mr. Kessler, I'm turning the meeting over to
22 you.

23 MR. KESSLER: Is there anyone else who has not had
24 an opportunity to speak concerning the information on
25 the Draft EIS/EIR for the Supplement?

1 Not seeing anyone else, I will remind you if
2 you feel you are unable to provide us with verbal
3 comments today, we will be accepting written comments
4 until 5:00 p.m. Pacific Standard Time, Friday, November
5 7th, 2003. You can mail your comments either to me at
6 the FAA or to Jim Ritchie at LAWA. The mailing
7 addresses are listed on the cover of the Supplement to
8 the Draft EIR/EIS.

9 I want to thank everyone for your comments
10 today. This public hearing for the Supplement to the
11 Draft EIR/EIS on the Los Angeles Airport Master Plan is
12 now closed. Thank you.

13 (Whereupon the proceeding adjourned
14 at 2:20 o'clock p.m.)

Mr. Jim Ritchie
City of Los Angeles
Los Angeles World Airports
LAX Master Plan Office
P.O. Box 92216
Los Angeles, CA 90009-2216

Dear Msrs. Kessler and Ritchie:

Under the proposed Alternative D of the Los Angeles International Airport Master Plan, the airport will undergo substantial changes which will impact a variety of sectors, including the communities, the airline industry, and the region. The plan is referred to as the "Safety and Security Plan" which reduces substantially the expansion in capacity and site footprint as proposed in Alternatives A, B and C.

While Alternative D has improved based on requests from the communities and from other constituents, it nonetheless raises some important questions. I have reviewed the Supplemental Draft Environmental Impact Report for the Master Plan and have determined that there are some specific issues that need to be further analyzed and addressed.

Transportation Issues:

Mitigation measures are unfunded, uncertain, & underevaluated: Alternative D

shifts the majority of the traffic impacts from the current central terminal area to the area now known as Manchester Square. While there are some traffic mitigations included in the Supplemental EIS/EIR, one of the main features of this proposal requires building an off-ramp from the I - 405 freeway at Lennox Blvd. directly into the new Ground Transportation Center (GTC). The vast majority of these mitigations are directly tied to the availability of airport-related funds and to the availability of funding from other agencies, like the Metro Transit Authority and the State of California. There is also a reliance upon "future" expansion of various programs outside of the airport's jurisdiction like the MTA's Rapid Bus service. There seems to be no analysis of the traffic impacts of Alternative D should these mitigations not materialize nor are there any alternatives presented.

Furthermore, there has been no analysis done of the impacts of the new freeway offramp from the I-405 freeway at Lennox Blvd. on the I-405 freeway, both North and South Bound. Currently, access to the airport via the I-405 is accessible via at least 3 freeway exits, both North and South bound. Alternative D concentrates the freeway access to one point from the I-405 freeway into the GTC. The draft document comparison states that under Alternative D, freeway speeds would be "faster than the No Action/No Project" alternative based on what appears to be an analysis of current traffic patterns. However, given that the proposal in Alternative D creates an entirely different traffic pattern, it is hard to imagine how the comparison is a valid one. Furthermore, there seems to be little hard evidence provided to back up the claims of faster freeway speeds and reduced traffic.

Cargo impacts could be further mitigated: DOT and LAWA have previously analyzed the extension of Avian Blvd. directly into the airport to provide a dedicated cargo road. This option has been fully designed and is likely ready to be implemented. This option would have a positive effect on current airport operations and traffic patterns.

Public transportation connectivity: The plan calls for the Green Line light rail to be connected to the Intermodal Transportation Center (ITC) located at the former Continental City site by way of a moving sidewalk or other device. Furthermore there is an existing EIR for expansion of the Green Line northward past LAX and into Westchester. Green Line project remains in the jurisdiction of the Los Angeles Metropolitan Transportation Authority (MTA), and the MTA owns the existing heavy rail right-of-way that proceeds northward along Aviation Blvd. into Westchester. Nonetheless, the plan should more explicitly call for the preservation and enhancement of the existing right-of-way for a future expansion of the Green Line. This is most sensitive in the area along Aviation adjacent to Runway 25/7, where it is subject to competing interests: light rail, heavy rail, automated people mover, street widening and FAA flight signaling infrastructure.

Security Issues:

Alternative D is billed as the "Safety and Security" plan for LAX. The premise upon which the security proposals have been designed is to protect the "primary function" of the airport, which, presumably, is the take-off and landing of aircraft. Therefore, the separation of passengers and vehicles from the Central Terminal Area was a primary design component of Alt D to prevent against bomb or other dangerous activity which would stop air traffic at LAX. While the specifics of the technologies required to implement the security provisions have not been detailed in the Supplement, additional information presented in the accompanying SAIC report relies upon a series of assumptions which lead to the ultimate conclusion that Alternative D is safer than the no project alternative and safer than all of the other alternatives previously presented.

As in other areas of the Supplemental EIS/EIR, Alternative D leads to more questions than answers, particularly in the realm of security. First, the premise of protecting the "primary function" of the airport is one that deserves greater consideration. Alternative D, while claiming to diffuse passengers through separate entry points at the Ground Transportation Center (GTC), the Consolidated Rental Car Facility (RAC) and the CTA, actually makes those locations easier targets for terrorists or others wishing to maximize the loss of life in any one incident. This leads to the question of whether enough will be done to protect airport patrons versus airport operations? In addition, one well-placed explosive device on the automated people mover could just as easily debilitate airport operations and create additional risk to area hotels and businesses located on Century Blvd. just below the people mover. There are any number of scenarios that could be imagined that seem to be ignored by the security proposals contained within the current document.

Further, it is worth noting that the current environmental documents do not fully elaborate upon the technology and construction specifics of the proposed security enhancements. LAWA's own security consultants have acknowledged that their analysis is based on technology that does not yet exist. The electronic scanning of automobiles and trucks upon entrance to parking facilities, face recognition technology, and fast baggage screening at the point of entry at the CTA are components of the security plan that are required to make Alternative D work. If any one of these component parts is not yet developed, is too costly once developed to implement or is not commercially available at the time of construction then the plan does not work and security risks are imminently greater.

SAIC consultants have also stated that while costs for implementation of the security plan are unknown at this time, ultimately the airport would achieve savings through the reduction in security personnel required since technology would replace them. However, the Supplemental EIS/EIR states clearly that there would be "no cost savings for law enforcement personnel" in fact, estimates that security personnel would increase by 162 for airport police and that 12 additional LAPD officers will be required. Is the baseline for this analysis security staffing at LAX pre- or post-9/11? Given that

the technologies do not yet exist, how do we even know what will be required to staff and maintain them?

Furthermore, LAWA's original intent was to create a security review after the approval of the EIR. However, the publication of the RAND study was an incentive to accelerate that review and incorporate the SAIC study into the plan release. If the security review was to come after the EIR approval by City Council, that suggests that any terminal structure can be made to be reasonably secure regardless of what was on the land use document. Otherwise, the security review by SAIC would have been incorporated at a very early date. Finally, should this be the case, it begs the fundamental question of why the plan calls for such aggressive construction and development of areas like the GTC to be located at Manchester Square, a mile away from the existing terminals.

There is also no discussion of how phasing of construction will affect the overall security elements. Since the CTA, people mover, and baggage transport facility are among the last components of the plan, how will the airport be protected, assuming the premise adopted by Alternative D, in the interim?

These discrepancies and the lack of detail for the actual implementation of the necessary security technologies are of grave concern. Other risk scenarios must be evaluated in this process.

Concerns over Growth Potential:

The Supplemental EIS/EIR acknowledges that under Alternative D, every single terminal function area will be substantially increased - in many cases doubled. This leaves the only restriction on growth the number of aircraft that can be accommodated by the physical gate structures. Regardless of the number of gates that will be constructed, there still exists the ability to expand gate capacity with portable gates, as are in use today in the western portion of the facility.

Given that ability, what will true capacity be at LAX following the implementation of Alternative D? Furthermore, what, if any, environmental or other review is required to move a portable gate onto the western tarmac? Finally, what constraints, if any, which exist for future elected officials in Los Angeles who may see fit to enact a true capacity expansion at LAX to 98 MAP or higher, even at the expense of a truly regional air transportation system?

Manchester Square:

Because of the uniqueness and prominence of the proposed GTC at Manchester Square, its discussion deserves special attention. Ground traffic impacts remain a question for the GTC. The community has been assured to a certain point at forums such as the LAX Working Group that traffic impacts would be minimized through the Westchester community because access points to the GTC are limited to the 405/105

freeways, Lennox Blvd. and other points south.

If, however, access to the GTC is largely expected from the 405/105 freeways, then those freeways which already experience overcapacity from non-airport uses will incur additional traffic impact. This suggests that some airport-bound vehicles will approach from north via other routes, like Sepulveda, Lincoln, Centinela, La Tijera, and La Cienega, much as they do today, even though the explicit design of the GTC is to make this access inconvenient for travelers.

The site footprint of the GTC as outlined in the land use plan raises further questions. If passengers are just moving through the GTC with no concessions or amenities, does it need to be of the large size as suggested on the plan's maps? What uses are called for in a facility the size of the GTC other than security devices? Alternative D is unclear on this. And if efficient passenger throughput can be achieved in a smaller facility, can it occupy either a smaller footprint in Manchester Square, or can it be located elsewhere? All of these issues raise the question of whether the GTC as located at Manchester Square will provide truly adequate security mitigation consistent with the costs associated with this aspect of the project.

OTHER ISSUES:

The draft documentation provided on Alternative D raises some significant additional concerns. One issue that appears to be under-addressed are the potential environmental impacts of the construction of the underground baggage transport facility. Some areas of the plan refer to the baggage facility as a part of the current proposal while others identify it as a potential future development. It seems that regardless of whether it is in or out of the current proposal, it should be evaluated as a part of the Master Plan. Placing a baggage transport system underground will have significant impacts - both during and after construction. How far below grade would this system need to be? What are existing physical limitations - both man made and natural that would affect the feasibility of this system? If the system is never implemented, how and where do the TSA requirements of 100% baggage screening get addressed? Currently there is little to no discussion of the myriad of issues including construction impacts, geological impacts, impacts of the water table, impacts on public utilities, relocation of public and other utility lines, and excavation requirements just to name a few.

Environmental Justice:

The Supplemental EIS/EIR, while identifying that the majority of affected communities are minority, clearly states that there are no Master Plan commitments related to environmental justice. It merely states that there will be continued input through the ongoing Environmental Justice Program. This is not sufficient given the serious impacts this project will have on the surrounding communities.

Cost:

The \$9 billion cost of Alternative D is no doubt a substantial fiscal impact on several sectors. While it is difficult to compare the LAX Master Plan with those of other U.S. airport remodeling plans and their local realities, the cost differences with those projects are nonetheless striking:

Atlanta:	\$5.4 billion
New York JFK:	\$1.2 billion
Chicago O'Hare:	\$6 billion
San Francisco:	\$2.4 billion

If the LAX Master Plan calls for limited or no capacity expansion plus safety and security improvements, then a cost of \$9 billion is inconsistent with the basic goals of the "Safety and Security Plan". Surely these laudable goals could be accomplished at a lower cost. Could not basic security and safety measures be implemented at LAX for \$2 billion, while reducing gates to limit capacity, increasing airfield safety, improving connectivity to public transportation and making LAX the crown jewel of a truly regional air transportation system?

The airline industry will be a substantial source of funding for this project. Assessments to the airlines will come in the form of passenger facility charges (PFCs) and sources. Currently, airlines at LAX enjoy low cost-per-enplanement (the cost of putting one passenger onto an airplane) as compared to other airports, due in part to the fact that LAWA has less debt service that it is currently passing on to the carriers. Cost-per-enplanement will nonetheless quadruple or quintuple at LAX as these assessments are incurred.

After the events of September 11, 2001 and due in part to the general economic downturn and subsequent reduction in business and pleasure travel, the airline industry is facing devastating economic impacts. As an industry that inherently has very high operating costs and capital investment requirements, the airlines are highly sensitive to fluctuations in their revenues.

Some airlines are currently in bankruptcy proceedings while others hover perilously close. Furthermore, some of the airlines currently operating at LAX, who represent a significant portion of the U.S. domestic and international travel markets, have expressed concern that they cannot incur these costs over the project's horizon and continue to provide service at LAX as their customers demand. While there has been some communication between the airlines and the planners, the airlines still feel that their concerns over project cost are unheard.

Other Alternatives Should be Examined:

Of all the project iterations to date, one concept that has never been given enough

thought is improving and enhancing the airport within the current physical layout. Creating transportation improvements like adding ATCS systems to more intersections, improving connectivity with public transportation, making security upgrades that will need to be done in the interim anyway, making runway modifications such as the South runway proposal, and terminal changes within the current physical layout can all be accomplished quickly and will have a real impact. These changes, combined with a consolidated transportation access location and a rental car facility could ultimately lead to a safer, more efficient airport that works better in the context of the surrounding community, truly caps growth, and costs significantly less than the soaring costs for Alternative D.

The RAND analysis of security identifies significant infrastructure improvements that can be done now, with existing technology, that will have a direct impact on the safety of airport patrons and airport operations. There are other proposals, such as the previously mentioned extension of Avion Blvd. as a dedicated cargo road and consolidated rental car facility that will significantly improve transportation access to LAX. The rental car facility alone will decrease over 1 million shuttle trips currently occurring because there are multiple rental car locations in and around the airport today.

By ignoring other options and issuing comparisons based on a "do nothing" alternative, we do a disservice to everyone. There is no question that "doing nothing" is not an option. This Master Plan should be one that achieves something real, at a reasonable price and not one that seems to raise more questions than it answers.

I urge your further consideration of these issues as you work to complete a true Master Plan for the future of LAX.

Sincerely,

Cindy Miscikowski
Councilmember, 11th District

**LAWA MASTER PLAN EIS/EIR
PUBLIC MEETING – FURAMA HOTEL - 23 AUGUST 2003
COMMENTS BY YVONNE BRATHWAITE BURKE CHAIR, LOS ANGELES
COUNTY BOARD OF SUPERVISORS**

Good morning! On behalf of the Los Angeles County Board of Supervisors, thank you for the opportunity to offer preliminary comments on the SUPPLEMENT TO THE DRAFT EIS/EIR for LAWA's Proposed LAX Master Plan. In reviewing the extensive materials presented in the original EIS/EIR of 2001 and the supplement of 2003, we recognize the enormity and importance of the challenge faced by LAWA, we acknowledge the extensive effort that has been made, and we thank LAWA for responding to public demand in extending the review period into November. HOWEVER, THESE CONSIDERATIONS DO NOT DIMINISH THE VERY REAL CONCERNS OF THE LOS ANGELES COUNTY BOARD OF SUPERVISORS CONCERNING THE PROPOSED MASTER PLAN and the INADEQUACIES OF THE SUPPLEMENT TO THE DRAFT EIS/EIR. I would like to touch briefly on a couple of the key issues at this time.

TRAFFIC, NOISE AND AIR QUALITY IMPACTS HAVE BEEN SHIFTED EASTWARD

The revised Master Plan as presented in new Alternative D reshuffles airport improvements away from neighboring areas north and south of LAX, and toward communities to the east. As a result, the unincorporated community of Lennox and the City of Inglewood now appear to bear the brunt of added traffic. The community adjacent to Manchester will now face a host of impacts related to the new passenger processing facility. Compared with the previously considered Alternative C, this proposal places even a heavier impact burden on communities to the north and east. I have serious concerns about the disproportionate impact of Alternative D on these communities, all of which are in my district. The City of Inglewood and the unincorporated community of Lennox will continue to be the most impacted by the operation of LAX.

Although Alternative D is presented as the alternative that will “constrain” passenger growth to 78.9 million annual passengers based upon the number of available gates, even the eye of a lay person can see that Alternative D provides LAWA with a footprint larger than the prior alternatives. This footprint, along with the new air terminal layout, provides the opportunity of future expansion of LAX with resulting increases in already intolerable air quality, noise, traffic and safety impacts on the communities of Inglewood and Lennox.

The residents of these communities already suffer inordinately from the current operation of LAX. *I personally believe it's high time we address whether LAX, an airport surrounded on three sides by urban development, shouldn't be scaled back rather than improved, enhanced and enlarged, unless the present impact from noise is mitigated.* The Los Angeles County Board of Supervisors has been on record for some time in support of a strong regional airport system which focuses on outlying airports such as Ontario or Palmdale, airports which are not surrounded by development . We expressed this position in our comments on the Draft EIS/EIR in 2001. Although Mayor Hahn has voiced his support for a regional airport system, Alternative D continues to reinforce **LAX as the preeminent airport for the Southern California region. Consequently, the concept of strengthening the role of outlying airports in order to avoid adversely impacting the lives of tens of thousands, if not millions, of people, is seriously undermined.**

ENVIRONMENTAL JUSTICE MAY NOT BE WELL SERVED BY THE EIS/EIR EVALUATION

The requirement to consider Environmental Justice has been in place for almost 10 years now, originally signed into law by President Clinton in 1994. And yet, the original Draft EIS/EIR prepared by LAWA in 2001 -- 7 years after Executive Order 12898 -- lacked even the most elementary analyses of this topic. Our preliminary review indicates that LAWA has not yet achieved a fair and complete assessment of the critically important issue of Environmental Justice.

In my earlier remarks concerning noise, air quality and traffic, I noted that Alternative D appears to shift the burden of airport improvements away from the wealthier communities on the north and south, and toward the more economically disadvantaged communities east and northeast of LAX. I believe that this Supplement to the Draft EIS/EIR will not be adequate until it provides an honest assessment of the trade-offs between environmental protection and environmental justice. In designing runway extensions and facilities to the east, this plan appears to protect biological resources -- particularly the El Segundo Blue Butterfly -- at the expense of residents -- children and families -- in the communities of Lennox, Inglewood and Manchester. Can such a trade-off be justified? I see no assessment that provides the evidence. This EIS/EIR is the right time to take a hard look at the human costs that will be incurred in order to protect a limited habitat area on the coast. We ask that the analysis be performed *now*, as part of the Environmental Justice assessment, before the opportunity is lost.

Thank you for your consideration of these comments.

TESTIMONY

Good morning, I'm Don Knabe, Los Angeles County
Supervisor for the Fourth District which represents LAX.

Thank you for the opportunity to speak this morning about
the future of Los Angeles International Airport and our
regional air transportation needs.

I appreciate Supervisor Burke's comments and support her
concerns about environmental justice issues, etc.

I'd like to begin by saying I agree with Mayor Hahn that
something must be done to make LAX more secure and
more efficient in handling passengers while balancing the

concerns of the local community and the need to create additional jobs.

Alternative D indicates that it is designed to accommodate a passenger activity level of 78.9 million annual passengers by reducing the number of existing gates and by foregoing the creation of the new terminal facilities and runway extensions that had previously been considered.

I support the mayor's stated goal of providing for more manageable limits on the passenger volumes at LAX given the well-documented impacts that the airport has had on the surrounding communities and the surrounding infrastructure.

The County of Los Angeles is in the process of reviewing the LAX Master Plan materials to get a better understanding of

just how the mayor intends to assure the region that the 78.9 MAP capacity will not be exceeded once Alternative D is implemented.

In May of this year our County Counsel provided us with their opinion that the City and Los Angeles World Airports could legally place deed restrictions on the LAX property restricting the future development of the airport in order to benefit nearby properties owned by other nearby public entities or private parties.

I believe limiting development is a way to keep a passenger cap in place. I have submitted a motion for consideration by the Board of Supervisors to call on the City of Los Angeles to deed restrict the land until 2020 to ensure that LAX does not exceed 78 MAP

I encourage Mayor Hahn and LAWA to follow through on efforts to limit LAX growth to a manageable level to the greatest extent possible through a commitment to place deed restrictions on certain portions of the LAX property until 2020 to prevent those portions from being used to expand facilities to serve passenger volumes beyond the intended 78.9 MAP level.

Specifically, it would be appropriate for LAWA and the City to commit that the portion of LAX generally located on the west side of the airport easterly of Pershing Drive between the north and south pairs of runways and westerly of the proposed Redeveloped Central Terminal Area (Area 1); and the portion generally located on the northeast corner quadrant of the LAX property and currently used for parking

lot and rental car purposes depicted as the site of the proposed Consolidated Rental Car Facility (Area 2) would be deed restricted through 2020.

The deed restrictions should provide that those two areas will not be developed with airport passenger terminal, airport runways, or other improvements intended to increase airport passenger capacities beyond Mayor Hahn's stated 78.9 MAP activity target levels.

Such a firm commitment may be crucial in obtaining the support of Mayor Hahn's Alternative D from at least some of the significant interested agencies and groups who will so directly be affected by the development at LAX.

While I've have spoken this morning about limiting growth, I do want to say that the security aspect of this plan is a major concern of mine. While the County is reviewing the security aspects of this plan and will comment on it in a written report as part of your official record, I still have strong security concerns with the Manchester Square passenger check in facility. I want to make sure that we ^{give} ~~consider~~ the same safety concerns to the passengers as we do the infrastructure of the airport.

Again, thank you for the opportunity to speak with you today and I hope that we can move forward in a productive way at achieving our common goals for the redevelopment of LAX; Limiting growth and protecting people through viable safety enhancements.

- * Good morning. I am Councilman Kelly McDowell, representing the City of El Segundo.
- * Given the length and complexity of the Master Plan and its environmental documents, our full comments on technical issues will not be ready for some time. Therefore my City's comments today are preliminary.
- * El Segundo continues to oppose Alternatives A, B, and C for the many reasons we expressed orally and in writing during the public review and comment period for the initial Draft EIS/EIR in 2002.
- * El Segundo has not endorsed Alternative D--but we feel its stated objectives are consistent with a regional aviation approach.
- * Specifically, the City of El Segundo supports a regional approach alternative that makes proper use of Inland Empire airports.
- * We support an alternative with fewer environmental impacts. And we would like to see the adverse impacts of the airport minimized and mitigated to the greatest extent feasible.
- * El Segundo supports enhanced safety and security at LAX.
- * And my City supports an alternative that by design will accommodate passenger and cargo levels no greater than the physical capacity of the airport as it exists today.

* Limiting LAX to its current capacity has always been our number one goal--and we believe that limiting LAX's capacity will:

** allow other airports in the region to develop and handle a fair share of future regional aviation demand;

** result in fewer environmental impacts; and

** improve safety and security at the airport.

* But my City is greatly concerned about the impacts of proposed southside airfield changes that would move the southernmost runway 50 feet closer to El Segundo.

* LAWA has stated that it believes these changes are necessary to improve runway safety.

* However, we are currently studying the impacts of the proposed reconfiguration, and the options for the southern runway complex.

* In particular, we urge full public consideration of end-around taxiways as an alternative that could provide greater safety at lower cost and with fewer added burdens on nearby communities.

- * Safety at LAX must be a priority for all of us.
- * El Segundo is prepared to support measures necessary to enhance safety--even if those measures increase our burden--but only if we are assured, by an independent expert, that other alternatives would not be equally effective.
- * In conclusion, we are grateful for Mayor Hahn's responsive leadership and his continuing pledge to constrain growth at LAX and foster a regional approach to meet future aviation demand.
- * It is our hope that the ultimate outcome of this Master Plan process will be a truly regional airport approach that ensures that LAX does not exceed its current capacity.
- * Thank you.

23 AUGUST 2003 LAWA MEETING
Furama Hotel, 8601 Lincoln Boulevard; 310.670.811; 9:00-1:00
TOPICS : Supplement, Baseline, Cumulative

- S. Bauer, here in assn. w/ AC Lazz, to Speak on Behalf of Co of L.A.

- In allotted 3 minutes, I will touch briefly on just a few key points:
 - - Use of Supplement to the Draft EIS/EIR
 - Baseline Data Assessment
 - Security Analysis for Alternative D

USE OF A SUPPLEMENT TO THE DRAFT EIS/EIR

CEQA Gdlns state that a *SUPPLMNT to an EIR may be prepared IF CHANGES IN A PROJ ARE NOT SIG.* **Where MAJOR REVISIONS** have occurred ... *the proper type of document is a SUBSEQNT EIR that presents ALL info ... instead of only the CHANGD info.* **BOTH types of review are intended for use in conjctn w/ prevsly certified docs.**

In present case, THERE IS NO PREVIOUSLY CERTIFIED or approved document. And FURTHERMORE, *the changes to this project are MAJOR - an entirely NEW ALT* has been introduced as the preferred project!

Thus EVEN AN ADAPTATION of CEQA -- to encompass a document that HASN'T BEEN CERTIFIED - would indicate the project should have been addressed through preparation of a comprehensive revised Draft EIS/EIR.

- **In this context, WHY DID LAWA NOT PREPARE A COMPHENSV REV. DR EIS/EIR THAT PRESENTED a FULL SET OF INFO for REVIEW w/ THE NEW ALT D?** } out

We have a 2ND SERIOUS CONCERN w/ this process: **In 2001**, Co. of L.A. devoted considerable **time, FUNDS & effort** to review & submit comments on *extnsive documntn* released by LAWA at that time. **I am CERTAIN a similar effort was spent by MANY OTHERS HERE TODAY.**

There is **NO QUESTION** that a *resp to the earlier comments* would have served to ADVANCE PUBLIC DISCOURSE, strengthen the opportunity for **ENV. PROTECTN**, and facilitate ^{an} UNDERSTANDING OF THE LEAD AGENCY'S THINKING on a wide range of KEY ISSUES...

current review + present insight into

→ **WHY, THEN**, did LAWA not take this opportunity to present ... or *EVEN SUMMARIZE* ... **ISSUES-RAISED** during the 2001 EIS/EIR review? *COMMENT OFFERED*

ADVANCE PUB DISCOURSE

FACILITATE CURRENT REVIEW

STRENGTHEN ENV. PROT.

PROVIDE INSIGHT INTO LD. AG. THINKING

INCONSISTENT AND OUTDATED BASELINE DATA

The 2003 Supplmt makes *cont'd widespread use of 1996 baseline data -- that was outdated even in 2001.* Instead of actually UPDATING the baseline, individual Sectns offer **BRIEF** discns comparing '96 data w/ data from 2000 (also 3 yrs out of date). Several ~~assmts actually conclude that the 96 base data is more useful~~ because the 'lower volumes would result in a larger change' (p.4-221) comp w/ current LAWA proposals.

What we DO NOT SEE is an **ANAL** of the **SIG.** baseline **SHIFT** that occurred following 9/11, and how that **SHIFT CHANGED** the **BENCHMARK** for understndg proj imps.

GIVEN that condns at LAX have **changed dramatically** since 2000 (much less '96) ... and ... GIVEN that LAWA developed an ENTIRELY NEW ALT D in resp. to the **MAGNITUDE** of those very changes, and designated ALT D as their **PREFERRED ALT** ...

→ ~~Given these things,~~ **WHY did LAWA NOT CONSIDER IT WORTHWHILE TO PROVIDE THE PUBLIC - & its own DECISION MAKERS - w/ a BASELINE REFLECTNG CONDNS AT LAX AS OF 2003?** *THAT ALSO*

SECURITY

The Suppl EIS/EIR presents Alt D as the "**Enhanced Safety & Security Plan.**" However, our review of Appdx I (*Comp of NA/NP Plan w/ Alt D*), indicates that LAWA has relied on a theoretical assmt that falls **SGNFECNTLY SHORT** on detail.

~~Our review of this KEY TOPIC is still in the early stages — we expect to significantly expand our comments on security when the anal is complete.~~
~~—~~ **However,** considerable adv media attn has already focused on LAWA's proposed use of *UNPROVEN SECURITY TECHNOLOGIES*. **I'd like to offer JUST 1 EXAMPLE to illustrate the potential impact of this approach.**

Why this is > valid concern

Apdx I mentions possible use of 'face-in-the-crowd' technology. On Aug 20 '03 -- just this past week -- the **Tampa, FLA Police Dept.** announced it has **DISCONTINUED** use of facial-recognitn surveillance after 2 yrs. This software product **failed to make a SINGLE positive identifiactn** from a database of more than 24,000 'mugshots'.

ALSO

~~Though Alt D is presntd as 'Safety & Security Alt', our anal indicates~~ this plan FOCUSES on 'hardening' security for ^{gateway ELEMENTS} ~~frontal aspects~~ of LAX while **largly IGNORING** perimeter, cargo areas, maintnce & fuel farm fac.. We've found **NO DISCN in Apdx I that specifically addresses backside security.**

We undrstd that MANY SECURITY FEATURES are TOO *sensitive* for public disclosure. However, the ~~apparent absence of detail,~~ **lack of sound analysis & ABSENCE OF CLARITY** – these flaws suggest that Alt. D is fundamentally flawed -- and in the very area of security that it was created to address.

Thank you for opportunity to share these comments on BEHALF of Co of LA

GOOD MORNING NADIA AND GENTLE

for every one

10/20
A
APRIL 20
LENNOX
ON
90304

My name is Jose Luis Acosta. I have lived in Lennox for 23 years, in the flight path of LAX. Together my wife and I have raised 2 children in Lennox. My sons are 13 and 17 years old I've worked in tourism for 17 years as a Bartender in the Manhattan Beach Marriott.

~~TOURISM~~ ~~TOURISM~~

Speaker 31

It is not easy to live in Lennox and raise children here. Our community is poor. We have traffic. Our schools are crowded and noisy from the planes flying overhead. But one thing that makes it worthwhile for me to raise my family here is that I have a good, stable job in the tourism industry.

(TOURISM)

Modernization will effect us in Lennox. It can hurt us, or it can help us. Modernization could cause more traffic, more noise, more pollution, without giving anything in return. Or, the city can do everything possible to make sure that modernization benefits our community and provides good jobs with living wages and health care. If modernization can benefits our community, then we are willing to support it.

My name is Emma Worthington and I live in Inglewood. I also work at the airport and have worked there for almost 30 years. Like myself many people who work at the airport live in the surrounding communities. We live in Inglewood, Lennox, Hawthorne, El Segundo and Westchester. We understand the connection between good quality jobs and a quality life. We need ^{more} new jobs but we don't minimum wage jobs. What we need is jobs that provide a livable wage and affordable family health coverage. The companies at the airport provide those types of jobs and that is how I have been able to raise ^{as a single mom} my family and not be on welfare. ^{We Need} In order to insure that this modernization plan provides good employment opportunities for our communities, we encourage the mayor to include in his plan a local hiring program so that others in my communities can also raise their families and our youths can strive to emulate their parents. When we talk about modernization we say we are bringing the airport and Los Angeles into the 21st Century. Well we the workers would like to be able to bring our communities into the 21st Century along with the airport and the rest of Los Angeles. That is why we urge the mayor to ensure that his plan provides good paying jobs with good benefits and a community packet that will ensure we are along for the ride. **NOT LEFT BEHIND.**

Good Morning (Or Afternoon)

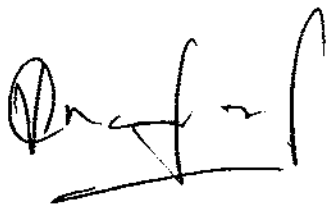

My name is Victor Crawford, **and I live at**
416 E. Regent St, **in the City of**
Inglewood Ca. 90301

I wanted to give my support to the proposal for Alternative D of the Airport Master Plan.

With Alternative D providing facilities for 78 million annual passengers and 3.1 million tons of cargo a year it supports the idea of Regional Airports. In past plans LAX was expected to have to handle as many as 98 million passengers a year and this was totally unexceptable to residents of the surrounding cities. Mayor Hahn has lived up to the commitment that he made before he was elected, that the modernization plan would limit airport usage.

Alternative D, according to the Environmental Impact Report, will provide the best design, including safety and security concerns, with the lest impact on area residents and I support that ideal.

Thank you for listening to my statement.

Hello. My name is Kevin Norton. I live at _____, in the City of _____.

I came today to let you know that I support the modernization of LAX. Mayor Hahn's design with Alternative D will fulfill the concerns that many area residents have had, especially in regard to the number of passengers that will be able to use the airport.

Mayor Hahn signed a letter that he would not support any airport design that allowed more than 78 million passengers a year to fly into or out of LAX. Alternative D, by design caps the number of passengers and cargo as well. This will push other airport sites to build airport facilities and redirect flights there.

A regional approach to air travel and cargo handling will be required when Alternative D is constructed and other area residents will realize that they should provide airport sites. This is a great plan and it should move forward as soon as possible.

Thank you.

My name is Maria Verduzco-Smith, my address is 10927 Grevillea Ave. Lennox, CA. 90304. I Serve as President of the Lennox Coordinating Council.

The Community of Lennox is severely impacted by airport operations but we feel we are mainly neglected. We have schools that jets fly directly over on their approach to the airport and most homes have not been sound proofed to protect against jet noise, as part of the sound mitigation program. Many of our residents can feel the oil and see the soot from the jets. Our children lose hours of education time yearly due to interruptions caused, each time a plane is landing.

There are many things to be taken into consideration when a community is located as close to an airport as Lennox: There is the health of the children, the quality of life for the residents and the impact of noise and traffic the airport causes. If the airport is going to modernize, then it is time for our community to modernize also. This plan must have some real community benefits in it so that future health problems can be alleviated, our schools can be safer, our community can be protected and measures are putⁱⁿ place to ensure that the people of Lennox are treated fairly.

Community benefits means that our community is not forgotten in the modernization process. It means that with \$9 billion being spent for airport modernization, there is money actually being spent in our community to make those infra-structural changes needed to accommodate the expected increase of noise and traffic. While there is a push for modernization, we also want to push for increased and visible benefits in our community of Lennox.

Thank you.

Good Morning (Or Afternoon)

My name is Robert Watson, and I live at _____, in the City of _____

Thank you for the opportunity to speak about the proposed LAX Modernization Plan.

Mayor Hahn has provided an excellent proposal for LAX and with his commitment to cap the airport passengers at 78 million a year, I think that he has satisfied many of the concerns of the residents who live and work near the airport. The idea that other areas, like Palmdale and Orange County will need to take some of the future airline passenger burden is a good one. Mayor Hahn's support for a Regional Approach should be commended as well.

We absolutely need to modernize LAX, not only for the economic and safety concerns that we have, but also so that the area residents will find solutions to their quality of live issues. I think that Alternative D provides many of these solutions, especially with the expanded use of the Green Line Light Rail system that will have a stop a the airport.

Thank you for holding these hearings.

In prior hearings such as this and numerous news paper articles regarding Alternative D, many factors as passenger caps, traffic, noise, jobs and security have been raised. Yet the major impetus behind alternative D continues to be security ^{regardless of the security initiated no security at all} so I'd like to address that ^{subject} particular issue. And frankly, it's not easy to assess the value of Alternative D in that light by reviewing the EIR document.

I offer these direct quotes from various sections of that document.

1. From the comparative analysis section of D vs No Action Page 34

“Vehicular traffic in the Central Terminal area results in crowded terminal areas that create attractive targets for terrorists & allows baggage containing potentially significant explosive devices into passenger congregation areas.” AND

“People approach all facilities with unsecured baggage until they reach the TSA checks.”

2. *“Security screening stations at the Ground Transportation Center and the Intermodal Transportation Center will protect the Central Terminal area from attack by persons armed with weapons.”*

By moving arrival & departure passengers rapidly through the entry point, only a small number of people would be clustered as a potential terrorist target.

3. From the Development & Refinement Sectionparagraph 2.2.8

“First level screening at the Ground Transportation Center will be random baggage and passenger checking and use of video surveillance and sniffing dogs.”

4. Same Sect 2.2.8

“The architectural design intent for the GTC is to create a partially climate controlled open-air structures to help diffuse potential blast impacts at the curb front by eliminating glass curtain walls.”

5. Again, from the comparative analysis section:

“The people mover presents a problem as it is unsecured and subject to attack – but, this can be partially mitigated by use of technology”

6. Again from Development & Refinement Section Paragraph 2.2.81

“Passengers not using skycap services may carry baggage on the Automated People Mover to the Central Terminal area where screening will be made by the appropriate airline.”

So =

- 1). If unsecured baggage in the Central Terminal is a current problem it doesn't appear this multi-BILLION dollar Alternative D solves that.
- 2). All passengers spread out through 8 terminals currently & you've seen lines all out down the sidewalk – Here all passengers must do through this one entry point but they will move rapidly so as not to present but a small number as a potential terrorist target?
- 3). The 6 car people mover really sounds like an exciting entry to the “*world class*” LAX with baggage carts being rolled in & out among the travelers as well as the meeters and greeters, who are able to ride to the central terminal area.
- 4). Of course, in a curbside blast, one would want nothing but “*partially climate controlled air*” between them & the explosion.

A security solution?

NO – A JOKE !

Submitted by Marvin D. Walter
7015 S. Sepulveda Private
Westchester, CA 90045-1512

Good morning (or Good Afternoon)

My name is Romeo Gonzalez. I live at _____, in the City of _____.

I would like to show my support for the LAX Master Plan and Alternative D. After almost 8 years of planning and dozens of hearings and testimony Mayor Hahn has introduced a plan that takes into account all of the concerns that have been raised.

With the heightened awareness of the possibility for airport disaster, either by accident or by human hand this plan will reduce and consequences. With the remote passenger and baggage handling facility, the flying public should have much more confidence in LAX security. This design, with the early scanning of passengers, carry-ons and baggage, makes the Central Terminal area and airline gates much safer.

I also like the use of people movers and trams in the design. Moving around LAX today is very difficult. The only way to get from airline to airline or different terminals is to walk or wait for a bus. Alternative D's transportation system saves time and confusion.

I hope Alternative D is adopted, and soon.

Thank you for taking my comments.

1 time or another. And if you've ever been at LAX lately,
2 you know how difficult it can be to get through the
3 check-in procedures or even pick up someone. That's why
4 I support the new proposal for the Master Plan.

5 As it is indicated on the boards that are set
6 up outside, there will be new passenger ticketing and a
7 baggage handling building built away from the central
8 terminal and gates. With the larger area for passenger
9 drop-off and pick-up and the baggage check-in facilities
10 being expanded, passengers should be processed much
11 faster.

12 Getting the people in and out of the drop-off
13 area faster will also give us a safer and more secure
14 airport. The chances that someone will be injured and
15 in a disaster will be greatly reduced with the new
16 design. Any idea that the existing security level at
17 the current airport will be more secure than the
18 expanding airport is ludicrous and damn near stupid.

19 And to the gentleman that is aspiring to
20 become a mayor, he is already 500,000 votes behind.
21 Anyone with common sense, because with all your
22 Princeton education, you have none.

23 (The statement submitted for the
24 record was marked as Statement 15
25 and is attached hereto.)

Good Morning (Or Afternoon)

My name is HOMER ANDERSON, and I live at 15824 S. WESTERN Ave., in the City of Gardena, CA 90247

All of us here today use airports at some time or another and if you have been at LAX lately, you know how difficult it can be to get through the check in procedures or even to pick-up someone.

That's why I support the new proposal for the Master Plan. As it is indicated on the boards that are set up outside, there will be new passenger ticketing and baggage handling building built away from the central terminals and gates. With the larger area for passenger drop-off and pick-up and the baggage checking facilities being expanded, passengers should be processed much faster.

Getting the people in and out of the drop-off area faster will also give us a safer and more secure airport. The chances that someone will be injured in any disaster will be greatly reduced with the new design.

Thanks

AFTERNOON

Good ~~morning~~ and welcome to Westchester. My name is Harry Rose, 7725 Hindry Avenue, Westchester 90045. I come before you today on behalf of Osage Neighbors Association, representing approximately 3600 homes in Osage Park and Westport Heights.

Because it would seem that none of our City officials have noticed, we would like to point out that most modern airports operate on a much larger footprint than LAX and are not located in densely populated urban areas. Denver had the vision to build a world-class airport on 53 square miles in a rural area and actually close their old airport. Total cost? Less than half the price of Alternative D. Los Angeles, where is the vision?

While we love a good Public Works boondoggle just as much as anyone else, this one is ill conceived and a violation of Mayor Hahn's election pledge to our community. Airport use of residential property violates his pledge to operate the airport within its current boundaries. The capacity of 78.9 MAP stated in the EIS violates the Mayor's election pledge to us by nearly 1 million passengers a year.

Alternative D would dramatically enhance flight field throughput and lay the groundwork for vastly increased ground transportation infrastructure setting the stage for future expansion of LAX operations. We have heard that the FAA is currently studying the feasibility of simultaneous landings on three runways under the new configuration. Do LAWA and FAA plan to visit this practice upon us in the future?

Alternative D would move airport bound traffic two miles to the east subjecting East Westchester, Lennox and Inglewood to increased vehicular air pollution and noise. How does this even begin to comply with the environmental justice provisions of CEQUA?

Alternative D locates a Ground Transportation Center in a tract of land currently zoned R1. The EIS clearly states that no residential property is to be acquired for the project. This leads us to assume that LAWA plans to use property acquired through an ongoing and supposedly Voluntary Noise Mitigation Acquisition program. This method of residential property acquisition for airport use ignores FAA guidelines in Order 5100.37A, Chapter 3, Section 9 implementing the Uniform Act of 1970. We would like a complete explanation as to how LAWA's acquisition and conversion of this property to airport use approaches any semblance of legality.

Thank You
Harry Rose, Osage Neighbors Association

Thank's for the opportunity to speak:

My name is Malcolm Joseph **I live at**
_____, **in the city of**
_____.

LAX has been a very large factor in the daily lives of all of us in Los Angeles County. Those who live near the airport have special concerns, even though the airport is an economic boon to us all. Obviously, traffic and noise have to be dealt with and I think that the LAX Master Plan with Alternative D does that.

The traffic plan, with improvements being proposed for intersections, extra lanes on La Cienega Boulevard and the improvement to the cargo delivery accesses roads will aid the flow of traffic in the airport's immediate area. But, the greatest change to increased traffic will be the connection of the Green Line Light Rail to the Transportation Center. Finally, a public transportation system will be available from Fly Away Parking facilities or Stations where passengers and be dropped off at over 50 sites throughout Los Angeles County.

Alternative D is my choice and I hope that the FAA and the City will approve the plan

Thank you.

LAX MASTER PLAN - SPENDS \$ 9 BILLION PLUS TO:

- * **Tear Down Airport Structures Possibly Not Yet Even Paid For**
- * **Concentrate Airport Congestion in Single Vulnerable Location**
- * **Promote Traffic Gridlock around LAX and Provide No New Rail Transit Access to LAX**
- * **Make LAX the Most Inconvenient Airport in the World**

Simply moves Airport Congestion & Likely Point of Terrorist Attack to another more congested site without equal replacement parking and still further away from Green Line to Blue Line to Red Line and Urban Destinations. Is it really convenient to go to Park and Ride Lots in Long Beach, Norwalk or Inglewood and ride busses to Manchester Square Airport Security Center ?

Our past leaders were visionary in buying a large airport site at Palmdale. Tokyo, Seoul, Hong Kong and Washington D.C. all built new larger International Airports far from their cities. Most now use old airports for Domestic Flights Only. Transit Links to other Airports and Cities.

HOW TO SPEND LESS AND GET MORE.....a possible Alternative Plan

LOS ANGELES AIRPORTS AND RAIL TRANSIT SCHEME * *

As Illustrated with Detailed Map - Plans & Text shown on Large Display Boards.
(Prevented from Showing at Airport *Public Hearing*. **Want to See ? Contact Me.**)

*** New Secure Los Angeles International Airport at Palmdale**

With all passenger and baggage screening and check -in features now in LAX Master Plan Using only a small portion of this vast site. Passenger Drop-Off at Tram-Transit Link.

Links Palmdale Metrolink Station (uc) with one-mile Elevated Airport Tram connecting to Security Center for Passenger and Luggage Screening, Flight Check-In and Baggage Check.

Continuing Tram to Huge International Terminal and on to even larger Domestic Terminal for Connecting Flights.

2.5 Mile Elevated Tram Loop from Terminals to Parking, Bus, Taxi and Car Rental Lots; to Security Center; and Metrolink Station.

Vehicle Entry Security Check Points. 500 acres of Open Parking Lots with approximately 50 to 70 thousand Car Capacity. 180 acres for Bus and Taxi Terminals and Car Rental Lots.

Existing Metrolink Travel Time from Union Station to Lancaster is 1 hour and 40 minutes. Would be less from Red Line/Metrolink Station to Palmdale Airport and even less by car on 14 Freeway.

Transit Travel Time to Airport could be greatly reduced by (1) Better Track Alignment (2) Improved Rail Roadbed (3) Grade Separation (4) Double Tracking and (5) Electrification.

*** Los Angeles Westchester Domestic Airport at LAX**

Linked by Terminals Tram to Metro Rail Line.

Passenger Drop Off and Security Check Point at Transit-Tram Entry Station

Security Check Stations at all Vehicle Entry Points.

Airport Conference Center & Corporate Jet parking at now Tom Bradley International Terminal.

Retain all LAX Terminals, Parking Structures and Runways as they now exist.

LAX Flights Actually Reduced. No Homes or Businesses Taken.

*** Easy Rail Transit to ALL Los Angeles Airports.**

Including Direct Metro Rail between LAX and Burbank Airports.

Only 15 miles of new Metro Rail lines could link Green Line and LAX to Burbank Airport and Metrolink Rail Line to Palmdale Airport.

Two mile Red Line Valley Metro Rail Extension to Burbank Airport Terminal. Then one mile more to new Antelope Valley Metrolink Station and Rail Transit Service to L.A. Int. Airport at Palmdale. Also increases low income workers access to large nearby affordable housing stock.

Ebony Metro Rail Line from Union Station to Wilshire-Western Stub. Then 12 miles to LAX. Subway down Crenshaw Blvd. and Elevated on MTA owned railroad right-of-way to Century/Aviation Station Link with LAX Airport Terminals Tram. Ending at Green Line Light Rail Aviation Station. Bay Area BART elevated everywhere except in Downtown City Areas.

Long Beach Airport Alternative Terminal Transit Links to Long Beach Blue Line Light Rail.

Now no direct rail access to Ontario Airport. Alternative Plan has new Ontario Airport Stations on Riverside and San Bernardino Metrolink Lines with Transit Links to Airport Terminal.

Creating jobs is a good thing, and keeping ALL of our U.S. airports modern and maintained is always a good thing.

But I have to say NO, emphatically, to the mayor's Alternative "d".

Mayor Hahn's PR machine keeps repeating that the 9 billion dollar plus LAX "Alternative d" will be safer and more secure. Experts from the Rand Corporation, in a study requested by Congresswoman Jane Harman, disagree. After studying the plan they found that the airport would, in fact, be less safe and less secure than the existing LAX.

In fact, the study concluded, modernization could be accomplished at a much lower cost than alternative d.

Concentrating all the travelers into one check-in just creates an even more attractive target for any terrorist activities. We all will be put at tremendous risk if we allow Mayor Hahn to create one giant bull's-eye at what once was Manchester Square.

Not safer, nor more secure, certainly not more convenient. and unnecessarily expensive.

Alternative "d" is not good community planning, Mr. Mayor, and it's not good governance.

Los Angeles, CA 90009-2216

Dear Sirs:

While Alt. D is a definite improvement over Alts A, B, and C, it does not achieve its stated purpose: to provide safety and security.

Alt. D would cost over \$9 billion, exacerbate the traffic and air pollution problems, expand the boundaries of LAX, and provide very little in mitigation measures.

By expanding LAX into the Manchester Square area, Alt. D would merely transfer the dangers from the facilities in the Central Terminal Area out to the community, thereby leaving the traveling public and the residents still at risk. Gathering a large number of people into one area would create a terrorist target - and that is what a Ground Transportation Center in Manchester Square would be.

Concrete, metal and plastic would get protection; people would not.

Extending LAX boundaries into Manchester Square sends the message that LAWA intends to just keep expanding LAX and it can handle all the Southern CA traffic - no regional approach is needed. Other counties and communities should be taking on their share of the air traffic, not told they can rely on LAX.

SPHF 

There have been very few Category A runway incursions at LAX - certainly not enough to warrant a \$9 billion renovation which includes moving runways. Adequate safety precautions could be instituted with the cooperation of FAA, LAWA, and the airlines.

Air traffic has not rebounded to pre-9-11 levels. This gives us the luxury of taking time to reexamine the assumptions previously made that air travel would return to and increase from those levels. There is no reason to rush to prejudgement. There is time to explore more options on bringing other airports into compliance with a regional approach to air traffic.

I will be making written comments on specifics of the proposal prior to the November deadline.

Sincerely,

Danna Cope

Quoting from the supplement to the draft EIR/EIS --

“As of October 31, 2002, progress in acquiring properties under the Voluntary Residential Acquisition/Relocation Program for Manchester Square and Belford indicates that 62 percent of the property owners (351 properties and 1130 dwelling units) have volunteered to participate in the acquisition program.” What about the other 38 percent? What about the people who lived there for over fifty years and DON’T want to move? I guess no one from LAWA or L.A. city really cares, but then why should they?

Then, as I was randomly leafing through the EIR/EIS, I found an interesting report on the residences which will be most impacted with the plans. Guess which city is impacted most -- Inglewood of course!

At more than 120 “Newly Exposed Residential and Noise -Sensitive Uses Outside of the 1992 CNEL Noise Contour” for the Alternative D, and over 2,000 listed under “Alternative D 2015 dBA SEL Noise Contours Listing of Newly Exposed Residential Uses Outside of the 1992 65 CNEL Noise Contour”, we -- Inglewood -- are the most impacted area in the communities surrounding LAX.

But I guess that really doesn’t matter. We -- Inglewood residents -- are just low income NIMBY’s who want to stop this “Modernization” -- or is it expansion? -- plan.

Also in the Supplement to the Draft EIR/EIS was that wonderful interchange on Arbor Vitae ST. -- which our beloved L.A. Co. Supervisor pushed for -- under the title:

“Model Update Information -- Regional Roadway Improvements.”

Our county supervisor had once mentioned that the Arbor Vitae Interchange has nothing to do with Airport Related issues -- at least that is what I remember.

Even worse though, a LAWA staff member had once said it was for our -- now nonexistent -- Kmart!

I don’t think so!

**Official Hearing Transcript
Doubletree Hotel
Rosemead, California
Monday, October 20, 2003**

Following this page is the transcript of the oral testimony taken at the above hearing. Each speaker at the hearing has been assigned a unique identification number. The numbers assigned to each speaker for this hearing are:

Number	Speaker	Affiliation
SPHR00001	John Spaulding	None Provided
SPHR00002	Richard Slawson	LA/O Counties Building & Construction Trades Council
SPHR00003	Theo Kitchen	Los Angeles Convention and Visitors Bureau
SPHR00004	Ken Alpern	Friends of the Green Line
SPHR00005	Bobby Blanks	Congressmember Maxine Waters' Office

Any exhibits attached to this hearing transcript have been previously reproduced in this Final EIS/EIR as individual public comment letters.

Note: The certified copy of the official hearing transcript of testimony taken on Monday, October 29, 2003, at the Doubletree Hotel identifies one statement submitted for the record. A second statement was submitted for the record on behalf of the Friends of the Green Line and is provided on page 27 of the transcript.

3 ---oOo---

4
5 MR. WALL: Ladies and gentlemen, good evening.
6 Welcome to the 10th in a series of open houses dealing
7 with the Los Angeles World Airport Master Plan,
8 Environmental Impact Report and Environmental Impact
9 Statement.

10 As we begin this evening, I would like to
11 introduce the two gentlemen sitting to my right. The
12 first will be Mr. Dave Kessler representing the Federal
13 Aviation Administration.

14 Mr. Kessler.

15 MR. KESSLER: Thank you. Good evening, ladies and
16 gentlemen. My name is David Kessler. I'm the
17 Environmental Protection Specialist for the Airports
18 Division of the Federal Aviation Administration,
19 Western-Pacific Region. I would like to welcome you to
20 the 10th of a series of public hearings the FAA and the
21 Los Angeles World Airports, or LAWA, are conducting on
22 the Supplement to the Draft Environmental
23 Statement/Environmental Impact Report, or EIS/EIR, for
24 the proposed Master Plan at Los Angeles International
25 Airport.

1 The Supplement to the Draft EIS/EIR addresses
2 an additional Alternative, Alternative D, the Enhanced
3 Safety and Security Plan that was added in the fall of
4 2001. This new alternative was added as a result of
5 comments submitted on the 2001 Draft EIS/EIR and the
6 terrorist attacks that occurred on September 11th, 2001.

7 The Notice of Availability of the Supplement
8 to the Draft EIS/EIR was published in various local
9 newspapers and in the Federal Register on Friday, July
10 11, 2003. The FAA and LAWA are the authors of the
11 Supplement. The Federal Highway Administration is also
12 a cooperating agency in the preparation of the Draft
13 EIS/EIR that was published in January 2001.

14 The purpose of these hearings is to collect
15 the comments of the general public concerning the
16 adequacy of the information disclosed in the Supplement
17 to the Draft EIS/EIR on the proposed Alternative D.

18 I would like to take this opportunity to make
19 sure that everyone understands that no decision will be
20 made today regarding the proposed project. Today's
21 hearing is not a question-and-answer type of forum. Our
22 job is to listen to what you have to say about the
23 accuracy of the information to the Supplement to the
24 Draft EIS/EIR. In other words, it is your turn to talk
25 to us.

1 Since we are here to listen, we're not going
2 to respond to questions about the pros and cons of the
3 proposed project. Since 5:00 o'clock this afternoon, we
4 have held a public workshop just outside of this room
5 for anyone to ask questions about the Master Plan, the
6 environmental process and the various proposed projects.

7 Following publication of the Supplement to the
8 Draft EIS/EIR for review and comment, the next step in
9 the joint federal and state environmental disclosure
10 process is holding this and other public hearings that
11 were held earlier in August of this year and continuing
12 through this week.

13 I would like to take this opportunity to recap
14 the environmental disclosure process for this project.
15 The environmental evaluation of the LAX Master Plan
16 began in 1997 with the publication of the Notice of
17 Intent to prepare the joint EIS/EIR in the Federal
18 Register. In July of 1997 we held a series of meetings
19 with members of the public and governmental agencies to
20 receive comments on the scope of the Draft EIS/EIR.
21 Following those meetings the Draft EIS/EIR was published
22 in January 2001. Both the 2001 Draft EIS/EIR and the
23 2003 Supplement have been prepared pursuant to the
24 National Environmental Policy Act of 1969, or NEPA, the
25 Council on Environmental Quality Regulations, which are

1 the implementing regulations for NEPA, the California
2 Environmental Quality Act of 1970, or CEQA, and the
3 Airport and Airway Improvement Act of 1982, as amended.

4 Following today's hearings and the close of
5 the comment period, we will then correct and revise the
6 EIS/EIR, as necessary, based on the comments received.
7 We will also prepare responses to the comments we
8 receive and include those responses along with those
9 that were submitted to the FAA and LAWA on the 2001
10 Draft EIS/EIR in the Final EIS/EIR. The information
11 contained in the Supplement will also be combined with
12 the information in the 2001 Draft EIS/EIR into the Final
13 EIS/EIR.

14 Before we begin receiving verbal comments, we
15 would like to let you know the grounds rules of this
16 hearing. First, as I said earlier, we're not here to
17 respond to questions about this project. We are only
18 here to listen and take notes. We also have a court
19 reporter here present to ensure we have an accurate
20 transcript of this hearing.

21 For anyone who would like to speak, we would
22 like to ask you to fill out a speaker card, like this
23 one, and give it to one of the people at the sign-in
24 desk. The card will then be brought up here to or
25 facilitator who then call the names of each speaker so

1 we could proceed in an orderly fashion. So everyone
2 gets an opportunity to provide verbal comments, everyone
3 will be given three minutes to speak. To be fair to
4 everyone, we will not allow people to transfer their
5 allotted time to someone else. I ask that when you
6 speak, you give us your name and address for the record.
7 We also have a Spanish language translator for anyone
8 wishing to provide comments in Spanish.

9 If there is anyone who is uncomfortable
10 speaking in front of a group or if you need more than
11 three minutes to provide your comments, we ask you to
12 provide your comments in writing. We have comment
13 sheets, like this one, available for your use also at
14 the sign-in desk. You could leave your comments at the
15 sign-in desk or you may mail your written comments using
16 the comment sheet or a letter to either address listed
17 on the cover of the EIS/EIR.

18 I would like you to understand that a verbal
19 comment is just as important as a written comment. So
20 please feel free to provide any comments on the document
21 you may have to us either verbally today or in writing.

22 On August 1st, 2003 LAWA asked FAA to extend
23 the public comment period to a total of 120 days. FAA
24 agreed to LAWA's request. On Friday, August 22nd, 2003
25 the U.S. Environmental Protection Agency published a

1 Notice in the Federal Register announcing the extension
2 to the public comment period. Therefore, comments on
3 the Supplement to the Draft EIS/EIR are now due by
4 5:00 p.m. Pacific Standard Time on Friday, November 7th,
5 2003.

6 Lastly, I would like everyone to know that
7 even though we have this hearing scheduled until
8 9:00 o'clock this evening, we will stay here as long as
9 necessary for everyone to provide verbal comments on the
10 Supplement to the Draft EIS/EIR. As I said earlier, our
11 job here today is to listen to your comments.

12 At this time I would like to ask everyone in
13 the room to take a moment, turn off your cell phones and
14 pagers to be courteous to those people making verbal
15 comments at tonight's hearing.

16 Now I will return the hearing back to our
17 facilitator who will introduce Mr. Jim Ritchie who will
18 provide some introductory comments from LAWA. Following
19 Mr. Ritchie's comments, we will then collect the speaker
20 cards and call the name of the first speaker.

21 Thank you.

22 MR. WALL: Thank you, Mr. Kessler. Receiving your
23 comments tonight representing the Los Angeles World
24 Airports is Mr. Jim Ritchie, the Deputy Executive
25 Director for long-range planning.

Mr. Ritchie.

MR. RITCHIE: Thank you, Tom. Good evening, ladies and gentlemen. Welcome to the Doubletree for the 10th in a series of public hearings. I'll read some comments into the record for the purposes of consistency of our other previous hearings.

You may recall the public hearing process in 2001 while we were examining other expansion alternatives for the modernization of Los Angeles International Airport. The tragic events of 2001 and the leadership of Mayor Jim Hahn have reshaped the environmental process. The mayor's pressing concerns for safety and security have provided new guidance along with the public comments received during that public comment period from January 2001 through November 2001.

You are here tonight primarily to provide comments on that new Alternative referred to as Alternative D. This is a Supplement to the existing environmental process, and it has undergone a rigorous environmental analysis.

We are here tonight to receive your comments on this new safety and security plan and its impacts as disclosed in the Supplement to the Draft Environmental Impact Statement/Draft Environmental Impact Report. So with that, Tom, let's go to work.

1 MR. WALL: Thank you, Jim. As I call your name, I
2 would like you to come to the lectern, please, and give
3 us your name and address if you feel so inclined.
4 Please speak slowly and clearly so the court reporters
5 can get an accurate transcript of your testimony. Your
6 voices will also be recorded by a tape recorder.

7 Again, you'll have three minutes. I will
8 start the clock after you make your introduction. The
9 clock will start at three minutes and wind down to zero.
10 With 30 seconds left, you will see an amber light
11 illuminate. And when the three minutes are up, the red
12 light will come on and you will see three zeros on the
13 timer.

14 Our first speaker tonight will be Mr. John
15 Spaulding. Mr. Spaulding, welcome, sir.

16 MR. SPAULDING: Good evening. I'm John Spaulding.
17 My office address is 150 East Corson, C-o-r-s-o-n,
18 Pasadena, California. I am also a resident of Pasadena,
19 California. And I have been involved in these hearings
20 since 1997 since we've started into this process. I
21 think it is very important we move forward so that we
22 retain our place as the best airport in the world, and I
23 think we need to do this.

24 I'm here to testify on behalf of Alternative D
25 because it is the best plan for the City of

1 Los Angeles. This plan will provide 49,000 construction
2 jobs. And with the budget cuts and layoffs pending,
3 these jobs will help stimulate the regional economy and
4 keep people working. Simply, I support Alternative D of
5 the LAX Master Plan. Thank you very much.

6 MR. WALL: Thank you, Mr. Spaulding.

7 Our next speaker will be Mr. Richard Slawson.
8 Welcome, sir.

9 MR. SLAWSON: Good evening. My name is Richard
10 Slawson. I'm the Executive Secretary of the Los Angeles
11 and Orange Counties Building and Construction Trades
12 Council. Our council represents craft workers and their
13 families, over 130,000 that live all in the area of
14 Los Angeles surrounding the airport as well as the other
15 communities in Los Angeles and Orange County.

16 I wanted to provide further testimony tonight.
17 Mayor Hahn has suggested Alternative D. I believe this
18 plan will provide the security design that is needed to
19 satisfy the needs of passengers in the airlines. With
20 the Central Terminal Area being accessed by tram and
21 foot traffic only, the chances of a terrorist action
22 will be almost eliminated completely. The security
23 message that this plan sends will help to bring the
24 flying public back to the airlines and improve our
25 economy. The overall plan fits well into the area and

1 will improve traffic and noise concerns of all the
2 residents in the communities surrounding LAX.

3 I noted in the information that has been
4 provided by LAWA to the communities, as well the mayor's
5 commitment to restrict the annual passengers under this
6 design to 78.9 million lives up to the commitment that
7 was made, I guess it is three years ago now when he was
8 elected mayor and, also, limits LAX and the surrounding
9 communities' responsibility for handling aircraft
10 traffic and then allows other communities to take up the
11 slack.

12 We all know that we need a regional approach
13 to our airports throughout the area, and eventually
14 Palmdale and March Air Force Base. Ontario will
15 probably also be able to take up some of the traveling
16 needs of the traveling public as well as the cargo
17 handling that is necessary to keep our economy going
18 here.

19 We believe in this particular alternative. We
20 think it is the best one and hope that the LAWA and FAA
21 will continue the process and improve this
22 Alternative D. Thank you very much.

23 MR. WALL: Thank you, sir, for your testimony.

24 Do I have any other speaker cards? Is there
25 anyone else in the audience wishing to speak? Seeing no

1 one at this point, we'll take a short recess.

2 (Recess was taken.)

3 MR. WALL: Ladies and gentlemen, we will reconvene
4 the public hearing at this time. I have two additional
5 speaker cards. Let me call the two names of the
6 speakers one at a time. Gentlemen, when you come to the
7 podium, you will have three minutes to make your
8 comments. You will see the clock start. Once you have
9 had a chance to introduce yourself, the clock will then
10 run down from three minutes to zero. With 30 seconds
11 remaining, the amber light will illuminate.

12 The first speaker I'll call is Mr. Theo
13 Kitchen. Welcome, sir. We would like you to please
14 state your name and address for the record. The court
15 reporters will record your testimony and will also
16 record it via audiotape as well.

17 MR. KITCHEN: Thank you very much. My name is Theo
18 Kitchen. I'm with the Los Angeles Convention of
19 Visitor's Bureau. Our office address would be 333 South
20 Hope Street, 18th Floor. That is Los Angeles,
21 California 90071. And as I said, I'm with the L.A.
22 Convention of Visitor's Bureau. We represent the
23 tourism industry, an 11.3-billion-dollar industry to the
24 County of Los Angeles and also L.A. County's second
25 largest employer providing some 255,000 residents with

1 jobs.

2 We're definitely supportive of this measure.
3 We think that the core strategies will improve safety
4 and security and also maintain L.A.'s position as an
5 international gateway, position which is fairly
6 important because our competitors, being San Francisco,
7 Vegas, Minneapolis and New York, are all increasing
8 their own airport facilities, which means that we
9 potentially lose market share. If we lose international
10 travelers, that translates into a loss of jobs as well
11 as a loss of tax revenues. So I thank you for your
12 time.

13 MR. WALL: Thank you, sir, for your comments this
14 evening.

15 Our next speaker will be Mr. Kenneth Alpern.
16 Welcome, sir.

17 MR. ALPERN: Hello again. Good evening.
18 Ken Alpern, Co-chair, Friends of the Green Line. There
19 has been a lot of learning on our part and I think on
20 your part as sort of the processes and the legality of
21 construction and traffic mitigation that has come along,
22 but this is the three realistic goals that we're going
23 to present to the City Council of L.A. and the press.
24 This is what we've already begun to pursue.

25 We are very much in favor of many of the

1 features of Alternative D. We want this to be the best
2 alternative possible. Specific goals for LAX
3 reconfiguration plans, Green Line connections, Friends
4 of the Green Line has concluded as its realistic goals
5 to ask the City of L.A. and L.A. World Airports to not
6 prevent LAX rail access from the north and/or to prevent
7 the Green Line from proceeding north beyond LAX.

8 Where Friends of the Green Line now stands
9 with respect to the Green Line and L.A World Airports
10 traffic mitigation as part of its Final EIR is that
11 non-automobile related traffic measures should include,
12 one, a written promise for LAWA to fund the necessary
13 trench west of Aviation Boulevard along the MTA Harbor
14 subdivision right away to allow the Green Line to
15 proceed north from the current Aviation/Imperial Green
16 Line station without interfering with LAX radar beacons
17 and/or other electromagnetic operations associated with
18 LAX.

19 Two, a written promise for LAWA to fund and
20 construct its final Ground Transportation Center whether
21 it is at Manchester Square or anywhere else in a manner
22 that allows for a future Green Line station. LAX found
23 passengers from the north, like the West Side and the
24 valley. A large component of LAX users should not have
25 to overshoot LAX if there is a northern rail access to

1 reach the future Intermodal Transit Center at
2 Aviation/Imperial in order to connect with the Central
3 Terminal Area via the LAX people mover. To overshoot
4 LAX by a mile and then go all the way back does not make
5 sense to the MTA, the planners that I've spoken to, and
6 I'm sure you understand where the West Side might feel
7 the same way.

8 Three, a written promise for LAWA to fund and
9 staff any future preliminary engineering for a Green
10 Line that connects Westchester and the West Side in a
11 manner that does not preclude the Green Line from
12 reaching these destinations and in a manner that
13 compliments, not competes, with the future LAX people
14 mover.

15 Friends of the Green Line likes to consider
16 itself allies of LAWA and the voting people of the City
17 of L.A. And we look forward to having a transit system
18 that not only serves the interests of LAX, but also of
19 its neighbors, something that enhances the business
20 community of the immediate region and, furthermore,
21 establishes L.A. as something that pretty much every
22 major city in the nation now has, something with a very
23 good quality LAX rail connection. Thank you and have a
24 great evening.

25 MR. WALL: Thank you, Mr. Alpern.

1 Our next speaker is Mr. Bobby Blanks. Sir, I
2 notice that you just arrived. You will have three
3 minutes for your testimony. After you state your name
4 and address, I'll start the clock. And it will wind
5 down from three minutes to zero. We appreciate you
6 coming this evening.

7 MR. BLANKS: Thank you very much. I'll speak my
8 three minutes now, and then I'll come back in the next
9 session and probably finish up. I think it is going to
10 take a little longer than that.

11 MR. WALL: We ask, sir, if you have more time that
12 is required, that you submit them in writing.

13 MR. BLANKS: Okay.

14 MR. WALL: We have to limit you to three minutes.

15 MR. BLANKS: I'll go as far as I can.

16 Good afternoon. My name is Bobby Blanks. I'm
17 field representative to Congressman Maxine Waters.

18 Alternative D is a \$9-billion-dollar project
19 that would demolish homes and disturb communities
20 without improving the safety and security of LAX. The
21 Supplement to the Draft EIS/EIR is an inaccurate and
22 misleading document that fails to reflect the true
23 impact of this project.

24 The centerpiece of Alternative D is the Ground
25 Transportation Center, a large remote passenger check-in

1 facility that would be constructed at Manchester Square
2 several blocks away from the airport terminals. An
3 Intermodal Transportation Center would be constructed at
4 Aviation Boulevard and Imperial Highway which would
5 provide a connection to the Green Line.

6 According to the Supplement to the Draft
7 EIS/EIR, the Ground Transportation Center and the ITC
8 would be the primary access points for all passenger
9 drop-off and pick-up and vehicle parking. An automated
10 people mover system would be constructed to transport
11 people to the airport terminals, and a baggage tunnel
12 would be constructed to transport baggage, and a
13 consolidated rental car facility will be constructed in
14 Westchester as well.

15 Local families could no longer drive to the
16 Central Terminal Area in order drop-off passengers.
17 Instead, all passengers and employees would access the
18 Central Terminal Area from the Ground Transportation
19 Center, the ITC, and a rental car facility via the
20 automated people mover carrying their carry-on baggage
21 with them. This would be extremely inconvenient for
22 most passengers and it would present hardships for the
23 elderly, the handicapped and families traveling with
24 small children.

25 Airport security issues: Supporters of the

1 proposed project to construct a remote passenger
2 check-in facility claim that the facility is necessary
3 to improve the safety and security of LAX and prevent
4 terrorist attacks at LAX. Theoretically, diverting all
5 vehicular traffic to remote parking structures and the
6 remote passenger check-in facility would protect the
7 Central Terminal Area from car bombs.

8 The RAND Corporation conducted a study of the
9 proposed remote passenger check-in facility, which was
10 released May 14th, 2003. The study concluded that the
11 proposed project would not significantly improve the
12 security of LAX. The study also concluded that
13 concentrating passengers in the proposed remote
14 passenger check-in facility could make the check-in
15 facility the likely target of a terrorist attack.

16 Finally, the study concluded that
17 concentrating several airport functions in the remote
18 passenger check-in facility could exacerbate the effects
19 of an attack on airport operations.

20 The Supplement to the Draft EIS/EIR makes the
21 astounding claim that Alternative D would not displace
22 any residents. Instead, the Supplement predicts that
23 2,500 houses and apartments will be acquired by the
24 residents relocated under LAWA's existing Voluntary
25 Residential Acquisition/Relocation Program, through

1 which LAWA may acquire property and relocate residents
2 on a voluntary basis in order to mitigate the impact of
3 airport noise.

4 The Supplement then concludes that Alternative
5 D would not require the acquisition of any additional
6 dwelling units or the relocation of any additional
7 residents. This claim is especially ironic given the
8 fact that several Manchester Square residents and
9 apartment owners have already said that they would not
10 leave their homes voluntarily.

11 MR. WALL: Do you have much more to state,
12 Mr. Blanks? You do. Would you like to submit that to
13 us in writing? We appreciate your time this evening.
14 Thank you, sir. Very well done. Our court reporters'
15 fingers are smoking over there.

16 (The statement submitted for the
17 record was marked as Statement 1
18 and is attached hereto.)

19 MR. WALL: Do we have any other speaker cards this
20 evening? Seeing none, we will take a short recess in
21 the public hearing.

22 (Recess was taken.)

23 MR. KESSLER: Is there anyone who else has not had
24 an opportunity to speak concerning the information in
25 the Supplement to the Draft EIS/EIR? Not seeing anyone

1 else, I will remind everyone that if you feel you're
2 unable to provide us with verbal comments today, we will
3 be accepting your written comments until 5:00 p.m.
4 Pacific Standard Time, Friday, November 7, 2003. You
5 can mail your comments either to me at the FAA or to
6 Jim Ritchie with LAWA. The mailing addresses are listed
7 on the cover of the Supplement to the Draft EIS/EIR.

8 I want to thank everyone for your comments
9 today. This public hearing for the Supplement to the
10 Draft EIS/EIR on the Los Angeles International Airport
11 Master Plan is now closed. Thank you.

12 (Whereupon the proceeding adjourned
13 at 9:00 o'clock p.m.)

Public Hearing
Supplement to the Draft EIS/EIR
for the Proposed LAX Master Plan
Doubletree Hotel, Rosemead, CA
Testimony from Rep. Maxine Waters
October 20, 2003

Alternative D is a \$9 billion project that would demolish homes and disturb communities without improving the safety and security of LAX. The Supplement to the Draft EIS/EIR is an inaccurate and misleading document that fails to reflect the true impact of this project.

The centerpiece of Alternative D is the Ground Transportation Center (GTC), a large remote passenger check-in facility that would be constructed at Manchester Square, several blocks away from the airport terminals. An Intermodal Transportation Center (ITC) would be constructed at Aviation Blvd. and Imperial Highway, which would provide a connection to the Green Line. According to the Supplement to the Draft EIS/EIR, the GTC and the ITC would be the primary access points for all passenger drop-off and pick-up and vehicle parking. An Automated People Mover (APM) would be constructed to transport people to the airport terminals, and a baggage tunnel would be constructed to transport baggage. A Consolidated Rental Car (RAC) facility would be constructed in Westchester.

Local families could no longer drive to the Central Terminal Area (CTA) in order to drop off passengers. Instead, all passengers and employees would access the CTA from the GTC, the ITC and the RAC via the APM, carrying their carry-on baggage with them. This would be extremely inconvenient for most passengers, and it would present special hardships for the elderly, the handicapped and families traveling with small children.

Airport Security Issues

Supporters of the proposed project to construct a remote passenger check-in facility claim that the facility is necessary to improve the safety and security of LAX and prevent terrorist attacks at LAX. Theoretically, diverting all vehicular traffic to remote parking structures and the remote passenger check-in facility would protect the Central Terminal Area from car bombs.

The RAND Corporation conducted a security study of the proposed remote passenger check-in facility, which was released on May 14, 2003. The study concluded that the proposed project would not significantly improve the security of LAX. The study also concluded that concentrating passengers in the proposed remote passenger check-in facility could make the check-in facility the likely target of a terrorist attack. Finally, the study concluded that concentrating several airport functions in the remote passenger check-in facility could exacerbate the effects of an attack on airport operations.

Statement
PLF/DEF 4
EXHIBIT
DATE 10-20-03 RPTR
Lisa Vargas
SPHR

On July 25, 2003, I introduced H.R. 2985, a bill to condition construction of a remote passenger check-in facility at LAX upon a finding that such a facility will promote the safety and security of the public. H.R. 2985 would require the Secretary of Homeland Security to review the proposed facility prior to its construction to determine whether it will protect the safety and security of air passengers and the general public more effectively than the existing facilities at LAX. If the Secretary of Homeland Security does not determine that the facility will improve public safety and security, the Federal Aviation Administration (FAA) would not be allowed to approve its construction. On Sept 2, the Board of Supervisors of Los Angeles County passed a motion to support my legislation.

Ironically, Alternative D does not even significantly improve security at the Central Terminal Area. According to the Supplement to the Draft EIS/EIR, Alternative D calls for the installation of new baggage screening facilities in the Central Terminal Area -- not the remote passenger check-in facility. If Alternative D were designed to protect the Central Terminal Area from terrorist attacks, one would think that the baggage would be fully screened before it is transported through the baggage tunnel to this area. Nine billion dollars is an extremely high price to pay for a project that provides a single building protection from car bombs but not from suitcase bombs.

Housing Issues

The Supplement to the Draft EIS/EIR makes the astounding claim that Alternative D would not displace any residents. Instead, the Supplement predicts that 2,500 houses and apartments will be acquired and the residents relocated under LAWA's existing Voluntary Residential Acquisition/Relocation Program, through which LAWA may acquire property and relocate residents on a voluntary basis in order to mitigate the impact of airport noise. The Supplement then concludes that Alternative D would not require the acquisition of any additional dwelling units or the relocation of any additional residents. This claim is especially ironic, given the fact that several Manchester Square residents and apartment owners have already said that they will not leave their homes voluntarily.

In reality, Alternative D would displace thousands of Manchester Square residents. In order to construct the remote passenger check-in facility, the City of Los Angeles would have to acquire and demolish 38 houses, 179 apartment buildings and a 52-year-old elementary school, in addition to the 263 structures it has already acquired. It would also have to relocate about 6,200 people, some of whom have federally subsidized housing vouchers. I strongly oppose the forced relocation of any of these residents.

Cost of the Alternative D

Alternative D would cost \$9 billion, an exorbitant amount of money, at a time when budget deficits are growing and the economy is weak. Airlines would be required to increase their passenger fees in order to fund the proposal, which would amount to a tax increase for air passengers. American taxpayers have already provided loan guarantees to the airline industry to keep the airlines in business following the terrorist attacks of September 11, 2001. They should not have to pay increased passenger fees for unnecessary airport construction projects as well.

Air passengers and other taxpayers are willing to provide reasonable expenditures to pay for measures that provide real increases in security, such as the installation of baggage screening facilities. However, the remote passenger check-in facility, the automated people mover and the baggage tunnel included in Alternative D are not reasonable expenditures and do not provide real increases in security.

The American people are sick and tired of deficits and bloated government spending. The State of California is now running a \$38 billion deficit, and the federal government has a \$525 billion deficit. Furthermore, Congress is in the process of providing the President an additional \$87 billion for continuing operations in Iraq and Afghanistan. Alternative D is an outrageously expensive boondoggle, which the American people cannot afford.

Conclusion

Alternative D is simply a continuation of former Mayor Richard Riordan's plan to expand the airport in the name of safety and security. I urge the City Council of the City of Los Angeles to reject this ill-advised and expensive scheme that will displace thousands of Manchester Square residents without improving the safety and security of LAX.

SPECIFIC GOALS FOR LAX RECONFIGURATION PLANS—GREEN LINE CONNECTIONS

Friends of the Green Line has concluded as its realistic goals to ask the City of Los Angeles and LA World Airports to **NOT PREVENT LAX RAIL ACCESS FROM THE NORTH AND/OR TO PREVENT THE GREEN LINE FROM PROCEEDING NORTH BEYOND LAX:**

Where Friends of the Green Line now stands with respect to the Green Line and LAWA Traffic Mitigation as part of its final EIR is that non-automobile-related traffic measures should include:

1) A written promise for LAWA to fund the necessary trench west of Aviation Blvd. along the MTA Harbor Subdivision ROW to allow the Green Line to proceed north from the current Aviation/Imperial Green Line station without interfering with LAX radar beacons and/or other electromagnetic operations associated with LAX

2) A written promise for LAWA to fund and construct its final Ground Transportation Center (whether it is at Manchester Square or anywhere else) in a manner that allows for a future Green Line station.

LAX-bound passengers from the north should not overshoot LAX to reach the future Intermodal Transit Center at Aviation/Imperial in order to connect with the Central Terminal Area via the LAX People Mover

3) A written promise for LAWA to fund and staff any future preliminary engineering for a Green Line that connects to Westchester and the Westside in a manner that does not preclude the Green Line from reaching these destinations, and in a manner that complements, not competes with, the future LAX People Mover

**Official Hearing Transcript
Granada Hills Charter High School
Granada Hills, California
Wednesday, October 22, 2003**

Following this page is the transcript of the oral testimony taken at the above hearing. Each speaker at the hearing has been assigned a unique identification number. The numbers assigned to each speaker for this hearing are:

Number	Speaker	Affiliation
SPHGH00001	Roger Cohen	Air Transport Association
SPHGH00002	Diana Dixon-Davis	None Provided
SPHGH00003	Bobby Blanks	Congressmember Maxine Waters' Office
SPHGH00004	Sergio Ramos	Laborers Local 300
SPHGH00005	Mike Ayer	None Provided
SPHGH00006	Chris Heywood	Los Angeles Convention and Visitors Bureau
SPHGH00007	Harry Sheffron	None Provided
SPHGH00008	M. E. Bryson	None Provided
SPHGH00009	Francisco Arrizon	Laborers Local 300
SPHGH00010	Jim Hilfenhaus	Democratic Party for the San Fernando Valley
SPHGH00011	Javier Nunez	Laborers Local 300

Any exhibits attached to this hearing transcript have been previously reproduced in this Final EIS/EIR as individual public comment letters.

1 GRANADA HILLS, CALIFORNIA, WEDNESDAY, OCTOBER 22, 2003

2 6:00 O'CLOCK P.M.

3 ---oOo---

4
5 MS. SMITH: Good evening, ladies and gentlemen. On
6 behalf of the Federal Aviation Administration and
7 Los Angeles World Airports, I want to welcome you to the
8 11th hearing in a series of 12 public hearings being
9 conducted to receive your comments on the Environmental
10 Impact Statement and Environmental Impact Report for the
11 LAX Master Plan.

12 My name is Shauna Smith. I will be your
13 facilitator this evening. The two gentlemen to my right
14 will be receiving your testimony this evening.

15 Before we start the formal proceedings, they
16 each have introductory remarks that they would like to
17 make to you. We'll start with Mr. David Kessler who is
18 an Environmental Protection Specialist with the Federal
19 Aviation Administration.

20 Mr. Kessler.

21 MR. KESSLER: Thank you. Good evening, ladies and
22 gentlemen. My name is David Kessler. I'm the
23 Environmental Protection Specialist for the Airports
24 Division of the Federal Aviation Administration,
25 Western-Pacific Region. I would like to welcome you to

1 the 11th of a series of public hearings the FAA and
2 Los Angeles World Airports, or LAWA, are conducting on
3 the Supplement to the Draft Environmental Impact
4 Statement/Environmental Impact Report, or EIS/EIR, for
5 the proposed Master Plan at Los Angeles International
6 Airport.

7 The Supplement to the Draft EIS/EIR addresses
8 an additional Alternative, Alternative D, the Enhanced
9 Safety and Security Plan that was added in the fall of
10 2001. This new Alternative was added as a result of
11 comments submitted on the 2001 Draft EIS/EIR and the
12 terrorist attacks that occurred on September 11th, 2001.

13 The Notice of Availability of the Supplement
14 to the Draft EIS/EIR was published in various local
15 newspapers and in the Federal Register on Friday, July
16 11, 2003. The FAA and LAWA are the authors of the
17 Supplement. The Federal Highway Administration is also
18 a cooperating agency in the preparation of the Draft
19 EIS/EIR that was published in January 2001. The purpose
20 of these hearings is to collect the comments from the
21 general public concerning the adequacy of the
22 information disclosed to the Supplement to the Draft
23 EIS/EIR on the proposed Alternative D.

24 I would like to take this opportunity to make
25 sure that everyone understands that no decision will be

1 made today regarding the proposed project. Today's
2 hearing is not a question-and-answer-type of forum. Our
3 job is to listen to what you have to say about the
4 adequacy of the information to the Supplement to the
5 Draft EIS/EIR. In other words, it is your turn to talk
6 to us. Since we are here to listen, we are not going to
7 respond to questions about the pros and cons of the
8 proposed project.

9 Since 5:00 o'clock this afternoon, we have
10 held a public workshop just outside of this room for
11 anyone to ask questions about the Master Plan, the
12 environmental process and the various proposed projects.

13 Following publication of the Supplement to the
14 Draft EIS/EIR for review and comment, the next step in
15 the joint federal and state environmental disclosure
16 process is conducting today's hearing along with the
17 public hearings that were held and the three that we are
18 going to continue to hold this week.

19 I would like to take this opportunity to recap
20 the environmental disclosure process for this project.
21 The environmental evaluation of the LAX Master Plan
22 began in 1997 with the publication of the Notice of
23 Intent to prepare the joint EIS/EIR in the Federal
24 Register. In July of 1997 we held a series of meetings
25 with members of the public and governmental agencies to

1 receive comments on the scope of the Draft EIS/EIR.
2 Following those meetings, the Draft EIS/EIR was
3 published in January 2001. Both the 2001 Draft EIS/EIR
4 and the 2003 Supplement have been prepared pursuant to
5 the National Environmental Policy Act of 1969, or NEPA,
6 the Council on Environmental Quality Regulations, which
7 are the implementing regulations for NEPA, and the
8 California Environmental Quality Act of 1970, or CEQA.
9 The documents have also been prepared pursuant to the
10 Airport and Airway Improvement Act of 1982, as amended.

11 Following today's hearings and the close of
12 the comment period, we will then correct and revise the
13 EIS/EIR, as necessary, based on the comments received.
14 We will also prepare responses to the comments we
15 receive and include those responses along with those
16 that were submitted to the FAA and LAWA on the 2001
17 Draft EIS/EIR in the Final EIS/EIR. The information
18 contained in the Supplement will also be combined with
19 the information in the 2001 Draft EIS/EIR into the Final
20 EIS/EIR.

21 Before we begin receiving verbal comments, we
22 would like to let you know the ground rules of the
23 hearing. First, as I said earlier, we are not here to
24 respond to questions about this project. We are only
25 here to listen to your comments and take notes. We also

1 have a court reporter here present to ensure we have an
2 accurate transcript of the hearing.

3 For anyone who would like to speak, we would
4 like to ask you to fill out a speaker card, like this
5 one, and give it to one of the people at the sign-in
6 desk. The cards will then be brought up here to our
7 facilitator who then call the names of each speaker so
8 we could proceed in an orderly fashion.

9 So that everyone gets an opportunity to
10 provide verbal comments, everyone will be allowed three
11 minutes to speak. To be fair to everyone, we will not
12 allow people to transfer their allotted time to someone
13 else. I ask that when you speak, you give us your name
14 and address for the record. We also have a Spanish
15 language translator available for anyone wishing to
16 provide their comments in Spanish.

17 If there is anyone who is uncomfortable
18 speaking in front of a group or if you need more than
19 three minutes to provide your comments, we ask that you
20 provide your comments in writing. We have comment
21 sheets, like this one, also available for your use at
22 the sign-in desk. You could leave your comments at the
23 sign-in desk or you may mail your written comments using
24 either the comment sheet or a letter to either address
25 on the cover of the Supplement to the Draft EIS/EIR.

1 I would like you to understand that a verbal
2 comment is just as important as a written comment. So
3 please feel free to provide any comments on the document
4 you may have to us either verbally today or in writing.

5 On August 1st, 2003 LAWA asked the FAA to
6 extend the public comment period to a total of
7 120 days. FAA has agreed to LAWA's request. On Friday,
8 August 22nd, 2003 the U.S. Environmental Protection
9 Agency published a Notice in the Federal Register
10 announcing the extension to the public comment period.
11 Therefore, comments on the Supplement to the Draft
12 EIS/EIR are now due by 5:00 p.m. Pacific Standard Time
13 on Friday, November 7th, 2003.

14 Lastly, I would like everyone to know that
15 even though we have this hearing scheduled until
16 9:00 o'clock this evening, we will stay here as long as
17 necessary for everyone to get a chance to provide verbal
18 comments on the Supplement to the Draft EIS/EIR. As I
19 said earlier, our job here today is to listen to your
20 comments.

21 At this time I ask that everyone in the room
22 take a moment to turn off your cell phones and pagers to
23 be courteous to those people making verbal comments at
24 tonight's hearing.

25 Now I will return the hearing back to our

1 facilitator who will introduce Mr. Jim Ritchie who will
2 provide some introductory comments from LAWA. Following
3 Mr. Ritchie's comments, we will then collect the speaker
4 cards and call the name of the first speaker.

5 Thank you.

6 MS. SMITH: Thank you, Mr. Kessler. Next I would
7 like to introduce Mr. Jim Ritchie, Deputy Executive
8 Director of Los Angeles World Airports.

9 MR. RITCHIE: Thank you, Shauna. Thank you ladies
10 and gentlemen for coming out tonight. On behalf of the
11 Mayor's office, on behalf of L.A. World Airports, we
12 welcome you to Granada Hills High to what has been now
13 the 11th public hearing. I see many friends in the
14 audience.

15 We appreciate you taking the time tonight to
16 comment on the environmental process that is a component
17 of a lengthy analysis that we have undertaken.

18 You may recall in the year 2001 we were in an
19 11-month public comment period during that time frame
20 examining three other Alternatives, Alternatives A, B
21 and C, expansion alternatives as described. It was
22 during that time frame, of course, we had a tragic event
23 that impacted the nation in the form of a terrorist act
24 on September 11th midway through the review of that
25 environmental process and those alternatives.

1 Under the guidance and the leadership of the
2 Mayor of Los Angeles, Jim Hahn, we have reshaped and
3 added an additional Alternative commonly referred to as
4 Alternative D for your examination this evening.

5 Tonight we will accept, as Mr. Kessler said,
6 your comments on Alternative D. We can assure you that
7 up to this point the Alternative, as described, has
8 undergone and passed the rigorous environmental analysis
9 prescribed by the Federal Government and the State of
10 California.

11 So with that, again, we appreciate your
12 presence and look forward to your comments.

13 Ms. Smith.

14 MS. SMITH: Thank you, Mr. Ritchie. As Mr. Kessler
15 and Mr. Ritchie just explained to you, we are here to
16 receive your testimony. And the only purpose of my role
17 here is to help you stay within the three-minute time
18 frame, as Mr. Kessler explained to you, and tell you a
19 little bit about this clock here.

20 I won't start your time until after you say
21 your name and address for the record. I ask that you
22 spell your last name, if possible, and speak as clearly
23 and loudly as possible for our court reporters to get
24 your testimony and to get your name into the record.

25 Once I start the time, the green light will

1 appear. When you have 30 seconds left, you will see the
2 yellow light appear. At that time I suggest you start
3 wrapping up your remarks. When your time is expired,
4 you will see the red light appear and you will hear a
5 beep tone. At that time I'm going to have to ask you to
6 end your remarks and call the next speakers.

7 With that said, I will start. I will call our
8 first two speakers so that the next person could prepare
9 to speak. We have Roger Cohen and Diana Dixon-Davis.

10 MR. COHEN: Good evening. My name is Roger Cohen,
11 C-o-h-e-n. I am managing director of state and local
12 government affairs for the Air Transport Association in
13 Washington, D.C. We will be submitting detailed
14 comments for the record.

15 (The comments were not submitted at this hearing.)

16 MR. COHEN: Let me take a moment to thank everybody
17 and explain who ATA is. ATA and our 23-member airlines
18 provide 95 percent of these scheduled service both
19 passenger and cargo here in the United States. We and
20 our member airlines share the same goal of everyone else
21 here in Southern California, and that is to maintain a
22 safe, secure and efficient LAX so that it continues to
23 be the community's number one economic asset.

24 ATA's purpose for appearing this evening is to
25 emphasize the importance of the LAX Master Plan to the

1 airline industry and to the national aviation system.
2 Our goal is that at the end of the Master Plan process,
3 LAX not only is an efficient cost-effective airport, but
4 that by working with all parties we can make LAX great
5 once again.

6 Doing nothing is not an option. And there are
7 several improvements long overdue and should begin
8 immediately, including immediately undertake the south
9 airfield runway improvements. We must alleviate the
10 roadway congestion, and we must upgrade the security
11 related infrastructure.

12 Going forward there are several principles
13 that we at ATA will focus on. First is flexibility.
14 And the airline industry is rapidly changing and has
15 undergone more radical upheaval in the last two years
16 than it has in its 75-year history. Future customer
17 patterns, security rules, and so forth, cannot be
18 predicted. So LAX should not lock into any plan that
19 forecloses future options.

20 Secondly, we must maintain the multifaceted
21 LAX mission. It's the world's largest O&D airport, most
22 unique in the country, if not in the world in this
23 regard. It serves long haul domestic, short haul
24 domestic flights. It is an international center and
25 cargo hub. The Master Plan should not sacrifice any of

1 these missions since Southern California has no other
2 viable airport options.

3 Thirdly, we must improve aviation safety,
4 security and capacity. The project should be
5 prioritized to fix the immediate aviation issues such as
6 the south airfield.

7 I would like to also focus on customer and
8 marketplace based solutions. LAX must be fixed to
9 maximize customer convenience and make it easier, not
10 harder, for commerce to flow freely at the airport. And
11 in this regard we strongly believe that funneling all
12 passengers through Manchester Square will be a barrier
13 to good customer service.

14 Finally, LAX is paid for by the users. It
15 must not be a burden on already -- and it is not a
16 burden on the already strapped local government. \$10 to
17 \$12 billion dollars is more than this industry has
18 earned in total over its 75-year history. And even a
19 scaled back plan would create thousands of jobs locally
20 and would represent one of the largest public works
21 projects in the United States.

22 We at ATA will work with all parties through
23 this process so that at the end of the day we could all
24 point with pride to an LAX that works for the next
25 generation. Thank you.

1 MS. SMITH: Thank you. I apologize, I didn't start
2 the timer on time, so I had to go do this.

3 Our next speaker is Diana Dixon-Davis, and I
4 will start the clock on time.

5 MS. DIXON-DAVIS: My name is Diana Dixon-Davis.
6 That's spelled D-i-x-o-n, hyphen, D-a-v-i-s. I live at
7 10832 Glendora Avenue in Chatsworth. I'm actually a
8 member of a local neighborhood council. I'm a
9 demographer by training. And I have -- first I have a
10 housekeeping question.

11 Frankly, this is the first time. I know there
12 have been hearings and they've been around the city;
13 however, I have never seen the EIR document. And I'm
14 wondering, is it available in our libraries? I don't
15 want to take up my time. Can you redo that because I
16 think that is more for the benefit of everyone? Where
17 are they available and what is the internet and website
18 for access to this document? Pardon?

19 MR. RITCHIE: Go ahead and finish your time. I'll
20 talk to you on the break and tell you.

21 MS. DIXON-DAVIS: Well, I think it's for everyone's
22 benefit to know how to get ahold of these documents. It
23 shouldn't just be myself knowing privately.

24 MS. SMITH: Yes, Ms. Dixon, as Mr. Kessler
25 explained --

1 MR. RITCHIE: I would suggest not waste your three
2 minutes. I don't know the exact library. I can tell
3 you it's throughout the L.A. basin. LaxMasterplan.org
4 is how you can reach it on the website.

5 MS. DIXON-DAVIS: Okay. That is basically what I
6 wanted to hear. Okay. I'm going to bring up three
7 points. I don't know if I'll get to all three of them.

8 First, I wanted see -- I don't know how this
9 plan fits into the regional air traffic needs without
10 the community. And I think that -- I don't know if
11 that's stressed in there. We could not get an answer in
12 the workshop as to how it fits into the needs throughout
13 the -- not only the L.A. basin, but the Southern
14 California air passenger traffic needs.

15 Secondly, I'm concerned about the choke
16 points. If you have everyone coming into two or three
17 places, one abandoned suitcase or bag, such as my purse
18 over there, could trigger a security alert. You could
19 shutdown tremendous portions of the entire LAX facility.
20 Everyone coming in or everyone leaving, I think there
21 needs to be a study of what would happen if you have
22 security alerts in certain sections and how much --
23 right now security alerts are, in essence, isolated
24 because of this first nature of the check-in and
25 check-out system.

1 Thirdly, and this is the most important point
2 I wanted to raise is concerning handicap facilities. I
3 have an inherited problem of muscular dystrophy. And I
4 find it very tiring to go through LAX because of the
5 long walks that currently exists. And it looks like
6 this will increase walking distance extensively. And
7 I'm wondering if there have been studies done as to
8 right now if I'm dropped off at the curb and I have to
9 walk to the check-in and then to the airplane, how many
10 feet I walk versus what it will be with now all these
11 remote access and constant changing of -- you have to go
12 from your car, to the train to -- or to the walkway, to
13 a train, to another walkway, to another place. It's
14 just -- I think there is going to be a significant
15 increase in the walking distance. And this will have a
16 significant impact on handicapped passengers who are
17 traveling alone.

18 And then those who are traveling with an
19 attendant might find it even more difficult. Because
20 currently if I take my mother to the airport, I can get
21 dropped off right at the curb. And, basically, we
22 arrange for a -- a wheelchair right there at the
23 entrance or I escort her using a wheelchair or other
24 type of conveyance up to the plane. And they give me
25 special permission for this. But right now I don't see

1 this -- I don't know whether this is incorporated into
2 your study. And I think giving the federal requirements
3 of ADA access, if this is an important thing, then
4 perhaps needs to be added to your study.

5 And, also, I would suggest that you do make
6 notification to all the neighborhood councils in the
7 city about these last few hearings. We have not heard
8 about this hearing in advance. I saw it in the paper
9 today. And I am the vice president of the local
10 neighborhood council. And there are 90 of us out there
11 who need to be notified. Thank you.

12 MS. SMITH: Thank you, Ms. Dixon.

13 Our next speakers are Bobby Blanks and Sergio
14 Ramos. I just want to -- you guys can prepare to come
15 up, Mr. Blanks first, but I just wanted to go over a
16 couple of ground rules before we proceed.

17 First I just wanted to reiterate that we're
18 here to take your testimony and your comments. We're
19 not able to answer questions during this period. We
20 still have some of our consultants in the workshop room
21 that are able to answer those questions and to answer
22 Ms. Dixon's question about where the document is
23 available. We still have people sitting in at the
24 sign-in area. And this young lady waiving the beige
25 document in her hand can provide that information to

1 you. We do have consultants placed all around that can
2 answer those questions, but this period, the three
3 minutes, is just to receive your testimony.

4 And if you're reading from any documents, if
5 you could give those to our court reporters after you're
6 finished so they can place those in the record as well.
7 Thank you.

8 I apologize, Mr. Blanks.

9 MR. BLANKS: My name is Bobby Blanks, B-l-a-n-k-s.
10 And I am the Field Representative to Congressman
11 Maxine Waters of the 35th Congressional District and
12 which LAX resides. Address, 10124 South Broadway, Suite
13 Number 1, Los Angeles, California 90003.

14 Alternative D is a \$9-billion-dollar project
15 that would demolish homes and disturb communities
16 without improving the safety and security of LAX. The
17 Supplement to the Draft EIS/EIR is an inaccurate and
18 misleading document that fails to reflect the true
19 impact of this project.

20 Local families could no longer drive to the
21 Central Terminal Area in order to drop off passengers.
22 Instead, an automated people mover would be constructed
23 to transport people to the airport terminals, and a
24 baggage tunnel will be constructed to transport baggage.
25 All airport employees and passengers would access the

1 Central Terminal Area from the Ground Transportation
2 Center, the Intermodal Transportation Center, and the
3 Rental Car Center via the automated people mover
4 carrying their carry-on baggage with them. This would
5 be extremely inconvenient for most passengers, and it
6 would present special hardships for the elderly, the
7 handicapped and families traveling with small children.

8 On July 25th, 2003 I introduced H.R. 2985, a
9 bill to condition construction of a remote passenger
10 check-in facility at LAX upon a finding that such a
11 facility would promote the safety and security of the
12 public. H.R. 2985 would require the Secretary of
13 Homeland Security to review the proposed facility prior
14 to its construction to determine whether it will protect
15 the safety and security of air passengers and the
16 general public more effectively than the existing
17 facilities at LAX. If the Secretary of Homeland
18 Security does not determine that the facility will
19 improve public safety and security, the Federal Aviation
20 Administration would not be allowed to approve its
21 construction. On September 2nd the Board of Supervisors
22 of Los Angeles County passed a motion to support my
23 legislation.

24 In reality, Alternative D will displace
25 thousands of Manchester Square residents. In order to

1 construct the remote passenger check-in facility, the
2 City of Los Angeles would have to acquire and demolish
3 38 houses, 179 apartment buildings and a 52-year-old
4 elementary school, in addition to the 263 structures it
5 has already acquired. It would also have to relocate
6 about 6,200 people, some of whom have federally
7 subsidized housing vouchers. I strongly oppose the
8 forced relocation of any of these residents.

9 The American people are sick and tired of
10 deficits and bloated government spending. The State of
11 California is now running a \$38-billion-dollar deficit,
12 and the federal government has a \$374-billion-dollar
13 deficit in 2003. Furthermore, Congress is in the
14 process of providing the President an additional
15 \$87 billion for continuing operations in Iraq and
16 Afghanistan. The American people cannot afford to spend
17 \$9 billion on an outrageously expensive boondoggle at
18 LAX. Alternative D is simply a continuation of former
19 Mayor Richard Riordan's plan to expand the airport in
20 the name of safety and security.

21 (The statement submitted for the
22 record was marked as Statement 1
23 and is attached hereto.)

24 MS. SMITH: Thank you.

25 Sergio Ramos.

1 MR. RAMOS: Good afternoon. My name is Sergio
2 Ramos. And I'm a union representative. I'm here on
3 behalf of my business manager Sergio Rascon of Laborer's
4 Local 300. We represent 7,000-plus members.

5 I'm here to testify on behalf of Alternative D
6 because it is the best plan for the City of Los Angeles.
7 The plan provides for 49,000 construction jobs. With
8 all the budget cuts and layoffs, jobs will help to
9 stimulate our regional economy and keep people working.
10 We support Alternative D of LAX Master Plan. Thank you.

11 MS. SMITH: Thank you. Mike Ayre and Christopher
12 Heywood, please.

13 MR. AYRE: My name is Mike Ayre spelled A-y-r-e;
14 address 17128 Lanark Street, Van Nuys, 91406.

15 I am here to speak in favor of the Mayor's
16 Alternative D plan. Mayor Hahn's plan addresses the
17 safety, security and regional needs. Most importantly,
18 it addresses the modernization that is necessary to
19 LAX to maintain LAX as a key international gateway and
20 one of the largest origination and destination airports.
21 Our regional economy needs -- our economy depends on it.
22 Modernization is long overdue. Let's move forward with
23 the Alternative D plan. Thank you.

24 MS. SMITH: Thank you.

25 Mr. Heywood.

1 MR. HEYWOOD: Good evening. My name is Chris
2 Heywood. I'm representing L.A., Inc., the Convention &
3 Visitor's Bureau, L.A.'s official tourism marketing
4 organization. And we are here in support of LAX Master
5 Plan Alternative D.

6 Tourism is L.A.'s second largest industry
7 representing 240,000 jobs in L.A. County alone in 2002.
8 We believe that Alternative D modernization of LAX is
9 key to maintaining L.A.'s key international gateway
10 status. Consumers have more choices than ever before in
11 terms of international gateway airports, and is crucial
12 for LAX to step up to the plate and ensure that its
13 already antiquated facility is brought up to modern
14 times.

15 LAX must also be in a comfortable position to
16 access its primary U.S. domestic markets. And we
17 believe that Alternative D does that. International
18 visitation to LAX represents 30 percent of total
19 visitors' spending. And ensuring that LAX is perceived
20 as a safe and secure airport from the international
21 market will ensure the steady flow of international
22 consumers. And we certainly want to continue to have
23 those consumers come to Los Angeles.

24 The plan also addresses the regionalization of
25 air travel demands throughout Southern California, and

1 we believe it is a sound and prudent Alternative.

2 Thank you.

3 MS. SMITH: Thank you.

4 Next we have Harry Sheffron, and Francisco
5 Arrizon after Mr. Sheffron, please.

6 MR. SHEFFRON: Good evening. My name is Harry
7 Sheffron, S-h-e-f-f-r-o-n, at 17121 Lorillaro Street,
8 Granada Hills. I speak as a local resident.

9 The first I heard about this was in today's
10 paper. My main concern is the 405 and the 105 freeways.
11 People bring us all these wonderful ideas. You want to
12 increase the body flow through LAX by another ten
13 million people. And that's great. We are going to need
14 that because we want the community to grow. But we also
15 have to address, and this is what my main concern is,
16 traffic on the freeways. We have the longest parking
17 lot in the world. And I don't want to be on it any
18 longer than I have to.

19 So for the record, I want to make sure that
20 somebody is going to address the fact that we have
21 ground transportation in and out of the city, not just
22 at the airport, so that we could handle this extra ten
23 million people including the people that are going to be
24 living in the new communities that are being built
25 around the San Fernando Valley upwards of 30,000 homes.

1 That's going to add more bodies to the freeway every
2 single day. Frankly, I'm tired of sitting on the
3 freeway.

4 So this is just for the record I want to make
5 sure it gets addressed. Thank you.

6 MS. SMITH: Thank you.

7 Francisco Arrizon.

8 UNIDENTIFIED SPEAKER: He stepped out.

9 MS. SMITH: He stepped out.

10 Mr. Bryson or Ms. Bryson, M.E. Bryson.
11 Mr. Bryson, you can go ahead and give Francisco a
12 chance. You'll be right after Mr. Bryson, Mr. Arrizon.
13 Okay.

14 MR. BRYSON: My name is M.E. Bryson, B-r-y-s-o-n.
15 I'm speaking as a concerned Northridge citizen.

16 I am against this proposal. One of the main
17 reasons I am against this proposal is to turn around and
18 make this one airport in Los Angeles the major source of
19 transportation in and out of this city and this country
20 would turn around and make it a very opportunistic
21 place for terrorists. If terrorists wanted to attack
22 this city and cause more harm to this country and our
23 economy, LAX would be a prime target. Wake up.

24 The other reason I'm against this is the
25 airport now is too big. It has poor highway access.

1 We'll add to check-in time. We'll increase access time
2 when weather is bad. We'll add noise to the surrounding
3 area. We'll increase the probability of overhead
4 accidents. And I've already told you about terroristic
5 opportunities. Too many people north of Mulholland
6 Drive need a better way to get in and out of the
7 Los Angeles, and the facility is available in Palmdale.
8 It is an international airport. It was intended to be
9 an international airport. The city has flubbed the dub.
10 Okay. The state at the current time has absolutely
11 nothing in their budgetary or planning stages to turn
12 around and provide better freeway or highway access to
13 the Los Angeles International Airport.

14 Now, my reasons why it should be the
15 international airport in Palmdale is Palmdale, like I've
16 already said, is a major international airport. And it
17 will make less attractive for terrorists. If there is a
18 terrorist bomb down in the Los Angeles International
19 Airport, you can kiss this city good-bye. The economic
20 effects would be unbelievable. You might as well just
21 drop an atomic bomb right in the middle of the Civic
22 Center. And I hope you people realize that.

23 We made a horrible mistake when we moved our
24 Navy fleet out of Long Beach and put it down in
25 San Diego for Admiral's Holiday. And everybody that

1 knows anything about planning knows you never put your
2 major forces in one place where they can all be attacked
3 at one time. Thank you.

4 MS. SMITH: Thank you. Francisco Arrizon.

5 MR. ARRIZON: Yes. Thank you. Good evening. Sorry
6 about that. I thought --

7 MS. SMITH: That's okay. Could you just state your
8 name and spell it for the record, please.

9 MR. ARRIZON: Yes. My name is Francisco Arrizon.
10 I'm with the Laborer's Local 300. I'm here representing
11 Mr. Sergio Rascon, our business manager and, also, the
12 8,000 members of the local.

13 We are here in support of Alternative D. This
14 will create jobs for our labor force, for the community.
15 We have -- throughout the City of Los Angeles we have
16 residents. I represent the public sector employees that
17 work in the school district, the County, the L.A.
18 Housing Authority, that they constantly are using our
19 airports. And it facilitates all of the air travels for
20 business, for pleasure. And once again, we are here in
21 support. Thank you.

22 MS. SMITH: Thank you. Do we have anyone else
23 present that wishes to give their testimony? We're here
24 until 9:00 p.m. Please fill out a speaker card if you
25 wish to speak. We would like to receive your testimony.

1 The speaker cards are located at the sign-in desk at the
2 entrance to my left.

3 And at this point we'll take a 15-minute
4 recess and we'll reconvene -- what time do we have?
5 We'll reconvene at 6:50. Thank you.

6 (Recess was taken.)

7 MS. SMITH: If I could have your attention for one
8 moment, please. It's 7:00 p.m. We were to reconvene,
9 but we still don't have any speaker cards. If you wish
10 to give us your testimony, we are here to receive it
11 until 9:00 p.m., but we will stay in recess until we
12 receive another speaker card. Thank you.

13 (Recess was taken.)

14 MR. KESSLER: After a moment we are going to take
15 our next speaker.

16 MS. SMITH: Reconvening now, we'd like to ask
17 everyone to take your seats, and we'll call our next
18 speaker who is Mr. Jim Hilfenhaus. Mr. Jim Hilfenhaus?
19 "Hilfenhau"? Mr. Hilfenhaus. Oh, in the rest room.
20 Time-out.

21 (Discussion was held off the record.)

22 MS. SMITH: Now, do you understand the ground rules,
23 Mr. Hilfenhaus?

24 MR. HILFENHAUS: What's that?

25 MS. SMITH: Is it Mr. "Hilpenhau" or "House"?

1 MR. HILFENHAUS: "House."

2 MS. SMITH: "House." So I was right the first time.

3 Do you understand the ground rules? You have
4 three minutes. It starts at the green light. 30
5 seconds you see the yellow light. The red light time is
6 expiring. I will have to ask you to stop speaking. If
7 you can just state your name and address and spell your
8 last name for the record, and then I'll start your time.

9 MR. HILFENHAUS: Sure.

10 MS. SMITH: Thank you.

11 MR. HILFENHAUS: My name is Jim Hilfenhaus. It is
12 spelled H-i-l, F like Frank, e-n-h-a-u-s, like Sam.
13 Address is 9732 Via Siena, S-i-e-n-a, Burbank, but
14 actually it's in the City of Los Angeles, mailing
15 address Burbank, 91504.

16 Okay. And I'm here to speak as the Regional
17 Director of the Democratic Party for the San Fernando
18 Valley. The Democratic Party has gone on record in
19 support of the LAX Modernization Plan and has been in
20 that position since it was first brought up as the
21 expansion. We're strongly supportive on both jobs,
22 environmental and security issues involved here.

23 The modernization of the LAX is well needed.
24 It's a 40-year-old structure that was designed for first
25 jet flights. We're now expanding to larger jets. Of

1 course, the runways need to be separated, widened. But,
2 basically, everything from 9-11 forward has been a
3 retrofit. The modernization enables security to be
4 smooth and efficient and expeditious through the
5 airport.

6 The airport is an economic driving engine for
7 the City of Los Angeles. It's our port of entry for
8 international tourism and travel, and tourism is the
9 largest basis of the economics of the City of
10 Los Angeles. So we do need to continue our tourists'
11 travel, which is subdued since 9-11, but will be
12 continuously expanding as it is throughout the country.

13 This is a well overdue project. We have gone
14 on record in the L.A. County Democratic Central
15 Committee on support. I think three years ago we had a
16 huge hearing with both sides appearing. It was voted
17 overwhelmingly in support of the LAX. At that time it
18 was modernization. We continue to support this plan,
19 and Plan D the Alternative.

20 The work is needed. From an economic engine
21 of jobs for the work itself, a 12-billion-dollar input
22 into the L.A. economy, which may not be the issue here
23 at hand, but can't be denied, can recoup the energy of
24 California in our current recession. We are in a job
25 crisis, and we do need to have these jobs out there

1 rehabilitating the airport that will drive other
2 economic engines within this economy. The purchasing of
3 houses, the scholarships of schools, sending children
4 off to further their careers in college, we need that.
5 We need the jobs that come about through that. The
6 local community needs the jobs, as far as the
7 maintenance in the airport that the modernization will
8 bring, the securitization, the internal shopping centers
9 and such. So thank you for your time.

10 MS. SMITH: Thank you. Do any other audience
11 members care to speak?

12 At this time we do not have any other speaker
13 cards. We are here until 9:00 p.m. We'd like to
14 receive your testimony. We will go into recess until we
15 receive another speaker card. Thank you very much.

16 (Recess was taken.)

17 MR. KESSLER: If you could please take your seats.
18 We do have another speaker card, Mr. Javier Nunez. We
19 will be calling him in just a moment. So I ask everyone
20 to return to their seats so we could listen to
21 Mr. Nunez. Thank you.

22 Just a second. Shauna is our facilitator.
23 She is going to explain the rules of our hearing. And
24 then Mr. Ritchie here will be ready in just a moment.
25 Once we get started, we'll use our clock here to help

1 you with your testimony this evening.

2 MR. NUNEZ: Thank you.

3 MS. SMITH: Good evening, Mr. Nunez. Are you
4 familiar with how these clocks run?

5 MR. NUNEZ: Yes.

6 MS. SMITH: Okay. So I will start the clock after
7 you state your name and spell your last name and address
8 for the record. You will have three minutes. When you
9 have 30 seconds left, the yellow light will flash. When
10 your time has expired, the red light will flash and you
11 will hear a beep tone.

12 To my far right is Mr. Jim Ritchie who is the
13 Deputy Executive Director of Los Angeles World Airports.
14 And to my near right is Mr. David Kessler. He is an
15 Environmental Protection Specialist with the Federal
16 Aviation Administration. They are here to receive your
17 testimony. I am just here to facilitate. So with that
18 said --

19 MR. NUNEZ: Understood.

20 MS. SMITH: -- we're here to take your testimony.

21 MR. NUNEZ: Thank you. My name is Javier Nunez,
22 N-u-n-e-z. And my address is 11006 Noble Avenue,
23 Mission Hills, California. And I am vice president of
24 Laborer's Local 300 in the construction industry. Also
25 along with that, I'm also a minister with Victory

1 Outreach Ministries and have done some extensive
2 traveling in, you know, other countries. And been as a
3 minister and as a union official have done quite a bit
4 of traveling.

5 In my opinion, Los Angeles is in desperate
6 need of change at LAX. There has to be a system that
7 has to be put in place where we're able to not only at
8 the same time provide jobs for our community and provide
9 work, because that's one of the reasons why I'm here,
10 but foremost what's most important is the security of
11 the people, the security of children going through the
12 airport and making sure that we do the best that we can
13 do as residents of the Los Angeles County in securing
14 our airport for visitors that are coming in from other
15 countries as well as from those that live within the
16 County of Los Angeles that are leaving to other
17 countries or to other destinations.

18 I think what we have in place right now, it's
19 a place where the world has changed tremendously. From
20 the 1950s -- and we won't go back that further -- to the
21 year 2003 the minds of people have changed. The
22 attitudes of people have changed. For some reason there
23 seems to be the attitude of people is, if you don't do
24 what I say, then I'm going to go ahead and be vindictive
25 and I'm going to use violence to make my point across.

1 And that's what we need to stop. We need to be careful
2 and make sure that we put a plan together that that will
3 not occur. That we will not -- that we will have the
4 people traveling that are coming in and out of LAX first
5 of all and foremost be safe and that we implement a
6 system at LAX that will meet those needs because
7 Los Angeles in the minds of many people is a great
8 target.

9 But I know together, with all of us coming
10 together we could have a safe and a beautiful terminal
11 that people will feel secure. And we need to bring the
12 business back to L.A. And we need other people to feel
13 secure that when they come fly into Los Angeles and they
14 are going to Hollywood, that they are secure. We need
15 tourists from all over the world to come and visit L.A.
16 and leave their money here. God bless you.

17 MS, SMITH: Thank you.

18 MR. KESSLER: Thank you.

19 MS. SMITH: Good night. Thank you for coming.

20 All right. Are there any other audience
21 members who wish to give their testimony? We're here
22 until 9:00 p.m. Please fill out a speaker card if you
23 wish to give your testimony. We will recess until we
24 receive another speaker card. Thank you.

25 (Recess was taken.)

1 MR. KESSLER: Is there anyone who else has not had
2 an opportunity to speak concerning the information in
3 the Supplement to the Draft EIS/EIR?

4 Not seeing anyone else, I will remind everyone
5 that if you feel you're unable to provide us with verbal
6 comments today, we will be accepting written comments
7 until 5:00 p.m. Pacific Standard Time, Friday, November
8 7, 2003. You can mail your comments either to me at the
9 FAA or to Jim Ritchie with LAWA. The mailing addresses
10 are listed on the cover of the Supplement to the Draft
11 EIS/EIR.

12 I want to thank everyone for your comments
13 today. This public hearing for the Supplement to the
14 Draft EIS/EIR on the Los Angeles International Airport
15 Master Plan is now closed. Thank you.

16 (Whereupon the proceeding adjourned
17 at 9:00 o'clock p.m.)

Testimony from Rep. Maxine Waters

**Public Hearing on the Supplement to the Draft EIS/EIR
for the Proposed LAX Master Plan**

**Granada Hills Charter High School
10535 Zelzah Avenue
Granada Hills, CA 91344**

October 22, 2003

Alternative D is a \$9 billion project that would demolish homes and disturb communities without improving the safety and security of LAX. The Supplement to the Draft EIS/EIR is an inaccurate and misleading document that fails to reflect the true impact of this project.

The centerpiece of Alternative D is the Ground Transportation Center (GTC), a large remote passenger check-in facility that would be constructed at Manchester Square, several blocks away from the airport terminals. An Intermodal Transportation Center (ITC) would be constructed at Aviation Blvd. and Imperial Highway, which would provide a connection to the Green Line. According to the Supplement to the Draft EIS/EIR, the GTC and the ITC would be the primary access points for all passenger drop-off and pick-up and vehicle parking. A Consolidated Rental Car (RAC) facility would be constructed in Westchester.

Inconvenience for Passengers

Local families could no longer drive to the Central Terminal Area in order to drop off passengers. Instead, an Automated People Mover would be constructed to transport people to the airport terminals, and a baggage tunnel would be constructed to transport baggage. All airport employees and passengers would access the Central Terminal Area from the GTC, the ITC and the RAC via the Automated People Mover, carrying their carry-on baggage with them. This would be extremely inconvenient for most passengers, and it would present special hardships for the elderly, the handicapped and families traveling with small children.

Airport Security

Supporters of the proposed project to construct a remote passenger check-in facility claim that the facility is necessary to improve the safety and security of LAX and prevent terrorist attacks at LAX. Theoretically, diverting all vehicular traffic to remote parking structures and the remote passenger check-in facility would protect the Central Terminal Area from car bombs.

The RAND Corporation conducted a security study of the proposed remote passenger check-in facility, which was released on May 14, 2003. The study concluded that the proposed project would not significantly improve the security of LAX. The study also concluded that concentrating passengers in the proposed remote passenger check-in facility could increase the likelihood that the check-in facility would be the target of a terrorist attack. Finally, the study concluded that concentrating several airport functions in the remote passenger check-in facility could exacerbate the effects of an attack on airport operations.

On July 25, 2003, I introduced H.R. 2985, a bill to condition construction of a remote passenger check-in facility at LAX upon a finding that such a facility will promote the safety and security of the public. H.R. 2985 would require the Secretary of Homeland Security to review the proposed facility prior to its construction to determine whether it will protect the safety and security of air passengers and the general public more effectively than the existing facilities at LAX. If the Secretary of Homeland Security does not determine that the facility will improve public safety and security, the Federal Aviation Administration (FAA) would not be allowed to approve its construction. On September 2, the Board of Supervisors of Los Angeles County passed a motion to support my legislation.

Ironically, Alternative D does not even significantly improve security at the Central Terminal Area. According to the Supplement to the Draft EIS/EIR, Alternative D calls for the installation of new baggage screening facilities in the Central Terminal Area -- not the remote passenger check-in facility. If Alternative D were designed to protect the Central Terminal Area from terrorist attacks, one would think that the baggage would be fully screened before it is transported through the baggage tunnel to this area. Nine billion dollars is an extremely high price to pay for a security project that provides protection from car bombs but not from suitcase bombs.

Displacement of Residents

The Supplement to the Draft EIS/EIR makes the astounding claim that Alternative D would not displace any residents. Instead, the Supplement predicts that 2,500 houses and apartments will be acquired and the residents relocated under LAWA's existing Voluntary Residential Acquisition/Relocation Program, through which LAWA may acquire property and relocate residents on a voluntary basis in order to mitigate the impact of airport noise. The Supplement then concludes that Alternative D would not require the acquisition of any additional dwelling units or the relocation of any additional residents. This claim is especially ironic, given the fact that several Manchester Square residents have already said that they will not leave their homes voluntarily.

In reality, Alternative D would displace thousands of Manchester Square residents. In order to construct the remote passenger check-in facility, the City of Los Angeles would have to acquire and demolish 38 houses, 179 apartment buildings and a 52-year-old elementary school, in addition to the 263 structures it has already acquired. It would also have to relocate about 6,200 people, some of whom have federally subsidized housing vouchers. I strongly oppose the forced relocation of any of these residents.

The Cost of Alternative D

Alternative D would cost \$9 billion, an exorbitant amount of money, at a time when budget deficits are growing and the economy is weak. Airlines would be required to increase their passenger fees in order to fund the proposal, which would amount to a tax increase for air passengers. American taxpayers have already provided loan guarantees to the airline industry to keep the airlines in business following the terrorist attacks of September 11, 2001. They should not have to pay higher passenger fees for unnecessary airport construction projects as well.

Air passengers and other taxpayers are willing to support reasonable expenditures to pay for measures that provide real enhancements in security, such as the installation of baggage screening facilities. However, the remote passenger check-in facility, the Automated People Mover and the baggage tunnel included in Alternative D are not reasonable expenditures and do not provide real enhancements in security.

The American people are sick and tired of deficits and bloated government spending. The State of California is now running a \$38 billion deficit, and the federal government has a \$374 billion deficit in 2003. Furthermore, Congress is in the process of providing the President an additional \$87 billion for continuing operations in Iraq and Afghanistan. The American people cannot afford to spend \$9 billion on an outrageously expensive boondoggle at LAX.

Conclusion

Alternative D is simply a continuation of former Mayor Richard Riordan's plan to expand the airport in the name of safety and security. I urge the City Council of the City of Los Angeles to reject this ill-advised and expensive scheme that will displace thousands of Manchester Square residents without improving the safety and security of LAX.

**Official Hearing Transcript
Epic Center/Olympic Swim Stadium
Los Angeles, California
Saturday October 25, 2003**

Following this page is the transcript of the oral testimony taken at the above hearing. Each speaker at the hearing has been assigned a unique identification number. The numbers assigned to each speaker for this hearing are:

Number	Speaker	Affiliation

3 ---oOo---

4
5 MS. SMITH: If I could get everyone's attention,
6 please. On behalf of the Federal Aviation
7 Administration and Los Angeles World Airports, I want to
8 welcome you to the 12th hearing in our series of public
9 hearings being conducted to receive your comments on the
10 Environmental Impact Statement and Environmental Impact
11 Report for the LAX Master Plan. My name is Shauna Bain
12 Smith, and I will be your facilitator this morning.

13 The two gentlemen to my right will be
14 receiving your testimony. Before we start the formal
15 proceedings, they each have introductory remarks they
16 would like to make. I'll start with Mr. David Kessler
17 who is the Environmental Protection Specialist with the
18 Federation Aviation Administration.

19 Mr. Kessler.

20 MR. KESSLER: Thank you. Good morning, ladies and
21 gentlemen. My name is David Kessler. I'm the
22 Environmental Protection Specialist for the Airports
23 Division of the Federal Aviation Administration,
24 Western-Pacific Region. I would like to welcome you to
25 the 12th of a series of public hearings the FAA and

7

1 the Los Angeles World Airports, or LAWA, are conducting
2 for the Supplement to the Draft Environmental Impact
3 Statement/Environmental Impact Report, or EIS/EIR, for
4 the proposed Master Plan at Los Angeles International
5 Airport.

6 The Supplement to the Draft EIS/EIR addresses
7 an additional Alternative, Alternative D, the Enhanced
8 Safety and Security Plan that was added in the fall of
9 2001. This new Alternative was added as a result of
10 comments submitted on the 2001 Draft EIS/EIR and the
11 terrorist attacks that occurred on September 11th, 2001.

12 The Notice of Availability of the Supplement
13 to the Draft EIS/EIR was published in various local
14 newspapers and in the Federal Register on Friday, July
15 11, 2003. The FAA and LAWA are the authors of the
16 Supplement. The Federal Highway Administration is also
17 a cooperating agency in the preparation of the Draft
18 EIS/EIR that was published in January 2001. The purpose
19 of these hearings is to collect comments from the
20 general public concerning the adequacy of the
21 information disclosed to the Supplement to the Draft
22 EIS/EIR on the proposed Alternative D.

23 I would like to take this opportunity to make
24 sure that everyone understands that no decision will be
25 made today regarding the proposed project. Today's

1 hearing is not a question-and-answer-type of forum. Our
2 job is to listen to what you have to say about the
3 adequacy of the information in the Supplement to the
4 Draft EIS/EIR. In other words, it is your turn to talk
5 to us. Since we are here to listen, we are not going to
6 respond to questions about the pros and cons of the
7 proposed project.

8 Since 9:00 o'clock this morning we have held a
9 public workshop just outside of this room for anyone to
10 ask questions about the Master Plan, the environmental
11 process and the various proposed projects.

12 Following publication of the Supplement to the
13 Draft EIS/EIR for public review and comment, the next
14 step in the joint federal and state environmental
15 disclosure process is conducting today's hearing along
16 with the public hearings that were held in August and
17 earlier this week.

18 I would like to take this opportunity to recap
19 the environmental disclosure process for this project.
20 The environmental evaluation of the LAX Master Plan
21 began in 1997 with the publication of a Notice of Intent
22 to prepare the joint EIS/EIR in the Federal Register.
23 In July of 1997 we held a series of meetings with
24 members of the public and the governmental agencies to
25 receive comments on the scope of the Draft EIS/EIR.

1 Following those meetings, the Draft EIS/EIR was
2 published in January 2001. Both the 2001 Draft EIS/EIR
3 and the 2003 Supplement have been prepared pursuant to
4 the National Environmental Policy Act of 1969, or NEPA,
5 the California Environmental Quality Act of 1970, or
6 CEQA, and Airport and Airway Improvement Act of 1982, as
7 amended.

8 Following today's hearings and the close of
9 the comment period, we will then correct and revise the
10 EIS/EIR, as necessary, based on the comments received.
11 We will also prepare responses to the comments we
12 receive and include those responses along with those
13 that were submitted to the FAA and LAWA on the 2001
14 Draft EIS/EIR into the Final EIS/EIR. The information
15 contained in the Supplement will be combined with the
16 information in the 2001 Draft EIS/EIR into the Final
17 EIS/EIR.

18 Before we begin receiving verbal comments, we
19 would like to let you know the ground rules of this
20 hearing. First, as I said earlier, we are not here to
21 respond to questions about this project. We are only
22 here to listen to your comments and take notes. We also
23 have a court reporter here to ensure we have an accurate
24 transcript of this hearing.

25 For anyone wishing to speak, we ask that you

1 fill out a speaker card, like this one, which is
2 available at the sign-in desk. Please give it to one of
3 the people at the sign-in desk after you filled it out.
4 The cards will then be brought up here to our
5 facilitator who will then call the names of each speaker
6 so we could proceed in an orderly fashion.

7 So that everyone gets an opportunity to
8 provide verbal comments, everyone will be given three
9 minutes to speak. To be fair to everyone, we are not
10 going to allow people to transfer their allotted time to
11 someone else. I ask that when you speak, you give us
12 your name and address for the record. We also have a
13 Spanish language translator here for anyone wishing to
14 provide their comments in Spanish.

15 If there is anyone who is uncomfortable
16 speaking in front of a group or if you need more than
17 three minutes to provide your comments, we ask that you
18 provide your comments in writing. We have comment
19 sheets, like this one, also available for your use at
20 the sign-in desk. You could leave your comments at the
21 sign-in desk or you may mail your written comments using
22 either the comment sheet or a letter to either address
23 listed on the cover of the Supplement to the Draft
24 EIS/EIR.

25 I would like you to understand that a verbal

1 comment is just as important as a written comment. So
2 please feel free to provide any comments on the document
3 you may have to us either verbally today or in writing.

4 On August 1st, 2003 LAWA asked the FAA to
5 extend the public comment period to a total of
6 120 days. FAA agreed to LAWA's request. On Friday,
7 August 22nd, 2003 the U.S. Environmental Protection
8 Agency published a Notice in the Federal Register
9 announcing the extension to the public comment period.
10 Therefore, comments on the Supplement to the Draft
11 EIS/EIR are now due by 5:00 p.m. Pacific Standard Time
12 on Friday, November 7th, 2003.

13 Lastly, I would like everyone to know that
14 even though we have this hearing scheduled until
15 1:00 o'clock this afternoon, we will stay here as long
16 as necessary for everyone to get a chance to provide
17 verbal comments on the Supplement to the Draft EIS/EIR.
18 As I said earlier, our job here today is to listen to
19 your comments.

20 At this time I'd ask that everyone in the room
21 take a moment, please turn off your cell phones and
22 pagers to be courteous to those people making verbal
23 comments at today's hearing.

24 Now I will return the hearing back to our
25 facilitator who will introduce Mr. Jim Ritchie who will

1 provide some introductory comments from LAWA. Following
2 Mr. Ritchie's comments, we will then collect the speaker
3 cards and call the name of the first speaker.

4 Thank you.

5 MS. SMITH: Thank you, Mr. Kessler. Next I would
6 like to introduce Mr. Jim Ritchie, Deputy Executive
7 Director of Los Angeles World Airports.

8 Mr. Ritchie.

9 MR. RITCHIE: Good morning, ladies and gentlemen.
10 Thank you, Shauna. I would like to welcome you to what
11 is today our 12th public hearing in a series we have
12 commenced since the beginning of this public comment
13 period that will close on November the 7th. I guess
14 that's in a couple of weeks from now.

15 On behalf of Los Angeles World Airports, on
16 behalf of the City of Los Angeles we appreciate you
17 taking your precious day off of the weekend to come out
18 here and join us and give us your ideas and thoughts.

19 I'd also like to thank Councilman Parks for
20 suggesting this wonderful venue, the restoration is --
21 (audience begins clapping) -- the restoration of such an
22 old, wonderful facility.

23 You may recall, this is part of a process, a
24 rather long process, you'll recall where we were in the
25 year 2001. We started in January of that year with

1 public hearings -- public hearings and a comment period
2 that went for a total of 11 months ending in November of
3 that year. At that time, of course, that year we saw
4 a lot of interesting things, some tragic things at that
5 time. But during that time this group, many of our team
6 that you've met in the workshop, we were reviewing what
7 was referred to as expansion plans, Alternatives A, B
8 and C during that time frame.

9 Of course, in the year 2001 we learned a lot.
10 We learned a lot from the communities. We had new
11 elected leadership. We learned from the elected
12 leadership across the region that many felt expansion
13 plans were not appropriate. We listened to our elected
14 leaders. We had a new mayor, Jim Hahn. He made a
15 pledge during his candidacy. He was elected and has
16 said "My pledge, and I'm sticking to it" from the
17 standpoint of not expanding LAX, but defining it around
18 some of the more critical things.

19 Immediately after his office, of course, we
20 had -- immediately after he took office, of course, we
21 had those issues of public comments we were aware of.
22 We had the issues of safety and modernization that had
23 continued to nag us at the airport -- well, since 1984,
24 frankly, that issue. We all tragically recall on
25 September the 11th we had a new dynamic. We had the

1 issues of security that we had to address.

2 Jim Hahn stood up to the plate at that time
3 and told us "Get back to the drawing board. I want an
4 airport defined around no expansion. I want an airport
5 to address the safety issues. We have new security
6 issues and pressing modernization needs."

7 We went back to the drawing table. And we
8 just emerged not too long ago after working in the dark
9 late hours under the bright lights of our drafting
10 tables and prepared a new approach. We're rather
11 excited about that approach. We're excited to get your
12 comments on how we've done. I'm equally as proud of the
13 response that this team has made listening to your
14 comments through 2001, as I as incorporating the
15 guidance and leadership we received from our elected
16 officials.

17 So today is a very important day. We are
18 looking at -- I mentioned Alternatives A, B and C had
19 been reviewed today. We have a new Alternative,
20 Alternative D based around safety, security and
21 modernization. You've had an opportunity to review that
22 with some of our technical experts in the room next
23 door.

24 So, again, I thank you. I can assure you that
25 that Alternative that you have looked at, that we have

1 presented to the public and our elected leadership has
2 passed that same rigorous environmental test, which is
3 always a challenge. It has passed that test. It is
4 ready for your comments. It is ready for us to respond
5 to that and adjust the plan where we can take it to our
6 City Council and provide them with a range of
7 Alternatives to address probably the most important
8 public facility in the City of Los Angeles.

9 I may be a little biased when I say that, but,
10 of course, I work at the airport. So, again, thank you.
11 And, please, Shauna, let's go to work.

12 MS. SMITH: Thank you, Mr. Ritchie.

13 Again, my name is Shauna Bain Smith. And as
14 your facilitator today, my only purpose is to ensure
15 that all those that wish to comment are able to do so in
16 an orderly and timely fashion. I have this high-tech
17 clock here to help me do that. I just want to go over
18 some of the ground rules Mr. Kessler mentioned so that
19 everyone understands them clearly.

20 Everyone will be allowed three minutes to
21 speak. Once you fill out this speaker card, it will be
22 given to me in the order which they receive it. So no
23 one speaker will be taken out of order. I ask when you
24 come to the podium, you state your name and you spell
25 your last name for our court reporters because it's

1 important for us to have your name for the record.

2 After you state your name, I will start the
3 time. I won't start the time before then. Your three
4 minutes will start when the green light appears. When
5 you have 30 second, left you will see the yellow light.
6 At that time I ask that you start wrapping up your
7 remarks because I don't want to be rude and cut anybody
8 off. When you see the red light come on, that means you
9 have to end your remarks there.

10 If you're reading from some prepared remarks,
11 I would appreciate it if you could give us a copy of
12 what you're reading and we can enter those into the
13 record. If feel you don't have enough time to actually
14 say everything, we can still input those into the record
15 by you turning in your written remarks. And, also, as
16 Mr. Kessler mentioned, you can also fill out a written
17 comment form. So when the red light appears, you will
18 also hear a beep tone, and I will ask you to complete
19 your remarks.

20 And I will call three speaker names so that
21 people can prepare to come to the podium. Starting with
22 the first speaker, we'll begin.

23 Does everyone understand? Is everyone happy
24 with that? Okay, I'm going to start.

25 Our first speaker is Councilman Bernard Parks.

1 And after Councilman Parks we'll have Councilman Kelly
2 McDowell and Kevin Norton.

3 COUNCILMAN PARKS: Good morning. I understand this
4 is the last meeting. I appreciate you having this
5 extension so the community could have input. I also
6 appreciate and want to say thank you to my staff Jessie
7 and Yolanda for bringing this meeting to this facility.

8 One of the things you will hear, and I think
9 it's important -- oh. You're going to hear from the 8th
10 District residents. And that is that they have felt as
11 a historical process --

12 MS. SMITH: Hold on, please, Councilman Parks. I
13 apologize. We're going to adjust that mic, and I will
14 start your time over.

15 COUNCILMAN PARKS: Okay.

16 MS. SMITH: Can we do a test on the mic? Do we need
17 to raise the mic for you, Councilman Parks? You're such
18 a tall man.

19 (The AV technician adjusted his microphone.)

20 MS. SMITH: Is that better?

21 COUNCILMAN PARKS: That's better.

22 I want to thank you and thank the staff. But
23 I think what you're going to hear from the 8th District
24 residents, they feel they've been historically ignored
25 as it relates to airport issues. They hear and read in

1 the newspaper constantly that issues that deal with
2 Westchester, El Segundo, maybe Inglewood are really what
3 dominates the airport's view of the world.

4 We have thousands of residents that live in
5 the flight path. When you go to the area Century and
6 Westwood, the area of Vermont and Manchester many times
7 you cannot conduct business outside without having to
8 give deference to airplanes. There is a great deal of
9 concern about what has been used by the airport as to
10 the noise ordinances, and when houses will be insulated
11 and when they are not. What people do not understand is
12 the issue of where a house right next door is insulated
13 and the one next door is not. And they do not believe
14 that your 1992 chart is accurate, and that it's
15 something in which they believe many decisions have been
16 made based on that information.

17 Also, you're going to hear the issues of
18 mitigation. They are fully aware that years ago that
19 airport middle school was abandoned because of the
20 noise, but, yet, little or nothing has been done in the
21 schools in this community that also suffer from the
22 noise.

23 They also are going to be concerned about the
24 lack of mitigation for traffic and how people drive
25 through their community to get to the airport. But

1 there has been no traffic mitigation or concerns as
2 relates to their streets being widened, having park and
3 rides for traffic mitigation to take them around their
4 community.

5 You're going to hear comments about what is
6 perceived to be a violation of rules about late night
7 flying in the sense of flights certainly coming in much
8 later than what the airport has said historically.

9 You're also going to hear information about
10 low flying in the sense that people believe the flights
11 fly lower than what the rules require.

12 Also, some health issues. There are people
13 that live in the area of Century and Western that
14 believe there are many health issues that are caused by
15 repetitiveness of flights, the amount of exhaust. And I
16 know there have been discussions for years whether there
17 is a droppage of fuel in the area and where many tests
18 have been given. And the airport says that doesn't
19 happen, but, yet, people believe that is a common
20 practice as they go outside and look at their vehicles
21 and look at their lawns and look at their homes as it
22 relates to what they believe is fuel that basically will
23 drop from the airplanes.

24 So these are the kinds of things that the 8th
25 District community feels they've been ignored. They

1 feel as though the airport makes -- oh, okay. They make
2 millions of dollars providing a very valuable asset to
3 the City of Los Angeles. I think half a million jobs
4 are associated, but they also realize that their lives
5 are negatively impacted and should be dealt with.

6 The other issue you're going to hear about is
7 contracts, who gets the contracts when it is built and
8 the issue of the safety. Is it really safe when you
9 deal with bringing everyone into one area of the airport
10 to have their baggage as opposed to a diverse plan that
11 moves people throughout the airport?

12 With that, before she pulls the gong on me, I
13 just want to say thank you for coming out to this
14 community. Again, you're going to hear frustration
15 because there is a sense in this community that they've
16 been ignored for a long time on many issues, but
17 particularly this issue. Thank you.

18 MS. SMITH: You had two seconds to spare.

19 COUNCILMAN PARKS: Thank you.

20 MS. SMITH: Thank you, Councilman Parks.

21 Before you start, Councilman McDowell, I have
22 a couple of quick remarks. First of all, I apologize
23 for our timer flub. I want to ask one of our AV techs
24 if he wouldn't mind sitting here so that when we have
25 people come to the mic, he can adjust the mic

1 accordingly, and we won't have any more delays that way.

2 And if anyone has any electronic devices on in
3 the audience, can you please turn them off so that we
4 could be respectful for those that are giving comments?

5 And with that, Councilman McDowell.

6 COUNCILMAN MCDOWELL: Good morning. I'm Councilman
7 Kelly McDowell, representing the City of El Segundo.

8 Given the length and complexity of the Master
9 Plan and the environmental documents, our complete
10 documents, including those on technical issues, will be
11 finalized and submitted soon. And my City's comments
12 today are preliminary.

13 We continue to oppose Alternatives A, B and C
14 for the many reasons we expressed both orally and in
15 writing during the public review and comment period for
16 the original Draft EIS/EIR in 2002.

17 The City of El Segundo has not endorsed
18 Alternative D. However, we feel that its stated
19 objective of constraining LAX to its current capacity is
20 appropriate and supports a regional aviation approach.

21 To be clear, my city could only support an
22 alternative that by design will accommodate passenger
23 and cargo levels no greater than the physical capacity
24 of the airport as it exists today.

25 We have retained a nationally respected expert

1 to assess the capacity of Alternative D. And to the
2 extent our expert's findings are that the passenger and
3 capacity of Alternative D, as currently designed,
4 exceeds 78 million annual passengers, we would hope that
5 LAWA cooperate with El Segundo in incorporating any
6 revisions to the plan necessary to ensure the capacity
7 is not increased beyond 78 MAP.

8 Limiting LAX's capacity to its current
9 capacity has always been our number one goal. And we
10 believe that limiting capacity at LAX will allow other
11 airports in the region to develop and handle their fair
12 share of future regional aviation demand. However, my
13 city is concerned about the impacts of southside
14 airfield changes that would move the southernmost runway
15 50 feet closer to
16 El Segundo. LAWA has stated that it believes these
17 changes are necessary to improve runway safety.

18 However, we're currently studying the impacts
19 of the proposed reconfiguration and the options for the
20 southern runway complex.

21 In particular, we urge full public
22 consideration of end-around taxiways as an alternative
23 that could provide greater safety at lower cost and with
24 fewer new burdens on local communities.

25 Safety at LAX must be a priority for everyone.

1 We are prepared to support measures necessary to enhance
2 safety, even if those measures increase our burden, but
3 only if we are assured through an independent expert
4 that Alternatives with fewer impacts are not equally
5 effective.

6 In conclusion, we are grateful for Mayor
7 Hahn's responsive leadership and his pledge to constrain
8 growth at LAX and to foster a regional approach to
9 meeting future aviation demand. And it is our hope that
10 the ultimate outcome of the Master Plan process will be
11 a regional airport approach that ensures that LAX does
12 not exceed its current capacity. Thank you.

13 (The statement submitted for the
14 record was marked as Statement 1
15 and is attached hereto.)

16 MR. RITCHIE: Thank you.

17 MS. SMITH: Thank you.

18 MR. NORTON: Good morning. My name is Kevin Norton.
19 I'm a business representative with International
20 Brotherhood of Electrical workers Local 11; 833 Airport
21 Boulevard, Los Angeles.

22 I wanted to testify on LAX Master Plan and in
23 support of Alternative D that Mayor Hahn has presented.
24 I know that LAX needs to be fixed. Most people here
25 know that LAX needs to be fixed. They also know that

1 doing nothing won't improve safety. Doing nothing will
2 not make our lives more secure, and doing nothing will
3 not stop people from using this airport. If we want a
4 limit of the number of people who will be flying out of
5 LAX, we need to adopt Alternative D. If we want traffic
6 improvements that are a part of this plan, we need to
7 move forward. If the airport is to be improved and made
8 safer, we need to use the designs that are built into
9 Alternative D. I hope your recommendations will be to
10 improve the environmental impact reports and support
11 Mayor Hahn's recommendation. Thank you.

12 MS. SMITH: Thank you. Again, I would ask everyone
13 to turn off their electronic devices, please.

14 Next we'll have Mr. Denny Schneider. After
15 Mr. Schneider we have Mr. Shabaca Heru. And after
16 Mr. Heru we have Ms. Emma Worthington. Thank you.

17 MR. SCHNEIDER: I'm Denny Schneider; 7929 Breen,
18 Westchester.

19 I'd like to address many issues. I also speak
20 on behalf of ARSAC, the Alliance for Regional Solution
21 to Airport Congestion. We're the ones that got the
22 mayor to his no expansion pledge, which he is not
23 meeting. We do not feel that this plan holds the
24 airport to 78 million annual passengers. It allows for
25 future expansion of significant size.

1 With all that said, I have personal concerns,
2 and that is safety, health, and what it's doing to our
3 communities. We have a problem here that as they are
4 now doing research, they are finding that we have
5 problems from the noise levels that are current criteria
6 that is causing us to endure high blood pressure, gastro
7 problems and everything else that you could imagine.
8 This plan does not resolve the issue. It helps foster
9 concentration of air traffic at LAX, not the region.
10 75 percent of all the traffic in the region will still
11 be going out of LAX. And that's like putting a sign
12 that says "If anything happens there, this community's
13 economy will tank." That is totally unacceptable.

14 There are some good things in the plan. There
15 are several unacceptable things including the Manchester
16 Square. This is a very unique situation where we, as
17 many of the community organizations -- and I could tell
18 you that our neighborhood council has also come out
19 against it with a very strongly worded article.

20 I also sit on the LAX Community Noise Round
21 Table where numerous serious questions of noise issues
22 have been raised. And the real issue is one of, how do
23 we resolve these issues? We need more cooperation and
24 listening. I can give you an example.

25 The OSAGE Neighbor's Association, of which I

1 am a board member, has represented the eastern half of
2 Westchester. For 14 months we have been requesting a
3 meeting with the Mayor's office, Board of Airport
4 Commissioners and LAWA. We have yet to have them find a
5 day that's available.

6 So in conclusion, I'm going to hand you a
7 small package of comments. And I wish you would
8 consider them because the documentation doesn't always
9 meet the videos and the words that we're hearing.
10 Thank you.

11 (The documents submitted for the
12 record were marked at Statement 2
13 and are bound under separate cover.)

14 MS. SMITH: Thank you, Mr. Schneider. No matter how
15 large or small, we do accept the comments. Thank you.

16 Mr. Shabaca Heru. Did I pronounce that
17 correctly, sir? Thank you. After Mr. Heru, we have
18 Emma Worthington.

19 MR. HERU: Good morning. My name is Shabaca Heru. I
20 live at 207 East 136th Street. That's H-e-r-u. My
21 organization's name is The Community Coalition for
22 Change. We have been in business for about eight years.

23 I've lived in L.A. County all my life. I've
24 moved around. What I'm concerned about primarily is
25 environmental injustice. The largest polluter in the

1 L.A. County area is the airport.

2 Just this morning in talking to people and
3 looking at the various proposals, they are very
4 ambitious. And it seems as though the biggest concern
5 isn't for the people because people have been affected
6 by the noise. They have been affected by the vibrations
7 of the aircraft. They've been affected by the
8 emissions. They have been affected by fuel falling on
9 their homes. They have been affected in various ways by
10 what's going on right now.

11 We'd like to have proposals that consider the
12 people first. The people seem to be put in a
13 confrontational position with the developers and with
14 the money interest. All of the plans, I think, have not
15 been presented to the public in a way that we can have
16 some sort of idea of what's going on. I think the
17 people in the city right now are held hostage. And we
18 would like to see something occur where there is
19 actually a clear dissemination of the information as to
20 what is going on. We'd like to have some clear-cut idea
21 as to how we're going to stop the pollution, not just
22 vague promises, not just lip service. And we'd like to
23 see that the expansion plan right now is capped and some
24 of the traffic is diverted to some of the airports in
25 the other outlying areas. There comes a point where it

1 becomes fruitless to just expand LAX, to concentrate and
2 to all of the development there. Thank you.

3 MS. SMITH: Thank you.

4 Ms. Worthington. And after Ms. Worthington we
5 have Tony Muhammad and Brenda Robinson.

6 MS. WORTHINGTON: My name is Emma Worthington.
7 That's W-o-r-t-h-i-n-g-t-o-n; 4634 West Imperial
8 Highway, Inglewood, California 90304.

9 I also work at the airport, and I have worked
10 at the airport for almost 30 years. I live in
11 Inglewood. And like a lot of my coworkers, we live in
12 the surrounding areas, Inglewood, Lennox, Hawthorne,
13 El Segundo and Westchester. We understand the
14 connection between good quality jobs and quality life.
15 We need new jobs, but we don't need minimum wage jobs.
16 What we need is jobs that provide a livable wage and
17 affordable family health coverage. The companies at the
18 airport provide those types of jobs, and that is how
19 I've been able to raise my family and not be on welfare.

20 In order to ensure this modernization plan
21 provides good employment opportunities for our
22 communities, we encourage the Mayor to include in his
23 plan a local hiring program, apprenticeships and
24 programs for the youth so that our youth can strive to a
25 better future.

1 When we talk about modernization, we say we
2 are bringing the airport and Los Angeles into the
3 21st Century. Well, we the workers would like to be
4 able to bring our communities into the 21st Century
5 along with the airport and the rest of Los Angeles. And
6 that is why we urge the Mayor to ensure that his plan
7 provides good paying jobs with good benefits and a
8 community packet that will ensure that we're along for
9 the ride and that we're not left behind. Thank you.

10 (The statement submitted for the
11 record was marked as Statement 3
12 and is attached hereto.)

13 MS. SMITH: Thank you. Mr. Tony "Mohammady," am I
14 pronouncing that correctly?

15 MR. MUHAMMAD: No.

16 MS. SMITH: I wanted to say "Mohammad," but there is
17 a Y on the end.

18 MR. MUHAMMAD: Well, okay. I'll get it right for
19 you.

20 I'm Minister Tony Muhammad. I'm the Western
21 Regional Representative for the Nation of Islam.
22 Muhammad is M-u-h-a-m-m-a-d.

23 First of all, I certainly thank you all for
24 coming to South Los Angeles. Our big concern here in
25 South Los Angeles that if this airport is going to be

1 expanded and built, then we want to make sure that our
2 community of South Los Angeles benefits in a great way.
3 And that we refuse to allow any constructions to go on
4 if we don't have our fair share.

5 So, therefore, we would hope that the Mayor's
6 office as well as your commission will partner, not just
7 with the multi-million dollar companies, but grass root
8 organizations. I'm talking about that man at the
9 bottom. And that there be apprenticeship programs set
10 up where we have proven programs that works with
11 ex-offenders, that worked with those gentlemen, men and
12 women, who are coming out of a lifestyle of gangs, who
13 wants to change their life, but there are no jobs.

14 So we're going to be watching you. We're
15 going to be circling our wagons to make sure that
16 whatever you're going to do is going to partner. We
17 want a real partnership with the community where you can
18 guarantee certain jobs as well as training. And if
19 these young men and women get the training and their
20 skills are used correctly, this is something they could
21 take for a lifetime. You could be very beneficial in
22 correcting a lot of social ills that is in our
23 community. For when we meet with many of the young men
24 and women who live a negative lifestyle, number one,
25 they said "we have no jobs." When there is no jobs,

1 there is hopelessness. And hopelessness becomes the
2 mother of violence.

3 And so, therefore, we would hope that you
4 would partner with our community and bring meaningful
5 jobs, not just jobs, but as well as work with
6 African-American and Latino contractors where we also
7 can get a big piece of the pie, I mean a big piece of
8 the pie. All right.

9 So we thank you and may God bless you all in
10 this endeavor. And we certainly will be watching.
11 Thank you.

12 MS. SMITH: Thank you. Ms. Brenda Robinson. And,
13 again, I apologize, Mr. Muhammad, but there is a Y
14 there.

15 MS. ROBINSON: Good morning. My name is Brenda
16 Robinson. That's R-o-b-i-n-s-o-n. I live at 1900 West
17 91st Street, 90047. And I have lived in the community
18 for 31 years.

19 I am here today to give testimony to the
20 damage being done to our homes as a result of the
21 increased air travel in our community. This issue is
22 not new to us. We have tried over the last ten years to
23 engage in a constructive dialogue with LAX airport
24 representatives time and time again. Yet, they have
25 decided to ignore our concerns and request for

1 assistance in repairing our homes that are impacted by
2 the increased air services. Many of our homes have
3 cracks in the foundations. Our doors and window frames
4 are out of alignment with the structure of the homes.
5 Our roofs have been damaged as a result of low flying
6 and the fumes traveling down. The noise has been so
7 loud when the airplanes are traveling over our homes
8 that we have to play an up-and-down game with the volume
9 control sound on our televisions in order to be able to
10 hear what is being said, in addition to our phone calls
11 not being able to hear someone talk to us because the
12 noise is so loud.

13 When representatives have met with us, and
14 that's only been on a few occasions, and have stated
15 that they wanted to work with us and to work
16 hand-in-hand in trying to address this issue, they are
17 not being true to their word. We have shown them based
18 on the MAP that you have as your flight path the noise
19 box indicators that it is outdated. It is well over ten
20 years old. And we are not even anywhere in the
21 indication of those noise box indicators.

22 We have requested time and time again that new
23 boxes be re-established and put into the community and
24 that we be an active part in identifying where those
25 boxes are placed. Yet, to no avail have we received any

1 kind of response to that request.

2 We are requesting -- and let me state it. No,
3 not requesting. We are demanding that the action take
4 place to address our concerns and to establish a
5 relationship with us in helping to resolve the issues
6 and the concerns of repairing our homes in the same
7 manner as you have done with Westchester, Inglewood and
8 a small portion of South L.A. close to the Inglewood
9 City line. Keep in mind that LAX is owned by the City.
10 And we as residents of the City pay taxes and we
11 patronize the facility and should be entitled to the
12 level of customer service you pay to visitors using that
13 facility. Thank you.

14 MS. SMITH: Thank you. Next we have Mr. Thomas
15 Heckman. After Mr. Heckman we have Skip Henke and Keith
16 Blauers after Mr. Henke.

17 Mr. Heckman.

18 MR. HECKMAN: Good morning. My name is Tom Heckman.
19 I'm member of Local 12 Operating Engineers. I'm also a
20 resident of the Village Green area of Los Angeles.

21 And I would like to say that I'm totally in
22 support of Mayor Hahn's Alternative D as the best plan
23 for the City of Los Angeles which would give jobs and
24 the proper flight plans and maybe deal with some of
25 these issues that we have coming up today. Thank you.

1 MS. SMITH: Thank you. If I could, again, remind
2 our speakers to spell their last names for our court
3 reporters, please.

4 Mr. Henke.

5 MR. HENKE: Thank you. My name is Skip Henke. Last
6 name is spelled H-e-n-k-e. I live at 3200 Whitney Lane
7 in the City of Burbank. I'm also in very close
8 proximity to the Burbank Airport. So I'm quite familiar
9 with the airplanes and noise and the other things that
10 happen when you live around it. And it's always not so
11 nice.

12 I'm a council representative for the
13 Los Angeles Building and Construction Trades Council.
14 Our constituents live throughout the Los Angeles,
15 Orange County, Ventura County area. And they fly when
16 they travel.

17 I myself find myself coming down to
18 Los Angeles International Airport periodically to fly to
19 a destination that I cannot reach from the Burbank
20 Airport in a very easy fashion.

21 I enjoy going to Burbank because it's
22 convenient. It's easily accessible. It's safe.
23 They have good security systems. And it's also near my
24 house. When I come to Los Angeles International
25 Airport, I find myself in a traffic jam. I find myself

1 not easily accessible standing in long lines being
2 detained for a long period of time to get access to the
3 ticket areas and to other locations within the airport
4 facilities.

5 When I get on the plane and I go to my
6 eventual destination, I do not find that. I find
7 airports that have been modernized, airports that have
8 been expanded, airports that have increased their
9 security system, their accessibility and the
10 transportation modes that are used in and around the
11 airport.

12 I stand here today to support Mayor Hahn's
13 Master Plan Alternative D. This plan limits the number
14 of passengers that can use LAX in the future and will
15 require the other airports in our region to take some of
16 the impact of new passengers. That along with the
17 security designs being incorporated into the plan will
18 benefit the flying public of the Los Angeles Regional
19 area.

20 Once again, I thank you for the opportunity to
21 speak here, and I urge your support of Alternative D.
22 Thank you.

23 MS. SMITH: Thank you.

24 Mr. Keith -- is it "Blauers" or "Blowers"?
25 "Blauers." And after Mr. Blauers we have James Hopkins,

1 please.

2 MR. BLAUERS: I'm Keith Blowers. I live at 6672
3 West 86th Place in Westchester. I want to thank you for
4 holding these hearings because I think they give us
5 information we need to make decisions on the effects of
6 a new airport. I believe the City is on the right track
7 with the LAX Master Plan, especially with Alternative D.

8 Alternative D designed has taken into account
9 all of the concerns. The traffic, noise and safety have
10 been voiced by elected officials. This plan will
11 improve the City's need to modernize the airport and the
12 responsibility to maintain a high degree of security.

13 This plan should be approved since it has
14 fulfilled the commitments that the airport has made to
15 the adjacent communities in the past. And with the time
16 and cost of the project being critical to improving the
17 City's airport commitments, I believe that the approval
18 process should be completed as soon as possible.

19 Thank you for your time.

20 MS. SMITH: Thank you.

21 Mr. Hopkins.

22 MR. HOPKINS: Hi. My name is James Hopkins. I live
23 at 6510 West 84th Place in Westchester right straight
24 across from the tower at LAX. And I just want to
25 express my favor of this expansion and this plan. It

1 certainly beats the other plans that they had up here
2 before.

3 Also where Westchester Parkway and the
4 Manchester Boulevard and Lincoln Boulevard, I think that
5 would accept and handle all the traffic in that area,
6 quite well on our side anyway, the Westchester side.

7 And as far as -- I hear a lot of people come
8 up here and express their concern about the noise. And
9 I just want to say that I only live four blocks from
10 Manchester right in the middle. And I have more
11 problems with neighbors' dogs making noise than I do
12 with the airport. Thank you very much.

13 MS. SMITH: Thank you. I'm going to call three more
14 speakers, and then we'll take a short break.

15 Mr. Kessler, Mr. Ritchie, 10 to 15 minutes?
16 Would that be okay? Thank you.

17 Steven Wehus. After Mr. Wehus we have James
18 Odom. And after Mr. Odom, we have Liz Badras.

19 Mr. Wehus. Thank you.

20 MR. WEHUS: Good morning. My name is Steve Wehus.
21 You said it right. Thank you. W-e-h-u-s. I live at
22 733 Hindry Avenue in the City of Inglewood. And if I
23 raise my hand, the airplane tires can touch me, but that
24 doesn't bother me.

25 I represent the International Brotherhood of

1 Electrical Workers Local 11. And I'd like to express my
2 support for Mayor Hahn's Alternative D. This project
3 will create 49,000 construction-related jobs which
4 impresses me because I'm pro Los Angeles, pro
5 Los Angeles County. I can work anywhere in the United
6 States. I chose L.A. to live. I love this city. I
7 support everything that this city does or doesn't do,
8 major projects, anything that concerns citizens. But
9 this project here environmentally isn't going to disrupt
10 anything. It's going to create jobs in the future. And
11 in the future and in the long run if we look at it, it's
12 going to benefit the City of Los Angeles.

13 I'm not too familiar with all of the programs
14 and all of the -- everything going on with the city, but
15 I do know one thing. It creates jobs. And to me 49,000
16 jobs is very impressive for Los Angeles residents.

17 Under the PLA agreement the jobs will be good
18 paying jobs. I think the plan is good for the workers
19 in Los Angeles -- no, I know it's good for the workers
20 Los Angeles.

21 I support Alternative D. I support the City
22 of Los Angeles. Thank you for listening to me.

23 MS. SMITH: Thank you.

24 MR. ODOM. Good morning. My name is James Odom,
25 O-d-o-m. I'm sorry. You were supposed to call --

1 MS. SMITH: No, no, no, you were right.

2 MR. ODOM: I reside at 3975 Cherry Wood Avenue in
3 the City of Los Angeles. I'm a Representative of the
4 Sheet Metal Trade Local 105 that covers
5 Los Angeles, Orange County, San Bernardino and
6 Bakersfield. I bring support of 5,000 members
7 supporting the L.A. Master Plan Alternative D.
8 Thank you.

9 MR. RITCHIE: Thank you.

10 MS. SMITH: Thank you.

11 Ms. Badras.

12 MS. BADRAS: Yes. Thank you. My name is Liz
13 Badras. And it's spelled B-a-d-r-a-s. I reside in
14 Glendale and I work in Hollywood.

15 I thank you very much for taking the time to
16 come out this morning to hear us. I've been in the
17 tourism and hospitality industry for over 20 years. I
18 work for a company that has been in tourism for over
19 35 years.

20 We are in support of the LAX Master Plan
21 because it's vital to the fundamental and continuation
22 of business growth and travel and tourism in
23 Los Angeles. The Master Plan outlines modernization and
24 security that are key elements required to ensure that
25 LAX remain an international gateway city for years to

1 come. Most important is the necessity to ensure our
2 airports in and around Los Angeles remain free from the
3 threat of terrorism. Widening the south runways to
4 prevent future airfield incursions when consolidating
5 rental car companies into one facility at LAX are some
6 of the merits that will encourage success of a well-run
7 airport.

8 Since tourism is the second largest industry
9 in Los Angeles, we feel it is very vital to support this
10 Master Plan. Thank you.

11 MS. SMITH: Thank you, Ms. Badras.

12 We're going to shorten this break because we
13 want to give everyone an opportunity to speak and get
14 their comments in. We don't want to hold anybody up.
15 So it's going to be a five-minute break, and we're going
16 to reconvene at 11:00 a.m.

17 (Recess was taken.)

18 MS. SMITH: If I could get everyone to take your
19 seats. If you have anyone in the hallway that you could
20 hustle in here, now would be a good time. I'm going to
21 go ahead and start while people are still coming in.

22 Again, good morning. My name is Shauna Bain
23 Smith. I'm your facilitator this morning. To my right
24 is David Kessler. He's an Environmental Protection
25 Specialist with the Federal Aviation Administration, and

1 Mr. Jim Ritchie, Deputy Executive Director of Los
2 Angeles World Airports.

3 We will reconvene now. And I just wanted to
4 go over the grounds rules again really quickly for those
5 that are just joining us. Everyone will have three
6 minutes to speak. We need you to fill out a speaker
7 card, which you can find at the registration desk if you
8 would like to speak. Your three minutes begins after
9 you give us your name and address for the record. If
10 you could spell your last names for our court reporters,
11 we would really appreciate that.

12 When you have 30 seconds of time left, you
13 will see this yellow light. When your time has expired,
14 you will see a red light and you will hear a beep tone.
15 I will call three names at a time so that you could
16 prepare your remarks while one person is speaking. I,
17 again, ask that if you have any electronic devices,
18 please turn them off now. And if we could keep
19 conversation to a minimum in order to respect those that
20 are speaking, I'm sure we would all appreciate it.

21 So with that said, I'll call our next three
22 speakers. Ms. Tammy Lazer. And after Ms. Lazer, we
23 have Mr. Charles Adelman. And after Mr. Adelman we have
24 Timothy Watkins.

25 MS. LAZER: I am standing, by the way. My name is

1 Tammy Lazer, L-a-z-e-r. I reside at 14159 Dickens
2 Street in Sherman Oaks. I'm a tour guide in the City of
3 Los Angeles for the last 20 years.

4 This expansion plan will be well situated to
5 meet the needs of the future of Los Angeles. An airport
6 that is modernizing is an airport with improved security
7 and conveniences. These perceptions help the case for
8 visiting Los Angeles and will certainly add to the
9 \$11 billion dollars in visitor spending in this city.
10 And, of course, we all know that we all benefit from
11 this, but what we need is a personal identity. So let's
12 become a first-class airport in the first-class city so
13 that we could maintain a standing as an international
14 Gateway.

15 LAX should provide passengers with direct
16 connections and protect its access to the primary U.S.
17 markets that are so important to us. The competition is
18 fierce out there. And everyone is investing their
19 ability to capture business which had traditionally come
20 to Los Angeles. Major destination at airports all over
21 are reinvesting to capture this international travel
22 market. And each year this international consumer and
23 domestic consumer is given other options in quality and
24 in quantity to his access to the United States. The LAX
25 modernization is necessary to meet the current and the

1 future aviation needs of this city. LAX is a Gateway to
2 the world. And we should certainly maintain a critical
3 role in aviation systems.

4 This expansion is a long-term investment and
5 will keep L.A. in the forefront. The eyes of the world
6 right now are on us with the advent of the Walt Disney
7 Hall, the new cathedral, the Getty museum. Thousands of
8 tourists and business people will be visiting
9 Los Angeles. So let's start to begin to take our bows
10 for a change as a first-class city with a first-class
11 airport. Let everyone know here today that there is
12 even more to come from Los Angeles. Thank you.

13 MS. SMITH: Thank you.

14 Mr. Charles Adelman. And, again, after
15 Mr. Adelman we'll have Timothy Watkins. And after Mr.
16 Watkins, we'll have Sheila Bernard, please.

17 MR. ADELMAN: Hi. My name is Charles Adelman,
18 A-d-e-l-m-a-n. I live at 6146 Eleanor Avenue in
19 Los Angeles. That's in Hollywood.

20 This plan proposes to spend billions of
21 dollars to fix up the airport, but it kind of leaves
22 things kind of the way they are, really. It just moves
23 congestion on the ground from one place to another,
24 moves a major security risk from the Central Terminal
25 Area to a new Central Parking Area off of the airport,

1 but doesn't really fix those problems.

2 The thing you have to remember about LAX, it
3 is a main trans pacific hub for the United States.
4 Every international flight going into or out of LAX
5 carries both local origin and destination passengers as
6 well as people connecting from other areas or to other
7 areas. The airlines need that to keep their airplanes
8 full on long international flights.

9 Transit, one of the major problems with LAX,
10 of course, is ground congestion. We cannot solve the
11 ground congestion problem by just moving the parking
12 from one place to another. We have got to build a real
13 mass transit system into the airport. We have got to
14 build direct rail connections from LAX to the other
15 airports in the region if you want the other airline --
16 airports to take some of the load off of LAX. You have
17 got to build real transit into LAX from downtown and
18 from the San Fernando Valley as well as from Orange
19 County because people are not all going to come in by
20 car and they are not all going to come in on the Green
21 Line coming from Norwalk because very few people are
22 coming to LAX from Norwalk.

23 Also the thing that needs to be dealt with at
24 LAX is we need to provide a little more in the way of
25 services for those people who are having to kill a lot

1 of time there between connecting flights. And that, by
2 the way, by providing more services for those people
3 will provide a new source of revenue for the airport to
4 make up for the revenue that is going to be lost if
5 people take public transit rather than paying to park.
6 Thank you.

7 MS. SMITH: Thank you.

8 Mr. Timothy Watkins.

9 MR. WATKINS: Good morning. My name is Timothy
10 Watkins. That's T-i-m-o-t-h-y, W-a-t-k-i-n-s. I live
11 at 1143 East 88th Place and I work at 10950 South
12 Central. Both of those locations are just about three
13 minutes apart from each other, and they are both under
14 the flight path into LAX.

15 I live in South Central Los Angeles, and I
16 don't mind much about the name change. It's South
17 Central Los Angeles for me because I live right off of
18 Central Avenue and 88th. It is South Central Avenue.
19 I've raised six children there and I've mentored two
20 children through college at the same location. And all
21 the while I've been there because I believe that we make
22 a contribution to the community.

23 When you get down to, you know, the impact
24 that the airplanes have on the community -- I'm happy to
25 see my brothers and sisters from the unions here because

1 I know that they are looking out for the best interests
2 of their membership. But as a community member, it's my
3 job at WLCAC to look out for their brothers and sisters,
4 mothers and fathers, grandparents and children that
5 aren't necessarily members of the union.

6 So I was especially pleased that Jim Hahn kept
7 one of his old campaign promises to reach out to the
8 community and invite people that are not ordinarily
9 invited into these discussions to have their voices
10 heard and to understand that there are, too,
11 opportunities for people that are not union members and
12 are not skilled yet, that there will be training
13 opportunities and there will be job development
14 opportunities to includes, again, those brothers and
15 sisters and sons and daughters of union members and
16 others.

17 At the end of the day, though, the question
18 that I'm raising -- and I hope everybody in this room
19 hears loud and clear -- is that the poor communities
20 that lie in the pathway of those flights that approach
21 the airport are going to feel the impact of whatever is
22 done for another 100 years and that we should be
23 involved in something that outlives the project to put
24 these improvements in place. We should be involved as
25 communities in something that either supplies a service,

1 a product, some goods or something else that brings
2 sustenance back to the community that helps improve
3 quality of life conditions.

4 Last thing I would like to say is that because
5 my daughters go to Westchester High School and they are
6 now going into the 12th grade, for two years I've had
7 the pleasure of getting on that freeway. And if I get
8 on the freeway at 7:15, I get to the school in ten
9 minutes. If I get on the freeway at 7:30, it takes
10 a half an hour. If I get there at about 7:40, it takes
11 even longer and it's because the freeway just backs up
12 at that off-ramp to the airport. So I'm hoping that the
13 people mover system that's an integral part of this
14 project will alleviate that backup pressure and let us
15 have that beautiful 105 that dumps us out on Sepulveda
16 in that five-minute run from Watts to the end of the
17 freeway. Thank you.

18 MR. RITCHIE: Thank you.

19 MS. SMITH: Thank you, Mr. Watkins.

20 Next we have Sheila Bernard. After Sheila
21 Bernard, we have Nelle Ivory. And Mr. Bobby Blanks
22 after Ms. Ivory.

23 MR. BERNARD: Good morning. I'm Sheila Bernard.
24 That's S-h-e-i-l-a, B-e-r-n-a-r-d. I'm the President of
25 the Grass Roots Venice Neighborhood Council. Many

1 months ago our council passed a resolution against the
2 widening of Lincoln Boulevard and for consideration of
3 rail transit along Lincoln Boulevard.

4 Advocates for rail such as the Friends of the
5 Green Line have proposed a number of ways that rail
6 could lead to points north including Venice and Santa
7 Monica, but also including Northern California,
8 including western states, et cetera.

9 Now, your technical people who are very
10 talented, very articulate, explained Alternative D does
11 not preclude rail transit. However, not precluding rail
12 transit is not enough. We need you to design rail into
13 the airport improvement. Now, we know it's not your
14 department and we know that the airport is not MTA's
15 department, but the public needs for LAWA and MTA to
16 provide leadership by designing the airport improvement
17 together.

18 We need both facilities to view the
19 transportation of problems of Los Angeles wholistically.
20 The public needs to see a decrease in air traffic, but
21 an overall increase in public transportation. Building
22 and maintaining and operating public transit can be an
23 enormous source of good jobs that will not pit working
24 people against community members seeking to protect
25 their health against the effects of increased air

1 traffic.

2 The decrease in air traffic can be
3 accomplished using high speed rail for destinations in
4 Northern California and western States. Those local
5 destinations are taking up at least a fourth of the air
6 traffic in LAX and will continue to do so in the future
7 unless we do otherwise.

8 While it's true that millions of dollars have
9 gone into the current design, it's worth millions more
10 to revise the plan to ensure its intentional inclusion
11 of both local and high speed rail to avoid billions of
12 dollars of expense later relative to continued erosion
13 of people's health, our environment and the quality of
14 life in our city. Thank you.

15 MS. SMITH: Thank you.

16 Ms. Nelle Ivory. And after Ms. Ivory, Mr.
17 Bobby Blanks.

18 MS. IVORY: My name is Nelle Ivory. My last name is
19 spelled I-v-o-r-y.

20 MS. SMITH: Tell us when the mic is comfortable for
21 you.

22 MS. IVORY: Yes, I think it is now. I made notes.
23 It may not be in order. However, I'm kind of angry
24 because -- and when I refer to you, don't take it
25 personal. I'm referring to, I guess, Master Plan of LAX

1 and who put it together. I feel it's an insult to have
2 all that information out there and expect us to absorb
3 it and come back and relate it to this project because I
4 hear people said C and D and all of that. I tried to
5 read as much as I could. And it's insulting to me to
6 think that you -- when I say "you," I'm not talking
7 about you personally. You're just a liaison between
8 them and us.

9 Now, I think that project is for, and I've had
10 consideration into it, is the politicians, the rich and
11 all of that because they did not come into our community
12 and ask us to do a ground walk-through and suggest how
13 they should do it because the people in the neighborhood
14 could tell them, but we didn't have that.

15 And another thing I would like to say, you
16 can't insult me, but I said that it's insulting for
17 people to think that we can absorb all of that and then
18 give you feedback to take back to the entities that is
19 involved in this. I think it's a regime to enrich the
20 rich, politicians and the other people, not the people
21 that live in the area and all of that because I find out
22 a lot of times jobs are given to out-of-state people. I
23 think it should be in-state, California people, and
24 mainly our area.

25 And like Mr. Muhammad said, all of these

1 people come in our prison, they have paid their price.
2 Why shouldn't they have jobs? All of them are not
3 murderers and all of that. However, they should have
4 jobs. And we want that.

5 Another thing, I was asking one man out there
6 where the funding is coming from. He said federal
7 bonds, grants, which is our money that we sent to the
8 Federal Government and paid taxes. And he said revenue
9 bonds. Revenue bonds come from us taxpayers, whatever
10 concession, landing fees, passengers worldwide, airline
11 concessions and all much that? 4.

12 However, all of that said, let everybody --
13 and I'm not ashamed to live in South Central
14 Los Angeles, any place like that -- let the people of
15 the community be employed, and like the lady said, pay
16 decent wage and don't pay for all of these other rich
17 companies to suck us up. I don't think it's necessary
18 to tear our airport down, just renovate it. And if you
19 want the terrorists to stay out, you don't have to tear
20 down the whole airport and renovate it. Have some place
21 outside the airport to do that before they get in. You
22 wouldn't open your door to a terrorist. You would keep
23 them outside. So don't let them get in.

24 I think that another thing, if you don't
25 believe I'm telling the truth, the planes start dumping

1 their fuel between Central Avenue and Avalon. I don't
2 live in that area right now, but I used to. And if you
3 don't believe it, sit on Century. They start dumping
4 their fuel between Central Avenue and Avalon, and they
5 dump it all over. I thought it was smoke, but I'm
6 sorry, I just wanted to say this. It's the fuel that
7 the airplanes dump before they go to the airport.

8 Thank you.

9 MS. SMITH: Thank you, Ms. Ivory.

10 Mr. Bobby Blanks, and then we'll have Sondra
11 Roberts.

12 MR. BLANKS: My name is Bobby Blanks. Last name is
13 B-l-a-n-k-s, Field Representative to Congressman
14 Maxine Waters. Address is 10124 South Broadway, Suite
15 Number 1, L.A., California 90003. I would like to read
16 a prepared statement.

17 Alternative D is a \$9-billion-dollar project
18 that would demolish homes and disturb communities
19 without improving the safety and security of LAX. The
20 Supplement to the Draft EIS/EIR is an inaccurate and
21 misleading document that fails to reflect the true
22 impact of this project.

23 The centerpiece of Alternative D is the Ground
24 Transportation Center, a large remote passenger check-in
25 facility that would be constructed at Manchester Square

1 several blocks away from the airport terminals.

2 The RAND Corporation conducted a study of the
3 proposed remote passenger check-in facility, which was
4 released May 14, 2003. The study concluded that the
5 proposed project would not significantly improve the
6 security of LAX.

7 On July 25th, 2003 I introduced H.R. 2985, a
8 bill to condition construction of a remote passenger
9 check-in facility at LAX upon a finding that such a
10 facility would promote the safety and security of the
11 public. H.R. 2985 would require the Secretary of
12 Homeland Security to review the proposed facility prior
13 to its construction to determine whether it will protect
14 the safety and security of air passengers and the
15 general public more effectively than the existing
16 facilities at LAX.

17 If the Secretary of Homeland Security does not
18 determine that the facility will improve public safety
19 and security, the FAA would not be allowed to approve
20 its construction. On September 2nd the Board of
21 Supervisors of Los Angeles County passed a motion to
22 support my legislation.

23 In reality, Alternative D would displace
24 thousands of Manchester Square residents. It would also
25 have to relocate about 6,200 people, some of whom who

1 have federally subsidized housing vouchers. I strongly
2 oppose the forced relocation of any of these residents.

3 My constituents living next door to LAX in
4 Westchester, Inglewood, Hawthorne, Gardena and South
5 Central Los Angeles must contend with excessive noise,
6 pollution and traffic congestion caused by the airport.
7 These residents suffer many sleepless nights due to
8 deafening jet noise. Residents have reported increased
9 cases of asthma, respiratory illness and hearing
10 problems.

11 The American people are sick and tired of
12 deficits and bloated government spending. The state
13 budget of California is now running a
14 \$38-billion-dollar deficit. And the Federal Government
15 has a \$374,000-billion-dollar deficit in 2003.
16 Furthermore, Congress is in the process of providing the
17 President an additional \$87 billion for continuing
18 operations in Iraq and Afghanistan. The American people
19 cannot afford to spend \$9 billion on an outrageously
20 expensive boondoggle at LAX.

21 Alternative D is simply a continuation of
22 former Mayor Richard Riordan's plan to expand the
23 airport in the name of safety and security. I urge the
24 City Council of the City of Los Angeles to reject this
25 ill-advised and expensive scheme that will displace

1 thousands of Manchester Square residents and others
2 without improving the safety and security of LAX.

3 (The statement submitted for the
4 record was marked as Statement 4
5 and is attached hereto.)

6 MS. SMITH: Thank you, Mr. Blanks.

7 Next, Sondra Roberts. After Ms. Roberts we
8 have Ms. Sandra Delahoussaye-Bonds, and then Willie
9 Solomon. Is this our first Sondra?

10 MS. ROBERTS: Yes. Good morning.

11 MS. SMITH: Good morning.

12 MS. ROBERTS: My name is Sondra, S-o-n-d-r-a. And
13 my last name is R-o-b-e-r-t-s. I live at 3503 West
14 113rd Street in Inglewood.

15 When I moved to Inglewood 30 years ago -- 31
16 years ago as a matter of fact, the airport was
17 innocuous. Inbound planes flew in a pattern which
18 seemed to follow Century Boulevard. Outbound planes did
19 not affect us. The air traffic was minimal. The street
20 traffic was bearable. The air was breathable. My sleep
21 was not disturbed at night. Now residents anywhere in
22 the city have either seen or heard an airplane over
23 their houses. All of this, all of these changes have
24 resulted in some very detrimental things.

25 Traffic congestion, our main arteries as well

1 as our neighborhoods are now affected, the speeding
2 traffic, very heavy traffic which has damaged our
3 streets and roadways. Noise pollution is evident
4 24 hours a day not only by aircraft, but by street
5 traffic. And if you're unfortunate enough to live near
6 the freeway, freeway traffic.

7 These are a main cause. Noise pollution can
8 be a cause of neurosensory disorders. Air pollution is
9 a known fact and it certainly comes with what we have to
10 deal with from the airport. Aircraft emissions,
11 traffic, street traffic emissions, particulate matter,
12 which is something we have to breathe day in and day
13 out. Most of our adults suffer from some respiratory
14 disorder, but alarmingly the problem is wide-spread
15 among our children whose young lungs should be
16 uncontaminated.

17 We have neurological and psychiatric
18 disorders, sleep deprivation, anxiety, depression,
19 learning disorders. Airports are on their descent
20 directly over many of our schools.

21 Safety issues such as low-flying aircraft, too
22 many aircraft flying in close proximity to one another.
23 More airport related facilities moving closer and into
24 our communities bringing with them the possibility of
25 terrorist attacks. Property damage, which is caused by

1 air pollution and sound waves. LAX has been
2 methodically increasing the airport's capacity without
3 the benefit of the required environmental impact
4 reports.

5 The current report is sorely lacking in
6 validity. It does not address the solutions to any of
7 our quality of life issues, traffic, noise and air
8 pollution, mental and physical health, property damage
9 and safety. It is based on old, erroneous,
10 unsubstantiated and irrelevant data.

11 LAX is not an asset to Inglewood. It is the
12 worst possible neighbor any community could have. It
13 profits from our misfortune. But what better place to
14 exploit than a low income minority community?

15 If I had any lung capacity left, I would go
16 outside -- it would be nice to go outside and take a
17 nice clean breath of air. Thank you.

18 MS. SMITH: Thank you. Ms. Roberts.
19 Ms. Roberts, do you mind giving us a copy of that so we
20 can enter it into the record? Thank you so much.

21 (The statement submitted for the
22 record was marked as Statement 5
23 and is attached hereto.)

24 MS. SMITH: Thank you.

25 MS. DELAHOUSSAYE-BOND: Good morning.

1 MS. SMITH: Good morning.

2 MS. DELAHOUSSAYE-BOND: I'm the next Sandra,
3 S-a-n-d-r-a, D-e-l-a-h-o-u-s-s-a-y-e, hyphen, Bonds,
4 B-o-n-d.

5 I am opposed to Plan D. The MAP now is
6 already over-tasking my community of Inglewood. I
7 didn't mention, I am from the City of Inglewood, 10503
8 South 2nd Avenue.

9 The mitigation measures that are currently
10 being performed within my city are grinding along very
11 slowly. Unfortunately not quick enough to keep up with
12 the adverse effects that those in the flight pattern are
13 having to endure. I am not in favor of the flyaway
14 sites off the perimeters as they are currently being
15 considered. I don't think the terrorists will not know
16 that we have hundreds of people in one convenient place
17 in which they've -- if that was their desire, wanted to
18 do any bombing.

19 The 1992 noise evaluation guides I think are
20 very skewed as well. They don't accurately today
21 represent the noise contours that have been expanded
22 from the time they were first performed, the evaluation
23 process. I encourage the lowering of the decibels from
24 65 to 60. I think that would more accurately address
25 the contours as they are now being impacted.

1 There is another situation that is currently
2 in effect with the mitigation measures. And that is the
3 process of only mitigating with noise insulation half of
4 many many blocks, as someone earlier had mentioned,
5 neighbor from neighbor next door. One is given
6 mitigation, the other is not. They are still involved
7 with pollution, structural damage, noise and, of course,
8 particulate particles that are coming down on them.

9 I support regional airport planning. To me
10 this is the most logical way of sort of spreading the
11 burden that is currently being forced upon those in the
12 flight pattern of LAX.

13 The infractions of nighttime curfews I think
14 are horrendous. Those who are in the flight pattern
15 know 4:00 o'clock in the morning almost religiously
16 you're going to be awakened. It goes on and on. No
17 matter how many times you call and make a complaint, you
18 are sent, if you're lucky enough to get a letter in
19 response there is some lovely explanation. The thing is
20 we're missing sleep. Our children, those who are having
21 to get up and go to work, they are rest broken. We
22 don't deserve this. We think we in the flight pattern
23 deserve as much as anyone else. My word is regional
24 regional regional.

25 MS. SMITH: Thank you. After -- is this

1 Mr. Solomon? Mr. Solomon, after you speak I need Ethel
2 Swiney to be prepared and Roger Williams.

3 MR. SOLOMON: My name is Willie Solomon. I live at
4 120 East Century Boulevard, Los Angeles, California.

5 Why are planes permitted to take-off and land
6 between the hours of 11:00 p.m. and 6:00 a.m.?

7 Referring to jet noise levels, why haven't
8 some criteria been established to account for flight
9 patterns over areas such as Vermont Knolls?

10 Why can't jet engine noise be muffled within
11 ten miles from the landing?

12 How can the residue from jet fuel be reduced
13 over our community?

14 Why not extend the airport and runways out
15 into the ocean? Japan has done this very successfully.

16 What methodology has been devised to mass
17 transit passengers to terminals if no curb side drop-off
18 is permitted?

19 Local residents have been told from the start
20 that the general aspects of the plans were not
21 negotiable, then why are you holding public hearings?

22 Since existing airport was designed to
23 accommodate 40 million passengers, last year 56.2
24 million used the facilities, and the expansion will
25 accommodate 78.9 million. What are your plans to not

1 further impact our quality of life or has it been
2 factored into your plans?

3 Now the economical part of this airport,
4 49,000 jobs that the airport expansion project to
5 create. How many jobs for the residents in these
6 communities that have and will be impacted be made
7 available?

8 The Mayor has addressed certain Unions with
9 expansion plans. Are there plans to reach out to
10 non-union workers, give them an opportunity for
11 employment?

12 How would this -- how will the public be
13 notified of available -- these employments? Thank you.

14 MS. SMITH: Thank you, Mr. Solomon. Mr. Solomon,
15 don't go away yet. Can I get that from you? Thank you
16 so much. (The statement submitted for the
17 record was marked as Statement 6
18 and is attached hereto.)

19 MS. SMITH: We have Mr. John Ferruccio? And I
20 should know this name because I've announced it before.
21 Did I announce it correctly? Almost. And after that
22 Mr. Ethel Swiney, please.

23 MR. FERRUCCIO: Thank you. Good morning. My name
24 is John Ferruccio. That's F-e-r-r-u-c-c-i-o.

25 Myself and my family have been longtime

1 residents of Los Angeles in the City of Gardena. And I
2 am here today to testify on behalf of Alternative D
3 because I feel it is the best plan for the City of
4 Los Angeles.

5 As a union organizer for both journeymen and
6 apprentices in the pipe trades, in the construction
7 field, my obligation to the local communities is
8 hopefully to provide an opportunity for employment.
9 This plan will provide for more than 50,000 construction
10 jobs and numerous employment positions after
11 construction in the local area. With all the budget
12 cuts and layoffs in our city, very obviously here
13 currently more jobs will help stimulate our region, our
14 regional economy, and most importantly, keep people
15 working.

16 As for the security concerns, I support Mayor
17 Hahn's efforts to incorporate safety as a key element of
18 the design of the airport. It is vital to the LAX
19 Master Plan.

20 In closing, let's not waste any more time. We
21 need to be pro-active with safety, security and jobs.
22 Let's move forward with Alternative D. Thank you for
23 your time.

24 MS. SMITH: Thank you.

25 MR. KESSLER: Thank you.

1 MS. SMITH: Ms. Ethel -- is it "Swiney"? Thank you.
2 And Mr. Roger Williams after Ms. Swiney. And after that
3 Ms. Oadie. I think it's Oadie Ross.

4 MS. SWINEY: Good morning.

5 MR. KESSLER: Good morning.

6 MR. RITCHIE: Good morning.

7 MS. SWINEY: My name is Ethel Swiney spelled
8 S-w-i-n-e-y. And I'm stakeholder in this area. I
9 represent the Wilton and Gramercy Place Club.

10 And I'm here in opposition to the expansion of
11 the LAX Airport because of the fact that most of us I
12 would say from Century Boulevard to north of
13 Manchester -- which I live 500 feet -- or from
14 Manchester Boulevard, and I am in direct landing
15 pattern, I can see the landing wheels go down at night.
16 If I'm in my play room, I can see the lights go on, the
17 landing lights.

18 I've been in the area for 38 years. I was
19 there when they opened up what is now called the North
20 Runway. Which when the 747s started coming in during
21 the '70s, the closest I was to the landing pattern was
22 Century Boulevard. I also worked at Manhattan Place
23 Elementary School, which is 1850 West 96th Street.
24 During the assembly the principal had to stop her
25 announcements in order to let the planes go by.

1 The children have been affected at least 37
2 years by the taking off and landing. And we in that
3 particular area get a double portion because when the
4 weather is bad, the airplanes come eastward. And we
5 also get the ones that is coming into the airport.

6 So for health reason I'm really against it
7 because it causes children to become asthmatic. I work
8 in my garden and I plant plants and things. And I can
9 feel the residue that come from these planes on my
10 beans, my greens, or whatever, and it is detrimental to
11 the people that's in this particular area.

12 And I also have been on the list for
13 soundproofing for three and a half years. No one has
14 taken the time to come out to check out my house. I
15 call every three months. And they tell me they will get
16 back to me and to let me know they are still working in
17 my area, but they have not contacted me. So I would
18 like to go on record as the President of the Wilton and
19 Gramercy Club, we are against the expanding of the LAX.
20 Thank you.

21 MS. SMITH: Thank you.

22 Mr. Roger Williams. And after Mr. Williams we
23 have Oadie Ross. Thank you.

24 MR. WILLIAMS: Good morning. My name is Roger
25 Williams, W-i-l-l-i-a-m-s. And my address is 733 South

1 Hindry Avenue in Inglewood, 90301. And I'm representing
2 the International Brotherhood of Electrical Workers
3 Local 11. I am basically here today to testify in
4 support of Mayor Hahn's Alternative D Master Plan.

5 I feel that Alternative D is the most sound
6 and balanced approach to modernization at LAX. And I,
7 therefore, voice my support of Alternative D and the
8 Mayor's effort to bring modernization at LAX. Thank
9 you.

10 MS. SMITH: Thank you. Ms. Oadie Ross. Is Ms. Ross
11 here? I'm going to pass on Ms. Ross and come back.

12 Mr. Richard Slawson. After Mr. Slawson, we'll
13 have Mr. James Harris. After Mr. Harris we'll have
14 Tarlise Netherly.

15 MR. SLAWSON: Good morning. It's still morning. My
16 name is Richard Slawson. I'm the Executive Secretary of
17 the Los Angeles and Orange Counties Building and
18 Construction Trades Council. Our council represents
19 construction craft unions that represent approximately
20 130,000 members living and working and raising their
21 families throughout Los Angeles and Orange County.

22 I wanted to comment on a couple of things that
23 have been said today about the difference between moving
24 forward and not moving forward. I've participated in
25 quite a few of the meetings that have been held by the

1 Southern California Association of Governments,
2 participated on the Aviation Subcommittee when many of
3 the proposals were put together talking about the
4 numbers of actual passengers that would be able to be
5 handled by not only LAX, but the other airports in the
6 area.

7 Without this Master Plan or without a Master
8 Plan going forward, the SCAG reports say that LAX could
9 expand to 98 million passengers annually. With the
10 plan, Mayor Hahn has limited that to 78 million. So I
11 want everyone that is here today to understand that we
12 need to do something to correct the problems at LAX, not
13 do nothing and see the problems be exaggerated and
14 continued.

15 We support the airport working with all of the
16 communities. I know that they have in many cases held
17 many many community meetings. I've attended probably 90
18 percent of them, everything from around the airport to
19 the San Fernando Valley. I live in Torrance. Our
20 office is in the City of Los Angeles at 1626 Beverly
21 Boulevard. So we live and work throughout every region
22 here.

23 And I also wanted to talk about our
24 membership. As you can see from the people that are
25 here today, we represent people that live everywhere in

1 Los Angeles and Orange County. They live in Inglewood.
2 They live in Los Angeles. I live in Torrance. There
3 are people that live in Redondo Beach, El Segundo. We
4 represent 130,000 members. We think we represent the
5 community as well. We are in support of Alternative D
6 because we think it is the solution to problems, not --
7 and will not allow the situation to continue to get
8 worse.

9 Talking about the jobs, our members make up
10 this community. We don't come from Arizona. We don't
11 come from Northern California or some other state. We
12 all live right here. Our 130,000 members who are
13 raising their families, purchasing homes, paying their
14 bills, sending their kids to school just like everyone
15 else here. There are 49,000 construction jobs
16 approximately. I think there is even more than that
17 that will be involved in this project. We have put
18 together an agreement with the City that utilizes
19 apprenticeship, that continues to open up entry level
20 positions in the construction trades to create careers
21 for people that live in our community, pay their taxes
22 in our community. And we are committed to making sure
23 that those jobs -- that everyone in the community has
24 opportunities for all of those jobs as well as the
25 people we already represent. Thank you very much for

1 the opportunity to speak here.

2 MS. SMITH: Thank you, Mr. Slawson.

3 Next we have Mr. James Harris. Mr. Harris.
4 We're going to pass on Mr. Harris. Mr. Tarlise
5 Netherly. After Ms. Netherly we'll have Dan Hawn. And
6 after Dan Hawn we'll have Carlos Porras.

7 MS. NETHERLY: Good morning.

8 MS. SMITH: Good morning.

9 MS. NETHERLY: My name is Tarlise Netherly. And it
10 is spelled, N as in Nancy, e, T as in Tom, h-e-r-l-y.

11 I'm going to start by saying I do support
12 Alternative D. However, it took me a total of 12 days,
13 3 hours a day, to read and understand the proposed plan
14 and the drastic changes being proposed. I originally
15 began reading the plan to get an insight on a piece of
16 property in your proposal that I would like to develop.
17 However, in doing research I found something quite
18 alarming.

19 With myself being handicapped, I am thoroughly
20 aware of my surroundings. Therefore, I notice that the
21 plan had not stated specific handicapped or disabled
22 safety precautions being developed. The Alternative
23 Master D Plan states "it's accessible" but what does
24 that mean?

25 For instance, in the proposal, the proposed

1 people mover, there are no intended railings for the
2 blind to hold on to. There are no seating schematics --
3 excuse me, there are no seating schematics and there are
4 no wheelchair safety locks. Anyone who knows anything
5 about wheelchairs knows that the wheel locks on the
6 wheelchairs are not always sturdy. There is also no
7 mention of our exceptional four-legged friends, our
8 dogs, to assist us in getting around. They, too, are a
9 part of us. Posting the well-recognized handicap
10 placard is meaningless if there is no actual assistance
11 to back it up.

12 Your suggestion of Alternative Master D Plan
13 utilizes a great deal of paper, but, yet, leaves out a
14 part of a social class that is still alive -- excuse me,
15 still alive, well and extremely vital to the community.
16 It is imperative that precautions for the handicapped
17 and disabled be included on paper and not just phased in
18 while construction takes place. This would be improper
19 procedure.

20 All too often society ignores the fact that
21 someone who looks, talks and walks differently may,
22 indeed, have feelings just like the next normal person.
23 This is precisely why I am asking the council to go back
24 and review the schematics of Alternative D before making
25 a commitment of spending millions of dollars in order to

1 construct and redevelop LAX and its surrounding areas.
2 Should you decide to research the information I have
3 given you regarding the handicapped and disabled, you
4 will find there is a substantial amount of people both
5 young and elderly who enjoy and/or are required to
6 travel. Your people mover must accommodate us as well.

7 MR. RITCHIE: Thank you very much.

8 MS. SMITH: Thank you, so much. Would you mind
9 giving your --

10 MS. NETHERLY: You can have it.

11 MS. SMITH: Thank you so much.

12 (The statement submitted for the
13 record was marked as Statement 7
14 and is attached hereto)

15 MS. SMITH: After Ms. Netherly is Mr. Dan Hawn.
16 Again, after Mr. Hawn we have Carlos Porras. We will
17 take a short break after Mr. Porras, another five-minute
18 break. I just wanted to remind you of that again.
19 Thank you.

20 Mr. Hawn.

21 MR. HAWN: Thank you. Hello, my name is Dan Hawn,
22 H-a-w-n. I'm a representative of the Local 12 Operating
23 Engineers Heavy Equipment Operators. We represent
24 approximately 23,000 members. And, of course, they
25 would benefit from --

1 MS. SMITH: Hold on, Mr. Hawn, excuse me. I
2 apologize. We are having some technical problems here.
3 Let's take the five-minute break now, if you don't mind,
4 Mr. Hawn. And we will take care of the timer and come
5 back. If I could ask everyone to give us five quick
6 minutes while we take care of our equipment. We will
7 reconvene I think it's at 11:50.

8 (Recess was taken.)

9 MS. SMITH: While we are waiting for Mr. Ritchie to
10 join us on the stage, he is coming from the back of the
11 audience now, I wanted to go over a couple of things
12 again for those who are just joining us.

13 First of all, we would appreciate it if you
14 have any electronic devices, cell phones, pagers,
15 stopwatches, if you could please turn those off so that
16 we can respect those that are providing their comments.
17 We would appreciate it.

18 Second of all, I wanted to introduce myself
19 and the gentlemen receiving your testimony again. My
20 name is Shauna Bain Smith. I'm your facilitator. To my
21 right, immediate right is David Kessler. He is an
22 Environmental Protection Specialist with the Federal
23 Aviation Administration. To my far right is Mr. Jim
24 Ritchie. And he is Deputy Executive Director of
25 Los Angeles World Airports. They will be receiving your

1 testimony. I am just here to ensure that we can receive
2 that testimony in an orderly and timely fashion.

3 So once again really quickly, although I know
4 our speaker here understands this, for those that are
5 just joining us, we have this time clock. Everyone will
6 be given three minutes to speak after you have filled
7 out this speaker card.

8 I will not start the time until you have given
9 your name and address for the record. If you could
10 please spell your last name for the benefit of our court
11 reporters, we would appreciate it. If you are reading
12 from prepared remarks, you can hand them to our
13 interpreter who is sitting right next to you to your
14 right, and she will turn those in for the record as
15 well.

16 When you have 30 seconds of time left, you
17 will see the yellow light. When your time has expired,
18 you will see the red light. I ask that you start
19 wrapping up your remarks at the 30 second mark so that I
20 don't have to cut you off when the red light does.

21 With that, we'll call our three speakers. And
22 we will start where we left off during the break. That
23 was with Mr. Dan Hawn. And after Mr. Hawn we will have
24 Carlos Porras and Sparky Carpio.

25 Mr. Hawn.

1 MR. HAWN: Good morning. My name is Dan Hawn,
2 H-a-w-n, at 150 East Corson, Pasadena, California. I'm
3 a representative of Operating Engineers Local 12, heavy
4 equipment operators. We represent approximately 23,000
5 members. Our members work on projects such as the
6 Alameda Corridor, the Alameda Corridor east that is
7 currently underway, the cost and freeway construction
8 going around Southern California and hopefully that
9 improves the lives of the residents in the communities.

10 Now, we would certainly benefit, our members
11 would, from all the work that would be generated by L.A.
12 expansion. But not only that, we're concerned about
13 when our members go home if they have quality of life to
14 enjoy their families when they do get home. That's an
15 important factor. For that reason we are -- we believe
16 that Mayor Hahn's Alternative D design serves the local
17 communities, the communities that our members live in.

18 I understand that a lot of people in those
19 communities have concerns about the workers or the
20 openings for the construction work that is going to be
21 generated through there. Our apprenticeship programs --
22 like Mr. Slawson indicated, our apprenticeship programs
23 are deeply involved in the career days in all the
24 communities. So they pass out the applications for the
25 apprenticeship programs who are always open to the

1 communities. Our members live in the communities. I
2 appreciate your time. Thank you.

3 MS. SMITH: Thank you, Mr. Hawn.

4 Carlos Porras.

5 MS. HERNANDEZ: Thank you. Hi. My name isn't
6 Carlos, but Lisa Hernandez, but I am making a statement
7 for Carlos Porras who is the Executive Director of
8 Communities for a Better Environment, CBE.

9 In L.A. County African-American, latinos and
10 Asians are three times more likely to have a hazardous
11 waste treatment, storage or disposal facility within one
12 mile of their homes than a white population. Schools
13 with more than 50 percent people of color population are
14 three times more likely to have a facility reporting to
15 the Federal Toxic Release Inventory within a mile of the
16 school. Children attending schools with the highest
17 risk of respiratory health problems score significantly
18 lower achievement. These are health problems due to
19 poor air quality. There aren't enough studies that
20 study the effect of exhaust. And the EIR does not
21 sufficiently address this problem.

22 People of color have historically been
23 burdened with negative impacts of development that
24 benefits the broader society while forced to live in
25 poverty. People of color are now declaring this

1 environmental racism unjust. We demand environmental
2 justice. Any project at LAX will have impacts on the
3 surrounding communities of color. And we demand justice
4 for these communities. Any project that benefits the
5 economy must benefit the people impacted. Thank you.

6 (The statement submitted for the
7 record was marked as Statement 8
8 and is attached hereto.

9 MS. SMITH: Thank you.

10 Next, we have Sparky Carpio. And after Sparky
11 we have Anthony Furtado. And after Mr. Furtado, we have
12 Styles Logan.

13 MS. CARPIO: S-p-a-r-k-y, Carpio, C-a-r-p-i-o; 407
14 Exton Avenue, Number 4, Inglewood, California 90302.

15 When I was skimming through the Supplement to
16 the Draft EIS/EIR and listening to different LAWA staff
17 people and elected officials, I have come to believe
18 they seem to be more concerned and careful of the
19 infrastructure and the economics of the buildings and
20 money-making resources than of the health, welfare and
21 sanity of the communities. All I see in this plan is
22 greed on all levels of government. Why don't people who
23 are not elected officials get the compensation and
24 quality of life they deserve?

25 Also in 2001 SCAG had an item in its RTP

1 about the Arbor Vitae interchange. And time and time
2 again elected officials had said that it had nothing to
3 do with the airport or its expansion, and LAWA staff
4 even went so far as to say that the interchange was for
5 the Forum, which is now a church, Hollywood Park, which
6 needed financial help from the City of Inglewood, and a
7 K-Mart that is no longer existent. So if the
8 interchange is not for the airport, why is it in the
9 EIS/EIR?

10 There is also an MOU between LAWA and
11 Inglewood that is mentioned in the EIS/EIR that its
12 aviation easement requirements are currently suspended
13 - the requirements to the aviation easements that the
14 residents had to sign takes away their rights to sue the
15 airport. In the past Inglewood's mayor had wrongly
16 stated at a City Council meeting that the easements had
17 been eliminated while in fact they were merely
18 suspended.

19 And then with Manchester Square as the GTC,
20 how will it improve security and safety? And, by the
21 way, there are two -- there are now two Manchester
22 Squares because a while ago L.A. City Council had --
23 had -- I forgot. I think they had -- they had renamed a
24 park in -- in L.A., Manchester Square, but it is not the
25 one near the airport adjacent to the airport. So that's

1 a bit confusing. I think in the EIS/EIR that should be
2 clarified to which one you were addressing.

3 And I guess if you want to keep the CTA safe,
4 Manchester Square helps. But how is putting all the
5 people closer to the residents of Westchester going to
6 keep the passengers and residents safe? If someone
7 really wanted to do something to improve safety and
8 security, they would do the best thing and regionalize.
9 Thank you.

10 (The statement submitted for the
11 record was attached as Statement 9
12 and is attached hereto.)

13 MS. SMITH: Thank you.

14 Mr. Furtado.

15 MR. FURTADO: I'm Anthony Furtado, F-u-r-t-a-d-o. I
16 live at 2300 Bellevue Avenue, L.A., 90026. That's Echo
17 Park. I'm also a member of International Union of
18 Operating Engineers Local 12. I'm an apprentice. I've
19 lived in Echo Park just about all my life. I'm here to
20 voice my support for Mayor Hahn's Alternative D. Thank
21 you.

22 MS. SMITH: Thank you.

23 MR. RITCHIE: Thank you. Styles Logan. And after
24 Mr. Logan we have Jimmie Holmes and then Shu Woo.

25 MR. LOGAN: The sun has changed. It is now good

1 afternoon to all of you here.

2 MS. SMITH: Good afternoon.

3 MR. LOGAN: Thank you for giving us time to address
4 some of our concerns here.

5 I have some comments about the quality of life
6 in the surrounding areas. First of all, pollution.
7 Both noise and aerosol components will increase
8 dramatically because airline traffic will expand the
9 level required by the planned MAP.

10 Included in the plan should be a proposal to
11 provide funds to complete the existing soundproofing
12 contracts and identify the remaining homes that are
13 affected based on 55 DNL noise levels and above.

14 The infrastructure, Century Boulevard from the
15 110 Freeway to La Cienega and other heavily traveled
16 streets to and from the airport should be resurfaced
17 regularly with funding support from the LAWA to
18 eliminate potholes and other irregularities.

19 Homeowners residing in the flight path of
20 Los Angeles International Airport are significantly
21 impacted by the airplane noise making it difficult to
22 plan and enjoy activities in the backyard or leave doors
23 and windows opened for ventilation. The constant drone
24 of the airplanes taking off and landing does not permit
25 normal phone conversations without interruption or the

1 enjoyment of a television program without exceeding the
2 60 decibel levels, which have been determined to be a
3 normal level for a conversation.

4 Environmental issues, health issues and
5 surrounding soundproofing for residents living in the
6 flight path and around LAX must be mitigated prior to
7 approval of any Master Plan.

8 The environmental; the environmental impact,
9 particularly air pollution and noise will be
10 substantially increased during the physical construction
11 as well as when the expansion is complete.

12 Health issues. Studies dating back to 1977
13 report that continued exposure to loud noise is a health
14 hazard to individuals living near and around the flight
15 corridor.

16 Airplane noises are linked to stress,
17 hypertension, sleep deprivation and interruptions,
18 work-related performances, learning and academic
19 performances.

20 The residents of the 8th District would like
21 to go on the record opposing any expansion until the
22 environmental health and economic issues are mitigated
23 to assure that our quality of life will not be further
24 compromised. My name is Styles Logan. That's
25 S-t-y-l-e-s, L-o-g-a-n. I live at 1243 West 80th Street

1 in Los Angeles, 90044. Thank you.

2 (The statement submitted for the
3 record was marked as Statement 10
4 and is attached hereto.)

5 MR. RITCHIE: Thank you.

6 MS. SMITH: Well, I see how you got your first name.
7 You changed your whole style. I was about to ask you
8 for your name. Thank you, Mr. Logan.

9 Jimmie Holmes. And after Mr. Holmes, Mr. Shu
10 Woo.

11 MR. HOLMES: Good afternoon. My name is Jimmie
12 Holmes, J-i-m-m-i-e, H-o-l-m-e-s. I live at 3933 6th
13 Avenue, Los Angeles, California 90008. And I'm not here
14 really about the expansion. I understand that
15 government is going to do what they want along with the
16 cooperation and support of billion-dollar businesses.
17 The thing I'm here for is the increased air traffic over
18 my home in the last two months.

19 I moved in my house approximately six years
20 ago and I saved a long time to buy it. Upon moving
21 there I never even noticed the airport. Now, every day
22 starting at approximately 4:30 a.m. and until 1:30 --
23 1:30 a.m. and through the night there is constant air
24 traffic. I've tracked it on the internet, planes of
25 shapes and sizes traveling at altitudes of three

1 thousand, five thousand feet to three thousand feet. I
2 don't understand. Airport expansion? Yeah, people will
3 stand to make billions of dollars from it, no doubt, but
4 why over the homes in the African-American and Hispanic
5 communities?

6 The plans that I have reviewed do not address
7 that. It's not going to slow air traffic over my home.
8 It's not going to limit exhaust fumes over my home.
9 It's not going to assist me with funding to buy a new
10 home outside of the area that has been attacked with
11 these planes. What am I to do? What is my six-year-old
12 son to do and all his playmates that are running up and
13 down the street? I'm really here just to get my name on
14 the record because I know you people are going to do
15 what you're going to do?

16 I make \$100,000 a year. And I'm sure that no
17 one making this decision is living in an area with
18 planes flying over their homes, except that one
19 gentleman who enjoys it, but that's not me. So please
20 take those things into consideration before the plan is
21 executed. Thank you.

22 MS. SMITH: Thank you. Shu Woo. After Mr. Shu Woo
23 we have Henry Jimenez.

24 MR. WOO: Good afternoon. My name is Shu Woo. I
25 live in Los Angeles near the airport area and work first

1 in El Segundo and then downtown Los Angeles for over 30
2 years. Prior to that I lived in another big city right
3 underneath the flight path. My son went to Westchester
4 neighborhood school for the past nine years. As an
5 airport user and a person who travels near the airport
6 often, I enjoy the convenient location but at the same
7 time see the shortcoming of the current airport,
8 particularly after 9-11.

9 I am here to speak to support Mayor Jim Hahn's
10 Alternative D plan. This plan basically is a safety and
11 security modernization plan. It is also an efficient
12 plan aimed at improving quality of life for travelers
13 and residents alike. It is to reduce waiting at the
14 terminal and on the airfield, move passenger in and out
15 of the airport quickly and safely, mitigate negative
16 impact on the surrounding, making everything flow
17 smoothly. This is the main idea here. Runways are to
18 spread further apart to improve safety. And when
19 arrival and check-in parcels are dispersed in a much
20 wider area and streamline it through a multi-layer of
21 securities, everything flows. When everything flows,
22 there is very little concentration along lines of
23 passenger at airport. The likely terrorist target would
24 be diminished.

25 Pollution will be reduced when everything

1 flows. Security as well as traveling experience and the
2 quality of life will be greatly enhanced. This is part
3 of a regional solution that would allow air traffic flow
4 to be shifted to other airports. This plan allows some
5 growth at LAX without negatively impacting the
6 neighborhood. It would not bring the neighborhood more
7 congested traffic in the air or the ground. However, it
8 is not decided to be an expansion plan that the
9 residents hates or some airline would like to see, but
10 nothing should be more important to the airline industry
11 than security and safety. You can't put a price tag on
12 that. You don't want to -- you can't afford to have
13 another 9-11 to happen. A few dollar each passenger
14 each time is well worth it.

15 It's like buying an insurance policy, but is
16 actually much better. An insurance policy pays the
17 beneficiary some money after something bad happen. Most
18 people would much prefer a plan that could spend some
19 money and be able to reduce the chance of something bad
20 from happening in the first place.

21 LAX is probably the most important
22 infrastructure in the region. It is like a major artery
23 carrying economic lifeblood to all the communities.
24 We simply can't ignore this. LAX has one major
25 advantage over most big city airports in the world. LAX

1 is very close to the heart of the city. This is great
2 for tourism, international trade, local jobs and
3 business alike. We want to preserve this major
4 advantage that makes Los Angeles great. However, LAX
5 fall behind in modernization compared to most other big
6 city airports. I believe Mayor Jim Hahn's plan is the
7 most balanced and well thought through approach. Let's
8 get to work. Thank you.

9 MS. SMITH: Thank you, Mr. Woo.

10 Next we have Henry Jimenez. After Mr. Jimenez
11 we have Daniel Aguilar. After Mr. Aguilar -- are any of
12 these people here? Okay. So we will pass on
13 Mr. Jimenez.

14 Mr. Aguilar? Jesus Jimenez? Greg Garcia?
15 Frederick DePalm? Is that a yes?

16 Fernando Contreras? Daniel Avina?
17 Jorge Sifuentes? Jorge? Esther Kwon? Esther Kwon,
18 yeah. Someone is here. After Esther we have Don Jung
19 and then Monica Choi.

20 MS. KWON: To save some time, we're all going to say
21 our names, and then I'll speak. Is that okay?

22 MS. SMITH: Is that okay with you guys? I don't see
23 a problem with that. Does that include Susan Kim?

24 MS. KWON: Yes.

25 MS. SMITH: And Jason Ahn?

1 MS. KWON: Yes.

2 MS. SMITH: And Samuel In?

3 MS. KWON: Yes.

4 MS. SMITH: Shawn Lim? Okay. What about Richard
5 Eum? Is he part of this group as well, and Scarlet Eum?

6 MS. KWON: Uh-huh, yes.

7 MS. SMITH: And I think that ends that group here.

8 I know I don't have to call these names afterwards.

9 Okay. If you would each like to state your name, please
10 for the record, and we'll have your speaker speak on
11 your behalf.

12 MS. KWON: My name is Esther Kwon. I'm the Korean
13 Community Service Active Member.

14 MR. AHN: My name is Jason Ahn, A-h-n.

15 MS. LEE: My name is Kay Lee. It's Buena Park -- I
16 come from Orange County, just one I want. I was
17 impressed -- I read -- when I read Thursday and the July
18 10th and James Hahn said doing nothing is not a potion
19 we have an antiquated airport from the standpoint of
20 modern -- if you read on there something, people will
21 fly somewhere else. That's it.

22 MS. SMITH: Thank you.

23 MR. PEK: My name is Tua, P-e-k.

24 MS. SMITH: Thank you.

25 MR. RHEE: My name is Peter Rhee, R-h-e-e, 2701

1 Wilshire Boulevard.

2 MS. SMITH: Thank you.

3 MR. JUNG: My name is Don Jung. I'm the President
4 of a company named Trim Life.

5 MS. SMITH: Thank you.

6 MR. OH: My name is John Oh. Spelling is O-h.

7 MR. KIM: My name is Jay Kim. Last name is K-i-m.

8 MS. SMITH: Okay.

9 MR. SONKO: Good afternoon. My name is Chun,
10 S-o-n-k-o. Thank you.

11 MS. SMITH: Okay.

12 MR. IN: Good afternoon. My name is Samuel In.
13 Spell is I-n, 952 Westchester Place, L.A., 90019.

14 MS. SMITH: Thank you.

15 MR. LIM: Good afternoon. My name is Shawn Lim.
16 Last name is L-i-m. We are here --

17 MS. SMITH: Excuse me one moment.

18 MR. LIM: Yes.

19 MS. SMITH: Are you now going to make the remarks
20 for the entire group because I need to know when to
21 start your time?

22 MR. LIM: Okay. I'm starting -- we are speaking
23 only two person. I'm starting --

24 MS. SMITH: So can I get the rest of the group to
25 please take a seat. If I could get the rest of the

1 group to take their seats that have introduced
2 themselves, and I'm going to give you time to make your
3 remarks, and then you will make your remarks. We have
4 to make them two separate remarks, okay?

5 MR. LIM: Yes.

6 MS. SMITH: So you've stated your name for the
7 record. And I'm going to start the time now. Okay?

8 MR. LIM: Okay. My name is Shawn Lim. Last name is
9 L-i-m. I'm trying to save the time for all of you. We
10 come in here Korean-American, we support Mayor James
11 Hahn, the expansion Alternative D Plan because that --
12 we had a lot of trouble coming in all of the others for
13 the country. Our LAX is old, small. We have a lot of
14 people coming in here. Then we have a lot of problem of
15 inconvenience. We need to let all people know in the
16 world L.A. is a big city. We need the security. We're
17 going to let them know. We're going to expand the
18 airport, better -- better technology. We're going to
19 put it up there. People knew we have the security.

20 I had a lot of people living in Korea. They
21 are not coming here after 9-11. Because of that, the
22 United States after 9-11, all these people think we have
23 a lot of problem, we have a lot of security reason. So
24 we had a better expansion, Alternative D plays a help
25 that all the other foreign country know L.A. is a safety

1 place. They come in here and travel.

2 Then, also, in Korea a lot of years ago they
3 had a big expanded international airport. They had a
4 separated international airport. They separated. They
5 built on it years ago is a real convenience because you
6 don't need to carry the luggage on it. You stop by the
7 terminal, luggage you check-in, luggage go to the
8 airport. Wherever you go just a little package you
9 carry, go inside the airport. This saves a lot of time.
10 And then, also, they had a lot of safety reason. It is
11 a good security. So we need the expansion LAX so people
12 know LAX is a better community, a better safety place.

13 So my point is our Korean-American business
14 owner, a lot have a difficult time for leave because our
15 businesses, some of them belong to Korea, some of them
16 belong to China and Japan. Nobody come in here and
17 visit the United States. So we need the expansion, the
18 LAX people convenience. People come in here. They feel
19 safety. They feel like it is security also. That's why
20 I support James Hahn Expansion Alternative D Plan. 100
21 percent our Korean-American organization supports the
22 James Hahn plan. Thanks for letting me talk.

23 MS. SMITH: Thank you. Thank you.

24 MS. KIM: Good afternoon. My name is Susan Kim.
25 The address is 952 South Western Avenue, L.A.,

1 California, 90006. I'm here to represent Korean
2 community.

3 I have come here today to support
4 Alternative D of the LAX Master Plan. To me when we buy
5 a house, we move into the house. If we live there for
6 like 10, 20 years, we spend money to operate the houses
7 whether we're going to sell it or still living in there.
8 We make it to moderate changes to have a better life.
9 And so that Mayor Hahn's proposal is a balanced plan
10 because it allows for some growth while taking into
11 consideration the impacts to the surrounding
12 communities. Plus this project will create some, what,
13 50,000 construction-related jobs for the people of
14 Los Angeles.

15 The plan will improve operations and create a
16 greater -- greater level by customer service by
17 improving the passenger experience for travelers.
18 I myself believe it is time for modernize LAX. And I
19 believe Alternative D is the step in the right
20 direction. Alternative D isn't for Mayor Hahn himself.
21 It is for the City of Los Angeles and the people in the
22 Los Angeles. Thank you.

23 MS. SMITH: Thank you, Ms. Kim. Ms. Kim, if you
24 have any of those prepared remarks to which you
25 referred, I believe there was another member of your

1 audience that used some, if you could turn those into
2 our court reporter. Thank you.

3 (The statement submitted for the
4 record was marked as Statement 11
5 and is attached hereto.)

6 MS. SMITH: We next have Jessie M. Gatis or is it
7 Jessie M. Gatis? And then we have Cecil Carpio, and
8 then Daniel Mishell. So is Jessie Gatis not present?
9 Daniel Mishell? Okay. After Mr. Mishell we have Cecil
10 Carpio, and then Diane Sambrano.

11 Mr. Mishell.

12 MR. MISHELL: Hi. Dan Mishell, M-i-s-h-e-l-l. I'm
13 here on behalf of the L.A. Convention, Inc., the
14 Convention & Visitors Bureau. We are the agency that
15 promotes tourism for the City of L.A. And we've had
16 over 20 million tourists spending over \$11 billion
17 dollars over the last many years.

18 We support the LAX Master Plan Alternative D
19 because the way it addresses three basic issues, safety
20 and security, modernization and efficiency and
21 regionalization that is sharing the incoming/outgoing
22 traffic with other regional airports.

23 We like that this plan addresses the value of
24 two supporting segments of L.A. visitor economy, the
25 transcontinental domestic market and its linkage with

1 the international travel customer. In order to maintain
2 standing as an international gateway, LAX must be able
3 to provide passengers with direct connections to the
4 primary domestic carriers. This plan understands that
5 to be a gateway, LAX will need to protect its access to
6 the primary U.S. markets. This is especially important
7 in face of what our competition is doing. Destinations
8 at airports like Las Vegas, San Francisco and
9 Minneapolis are reinvesting in their airports to capture
10 more of the international travel market. Each year it
11 goes by the international consumer is given greater
12 options in the quantity and quality of his access to the
13 U.S.

14 Finally, we are very aware of the perception
15 that modernization has on a city. An airport that is
16 modernizing is an airport with improved security and
17 conveniences. These perceptions help make the case for
18 visiting Los Angeles and, thus, adding to the \$11
19 billion dollars in visitor spending and securing the
20 jobs of 240,000 citizens. Thank you.

21 MS. SMITH: Thank you. Ms. Cecil Carpio, please.

22 MS. CARPIO: Cecil Carpio, C-e-c-i-l, C-a-r-p-i-o.
23 I'm from the City of Inglewood.

24 Well, not to belittle this whole public
25 hearing process, but this is almost kind of my hobby. I

1 almost don't take it seriously.

2 First off I'd like to say that my daughter
3 spoke earlier and took out all my -- took all my thunder
4 from what I'm about to say, but I'll just skip through
5 it real quick. I'll do this real quick.

6 My concern is small, but significant. The
7 name Manchester Square is meaningful to anyone who is
8 familiar with the Master Plan for LAX. Manchester
9 Square is, or I should say was, a neighborhood within
10 Westchester. Westchester is a community within the City
11 of Los Angeles. The homes within Manchester Square are
12 being acquired and demolished by Los Angeles World
13 Airports. Manchester Square is slaughtered to become
14 the site of a huge Ground Transportation Center.
15 Manchester Square is part of the Mayor Hahn's Master
16 Plan for expansion of LAX.

17 The name Manchester Square is in the minds and
18 on the lips of anyone who seriously discusses
19 Alternative D. However, how many people know that the
20 City Council of Los Angeles approved a resolution to
21 name a neighborhood within the community of South
22 Central Manchester Square. On an editorial aside, I
23 think that's rather sinister. There are two Manchester
24 Squares in the City of Los Angeles. The question I pose
25 to the respondents to public comments, how are you going

1 to differentiate between the old Manchester Square and
2 the new one?

3 I oppose all Alternatives that increase the
4 capacity of Los Angeles International Airport. All
5 Alternatives including the no-action no-project
6 Alternative increase the capacity of LAX. Until the
7 Department of Airports aggressively protects the
8 communities from noise and pollution, I will not support
9 any Alternative for LAX. The noise variance is coming
10 up. It is time to aggressively address the issues --
11 I'm sorry, that was -- thank you. If I may just --

12 (A cell phone rings.)

13 MS. SMITH: Hm-hm.

14 MS. CARPIO: Thank you. I would hope that the
15 Department of Airports would aggressively address those
16 issues within that noise variance, otherwise you're
17 going to have a lot of problems on your hands. The
18 noise variance will probably be submitted by February of
19 next year. It's time we sit down and start talking
20 about some real resolutions to what's going on,
21 particularly in the City of Inglewood. And I propose
22 that those involved with that variance start talking to
23 community members rather than city officials or there is
24 going to be a lot of problems in Inglewood. Thank you.

25 MR. RITCHIE: Thank you.

1 MS. SMITH: Thank you. Diane Sambrano. After
2 Diane, Clarence Daniels, please. After Mr. Daniels,
3 we'll have Byrd Young.

4 Sambrano.

5 MS. SAMBRANO: Thank you. My name is Diane
6 Sambrano. That's D-i-a-n-e, S as in Samuel, a, M as in
7 Mary, B as in boy, r-a-n-o.

8 I couldn't help but notice today as she went
9 through the list of persons who had requested to speak
10 that so many of the persons that did leave had names
11 like mine, Garcia, Hernandez, Enriquez. And how they
12 came to this meeting simply amazes me to begin with
13 because 120 pages of the EIR/EIS, how many of them can
14 you count that were in Spanish? Oops, kind of like the
15 lady about handicapped awareness. I think we have
16 totally disregarded populations most impacted.

17 As I look at my community, no matter how many
18 reports I pick up from various institutions that like to
19 put us in those little boxes and say we look like this
20 and we sound like that, no -- no agency has come up with
21 less than 56 Hispanicity. The vast majority of our
22 students, 67 percent Hispanic came from
23 non-English-speaking homes. How are they made aware of
24 the impacts to their lives, the respiratory ailments?

25 We all talk about noise. Do you realize that

1 every time a speaker gets up to speak here if you live
2 in my house, three planes have flown over you, three
3 planes where you had to stop speaking. So we're very
4 accustomed to this very quick and rapid speaking where
5 we can get a lot said very quickly because we do it on a
6 regular basis. Unfortunately that does not help our
7 children learn in their institutions we call
8 educational.

9 Now I know that LAWA is very much aware of the
10 great outreach to community and they give our children
11 Barbie dolls and Tonka trucks at Christmas, but that
12 doesn't give them an education nor does it help
13 the respiratory ailments. It frustrates me that as I
14 listen to several people from the unions come up and
15 give an address, many of those addresses are in that
16 area that I know is now airport compatible because it is
17 only industrial. So I think the address frequently
18 given was not of a residence but of a business office.

19 So how then can they talk about how good it is
20 for them to make so many thousand dollars a year when
21 they aren't the ones losing the sleep because they don't
22 live in that business address? It also amuses me coming
23 up is a seminar called "Keeping the Public Trust, Ethics
24 In Government." When we decide any community is not
25 entitled a quality of^c life and environment justice, that

1 definitely smacks in the face of public trust. Safety
2 and security, anyone who read, not just thought of or
3 heard about this plan, would find out that any time you
4 put a group of people in one location, they become a
5 wonderful target. It is kind of like anyone who cooks
6 using a funnel can totally be plugged by one bean.

7 Thank you.

8 MS. SMITH: Thank you. Mr. Clarence Daniels,
9 please. And after Mr. Daniels, Ms. Byrd Young.

10 MR. DANIELS: Good afternoon. My name is Clarence
11 Daniels. And I'm the president and owner of Concessions
12 Management Services. Our company operates food and
13 beverage concessions at LAX.

14 However, I'm here this morning really wearing
15 several hats. In addition to being a business owner at
16 LAX, I'm a resident of the City of Los Angeles. I'm
17 currently President of the Greater Los Angeles
18 African-American Chamber of Commerce which represents
19 African-American owned businesses in the Greater
20 Los Angeles area. And I serve on the board and I'm the
21 Western Regional Representative for the Airport Minority
22 Advisory Council, which is the Professional Trade
23 Association for minority and women-owned businesses that
24 do business in airports across the country.

25 And really I think I'm here this morning to

1 really ask the question, if not now, when? All of us
2 know that LAX, the location of LAX cuts both ways.
3 One, it's near the ocean. So we can't expand westward.
4 So we're landlocked. An earlier speaker made the point
5 that the location of LAX is also very convenient to
6 downtown and because of our freeway system to other
7 areas of economic activity. So we have a great
8 location, a great airport. And we have great
9 management. However, we are handicapped by the age of
10 our facility, by the layout of our facility and by the
11 need for our facility to grow. We must remain
12 competitive.

13 LAX right now is a major entry point for
14 Pacific Rim nations for both passengers and cargo.
15 There are a lot of airports because I work at five other
16 airports as well. And our organization is involved in
17 every airport around the country. And most airports are
18 remaining competitive by expanding their capacity, by
19 increasing their technology, by making themselves more
20 accessible for transportation. Most airports you can
21 take public transportation right into the airport.

22 You know, I hope we don't make the mistake
23 like we've done in other areas of public transportation
24 and not be forward thinking enough to realize that
25 Alternative D, which is a very balanced approach, gives

1 us an opportunity to plan for the future of L.A., for
2 our children, for our economy. Alternative D really is
3 a balanced approach that would allow us to remain
4 competitive. It would address a lot of safety issues.

5 I operate right now at Tom Bradley
6 International Terminal. So we serve the international
7 carriers, and I'm in terminal six which serves domestic
8 carriers. And we interact and talk to airport station
9 managers and airline employees all the time. And the
10 real issue is, when we are going to make LAX as safe as
11 secure as we all want it to be. I think Alternative --
12 I know -- I believe that Alternative D is finally an
13 Alternative that would allow us to remain competitive.

14 Also, I think it's important as an
15 African-American business owner to point out that LAX
16 has a disadvantaged business enterprise program, a
17 minority business enterprise program that ensures right
18 now in the concession area 40 percent of all the
19 concession opportunities go to minority and women-owned
20 companies. I employ 70 employees. 90 percent of them
21 are minority who live in Hawthorne, who live in
22 Inglewood, who live in Westchester.

23 MS. SMITH: Thank you, Mr. Daniels.

24 MR. DANIELS: And those employees would greatly
25 benefit from the Alternative D. Thank you very much for

1 the opportunity to speak.

2 MS. SMITH: Thank you. If you have prepared remarks
3 there, would you mind giving them?

4 MR. DANIELS: I don't.

5 MS. SMITH: You don't. It was so eloquent I thought
6 they were prepared. After Mr. Daniels, Byrd Young,
7 please.

8 MS. YOUNG: Good afternoon. Hello, Mr. Ritchie. I
9 think you've met me before. My problem is pollution.

10 Federal environmental protection, that's Code
11 40 of the CFR, and I think that's Chapter One that gives
12 the outline of what we should be doing. Now, I found --
13 I was researching this. I'm sorry my time was so
14 limited in the research effort, but my beef is with
15 cancer. Since 1990 cancer has been the second leading
16 cause of deaths of illnesses in the 90047. Okay.
17 Recently I had to take a leave because I contract it.
18 Many of my neighbors, I -- in case Mr. Logan is one of
19 my neighbors, and I think Mr. Ritchie was at one of the
20 seminars. And according to UCLA studies -- and it's
21 continually on the rise. So, you know, CDC in 1990
22 report stated that there were clusters of illnesses that
23 were not investigated. And I think -- and chronic
24 diseases, and I don't think all of them have been
25 reported. Because in one of the neighborhoods there

1 have been 11 people to die of cancer within maybe, what,
2 200-foot block -- foot block. And I was really
3 concerned about that. I'm sure that's not all. Those
4 are not all of the problems and the health problems.

5 So, as he said, you know, we are not going to
6 have it. Our children are not going to have -- want to
7 be alive if this continues. So I think this problem
8 should be -- that I recommend that people protect
9 whoever is beneath the flight path. And that's whether
10 that is doing the -- doing the noise protection -- what
11 is that called? But I think --

12 MS. SMITH: Soundproofing?

13 MS. YOUNG: Soundproofing, because it's known that
14 50 percent of the population is deaf.

15 MS. SMITH: Thank you. Can you please state your
16 name for the record, Ms. Young? You forgot to do that.

17 MS. YOUNG: My name is Byrd Young with the Y -- the
18 Y with the I. And I live at 9416 South Hobart directly
19 beneath a flight path.

20 MS. SMITH: Thank you so much.

21 Bill West. After Mr. West -- after Mr. West
22 we'll have Marqueece Harris Dawson. Is Marqueece here?
23 And after Mr. Harris Dawson, we'll have Harry Rose.

24 Mr. West.

25 MR. WEST: Thank you very much.

1 MS. SMITH: Thank you.

2 MR. WEST: Jim, congratulations on all of these
3 hearings.

4 MR. RITCHIE: Good morning. Thank you.

5 MR. WEST: Bill West, 8929 South Sepulveda
6 Boulevard, Los Angeles, 90045.

7 I wear many hats. Where do I begin? I am
8 currently the business representative of the
9 neighborhood council in Westchester/Playa del Rey. I'm
10 also the general manager of the HP Drolinger Company
11 (phonetic). We have 28 properties just north of LAX,
12 about 400 tenants. I'm also a homeowner, born and
13 raised in the city, went to that wonderful school just
14 down the street. And I'm happily retired from the
15 Los Angeles Police Department. And I guess I'm still a
16 member of that union.

17 With that, I am happy to tell the panel that
18 on Tuesday last the neighborhood council of the
19 Westchester/Playa del Rey voted to oppose Alternative D.
20 I remind you that neighborhood councils were enacted as
21 part of the City Charter to take up local issues and
22 recommend courses of action for their consideration.
23 And we have reviewed this for months and months. And it
24 was the overwhelming vote of that council to reject
25 Mayor Hahn's Plan D.

1 One of the issues that has come up is the
2 toxicity of airline fuel. I might remind you that
3 airline fuel is located -- or loaded with toxic
4 chemicals. As the planes decelerate for landing, their
5 engines operate less efficiently than while cruising
6 and, thus, they discharge more pollutants than they do
7 when they are cruising.

8 We have teachers and we have children and we
9 have families that live probably in three or four
10 counties that are affected by this. I understand that
11 LAUSD has an environmental section that has done some
12 studies on this. And I would urge that those studies be
13 made part of the public record on this.

14 Also there are certain areas that are going to
15 have to be dealt with based on an overriding
16 consideration issue which basically means that if you
17 choose to go forward with this plan, you have to
18 acknowledge that there are adverse environmental
19 impacts. You don't care and you're going to go forward
20 anyway, which would include children's health issues,
21 which would include cancer clustering, other respiratory
22 conditions, hearing loss. You have decrease in
23 productivity as motorists spend more hours stuck in
24 traffic. While the construction workers will see
25 increase work during the years this plan would take to

1 build out, everyone else traveling to or within miles of
2 the airport will spend more time on the road and less at
3 work or with their families.

4 Public safety at the airport; LAX now states
5 that they operate the airport quite safely. And I
6 believe they do. If they do that, why do we need to
7 "increase the safety," quote, unquote, going a mile and
8 a half to the east. And I would refer to the RAND
9 report on that. They need to create jobs where people
10 live rather than move people through congested traffic
11 from where they live to LAX. Thank you very much.

12 MS. SMITH: Thank you, Mr. West.

13 MR. RITCHIE: Thank you.

14 MS. SMITH: Marqueece Harris-Dawson, please.

15 MR. HARRIS-DAWSON: Good morning.

16 MS. SMITH: Good morning.

17 MR. HARRIS-DAWSON: Afternoon rather.

18 MS. SMITH: Afternoon.

19 MR. HARRIS-DAWSON: My name is Marqueece
20 Harris-Dawson. I am a staff member at the Community
21 Coalition in South Central Los Angeles at 8101 South
22 Vermont Avenue in the South L.A. Manchester Square.

23 MS. SMITH: I was going to ask you to spell your
24 name.

25 MR. HARRIS-DAWSON: M-a-r-q-u-e-e-c-e.

1 MS. SMITH: Thank you.

2 MR. HARRIS-DAWSON: So Manchester Square in South
3 L.A. is where our office is located. We represent 3,500
4 members who live in the Vermont Knowles area and
5 throughout South Central. We wanted to come to this
6 hearing to make a couple of points.

7 One, is that any expansion or public works
8 project of this size should include both the needs and
9 the interests of the people who live in the flight
10 pattern. And actually our offices are in the flight
11 path. And one of those things is repaving of our
12 streets and other public works projects like
13 soundproofing at the homes of our members.

14 The other point we would like to make is that
15 any public works project of this size should include a
16 significant community benefits package. We believe if
17 taxpayer money is going to be spent, especially with
18 this big a price tag, that the primary beneficiaries
19 ought to be people who pay taxes. So jobs at living
20 wage for the source of hiring and making sure that this
21 project improves the quality of our lives as best it can
22 rather than us being built over and built through, like
23 we get done over and over again. So I want to thank you
24 for your time and invite you all to come to the
25 community Coalition and hear from our members sometime.

1 MS. SMITH: Thank you so much.

2 Harry Rose, please. After Mr. Rose, Carole
3 Hossan. And after Ms. Hossan we have Bruce McDaniel.

4 Mr. Rose.

5 MR. ROSE: Good afternoon. I'm Harry Rose. I live
6 in Osage Park neighborhood of Westchester. I believe
7 you probably know where that is by now. We're
8 eight-tenths of a mile north of where you say you would
9 like to locate your Ground Transportation Center.
10 There is a couple of issues I would like to talk about.

11 One is the lip service that the City of
12 Los Angeles pays to affordable housing. Now, Manchester
13 Square is an area that once contained affordable
14 housing. There were 7,000 residents that lived there.
15 On October 29th, 1999 Los Angeles City Council adopted
16 resolution 99, dash, 2013 to purchase 33 single-family
17 dwellings and five multi-family dwellings located in
18 Manchester Square. They've been doing this under an
19 airport noise mitigation program.

20 Now, normally when you buy property in an
21 airport noise mitigation program, what you do is you buy
22 the property on a voluntary buy-out, place an aviation
23 easement on the property and you resell it on the
24 residential market, thus maintaining affordable housing.

25 With the council's resolution began a

1 multi-year program to purchase residential property with
2 passenger facility charges collected for the stated
3 purpose of noise mitigation. The initial purposes were
4 properties from owners who had approached LAX and asked
5 their homes to be acquired. Throughout the ensuing
6 years about 50 percent of the homes in Manchester Square
7 have been acquired. None of it has been resold. None
8 of it has been placed back on the market.

9 It should be noted before this process began,
10 LAX had entered into a Master Plan process that
11 considered all of Manchester Square properties as
12 belonging to the airport and usable for airport
13 operations. Yet, the current executive summary for
14 LAX Master Plan Alternative D tells us that the entire
15 process will be able to move forward without the
16 purchase of a single residential property. In the
17 regional discussions of voluntary buy-out for residents
18 that desire to have their homes purchased, LAX had
19 assured people that the purchased homes would be well
20 maintained and kept in a condition that would not blight
21 the neighborhood. This soon changed. As vacant homes
22 were looted and crime in the neighborhood increased, LAX
23 began the demolition process of its purchases.
24 Remaining residents found themselves increasingly
25 surrounded by fenced-off vacant lots. And the question

1 now rises, when does voluntary acquisition become
2 involuntary?

3 The community of Westchester has historically
4 lost homes to airport expansion time and time and time
5 again. And the residents of Westchester are tired of
6 this. And it's time that it stop.

7 MS. SMITH: Thank you. Thank you, Mr. Rose.

8 Carole Hossan, please. Can we get some help
9 with that?

10 MS. HOSSAN: Thank you.

11 MS. SMITH: Are you comfortable with the mic?

12 MS. HOSSAN: A little lower. I'm short. Thanks.

13 Carole Hossan, Westchester. I have a couple
14 of questions at the beginning.

15 How long -- or what is the cost going to be to
16 fix LAX to accommodate the new large airplanes? How
17 much would the cost be to have Ontario accommodate those
18 new large airplanes?

19 My second question is, how long will it take
20 at LAX, the profits generated by the new NLAs to pay for
21 the cost of the renovations and the same at Ontario?
22 Onto something else.

23 The Alternative D EIS/EIR states that under
24 Alternative D the LAX Master Plan would be consistent
25 with the policy of the regional aviation plan, that's

1 SCAGs, which calls for no-expansion of LAX. So explain
2 how can that be possible when the centerpiece of the
3 plan, the GTC, is not owned by LAX? The Alternative D
4 EIS/EIR states the purposes of objectives of the Master
5 Plan are to provide sufficient airport capacity for
6 passengers freight in the L.A. region. So why did your
7 original scoping outreach effort not include a single
8 agency within San Bernardino, Orange, Riverside or
9 Ventura Counties?

10 Here is a quote from an article in the Sierra
11 Club Magazine. According to the NRDC a single jet
12 landing, taxiing, idling and taking off causes as much
13 pollution as a car traveling 5,600 miles. Also, some of
14 today's quieter more fuel-efficient aircraft engines
15 generate an average of 40 percent more smog forming
16 nitrogen oxides than the engines they replaced. So why
17 is it that your analysis in your Alt D EIS/EIR indicated
18 that aircraft emissions account for 90 percent -- 97
19 percent of total emissions and contribute most to the
20 emissions of individual toxic air pollutants, yet, none
21 of the mitigation measures address aircraft emissions?
22 Why is that?

23 I think your analysis of air pollution has
24 been widely lacking. And since we do live there, it
25 would be nice to know exactly what it is we are

1 breathing and how it can be fixed. Thank you very much.

2 MS. SMITH: Thank you, Ms. Hossan.

3 Next we have Bruce McDaniel. After
4 Mr. McDaniel, we'll have Willy Colinden. My
5 brother-in-law's name is Crittendon. I saw it, but no
6 one crossed the Ts. Mr. Crittendon, you will be after
7 this gentlemen here.

8 MR. MCDANIEL: Hi. My name is Dr. Bruce McDaniel.
9 I'm the superintendent of the Lennox School District
10 which is located immediately west of LAX and it's
11 bordered on two sides by the 405 Freeway and 105
12 Freeway.

13 We serve over 7,000 children in this very
14 condensed area, nearly all of whom are from ethnic
15 minorities and extremely low socioeconomic families. We
16 have a paramount interest in the LAX Master Plan because
17 of the direct effect on our community. We've carefully
18 analyzed the impacts of the new option in the Master
19 Plan and found that mitigations are crucial in our
20 community because of the extreme proximity to the
21 airport.

22 The Lennox School District previously conveyed
23 many of our communities' interests and of impacts and
24 specific concerns in September 2001. We're a member of
25 the LAX Coalition for Economic Environmental and

1 Educational Justice. And as such, we are committed to
2 working to ensure that the appropriate mitigations do
3 take place.

4 Lennox School District looks forward to
5 working with Mayor Hahn, the Los Angeles City Council,
6 the LAWA Board of Airport Commissioners and Los Angeles
7 World Airport staff in the development of appropriate
8 measures. We're confident that with the mitigation that
9 is necessary, we can support the Mayor in his effort to
10 improve safety and security at Los Angeles International
11 Airport. Thank you.

12 MR. RITCHIE: Thank you very much.

13 MS. SMITH: Thank you. Mr. Willie Crittendon.

14 MR. CRITTENDON: Thank you very much.

15 MS. SMITH: You're welcome.

16 MR. CRITTENDON: Good afternoon.

17 MS. SMITH: Good afternoon.

18 MR. CRITTENDON: My name is Willie Crittendon. And
19 I'm the president of the Inglewood School District Board
20 of Education. We know that the expansion program is
21 going to happen. So we need to ensure that our
22 community, our voices are heard, the mitigation, which
23 really affects our school district, and especially Oak
24 Street School. We are looking at that piece. And far
25 more important than that, jobs for our students and

1 apprentice-type of program because we know every student
2 is not going to go to college. And this is going to be
3 a seven- or eight-year process. And we need to ensure
4 that there are training programs, apprenticeships that
5 would involve the Inglewood Unified School District in
6 terms of providing opportunities for those students to
7 learn and graduate and go out in the world of work.
8 Because if students -- if students have those skills,
9 they will feel good about themselves and they will
10 become productive.

11 And there is a hook in this that you will tell
12 the students, if you do the right thing, you have to
13 come to school. You have to perform. And here is an
14 opportunity for you to be gainfully employed and learn a
15 sellable skill. And that's where we're coming from, the
16 job aspect, sellable skills and the mitigation because
17 I've lived in Inglewood since 1967. I lived on 6th
18 Avenue. I could stand in my backyard and read the
19 labels on the planes. So we need to ensure that the
20 insulation, sound abatement is well taken care of so
21 that our students, our parents won't start to have a
22 loss of hearing and to show that we will be working with
23 you to make sure that this is going to be in the best
24 interest of our community and, most importantly of all,
25 to benefit our City of Inglewood and the Inglewood

1 Unified School District and especially the 18,000
2 students that we have responsibility for.

3 Thank you very much.

4 MR. RITCHIE: Thank you, sir.

5 MS. SMITH: Thank you, sir. I'm going to call some
6 names of people that passed earlier. Oadie Ross? Is
7 Oadie Ross available? Henry Jimenez? Daniel Aguilar?
8 Jesus Jimenez? Greg Garcia? Frederick DePalm?
9 Fernando Contreras? Daniel Avina? Jorge Sifuentes?
10 Jessie M. Gatis?

11 At this time I don't have any other speaker
12 cards in hand. One gentleman. Welcome. Can we make
13 sure to get him a speaker card as well, please.

14 Can I get you to state your name and address
15 for the record, please, and spell your last name. And
16 then I'll start your time.

17 MR. WASHINGTON: I did sign a card. My name James
18 Washington. I represent Local 347, Service Employees
19 International Union. I am here to read into the record
20 a statement from the general manager of Local 347 Julie
21 Butcher and president of the Local, Bob Schoonover.

22 MS. SMITH: Thank you.

23 MR. WASHINGTON: W-a-s-h-i-n-g-t-o-n. The address
24 is 1015 Wilshire Boulevard, Los Angeles. I am a
25 longtime city resident. I live in between two airports,

1 Long Beach and LAX and several general aviationary
2 facilities.

3 "On behalf of the Service Employees
4 International Union, I would like to express our strong
5 support for Alternative D of the LAX Master Plan.

6 SEIU Local 347 represents over 700 employees
7 that work at LAX and thousands that live in surrounding
8 communities. The employees we represent are directly
9 impacted by what happens at LAX. We feel your efforts
10 to modernize LAX are a step in the right direction.
11 Alternative D is a balanced approach to maintaining LAX
12 as an economic engine for our regional economy while
13 considering the environmental and traffic impacts to the
14 surrounding communities.

15 Your safety and security alternatives address
16 many security concerns at LAX and allows the flexibility
17 to accommodate evolving federal security requirements
18 and technology. SEIU Local 347 has a great interest in
19 providing a safe and secure work environment for its
20 members at the airport and in surrounding areas.

21 SEIU Local 347 feels strongly that the
22 modernization of the airport is long overdue and
23 necessary. The improvements that Alternative D poses
24 will provide for improved operations, increased
25 efficiencies that will benefit passengers and

1 concessions at LAX. Maintaining LAX as an international
2 gateway to the country will maintain hundreds of
3 thousands of jobs directly related to LAX. We recognize
4 the importance of preserving LAX as a premier airport in
5 the world.

6 We appreciate your leadership and continuous
7 effort to modernize LAX. We look forward to working
8 closely with you through the Master Plan process.
9 Sincerely, Julie Butcher."

10 MS. SMITH: Thank you so much. Do you mind
11 providing our staff with that? Thank you so much.

12 (The statement submitted for the
13 record was marked as Statement 12
14 and is attached hereto.)

15 MS. SMITH: At this time I don't have any other
16 speaker cards before me. We want to ensure that
17 everyone had an opportunity to speak.

18 At this time having no more speaker cards
19 before me, I will turn the hearing over to
20 Mr. David Kessler to close the hearing out.

21 MR. KESSLER: I will ask, again, if there is anyone
22 who has not had an opportunity to speak concerning the
23 information in the Supplement to the Draft Environmental
24 Impact Report/Environmental Impact Report?

25 Not seeing anyone else, I will remind you that

1 if you feel you are unable to provide us with verbal
2 comments today, we will be accepting written comments
3 until 5:00 p.m., Pacific Standard Time, on Friday,
4 November 7, 2003. You can mail your comments either to
5 me at the FAA or to Jim Ritchie with LAWA. The mailing
6 addresses are listed on the cover of the Supplement to
7 the Draft EIS/EIR.

8 I want to thank everyone for your comments
9 today. This public hearing for the Supplement to the
10 Draft EIS/EIR on the Los Angeles International Airport
11 Master Plan is now closed. Thank you.

12 MS. SMITH: Thank you.

13 (Whereupon the proceeding adjourned
14 at 1:02 o'clock p.m.)

Comments on the LAX Master Plan Draft EIS/EIR Supplement
EPIC Center, Los Angeles
October 25, 2003

Good morning. I am Councilman Kelly McDowell, representing the City of El Segundo.

Given the length and complexity of the Master Plan and environmental documents, our complete comments, including those on technical issues, will be finalized soon and my City's comments today are preliminary.

The City of El Segundo continues to oppose Alternatives A, B, and C for the many reasons the City expressed orally and in writing during the public review and comment period for the initial Draft EIS/EIR in 2002.

The City of El Segundo has not endorsed Alternative D. However, we feel its stated objective of constraining LAX to its current capacity is appropriate and supports a regional aviation approach.

To be clear, the City of El Segundo can only support an alternative that by design will accommodate passenger and cargo levels no greater than the physical capacity of the airport as it exists today.

The City has retained a nationally respected expert to assess the capacity of Alternative D.

To the extent that our expert consultant's findings are that the passenger capacity of Alternative D, as currently designed, exceeds 78 MAP, we would hope that LAWA would cooperate with El Segundo in incorporating any revisions in the Plan necessary to ensure the capacity is not increased beyond 78 MAP.

Limiting LAX's capacity to its current capacity has always been our number one goal.

We believe that limiting capacity at LAX ~~will~~ allow other airports in the region to develop and handle their fair share of ~~the~~ future regional aviation demand.

However, my City is greatly concerned about the impacts of southside airfield changes that would move the southernmost runway 50 feet closer to El Segundo.

LAWA has stated that it believes these changes are necessary to improve runway safety.

However, we are currently studying the impacts of the proposed reconfiguration and the options for the southern runway complex.

In particular, we urge full public consideration of end-around taxiways as an alternative that could provide greater safety at lower cost and with fewer new burdens on local communities.

Safety at LAX must be a priority for all of us.

El Segundo is prepared to support measures necessary to enhance safety, even if those measures increase our burden, but only if we are assured, through an independent expert, that alternatives with fewer impacts are not equally effective.

In conclusion, we are grateful for Mayor Hahn's responsive leadership and his pledge to constrain growth at LAX and foster a regional approach to meeting future aviation demand.

It is our hope that the ultimate outcome of this Master Plan process will be a regional airport approach that ensures that LAX does not exceed its current capacity.

Thank you.

####

My name is Emma Worthington and I live in Inglewood. I also work at the airport and have worked there for almost 30 years. Like myself many people who work at the airport live in the surrounding communities. We live in Inglewood, Lennox, Hawthorne, El Segundo and Westchester. We understand the connection between good quality jobs and a quality life. We need new jobs but we don't minimum wage jobs. What we need is jobs that provide a livable wage and affordable family health coverage. The companies at the airport provide those types of jobs and that is how I have been able to raise my family and not be on welfare. In order to insure that this modernization plan provides good employment opportunities for our communities, we encourage the mayor to include in his plan a local hiring program so that others in my communities can also raise their families and our youth can strive to emulate their parents. When we talk about modernization we say we are bringing the airport and Los Angeles into the 21st Century. Well we the workers would like to be able to bring our communities into the 21st Century along with the airport and the rest of Los Angeles. That is why we urge the mayor to ensure that his plan provides good paying jobs with good benefits and a community packet that will ensure we are along for the ride. NOT LEFT BEHIND.

Testimony from Rep. Maxine Waters

**Public Hearing on the Supplement to the Draft EIS/EIR
for the Proposed LAX Master Plan**

**EPIC Center/Olympic Swim Stadium
Community Hall
3980 S. Menlo Avenue
Los Angeles, CA 90037**

October 25, 2003

Alternative D is a \$9 billion project that would demolish homes and disturb communities without improving the safety and security of LAX. The Supplement to the Draft EIS/EIR is an inaccurate and misleading document that fails to reflect the true impact of this project.

The centerpiece of Alternative D is the Ground Transportation Center (GTC), a large remote passenger check-in facility that would be constructed at Manchester Square, several blocks away from the airport terminals. An Intermodal Transportation Center (ITC) would be constructed at Aviation Blvd. and Imperial Highway, which would provide a connection to the Green Line. According to the Supplement to the Draft EIS/EIR, the GTC and the ITC would be the primary access points for all passenger drop-off and pick-up and vehicle parking. A Consolidated Rental Car (RAC) facility would be constructed in Westchester.

Inconvenience for Passengers

Local families could no longer drive to the Central Terminal Area in order to drop off passengers. Instead, an Automated People Mover would be constructed to transport people to the airport terminals, and a baggage tunnel would be constructed to transport baggage. All airport employees and passengers would access the Central Terminal Area from the GTC, the ITC and the RAC via the Automated People Mover, carrying their carry-on baggage with them. This would be extremely inconvenient for most passengers, and it would present special hardships for the elderly, the handicapped and families traveling with small children.

Airport Security

Supporters of the proposed project to construct a remote passenger check-in facility claim that the facility is necessary to improve the safety and security of LAX and prevent terrorist attacks at LAX. Theoretically, diverting all vehicular traffic to remote parking structures and the remote passenger check-in facility would protect the Central Terminal Area from car bombs.

The RAND Corporation conducted a security study of the proposed remote passenger check-in facility, which was released on May 14, 2003. The study concluded that the proposed project would not significantly improve the security of LAX. The study also concluded that concentrating passengers in the proposed remote passenger check-in facility could increase the likelihood that the check-in facility would be the target of a terrorist attack. Finally, the study concluded that concentrating several airport functions in the remote passenger check-in facility could exacerbate the effects of an attack on airport operations.

On July 25, 2003, I introduced H.R. 2985, a bill to condition construction of a remote passenger check-in facility at LAX upon a finding that such a facility will promote the safety and security of the public. H.R. 2985 would require the Secretary of Homeland Security to review the proposed facility prior to its construction to determine whether it will protect the safety and security of air passengers and the general public more effectively than the existing facilities at LAX. If the Secretary of Homeland Security does not determine that the facility will improve public safety and security, the Federal Aviation Administration (FAA) would not be allowed to approve its construction. On September 2, the Board of Supervisors of Los Angeles County passed a motion to support my legislation.

Ironically, Alternative D does not even significantly improve security at the Central Terminal Area. According to the Supplement to the Draft EIS/EIR, Alternative D calls for the installation of new baggage screening facilities in the Central Terminal Area -- not the remote passenger check-in facility. If Alternative D were designed to protect the Central Terminal Area from terrorist attacks, one would think that the baggage would be fully screened before it is transported through the baggage tunnel to this area. Nine billion dollars is an extremely high price to pay for a security project that provides protection from car bombs but not from suitcase bombs.

Displacement of Residents

The Supplement to the Draft EIS/EIR makes the astounding claim that Alternative D would not displace any residents. Instead, the Supplement predicts that 2,500 houses and apartments will be acquired and the residents relocated under LAWA's existing Voluntary Residential Acquisition/Relocation Program, through which LAWA may acquire property and relocate residents on a voluntary basis in order to mitigate the impact of airport noise. The Supplement then concludes that Alternative D would not require the acquisition of any additional dwelling units or the relocation of any additional residents. This claim is especially ironic, given the fact that several Manchester Square residents have already said that they will not leave their homes voluntarily.

In reality, Alternative D would displace thousands of Manchester Square residents. In order to construct the remote passenger check-in facility, the City of Los Angeles would have to acquire and demolish 38 houses, 179 apartment buildings and a 52-year-old elementary school, in addition to the 263 structures it has already acquired. It would also have to relocate about 6,200 people, some of whom have federally subsidized housing vouchers. I strongly oppose the forced relocation of any of these residents.

Noise and Traffic Congestion

For several years, I have been working to limit the environmental impact of Los Angeles International Airport (LAX) on the surrounding community. My constituents living next door to LAX, in Westchester, Inglewood, Hawthorne, Gardena and South Central Los Angeles, must contend with excessive noise, pollution and traffic congestion caused by the airport. These residents suffer many sleepless nights due to deafening jet noise. They must wipe the soot from aircraft emissions from their cars and driveways everyday. Residents have reported increased cases of asthma, respiratory ailments and hearing problems.

I do not accept the claim in the Supplement to the Draft EIS/EIR that Alternative D would reduce by 1,300 the number of residents exposed to noise levels of over 65 CNEL by the year 2015. Most airport noise is the result of airplane landings and departures, and Alternative D does not propose any reduction in landings and departures. In fact, Alternative D would increase the airport's capacity from 78 million air passengers per year to 78.9 million air passengers per year. Consequently, Alternative D could allow the number of landings and departures and the corresponding jet noise to increase. Of course, Alternative D could reduce the number of residents exposed to high levels of airport noise as a result of the forced relocation of residents from Manchester Square. However, forcing residents to leave their homes is no way to respond to their complaints about noise.

The claim in the Supplement to the Draft EIS/EIR that Alternative D would reduce traffic congestion is also not credible. Alternative D would concentrate airport traffic on the east side of the airport near the proposed remote passenger check-in facility, causing a shift in airport traffic to the I-405 freeway near the Arbor Vitae/Manchester Avenue exits. This could cause a tremendous increase in traffic congestion on I-405, which is already heavily congested. It could also increase traffic congestion in the surrounding communities as airport passengers and other drivers seek alternative routes to get to, from and around the airport. Concentrating airport traffic at a single facility will not reduce congestion.

The Cost of Alternative D

Alternative D would cost \$9 billion, an exorbitant amount of money, at a time when budget deficits are growing and the economy is weak. Airlines would be required to increase their passenger fees in order to fund the proposal, which would amount to a tax increase for air passengers. American taxpayers have already provided loan guarantees to the airline industry to keep the airlines in business following the terrorist attacks of September 11, 2001. They should not have to pay higher passenger fees for unnecessary airport construction projects as well.

Air passengers and other taxpayers are willing to support reasonable expenditures to pay for measures that provide real enhancements in security, such as the installation of baggage screening facilities. However, the remote passenger check-in facility, the Automated People Mover and the baggage tunnel included in Alternative D are not reasonable expenditures and do not provide real enhancements in security.

The American people are sick and tired of deficits and bloated government spending. The State of California is now running a \$38 billion deficit, and the federal government has a \$374 billion deficit in 2003. Furthermore, Congress is in the process of providing the President an additional \$87 billion for continuing operations in Iraq and Afghanistan. The American people cannot afford to spend \$9 billion on an outrageously expensive boondoggle at LAX.

Conclusion

Alternative D is simply a continuation of former Mayor Richard Riordan's plan to expand the airport in the name of safety and security. I urge the City Council of the City of Los Angeles to reject this ill-advised and expensive scheme that will displace thousands of Manchester Square residents without improving the safety and security of LAX.

I've resided in Inglewood for 30 years. When I moved here the airport was innocuous. Inbound planes flew in a pattern which seemed to follow Century Blvd. Out bound planes did not affect us.

The air traffic was minimal. The street traffic was bearable. The air was breathable. My sleep was not disturbed at night.

Now residents anywhere in the city have either seen or heard an airplane over their houses.

And this has resulted in.....

Traffic Congestion

main arteries

neighborhoods (speeding)

street damage

Noise Pollution 24 hours per day

aircraft

street

freeway

neurosensory disorders

Air Pollution

Aircraft emissions

Traffic emissions

Particulate matter (that we have to breath day in and day out)

Most of our adults suffer from some respiratory disorder, but alarmingly the problem is wide spread among our children whose young lungs should be uncontaminated.

Neurological / Psychiatric Disorders

Sleep deprivation

Anxiety-depression

Learning disorders *airplanes are on the descent directly over many of our schools*

Safety Issues

Low flying aircraft

More airport related facilities moving closer and into our communities – bringing with them possible terror attacks

Too many aircraft flying in close proximity at a time

Property Damage

caused by air pollutants and sound waves

LAX has been methodically increasing the airport's capacity without the required environmental impact reports.

The current report is sorely lacking in validity. It does not address solutions to any of our quality of life issues, traffic, noise and air pollution, mental and physical health, property damage and safety. It's based on old, erroneous, unsubstantiated, and irrelevant data.

LAX is not an asset Inglewood. It is the worst possible neighbor any community could have. It profits from our misfortune. But what better place to exploit than a low income minority community?

If I had any lung capacity left, I'd like ^{to go out of my house} to be able to fill them with clean air.

LAX PUBLIC HEARING

Questions from constituents of the 8th District concerning flight schedules, noise and employment:

- Why are planes permitted to take-off and land between the hours of 11:00 PM and 6:00 AM?
- Referring to jet noise levels - why haven't new criteria been established to account for flight patterns over areas such as Vermont Knolls?
- Why can't jet engines noise be muffled 10 miles before landing?
- How can the residue from jet fuel be reduced over our community?
- Why not extend the airport and runways out into the ocean?, Japan has done this successfully?
- What methodology has been devised to mass transit passengers to terminals if no curbside drop off is permitted?
- Local residents were told from the start that the general aspects of the plans were not negotiable, then why are you holding public hearings?
- Since the existing airport was designed to accommodate 40 million passengers, last year 56.2 millions used the facilities and the expansion will accommodate 78.9 million, what are your plans to not further impact our quality of life or has it been factored into your plans?

✓ ECONOMY: ✓

- Of the 49,000 jobs that the airport expansion is projected to create, how many jobs for the residents in those communities that have and will be impacted be made available?
- The Mayor has addressed unions with the expansion plans, are there plans to reach out to none union workers, giving them an opportunity for employment?
- How will the public be notified of available employment?

AA (NAME) W. SOLOMON
LIVE, SOUTHEAST
NEI COUNCIL

SOUTH
EAST

Dear Counsel Members,

My name is Tarlise Netherly; I am addressing you today for two reasons.

First, I am here to ask you not to approve "Alternative Master D Plan" for the Los Angeles International Airport and its surrounding area. I am making this request because there is a problem with the proposed plan. ~~THE WAY IT IS.~~

It took me a total of 12 days, 3 hours a day, to read and understand the proposed plan and the drastic changes being proposed. I originally began reading the plan to get insight on a piece of property in your proposal that I would like to develop; however, in doing my research I found something quite alarming.

With myself being handicapped I am thoroughly aware of my surroundings; therefore, I noticed that the proposal has not stated specific handicapped or disabled safety precautions being developed. The "alternative master d plan" states is "it's accessible" but what does that mean?

For instance in the proposed "People Mover", there are no intended railings for the blind to hold onto, there are no seating schematics, and there are no wheelchair safety locks. Anyone who knows anything about wheelchairs knows the wheel locks on the wheelchair are not always sturdy. There is also no mention of our exceptional four-legged friends (dogs) who assist some of us in getting around; they too are a part of us. Posting the well-recognized handicap placard is meaningless if there is no actual assistance to back it up.

Your suggestion of "Alternative Master Plan D" utilizes a great deal of paper, and yet leaves out a part of a social class that is alive, well and extremely vital in the community, it is imperative that precautions for the handicapped and disabled are included on paper and not just phased in while construction takes place; this would be improper procedure.

All too often, society ignores the fact that someone who looks, talks, and walks differently may indeed have feelings just like the next "normal" person. This is precisely why I am asking the counsel to go back and review the schematics for "Alternative Master Plan D", before making a commitment to spending millions of dollars in order to reconstruct and redevelop LAX and its surrounding areas. Should you decide to research the information I have given you regarding the handicapped and disabled, you will find there are a substantial amount of people both young and elderly who enjoy and/or are required to travel. Your "people mover" must accommodate us as well.

The second reason for my coming before you is, as I have previously stated, there is a piece of property in your plan that I would very much like to develop.

The current address of the property is 9011 S. Airport Blvd, Los Angeles, Ca. Its location is on the north/south corner of Arbor Vita and Airport Blvd; [directly adjacent the Post Office]. Please see map 2.3-1 and 2.3-2 in Alternative Master Plan D Volume I The

property has been vacant for approximately five years; previously, it was occupied by the Hertz Corporation, as a car rental station.

I would like to take this land and establish a nightclub. Allow me to emphasize that this will not be a strip club but an establishment where all diversities can go and enjoy themselves. The club will promote class, excitement, and relaxation, as there will be "Spoken Word" and Jazz on Wednesday's and Sunday's. There will also be Hip Hop and disco Thursday through Saturday, with hopes of diverting attention away from the adult entertainment in the area. In doing so, we will introduce a higher quality of entertainment in correlation with the image you are trying to establish with the reconstruction of the LAX area. Thus, generating additional positive revenue for the various surrounding communities around the Los Angeles International Airport.

My proposal of the nightclub will generate positive revenue for the area. As you may already know there is currently a law on the table regarding lap dancing which if passed would mean that exotic dancers would have to remain six feet way from the customer; no doubt that this will cripple the adult entertainment industry. Should this law come to pass, it will affect the three adult clubs in the airport area. From a strategic standpoint, I would like for my nightclub to take a positive spin from the negative outcome. Bring a positive outlook to the situation while still maintaining and generating more revenue for the area, ~~thus raising the property value of the said target area.~~

According to your "Alternative Master Plan D-section A2.2- Passenger Operations 1996 vs. 2000". LAX in 1996 had 57,975 visitors to the Los Angeles area vs. in 2000 there was 67,303, a difference of 9,328 (1.7%) in approximately 4 years. With ~~the~~ precise advertising, considering future demographics of the area, I believe that there will be an approximate growth increase of 2% to 5% in 5 years to support the financial burden needed for the redevelopment of the area.

I know that I am solely one person, however I am one person taking a stand for not only myself but for others in my community. The handicapped and disabled persons issue came up only after doing the research required for the nightclub. I now leave you with two major issues to contemplate. First, how to incorporate safety precautions for the handicapped and disabled into your plan, and second, allowing me to lease a plot of land that has been vacant for quite some time. My objective is to turn it into a positive influence for the community and the LAX area as well.

I have taken the liberty of visiting the land, as well as have taken (show pictures) as you can see, the surrounding area is a place where an influx of revenue can have a positive influence on the area. Since the current night spots are the sports bars in hotels. with the nightclub in this central area there will be a diversion of revenue from the distant surrounding areas to the main area in which you are trying to redevelop.

The areas that will be influenced by the nightclub's location; 1) more employment, 2) parking structures, 3) eateries, 4) the hotels in the area, 5) airport travelers, and 6) the ~~raise of value for the airport and~~ the surrounding business and residential communities.

Now I am not going to tell you that everything is going to be completely positive, because this is not Utopia. The downside to all this is going to be a security issue for both the Airport and the nightclub, however that can be minimized, with the right Security firm that coincides with the Security implemented in the surrounding parking structures and the Airport, that downside can become null and void.

I urge you, the counsel, to please consider this alternative, ^{in the} as opposed to using taxpayer money to ~~redevelop and reconstruct LAX.~~

City: HUNTINGTON PARK State: CA Zip Code: 90255

Document: Draft Master Plan Addendum Supplement to the Draft EIS/EIR

Subsection (if applicable):
 Number: _____ Title: EXECUTIVE DIRECTOR

Comments:

In L.A. County African American, Latinos and Asians are three times more likely to have a hazardous waste treatment, storage or disposal facility within one mile of their homes than white population. Schools with more than 50% people of color population are three times more likely to a facility reporting to the Federal Toxic Release Inventory within a mile of the school. Children attending schools with the highest risk to respiratory health problems score significantly lower achievement (from poor air quality)

People of color have historically been burdened with the negative impacts of development that benefits the broader society while forced to live in poverty. People of color are now declaring this environmental racism unjust. We demand environmental justice. Any project at LAX will have impact on the surrounding communities of color and we demand justice for these communities. Any project that benefits the economy has to benefit the people impacted.

Skimming through the supplement to the draft EIS/EIR, and listening to different LAWA staff people (and elected officials) I have come to believe that they seem to be more concerned and careful of the infrastructure and economics of the buildings and money-making resources, than of the health, welfare and sanity of the surrounding communities. All I see in this plan is greed on all levels of government. Why don't people who are elected officials get the compensation and quality of life they deserve? ~~are~~ ^{not}

In 2001 SCAG had an item in its RTP about the Arbor Vitae interchange. Time and again elected officials had said that it had nothing to do with the airport or its expansion, and LAWA staff even went so far as to say that the interchange was for the Forum (which is now a church), Hollywood Park (which needed financial help from the city of Inglewood) and a Kmart that is no longer existent. So if the interchange is not for the airport why is it in the EIS/EIR?

There is a MOU between LAWA and Inglewood that is mentioned in the EIS/EIR, that its aviation easement requirements are currently suspended—the requirements to the aviation easements that the residents had/have to sign takes away their right to sue the airport.

In the past Inglewood's mayor had wrongly stated at a City Council meeting that the Easements had been eliminated while in fact they *were* merely suspended.

With Manchester Square as the GTC how will it improve security and safety? I guess if you want to keep the CTA safe Manchester Square helps, but how is putting all the people closer to the residents of Westchester going to keep the passengers and residents safe? If someone really wanted to do something to improve safety and security they would do the best thing and regionalize.

QUALITY OF LIFE COMMENTS:

- Pollution - both noise and aerosols components will increase dramatically, because airline traffic will expand to the level required by the planned MAP goal.
- Included in the plan, should be a proposal to provide funds to complete the existing soundproofing contracts and identify the remaining homes that are affected, based on 55 DNL noise levels and above.
- The infrastructure- Century Blvd. from the 110 freeway to La Cienega and other heavily traveled streets to and from the airport should be resurfaced regularly with funding support from LAWA to eliminate pot holes and other irregularities.
- Homeowners residing in the flight path of Los Angeles International Airport are significantly impacted by airplane noise, making it difficult to plan and enjoy activities in the backyard or leave doors and windows opened for ventilation. The constant drone of airplanes taking off or landing does not permit normal phone conversation without interruptions or the enjoyment of a television program without exceeding the 60 decibels dBA level, which have been determined to be a normal level for conversation.
- Environmental issues, health issues and soundproofing for residents living in the flight path and around LAX must be mitigated prior to approval of any plans to expand.

ENVIRONMENTAL:

- The environmental impact, particularly air pollution and noise will be substantially increased during the physical construction as well as when the expansion is complete.

HEALTH ISSUES:

- Studies dating back to 1977 reports that continued exposure to loud noise is a health hazard to individuals living near or around flight corridors.

- Airplane noises are linked to:
 - Stress
 - Hypertension
 - Sleep deprivation and interruptions
 - work-related performance
 - learning and academic performance

The residents of the 8th District would like to go on record opposing any expansion until the environmental, health and economic issues are mitigated to assure that our quality of life will not be further compromised.

952 S. WESTERN AVE
CANA CA 90006 #112

MY NAME IS SUSAN KIM
AND I REPRESENT KOREAN WELFARE ORGANIZATION
I have come here today to ~~testify on~~ support
~~of~~ of ~~the~~ Alternative D of the
LAX MASTER plan.

I believe that Mayor Hank's proposal
is a balanced plan because it allows
for some growth while taking into
consideration the impacts to the surrounding
communities plus this project will create
some what 50,000 jobs. construction
related jobs for the people of Los Angeles

The plan will improve operations and
create a greater level of customer
service by improving the passenger
experience for travelers

I ~~believe~~ myself believe it is time to
~~modernize~~ modernize LAX. ~~and~~ ~~that~~
and I believe Alternative D is step
in the right direction
Alternative D isn't for Mayor Hank.
IT'S for the Thank you
city of Los Angeles.

October 24, 2003

The Honorable James K. Hahn
Mayor's Office
City of Los Angeles
200 North Spring Street
Los Angeles CA 9012

1015 WILSHIRE BLVD.
LOS ANGELES, CA 90017

213/482-6660
213/482-6673 FAX
800-LOCAL347

www.seiu347.org

Dear Mayor Hahn:

On behalf of the Service employees International Union - AFL-CIO (SEIU) Local 347, I would like to express our strong support for Alternative D of the LAX Master Plan.

SEIU Local 347 represents over 700 employees that work at LAX and thousands that live in the surrounding communities. The employees we represent are directly impacted by what happens at LAX. We feel that your efforts to modernize LAX are a step in the right direction. Alternative D is a balanced approach to maintaining LAX as an economic engine for our regional economy while considering the environmental and traffic impacts to the surrounding communities.

Your Safety and Security Alternative addresses many security concerns at LAX and allows the flexibility to accommodate evolving federal security requirements and technology. SEIU Local 347 has a great interest in providing a safe and secure work environment for its members at the airport and in the surrounding areas.

SEIU Local 347 feels strongly that the modernization of the airport is long overdue and necessary. The improvements that alternative D proposes will provide for improved operations and increased efficiencies that will benefit passengers and concessions at LAX. Maintaining LAX as an international gateway to the country will maintain hundreds of thousands of jobs directly related to LAX. We recognize the importance of preserving LAX as a premiere airport in the world.

We appreciate your leadership and continuous efforts to modernize LAX. We look forward to working closely with you throughout the master plan process.

Sincerely,

Julie Butcher

COMMENTS SUBMITTED BY DENNY SCHNEIDER

<u>STATEMENT NUMBER</u>	<u>DESCRIPTION</u>	<u>PAGE</u>
2	A Compilation of Comments Submitted by Denny Schneider	26

Comments to the LAX Master Plan and EIS/EIR dated July 2003

Hand Delivered at the last LAX MP hearing held on October 24, 2003

From: Dennis J. Schneider
7929 Breen Av., Los Angeles, CA 90045

Attached to this cover sheet are approximated 300 pages of detailed annotated comments provided in both hard copy and on CD.

Summary:

Alternatives A, B, and C were demonstrated to be deficient in 2001. Earlier comments to the approximate 12,000 page review materials provided showed that these alternatives have unacceptable impacts on local communities and for Southern California. Although numerous comments were provided in 2001, **no responses have been provided to the public.** Although the newest alternative, Alternative D, addresses several of the prior fatal flaws and is preferable to the earlier proposed alternatives many issues remain.

LAWA and the City of LA is to be commended for their outreach efforts to verbally present their plans to the many public organizations. Plans such as the "flyaways" should be commended.

LAWA outreach for idea exchange, however, has fallen very short. The Osage Neighbors Association, which represents the eastern half of Westchester, is one of the areas most heavily impacted and has many concerns. Yet the Board of Airport Commissioner leadership, LAWA management, and the Mayor's Office have been unable to find an available evening to meet with the ONA Board of directors during the past 14 months despite numerous requests by ONA.

Development of the alternatives has been in a restrictive environment. Documents were released in security controlled areas and anyone potentially critical of the plans was prohibited from attending. The same restricted access policy was true of the Mayor's Blue Ribbon Committee on Manchester Square. It was held in a restricted area of LAX with specifically selected individuals. Neither handouts nor recordings were made available to the committee members; the public and press were excluded from these meetings. When an alternative plan was presented by several committee members concerned about the use of Manchester Square it was rebuffed and not seriously considered.

The approximately 6,500 pages of the Supplemental documents released in July 2003 is very tricky to read and evaluate due to persistent cross referencing between documents released in 2003 and those from 2001. Further, it is very difficult to determine the origin and dates of materials used in exhibits. Numerous times charts dated 2002 or 2003 contained only 1994-96 data without saying so. Many exhibits are sorely deficient in detail on some issues and contain conflicting information for others. The basis assumptions for specific conclusions are difficult to determine from the way in which data is presented. Broadly subjective words like "substantial," or "minimal" are used in place of specifics.

The various alternatives (with several options inside each) are compared to a "No Action/No Project" which is unrealistic and results in a comparison of "apples to vegetables."

Numerous critical issues in Alternative D remain unanswered or unaddressed. On that basis, alone, it should be rejected. Spending more good money just because enormous amounts of money have already been expended is a POOR justification to continue with this EIS/EIR. It should be redone due to the irrecoverable number of errors and omissions.

The Supplemental (and original) document reviews are further complicated by the page numbering differences in the electronic versions posted and the hard copy.

This Plan still concentrates over 75% of commerce at LAX resulting in an unwarranted economic risk for Southern California.

Below is a representative sample of major impact issues for Alternative D EIS/EIR

Noise

- Incomplete review of CNEL impact; changes in patterns depend on which runway configuration is implemented, mix of aircraft that actually occurs, no topology impacts are considered, frequency ranges measured (higher and lower) are not comprehensive.
- Single event (SNL) impacting level criteria are overly generous; impacts understated
- Health impacts-such as respiratory issues, learning issues, autonomic issues such as blood pressure, sleep deprivation and sleep interruptions, and gastrointestinal issues are understated.

Air analysis

- Air circulation patterns not adequately considered.
- Particles less than PM10 (ie PM2.5 studies) not done
- NOx gases not considered.

Traffic issues

- Mitigations recommended, not fixed – many to be paid by agencies other than LAWA or the city not guaranteed or funded.
- Cargo not fully controlled yet; needs separate entrance off 105 freeway.
- Traffic into the community.

Construction Impacts

- Traffic, noise, pollution
- Business impacts

Safety

Manchester Square separation from the rest of the contiguous airport.

- Ability to evacuate; how to get emergency crews there?
- Community closer to potential attacks.
- LNG facility closer to the community (northern MS area).
- Security is only as good as weakest link which may be other airports.

Substantial difference between Alt D and others that came first makes the CEQA compatibility questionable. Much of the old data from 1996 was incomplete and evaluations and comparisons with 2000 conditions does not fix the old data flaws.

Passenger Inconvenience

- Baggage handling; One stop check in needed
- Lugging baggage on APM? Handicapped, Elderly, Children, bulky items not addressed.
- Delays and transferring is inconvenient.

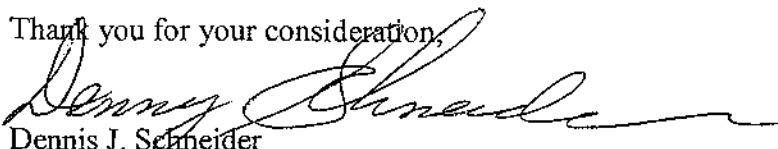

Consolidated Rental Car facility (RAC) would be better serving near the 105 freeway.

Impreciseness of plans; multiple options listed so impact projections can't be traced to the cost impacts on future commerce (increased fees)

Modes other than cars need consolidation and convenience; i.e. Green Line on MTA route to downtown; major bus center, cabs, level three bus routes.

Massive expenditures at LAX detracts from the possibility of the development of a practical regional solution.

Thank you for your consideration,

Dennis J. Schneider

THE FAILURE OF AMERICA'S AVIATION NOISE ABATEMENT POLICY

*Citizen's
Top Priority
Concerns
Always
Avalanche
Noise*

SPHE

EXECUTIVE SUMMARY

This study exposes the aviation industry and the Federal Aviation Administration (FAA), its federal regulatory body, as oblivious to the true impact aviation noise has on the public who live near airports as well as ignorant of the science of noise impact assessment. Based on the technique of content analysis applied to the 1,261 public comments received by the FAA concerning its draft Noise Abatement Policy 2000, this study finds that the overwhelming majority of commenters believe the FAA's noise abatement policy is a failure. 96% of the more than one thousand people who submitted comments to the FAA believe the draft Noise Abatement Policy will not adequately protect citizens from aviation noise.

KEY FINDINGS OF THE STUDY INCLUDE:

Aviation noise is getting worse

The people who actually live near airports report that the noise problem has grown, while the FAA in their draft noise abatement policy and the industry in their comments think aviation noise problem has decreased substantially. 759 commenters specifically mentioned aviation noise as a worsening problem, and 739 included this in their top three concerns.

Nighttime flights and sleep interference are citizens' greatest concerns

The top concern of citizens was sleep interference and nighttime flights. 998 commenters raised this issue, and for 968 people, it was one of their top three concerns. This is in sharp contrast to the

"With regard to the protection of public health and welfare, the FAA has previously concluded that the state of scientific knowledge does not support any inference of a direct, quantitative relationship between airplane noise exposure and health consequences."

Patricia Higginbotham for the Air Transport Association

"The 1976 Policy has been highly successful. It has guided actions over a period of almost 25 years that have substantially reduced aviation noise and its impacts. By the year 2000, the FAA estimates that there will be about 500,000 Americans exposed to significant levels of aircraft noise—down substantially from the six to seven million people exposed in 1976."

FAA's Noise Abatement Policy that mentioned sleep interference only four times in a 25,000 word plan, and then only tangentially. Nighttime effects are almost totally ignored by the industry and regulators.

Aviation noise is imposed on neighbors unjustly

Airport neighbors feel strongly that the FAA, airports, and aviation industry would not subject themselves to the same noise levels that they impose on neighbors. 686 people noted this incompatibility with Christian and Kantian conceptions of justice that require treating your neighbor as you would like to be treated. The solution: require that FAA and airport officials live within the FAA's significant impact zone, the 65 DNL contour around airports. If FAA officials had to live with aviation noise, the noise would be reduced drastically.

What They Said:

Even as noise has been so dramatically reduced, the national aviation system, including the airport component of that system where aircraft noise is the most severe, has grown significantly in this last quarter of the century."

FAA, Noise Abatement Policy 2000

"Northwest Airlines fundamentally disagrees with the FAA's suggestion that the number of Americans impacted by aviation noise remains significant and that aggressive new measures must be taken to address aviation noise without regard to the high costs of such measures relative to the modest incremental benefits of such expensive measures."

Tom Tinkham for Northwest Airlines

"You may want to believe current policy has worked but your head is buried in the tainted soil of the aviation industry and the beltway."

Chas Feltus from the DeKalb Peachtree Airport Advisory Committee in Chamblee, GA

"Jet noise is not 'white' noise, like the hum of a fan or refrigerator. It is an intrusive, drawn-out, congested scraping noise which sounds as large as the entire sky. Worse, it is heard approaching, then peaking, then resonating repeatedly as it fades. Each jet passage is a distinct nerve-grating event, which cannot be 'tuned out.'"

Gregory Muldowney from Glen Mills, PA

Major Concerns of Commenters

Ranking of Major Issues within the Top Three Concerns of Each Commenter

SPHE

More than 1,200 citizens living near airports and heliports mailed and emailed comments to the FAA in response to the draft. Overwhelmingly, they found these goals and the related policies to be insufficient. In addition, they feel the previous Policy and the subsequent laws and regulation have failed to protect their health and quality of life. The neighbors of airports report the aviation noise is a growing problem with increasing instances of interference from increased flights, and that less noisy technology has not kept up with the increase in number of flights.

The FAA will soon be releasing its revised Noise Abatement Policy. This study is designed to aid the FAA, the airline industry, and local airports' understanding of exactly what airport neighbors need. Employing the method of content analysis, this study provides an accurate image of the problems with the current and proposed noise abatement policy as seen by the people who have to live with the problems.

II. METHODOLOGY

The Noise Pollution Clearinghouse (NPC) obtained a copy of all comments submitted to the FAA. A total of 1,261 people and organizations submitted comments. An initial sample of 130 comments (approximately 10%) was read to determine the most often repeated themes and ideas within the comments. A category for each unique idea was created in a database. Categories of ideas that were mentioned by only one or two of the initial 130 commenters were eliminated to focus on the major concerns of the commenters. Since there were only 45 industry comments, their idea categories were not similarly filtered, because doing so would have virtually eliminated their concerns from this study. This process, and a few slight modifications to the categories as more comments were read, left 36 categories. (See Appendix A2 for a list and description of the categories.)

The 1,261 comments were read and checked for the presence of the 36 categories. In addition, the top three concerns of each commenter were noted. The top three concerns were taken to more accurately reflect the most important issues to neighbors (although in this paper both the top three concerns as well as all mention of the 36 categories by each commenter are presented). An idea was considered to be one of a commenter's top three concerns based on the space devoted to that idea. If three ideas were not clearly most important after this test, proximity to the beginning of the comment was used to determine importance.

III. RESULTS

1. Nighttime Flights Disturb and Interfere with Sleep

The top concern of citizens was sleep interference and nighttime flights. 998 commenters raised this issue, and for 968 people, it was one of their top three concerns. This is in sharp contrast to the FAA's Noise Abatement Policy that mentioned sleep interference only 4 times in a 25,000 word plan, and then only tangentially. From the comments, it is clear that sleep disturbance is a major concern and that less noisy Stage III aircraft have not addressed this problem. Nighttime flights prevent people from falling asleep, wake them after they manage to fall asleep, and prevent them from falling back to sleep again. Given the current aviation technology, location of airports, and scientific knowledge concerning sleep disturbance, nighttime curfews at most airports are needed to protect sleep, and thereby secure improved health and a better quality of life of people living near these airports.

That aviation noise disturbs and interferes with sleep is of little surprise to anyone who has had a flight path routed over their home. It is not uncommon for noise levels outside a home to be 90 decibels, and for interior levels to be louder than typical alarm clocks. The World Health Organization recommends that exterior levels not exceed an instantaneous value of 60 dBA and an average value of 45 dBA at night (WHO, 1999, Guidelines for Community Noise). Many communities and states also recognize the need to control nighttime noise to protect their citizens. Typical nighttime maximum levels, such as the state of New Jersey limit for residential areas, are 50 dBA.

What is truly remarkable is that the FAA has not yet taken sleep disturbance and interference seriously. An entire chapter of the Noise Abatement Policy should have been devoted to sleep disturbance and interference, yet it was mentioned only four times. Here is all the 25,000-word plan to protect citizens from aviation noise has to say about sleep:

1. "Since its inception in 1993, [Federal Interagency Committee on Aircraft Noise] FICAN has reached the following conclusions:
 - ◆ The Acoustical Society of America should form a working group tasked with development [sic] a revised standard for predicting noise-induced sleep disturbance."
2. "Current and future FICAN activities include:
 - ◆ Publishing technical positions on aviation noise topics based on definitive research by member agencies. Such topics include noise-

"For a good night's sleep, the equivalent sound level should not exceed 30 dB(A) for continuous background noise, and individual noise events exceeding 45 dB(A) should be avoided...."

Physiological Functions. *In workers exposed to noise, and in people living near airports, industries and noisy streets, noise exposure may have a large temporary, as well as permanent, impact on physiological functions. After prolonged exposure, susceptible individuals in the general population may develop permanent effects, such as hypertension and ischaemic heart disease associated with exposure to high sound levels....*

Performance. *It has been shown, mainly in workers and children, that noise can adversely affect performance of cognitive tasks. Although noise-induced arousal may produce better performance in simple tasks in the short term, cognitive performance substantially deteriorates for more complex tasks. Readings, attention, problem solving and memorization are among the cognitive effects most strongly affected by noise. Noise can also act as a distracting stimulus and impulsive noise events may produce disruptive effects as a result of startle responses.*

"Noise exposure may also produce after-effects that negatively affect performance. In schools around airports, children chronically exposed to aircraft noise under-perform in proof reading, in persistence on challenging puzzles, in tests of reading acquisition and in motivational capabilities. It is crucial to recognize that some of the adaptation strategies to aircraft noise, and the effort necessary to maintain task performance, come at a price. Children from noisier areas have heightened sympathetic arousal, as indicated by increased stress hormone levels, and elevated resting blood pressure. Noise may also produce impairments and increase in errors at work, and some accidents may be an indicator of performance deficits."

WHO, 1999, Community Noise Guidelines

While the industry is quick to deny any noise problem, they are equally quick to insist the problem has gotten better. And it is true, some aircraft have gotten less noisy. The introduction of a Stage III aircraft (among those that weigh more than 75,000 pounds) has enabled the FAA to advance the myth that aviation noise problem has decreased. People living around airports, however, report the problem is worsening. The reasons for this disconnect are many. The reduction in noise per aircraft has been more than offset by the increase in instances of interference. Moreover, less than 5% of the total number of non-military US airplanes meet Stage III requirements. Many aircraft (those weighing less than 75,000 pounds) do not have

to meet quieter restrictions, and many aircraft only marginally meet Stage III requirements. In addition, night flights, which occur at more sensitive times, have grown substantially, resulting in more instances of sleep interference. Finally, many formerly small airports have more than doubled or tripled in size, creating major problems where once only occasional overflights had once occurred.

Reliance on a Yearly Day-Night Average Sound Pressure Level as a metric and 65 dBA criterion for significant impact allows the FAA to maintain that noise impacts are decreasing while they are actually increasing. See "65 dBA is Unacceptable" below for more information concerning the inappropriate 65 DNL metric and criterion.

3. The Aviation Noise Problem is Unjust: FAA, Airport, and Airline Officials Would Not Live with this Situation Themselves

Airport neighbors feel strongly that the FAA, airport, and aviation industry officers would not subject their families to the same noise levels that they impose on airport neighbors. 686 people noted this incompatibility with Christian and Western conceptions of justice and the unfairness of the situation they endure. The "Golden Rule," the command that you treat your neighbor as you would like to be treated, is not one airports, airlines, or the FAA heeds.

The FAA steers well clear of Christian or similar secular western ethical principles. What applies to citizens on the ground, for example, that it is wrong to drive through a residential neighborhood at night, honking your horn and waking the residents, does not apply to the FAA and airlines, whose night flights wake hundreds of neighbors repeatedly.

There is an easy way to correct the inherent unfairness airport neighbors suffer at the hands of people who would not themselves live with the noise problem: require FAA and airport public employees to live within the 65 DNL significant impact contour around airports. Residency requirements exist for many municipalities across the country, such as Boston, and should be applied to the FAA and airport officials.

A residency requirement would embody the Golden Rule by employing a simple procedure that would require that public employees experience and live with the noise they permit. This procedure is akin to procedures used by five-year-olds across the country: that the one who divides the pie chooses last. Whether the issue is apple pie or aviation noise policy, this

Number of Commenters Supporting Each of the 36 Categories

Ranking of All Issues Mentioned by Each Commenter

SPHE

paths – once set – must be enforceable using fines or other disincentives. Community input should be considered when choosing flight paths.

Regulate Helicopters Along with Other Aircraft

Helicopters must be subject to engine noise standards, minimum height requirements, and limitations on hovering duration. Heliports should be sited 5,000 feet away from residential areas.

Quiet Military Aviation Noise

Increase Funding for Soundproofing

Homes and public buildings must be soundproofed by the FAA so that there are no single noise events that reach higher than 45 dBA inside the building. Easements must not be required as a prerequisite for obtaining soundproofing. Multi-year funding should be considered to allow for better local planning.

Prohibit Sonic Booms Over Land

Do Not Permit "Free Flight"

Free flight would allow consistent use of the cheapest routes, even if they impose social costs on whoever is under that route. A noise abatement policy must ensure that routes are chosen to minimize the noise impact to communities.

Use Precision GPS and Other Navigation Technology to Better Track and Regulate Aircraft

GPS and other navigation technology should be used because it can keep flights on carefully designed, less disruptive flight paths, and allow violators to be identified and fined.

Do Not Use Precision GPS and Other Navigation Technology as Envisioned by the Policy

GPS and other navigation technology should not be used because it will assure that noise burdens unfairly fall on only a narrow band of residences over and over again. If it is used, paths should be spread somewhat so as to avoid overburdening a tiny section of the population.

Fund Alternative Transportation

Alternative transportation, such as high-speed rail, should be funded. If high-speed rail replaced air trips of under 500 miles, the noise situation could be greatly improved without significant sacrifices in travel time.

Address Environmental Injustice Issues

No racial, ethnic, or socioeconomic group should bear a disproportionate share of the negative environmental consequences (including noise, air, and water pollution) resulting from the operation of airports, airlines, and air-planes. The new policy must actively seek ways to abate noise for minorities and low income families.

Compensate Residents Whose Property Loses Value Due to Airports

Each year compensation should be given to homeowners and to compensate for lost value and lost quality of life.

Categories for Which a Small Number of Comments from Industry were Received:

- Wait for International Noise Standards Before Finalizing this Policy
- FAA Is Right, Noise Is a Shrinking Problem.
- Research Low Frequency Noise and Effects
- Maintain Nationwide Uniformity With Minimal Local Control
- Don't Focus On Source Noise Reduction
- Rate Noise Reduction By Results, Not Method (Like Hushkits)
- If Small Aircraft Come Under a Standard, Do a Gentle Phase-In
- If Stage IV Is Introduced, Do a Gentle Phase-In
- Don't Burden Commerce With Noise Standards
- Minimize Procedures for Air Traffic Controllers and Pilots
- DNL Is A Good Way to Analyze Noise Impact

"The information I received said that letters must be sent by Monday August 28. I am mailing this on Sunday, August 27. I am 70 years old, disabled and have been very busy this week so this is the best I can do. But I do want to protest Fed Ex. I have personally investigated the residential areas threatened by Fed Ex Noise. Two are retirement homes run by the Friends - Friends Home West on Friendly Avenue and New Garden Friends Home where I plan to move. The New Garden Friends cemetery where I plan to be buried is also in the noise cone but I don't think it will bother me there."

Jean Gordon from Greensboro, NC

"Please carefully consider - many who chose to purchase homes in airport areas when jet travel was still in the imagination of engineers are the blue collar factory workers who built the early airplanes and defense equipment insuring this country's safety. It is their spouses and their children who inhabit the homes near many of the nation's airports today. Many of those workers sacrificed their lives by exposure to various elements. Must their families continue to sacrifice quiet and air quality?"

Diane Sambrano from Inglewood, CA

"A pox on you for trying to do a 'comprehensive update...to build upon A.N.C.A....' It is bad enough that you fooled Congress into thinking the Airport Noise and Capacity Act (ANCA) would control airport capacity and limit noise. It did nothing of the kind! It was a clever way to pass control over all future regulation into your hands. It denies states' rights and the ability for voters to exercise 'the will of the people.'"

Donald Elsmore from Burbank, CA

Industry:

"Section 2 (Goals and Policies) contains the 'heart of the Aviation Noise Abatement Policy.' Unfortunately, portions of this proposed policy present serious heartburn."

Stephen Alterman for the Cargo Airline Association

"Contrary to the opinions of some parties to this debate, airlines do not fly aircraft solely to annoy local communities and politicians. Rather, the aircraft used, and the timing of the flights, are specifically designed to meet market demands."

Stephen Alterman for the Cargo Airline Association

"Moreover, with regard to the protection of public health and welfare, the FAA has previously concluded that the state of scientific knowledge 'does not support any interference of a direct, quantitative relationship between airplane noise exposure and health consequences.'"

Patricia Higginbotham for the Air Transport Association

"ATA supports FAA's confirmation that it will...maintain the priority of safety and efficient use of air space over noise mitigation."

Patricia Higginbotham for the Air Transport Association

"In particular, Northwest Airlines fundamentally disagrees with the FAA's suggestion that the number of Americans impacted by aviation noise remains significant and that aggressive new measures must be taken to address aviation noise without regard to the high costs of such measures relative to the modest incremental benefits of such expensive measures."

Tom Tinkham for Northwest Airlines

"Although each citizen benefits, whether or not they actually fly in this system, the value of this national resource to the nation is both under appreciated and threatened."

Andrew Cebula for the National Air Transportation Association

"Local opposition based on noise was identified as a major barrier to improving the Nation's airports. Aircraft noise has become the rallying point for many of these anti-airport organizations."

Andrew Cebula for the National Air Transportation Association

Sequence number: 1

Author: Denny Schneider

Subject: Note

Date: 7/23/2003 9:01:38 PM

Security from connecting passengers needs addressing.
Sepulveda could back up long distances as it become a drop off for "walk in" passengers.

Preface

The goal of the Master Plan process is to produce a plan for modernizing Los Angeles International Airport (LAX) that is appropriate for the City of Los Angeles and for the five-county region. In 2001, the **Draft LAX Master Plan** and the **Draft Environmental Impact Statement/Environmental Impact Report (Draft EIS/EIR)** were published by Los Angeles World Airports (LAWA), the operator of LAX, to seek input from the public and to start the agency review and comment process. These documents were produced to describe and analyze four alternatives: the No Action/No Project Alternative, Alternative A, Alternative B, and Alternative C.

Alternative D, the fifth Master Plan alternative, was developed after the **Draft LAX Master Plan** and **Draft EIS/EIR** documents were published. Alternative D was developed in response to the feedback and public comments received on the No Action/No Project Alternative and Alternatives A, B, and C.

There are three reports to document and describe Alternative D and each is intended for a specific audience and purpose. The **Draft LAX Master Plan Addendum**, the **Supplement to the Draft Environmental Impact Statement and Environmental Impact Report (Supplement to the Draft EIS/EIR)**, and the **Airport Layout Plans (ALP) Package**.

Draft LAX Master Plan Addendum: This document is an addendum to the **Draft LAX Master Plan** and has been prepared to add Alternative D to the four Master Plan alternatives currently being evaluated as part of the LAX Master Plan process. The **Draft LAX Master Plan Addendum** describes and evaluates Alternative D in the same manner the previous alternatives were described, with content and format based on the constrained alternatives analysis contained in Volume 4, Chapter V, Section 3.3 of the **Draft LAX Master Plan**.

Supplement to the Draft EIS/EIR: This document has been prepared to analyze the potential environmental impacts of Alternative D, using the same methodology by which the previous alternatives were analyzed in the **Draft EIS/EIR**, and to compare Alternative D to these alternatives. The environmental impacts of Alternative D have been analyzed in accordance with the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). An EIS is produced in accord with NEPA and an EIR produced in accord with CEQA.

Airport Layout Plans (ALP) Package: The Airport Layout Plans Package consists of a series of drawings that illustrate the layout of existing and proposed facilities at the airport. This Federal Aviation

LAX Master Plan Addendum

Administration (FAA) required plans set is intended to serve as a record drawing for the airport as well as a guide for the airport's future development. The **ALP Package** also includes a narrative description of the drawings. The objective of the narrative report is to explain the reasoning behind, and the key features of, the plan and to provide the FAA with information needed to approve the drawings.

The public will have the opportunity to formally review and comment on the **Draft LAX Master Plan Addendum** and the **Supplement to the Draft EIS/EIR**. Government entities and the public will have a chance to review and provide comments through oral testimony, written comments, and public hearings. The City of Los Angeles and the FAA will decide which of the Master Plan alternatives best meets the needs of Los Angeles and the Los Angeles region after input from the public and governmental entities has been received and considered.

No action will be taken on the proposed LAX Master Plan until the Mayor of Los Angeles and the Los Angeles City Council approve it.

 When will the FAA have a say? Is the FAA veto only? In the event of a conflict between FAA and LAWA who is the referee to determine a final resolution?

Executive Summary

The Los Angeles International Airport (LAX) Master Plan is a modernization plan that accounts for the growth of the airport since 1984. In 2001, the Draft LAX Master Plan and Draft Environmental Impact Statement and Environmental Impact Report (Draft EIS/EIR) were published and included three project alternatives (A, B, and C), plus a No Action/No Project Alternative. Los Angeles World Airports (LAWA) received a large number of comments on the plans described in these documents and subsequently offered a new alternative for consideration. The new alternative, Alternative D, was developed to offer a regional approach alternative for the LAX Master Plan to ensure representation of the communities' full range of priorities as well as to increase the safety and security of the airport. Figure ES-1 provides an illustration of the plan.

Alternative D would be designed to serve approximately 78 million annual passengers (MAP), the level of passenger activity identified by Southern California Association of Governments (SCAG) for LAX in the 2001 Regional Transportation Plan (RTP). Alternative D would encourage the development and use of regional airports to serve local demand by constraining the facility capacity at LAX to approximately the same aviation activity levels identified in the No Action/No Project Alternative. In the short-term LAX would continue to serve as the region's predominant international airport for passenger and cargo operations due to the specialized facilities developed over time to serve these functions.

Alternative D represents a new design approach to securing airports for the future. This would be achieved in part by removing private and commercial vehicles from the existing Central Terminal Area (CTA). This approach reduces the risk to airport users while also protecting the airport infrastructure and its link to the economy. The alternative would incorporate, to the greatest extent possible, Transportation Security Administration (TSA) recommendations as they are developed as well as the latest passenger and baggage security screening technologies. Alternative D would also enhance the on-airport presence of law enforcement, surveillance security, and emergency response teams. The Alternative D airfield modifications would include new taxiways on the north and south airfields and additional runway length on the main airfield to improve aircraft movement, thereby reducing the potential for runway incursions and reducing delays. The airfield reconfigurations would improve the efficiency of the airport by reducing large aircraft movement restrictions and physically accommodating the New Large Aircraft (NLA) and the next generation of quieter jets.

... This increases potential through put for more flights per gate

Alternative D would improve the level of passenger service throughout the LAX by including new passenger and baggage processing facilities where the public parking garages are located today. In addition, Alternative D would provide for construction of new aircraft parking gates as well as demolition of some existing gates. As a result, Alternative D would have fewer total gate positions than the existing conditions or the No Action/No Project Alternative. As a result, all aircraft parking would be adjacent to a terminal or concourse, eliminating the current need to bus passengers to remote aircraft parking positions.

Deterrence and prevention of terrorist attacks are essential considerations of the Alternative D plan. Its elements include (1) avoiding concentration of people in the public areas, to the greatest extent possible, so as to reduce the likelihood and potential lethality of terrorist attacks with bombs or firearms; (2) moving passengers and their baggage through check-in and security screening and into the secure areas as quickly as possible, and (3) permitting only known, screened, and controlled vehicles into the Central Terminal Area (CTA), and avoiding concentration of unscreened vehicles and people at the curbs of the proposed Ground Transportation Center (GTC), Intermodal Transportation Center (ITC), and the Consolidated Rental Car (RAC) facility. Alternative D would utilize an expanded LAWA-operated FlyAway program throughout the region to disperse passenger processing. This service would include remote check-in of passengers and baggage, and provide direct access into the CTA. Refer to Appendix I for a detailed assessment of security and safety features of Alternative D.

Alternative D would consolidate parking and curbside area at a new GTC. This facility would become the primary point of pick-up and drop-off for passengers utilizing LAX. The facility would combine a controlled and monitored roadway access system with first level passenger security screening and profiling to further enhance the safety and security of all passengers using LAX.

A new ITC would provide a more efficient connection currently exists between the existing MTA Green Line station and the CTA. The airport's rental car facilities would be in one location, referred to as the RAC, to simplify passenger access to these services. A new Automated People Mover (APM) system would connect the GTC, ITC, and RAC to the redeveloped CTA. The end goal of this design concept is to achieve a new balance between the needs of both passenger security and passenger convenience.

Comments from page 18 continued on next page

Alternative D would improve the level of passenger service throughout the CTA by including new passenger and baggage processing facilities where the public parking garages are located today. In addition, Alternative D would provide for construction of new aircraft parking gates as well as demolition of some existing gates. As a result, Alternative D would have fewer total gate positions than the existing conditions or the No Action/No Project Alternative. As a result, all aircraft parking would be adjacent to a terminal or concourse, eliminating the current need to bus passengers to remote aircraft parking positions.

Deterrence and prevention of terrorist attacks are essential considerations of the Alternative D plan. Its elements include (1) avoiding concentration of people in the public areas, to the greatest extent possible, so as to reduce the likelihood and potential lethality of terrorist attacks with bombs or firearms; (2) moving passengers and their baggage through check-in and security screening and into the secure areas as quickly as possible, and (3) permitting only known, screened, and controlled vehicles into the Central Terminal Area (CTA), and avoiding concentration of unscreened vehicles and people at the curbs of the proposed Ground Transportation Center (GTC), Intermodal Transportation Center (ITC), and the Consolidated Rental Car (RAC) facility. Alternative D would utilize an expanded LAWA-operated FlyAway program throughout the region to disperse passenger processing. This service would include remote check-in of passengers and baggage, and provide direct access into the CTA. Refer to Appendix I for a detailed assessment of security and safety features of Alternative D.

Alternative D would consolidate parking and curbside areas at a new GTC. This facility would become the primary point of pick-up and drop-off for passengers utilizing LAX. The facility would combine a controlled and monitored roadway access system with first level passenger security screening and profiling to further enhance the safety and security of all passengers using LAX.

A new ITC would provide a more efficient connection than currently exists between the existing MTA Green Line station and the CTA. The airport's rental car facilities would be in one location, referred to as the RAC, to simplify passenger access to these services. A new Automated People Mover (APM) system would connect the GTC, ITC, and RAC to the redeveloped CTA. The end goal of this design concept is to achieve a new balance between the needs of both passenger security and passenger convenience.

Does the People Mover system preclude any other use of the MTA right of way along Aviation Blvd? This will be critical for future development of a mass transit system to support LA because this right of way goes from the South Bay all the way to Downtown LA.

1 Planning Objectives

The Los Angeles International Airport (LAX) Master Plan is a modernization plan that accounts for the growth of the airport since 1984. In 2001, the Draft LAX Master Plan and Draft Environmental Impact Statement and Environmental Impact Report (Draft EIS/EIR) were published and included three project Alternatives (A, B, and C), plus a No Action/No Project Alternative. Los Angeles World Airports (LAWA) received a large number of comments on the alternatives described in these documents and subsequently offered a new alternative for consideration. The new alternative, Alternative D, was developed to offer a regional airport alternative for the LAX Master Plan to ensure representation of the communities' full range of priorities. LAWA simultaneously began master planning effort for Ontario International Airport (ONT) and Palmdale Regional Airport (PMD). The fifth Master Plan alternative, Alternative D: The Enhanced Safety and Security Plan, is the focus of this report. Figure ES-1 provides an illustration of the proposed plan.

1.1 POLICY AND PLANNING OBJECTIVES

The planning objectives for the Draft LAX Master Plan have evolved throughout the development of the study. They reflect the future needs of the airport users and community and environmental oversight agency input. At the beginning of the Master Plan process in 1995, seven goals were established to guide the planning effort:

- ◆ **Goal 1:** Continue to satisfy regional demands for global air transport of passengers and cargo by adding new and optimizing existing facilities at LAX, along with distributing commercial service not essential to the LAX international gateway role to other airports in the region.
- ◆ **Goal 2:** Ensure the safety of all airports.
- ◆ **Goal 3:** Continue to operate efficiently and continue to provide major direct and indirect economic benefits to local, regional and state environments.
- ◆ **Goal 4:** Operate LAX in an environmentally sensitive and responsible manner.
- ◆ **Goal 5:** Through enhanced urban design, maximize compatibility between LAX and the demand for housing, employment, service, and protect surrounding neighborhoods.
- ◆ **Goal 6:** Improve ground access to and around LAX by maximizing the use of regional highway and transit networks and mitigate neighborhood traffic impacts.

Efficient operation? How will baggage movements be accomplished? This critical action is not firmed up at all. Studies are being released to state that the economic benefits are NEUTRAL for Alternative D. Studies to determine regional economic benefits should be done to determine if equivalent expansion/development at locals other than LAX is more rewarding. This study should include secondary impacts such as lost efficiencies due to exacerbating LAX area congestion and increased pollution resulting in health and social welfare impacts.

Use of regional highways is another euphemism for all of the major streets through the communities around LAX. In Westchester-Playa del Rey there is no more room to expand these streets without removing homes or moving them far too close to homes. Additional manipulation of signals to foster flow is also limited as the egresses from the residential areas has already limited the number of autos able to leave and pedestrians to safely cross streets.

- ◆ **Goal 7:** Achieve a balance between increased LAX operations and environmental, social, land use, ground access, economic and air commerce impacts.

In the early stages of the Master Plan, a number of alternatives were developed that reflected these goals. Chapter V, Section 2 of the Draft LAX Master Plan (January 2001) contains a discussion of these alternatives.

As the Master Plan progressed through public review, the original goals remained, however, the weight and emphasis given to each goal has varied over time. In particular, as feedback on the initial alternatives was obtained from the community and oversight agencies, a higher priority was placed on environmental and community objectives than on economic and air service objectives. As a result, the four shortlisted alternatives in the Draft LAX Master Plan contained airside facility limitation that would require air service adjustments to meet the 2015 unconstrained passenger and cargo forecasts. Chapter V, Section 3 of the Draft LAX Master Plan contains the descriptions and evaluations of the shortlisted alternatives. Chapter III of the Draft LAX Master Plan contains the forecast of aviation activity.

The environmental impacts of the four Master Plan alternatives were evaluated in the Draft LAX Master Plan and the Draft EIS/EIR. Following the publication of the Draft LAX Master Plan and the Draft EIS/EIR in January 2001, public comment received during the review period called for a regional approach alternative, whereby growth at LAX would be planned so as to encourage other airports to accommodate future air travel demand. The terrorist attacks that occurred on September 11, 2001 greatly elevated the issue of airport security. In response to these events the newly elected Mayor of Los Angeles directed the Los Angeles Board of Airport Commissioners to develop a new LAX Master Plan alternative that, consistent with public comment calling for a regional approach alternative, would be designed to accommodate passenger and cargo activity levels at LAX that would approximate those of the No Action/No Project Alternative, have fewer environmental impacts than the No Action/No Project Alternative, and in light of the tragic events of September 11, 2001, would be designed to enhance airport safety and security.

Responding to the Mayor's direction, the new alternative is designed to:

1. Enhance safety and security at LAX for users and to protect the airport infrastructure;
2. Encourage the development and use of regional to serve local demand by constraining the facility capacity at LAX to approximately

the same aviation activity levels identified in the No Action/No Project Alternative;

3. Maintain LAX as the international gateway to Southern California; and

4. Mitigate the impacts of LAX's continued operation.

Based on this direction, LAXA began master planning efforts of Ontario International Airport and Palmdale Regional Airport and simultaneously developed a fifth alternative for the LAX Master Plan, Alternative D: The Enhanced Safety and Security Plan. The latter effort is the focus of this report.

1.2 FACILITY CONSTRAINTS

The most constraining component of an airport defines the practical capacity¹ of the entire airport. The airport is a complex system made up of components through which passengers and aircraft flow in a sequential order. Aircraft arriving at the airport pass through the airspace, land on the runways, travel on the taxiways and proceed to the terminal gates to unload and reload passengers. Once loaded and ready for departure, the aircraft will pass through these same components in reverse order. Passengers move through the system in a similar set of sequential steps. Departing passengers travel on local roadways and on-airport roads, arrive at the terminal from the curbside, parking, or other shuttle facility, are processed in the terminal and proceed to the designated aircraft gate for boarding. Arriving passengers generally proceed through these steps in reverse order upon arrival at an airport. Exceptions for arriving passengers include domestic connecting passengers who board other flights, international arrivals who move through Federal Inspection Services (FIS) facilities, and baggage claim before they connect to other flights or use ground transportation facilities.

Each component of the airport system has a throughput capacity level, which is typically a function of the physical characteristics of the component. For example, the number of runways, the size of the terminal buildings, number of gates, and the airport's operating

¹ & Practical Capacity is a term used here to refer to the number of operations (take-offs and landings) that can be accommodated with no more than a given amount of delay, usually expressed in terms of maximum acceptable average delay. Practical annual capacity (PANCAP) is the level of operations that results in a reasonable average delay per aircraft in the normal peak two-hour operating period. Another term used is throughput capacity, which is the rate at which aircraft can be brought into or out of the airfield without regard to any delay they might experience. This definition assumes that aircraft will always be present waiting to take off or land and capacity is measured in terms of the number of such operations that can be accomplished in a given period of time.

Master Plans already exist for Ontario and Palmdale. Why were these never implemented? Why, for instance, is a top post still existing to recruit business for LAX instead of placing even greater emphasis on other regional airports?

procedures determine the throughput or processing rate of the airport. The capacity of the overall airport system equals the capacity of its weakest component. On the airside, where capacity is measured in terms of aircraft operations, the airport's capacity is driven by the most constraining of its major components: airspace, runway acceptance rate, taxiway accessibility, or available and accessible aircraft parking gates.

Each of the Master Plan alternatives has facility constraints that would limit its ability to accommodate the forecast of unconstrained passenger and cargo demand to varying degrees. Alternatives A and B, which accommodate the forecast for both passengers and cargo, nonetheless require adjustments in airline schedules to do so because of airfield limitations. When an airport system component is operating at capacity, meaning that it is processing a maximum level of hourly operations given its characteristics and procedures, increasing the capacity of other components does not increase the capacity of the system. For example, if a runway is operating at its throughput operational capacity and, by definition, accepting the maximum number of hourly arriving and/or departing flights without regard for delay, increasing the number of gates will not improve the airport's ability to accept more arriving flights. The runway system would have to be expanded to increase the throughput operational rate.

Each Master Plan alternative has an activity level that is determined by the ability of facilities in that alternative to serve the unconstrained passenger and cargo market demand. **Figure 1.2-1** summarizes the Master Plan alternatives and their corresponding activity levels.

The No Action/No Project Alternative is limited by the capacity of the curbside in the Central Terminal Area (CTA) where passengers are dropped off and picked up in front of the existing terminals. The resulting annual passenger performance measure of this alternative is approximately 78 million. Alternatives A and B include a fifth runway and were designed to serve the 2015 passenger demand forecast. Alternative A and B would accommodate approximately 97.9 million annual passengers (MAP).² Alternative C's projected annual passenger activity level served is limited by the capacity of the four-runway system and is forecast to be approximately 89.6 million. The constrained activity profiles for Master Plan Alternatives A, B, and C are discussed in Chapter V of the Draft LAX Master Plan in Section

² & ⁵ In order to accommodate the 2015 unconstrained passenger forecast of approximately 98 MAP, it would be necessary for the airlines to make air service adjustments, such as reducing the number of daily flights to a destination, limiting the number of non-stop destinations served or adjusting the flights' departure or arrival time to off-peak hours.

The footnote stating a 98 MAP estimate for Alt A or B states that it assumes voluntary air service adjustments such as reducing the number of flights to LAX!

3.3.2. Extensive analysis is included in that document, establishing the levels of passengers that each alternative is designed to accommodate. Alternative D was designed to accommodate approximately the same level of passenger activity and design day aircraft operations as the No Action/No Project Alternative.

The passenger activity that would be expected in 2015 with Alternative D was determined based on the design of the Alternative D gate facilities and the projected airline response to the constrained facilities. The ability to increase aircraft size, thereby increasing passenger levels, was limited by the number and type of gates available under the Alternative D terminal design. The design of Alternative D would encourage airlines to choose the most efficient use of the gate facilities at LAX and supplement high-frequency domestic service at other airports in the region.

Date: 7/13/2003 8:24:32 AM
 This basic premise of limiting Alt D via gates indicates an assumption of specific numbers and types of gates. This addendum does not have this detail and in LAX Working Group meetings LAWA officials were unable to define how gates were to be modified.

* In order to accommodate the 2015 unconstrained passenger forecast of 98 MAP, it would be necessary for the airlines to make air service adjustments, such as reducing the number of daily flights to a destination, limiting the number of non-stop destinations served or adjusting the flights' departure or arrival time to off-peak hours.

Figure 1.2-1 graphs Alternative Capacity Constraints. Where is the back up materials listing the assumptions?

The Alternative D cargo activity is determined by the amount of cargo space available to process cargo tonnage. This sort space would be measured in square feet of cargo building space. The Alternative D cargo facilities would be sized to accommodate the total cargo volume forecast in the constrained No Action/No Project Alternative.

The effective constraint on cargo activity in Alternative D would be the lack of sufficient cargo building space to process the unconstrained cargo activity forecast. The most effective representation of this constraint is illustrated by the utilization rates, or tons per square foot, for the available warehouse space. A common benchmark in the industry is to process approximately 0.9 to 1.0 annual ton of cargo for each square foot of cargo warehouse space available. Higher space utilization rates, ranging from 1.1 to 1.42 annual tons per square foot, are expected for domestic and express cargo, with lower space utilization rates, ranging from 0.5 to 0.6 annual tons per square foot, expected for international freight due to the added time associated with customs clearing and fewer available flights.

The space utilization rate (excluding air mail) calculated for Alternative D is 1.22 tons per square foot. This rate is based on approximately 2.3 million square feet of cargo building space and approximately 2.85 million annual tons (MAT) of cargo (excluding air mail). It is the weighted average of the domestic and express cargo (approximately 2.09 tons per square foot) and international cargo (approximately 0.8 ton per square foot). Based on current cargo activity, the split is 55 percent domestic and 45 percent international, however cargo space split is 32 percent domestic and 68 percent international. Air mail is projected to be 272,000 tons, resulting in approximately 3.1 MAT of cargo activity.

The utilization rates for Alternative D exceed both the industry standard rates and the high utilization rates already experienced at LAX. Improvements in cargo technologies and efficiencies that may not be realized within the planning horizon would be required to realize the Alternative D utilization rates.

Landrum & Brown, 2000

In each of the three scenarios, LAX was projected to serve passenger levels higher than those associated with the No Action/No Project Alternative and Alternative D. These alternatives would accommodate approximately 78 MAP producing a potential demand of approximately 13 to 20 MAP that cannot be accommodated by the region's airports.

1.3.2 PROJECTED REGIONAL CAPACITY ESTIMATES

As of 2001, the Southern California Association of Governments (SCAG) estimated the existing airport capacity in the region at approximately 120 MAP.³ As discussed in the previous section, the 2015 regional demand is expected to total approximately 146.5 MAP. Approximately 73 percent, or 107 MAP, will be origin and destination (O&D) demand by 2015. Table 1.3-3 summarizes the estimated 2025 capacity and/or passenger forecast of the region's airports.

Total Passenger Activity	167

Source: SCAG 2001 Regional Transportation Plan, excluding Marine Corps Air Station El Toro

As illustrated in Table 1.3-3, the region's airports would have a projected shortfall of approximately 30 MAP. Although SCAG's forecast horizon is 10-years beyond the planning horizon of the Master Plan, there is inadequate existing airport capacity in the region to serve long-term passenger demand.

Lack of capacity in the regional airport system would lead to a loss of connecting passenger demand to airports outside the region. The airlines would encourage connecting passengers to use other hub airports to reach their destination by offering more flight options, more convenient schedules, and lower prices. Serving local passenger demand, both domestic and international, is the airlines' highest priority. However, connecting passengers allow the airlines to offer more frequent service to many destinations by filling more seats on each flight. If connecting passengers are routed over other hubs, the airlines would likely reduce the number of flights offered, resulting in reduced customer service.

This pattern would be most evident—and the economic impact most strongly felt—in international service. Other regions in the western part of the U.S. compete with Los Angeles for the economic benefits of international air service and have been building the specialized airport facilities required to serve as international gateway airports. A more complete discussion of the status of competing U.S. gateway airports is found in Section 1.3.5 of this document.

SCAG forecast of 2015 is 10 years beyond the planning horizon of the LAX Master Plan? It will take almost that long to finish this LAX project. Doesn't this plan look that far into the future?

A sensitivity analysis conducted by SCAG in 1998 found that if LAX capacity was constrained in an effort to force demand to other regional airports, much of the traffic would relocate to airports outside the region such as San Francisco, Denver, and Dallas rather than to secondary regional airports within the region. This loss of traffic would take place largely because the Los Angeles region's secondary airports are not in a strong enough position, nor do they have the infrastructure necessary, to provide competitive international gateway service by 2015. In the near future, it is unlikely that they will develop the volume of connecting flights, specialized import-export facilities, and other facilities associated with an international gateway. Accordingly, failure to provide facilities to accommodate regional demand would mean increasing levels of congestion and delay, which would result in passenger air service going to other regions.

1.3.3 SECONDARY REGIONAL AIRPORTS

Examining passenger activity and scheduled passenger departures reveals a close match between each of the regional airports' share of total regional aviation service and passengers for the year 2000 (see Table 1.3-4). This correlation demonstrates that the air transportation marketplace tends to reach a balance between supply and demand. As long as there are adequate airport facilities, the level of service will rise or fall with local demand and airport activity. The existing conditions and published plans for each of the secondary airports in the Los Angeles region are provided in Appendix C.

Table 1.3-4

COMPARISON OF AIR SERVICE AND PASSENGER MARKET SHARE

Airport	2000		Percent (%) Share	
	Passengers ^{1/}	Departures ^{2/}	Passengers ^{1/}	Departures ^{2/}
Los Angeles Int'l.	67,303,000	372,525	76.0%	72.2%
John Wayne	7,773,000	49,779	8.8%	9.6%
Ontario	6,756,000	40,347	7.6%	7.8%
Burbank	4,749,000	27,745	5.4%	5.4%
Long Beach	638,000	4,213	0.7%	0.8%
Palm Springs	1,281,000	17,189	1.4%	3.3%
Commuter Airports	111,000	4,061	0.1%	0.8%
Total	88,611,000	520,000	100.0%	100.0%

Stating that regional airport share matches use demonstrates market balance does not take into consideration disparity in ticket pricing and flight availability. With incentive pricing equal to LAX ticket costs many people living in the other areas of the LA region would use their local airports.

Airlines make decisions on which airport to serve based on several factors, including the population within a reasonable travel distance and the cost to introduce service at a new airport. **Figure 1.3-2** shows the population concentration of travel demand, where people are living and working, as it varies throughout the region. **Figure 1.3-3** shows the region's airports and the areas around each airport considered to be within a reasonable travel distance, or a 60-minute travel time. When combined, these figures provide information on the location of the travel demand, and how much time would be necessary to access the airports. This is the type of data the airlines use when selecting which airports to serve. In the case of the Los Angeles region, travel time tends to be a better predictor than travel distance due to congested local traffic conditions.

Table 1.3-5 presents the top 25 domestic O&D markets for the Los Angeles region in 2000 and the market share of scheduled departures from LAX and each of the close-in secondary airports. The cities representing the domestic market in highest demand, and the relative share of scheduled service for the year 2000, changed very little from the top markets in 1995. Domestic markets are relatively stable and, without outside influence, the airport and destination pairs are unlikely to change dramatically (see Section 1.3.2). Tables that present the O&D demand to the top domestic markets and the scheduled service from each of the regional airports are included in **Appendix 1**

1.3.4 AIRLINE DEREGULATION AND COMPETITION

Since passage of the Federal Airline Deregulation Act of 1978, airlines must decide which airports they will serve and how much they will charge for this service. As a general rule, airlines will choose airports near the highest concentrations of conveniently located customers. In this deregulated environment, the key to airline success has been to provide a better product than the competition. Convenience, price and frequent flier incentives have been the tools used most frequently in this competition. In air travel, convenience involves two key factors:

- ◆ **Airport Accessibility** – Airport locations and ground transportation options that make an airline's services convenient to the most potential passengers.
- ◆ **Service Frequency** – Flight schedules that most closely match airline service to potential passenger need.

Within this general framework, airlines must make strategic decisions about air service to maximize their investments and gain competitive advantages. Airlines will only provide air service where demand exists. For instance, in regions with multiple airports, airlines tend to concentrate their air service at a single well-located primary airport for economic efficiency. Concentrating service at a dominant airport also facilitates connecting service, which can significantly increase an airline's market share and allow even greater frequencies to more destinations. In particular, international service relies on the availability of domestic connecting flights to a wide range of destinations.

Airlines consider several factors when making decisions about which airports to serve in a region with multiple airports. The key factors include:

- ◆ **Local Passenger Market Potential** – The potential market is based on the airport's location and its accessibility or convenience to passengers.
- ◆ **Network Synergy** – A particular airport may play an important role in a particular airline's air service network, offering opportunities for connecting passenger flows (domestic or international), or encourage competition with other airlines.
- ◆ **Airport Facilities** – A particular airport's ability to accommodate existing and projected demand may be constrained by one or more of the following:
 - ▶ **Airport Infrastructure** – The size, configuration, and condition of the airfield, aircraft parking gates, terminal

facilities, security screening facilities, ground access facilities, cargo facilities, FIS facilities, freight forwarding facilities, fueling systems and other physical infrastructure elements.

- ▶ **Policy** – The airport owner’s policies regarding future airport development and the utilization of existing facilities.
- ▶ **Environmental** – Significant environmental considerations that may limit airport activity or future development.
- ▶ **Airspace** – Airspace limitations due to terrain or interactions with other airports.

In a multi-airport system, where passengers, cargo operators and airlines have alternatives, these factors may cause certain airports the inability to capture their potential market share.

Airlines will establish additional service at secondary regional airports only if the local market generates sufficient demand and adequate facilities exist. In some cases, secondary airports can offer a competitive advantage over a primary airport by reducing airline costs, or by providing more convenient access to and from a Central Business District (CBD) or tourist destination. However, airlines are generally reluctant to serve secondary airports, even under these circumstances, if doing so would dilute their market share or significantly increase operating costs. An airline that attempts to shift service from one airport to another may instead end up losing that share of the market to a competitor.

Passenger demand cannot simply be moved to another airport. In fact, under federal law, it is very difficult for local, regional or federal officials to force airlines to serve one airport over the other. AWA has tried subsidies to encourage airlines to serve outlying Palmdale, with only limited temporary success. The airlines provide service at the airports where demand exists. Without demand from the traveling public, airlines deploy their assets to serve the greatest number of passengers and earn the best return on their investment.

1.3.5 INTERNATIONAL DEMAND

Historically, U.S. international air traffic has been concentrated at three entry points, or gateways. John F. Kennedy International Airport in New York City has dominated the Atlantic air routes; Miami International Airport is the main connecting point for Latin American traffic; and LAX has been the primary gateway to the Asia-Pacific region. As a result of this historic position, the regions around each of the three primary gateway airports have developed

The argument that Gateways are becoming more important because their % of passengers is increasing is spurious. Explain why this same data can not also be explained by the deregulation efforts to concentrate air traffic into specific hubs.

The Immigration and Naturalization Service (INS) records show that New York is the dominant gateway for travel from the U.S. to the Atlantic Region (Europe, Middle East, and Africa). Miami is the dominant gateway to Latin America (Central and South America and the Caribbean), although Los Angeles is the primary gateway to Central America. Los Angeles is the primary gateway to the Asia-Pacific Region, followed closely by Honolulu. Due to the expansion of international air service at mid-continent airports, New York and Miami lost market share between 1995 and 2000 to their respective world regions. In contrast, Los Angeles' market share of the Asia-Pacific Region increased between 1995 and 2000. Detailed tables of INS international passenger data for 1995 and 2000 are presented in Appendix C.

1.3.6 REGIONAL ECONOMIC CONTRIBUTION

An important function of a gateway airport is to serve both local O&D passengers and connecting passengers with quality air service. The value to the region is better international air service than could be justified based on O&D passengers alone. With 50 percent connecting passengers, an airline can operate twice as many flights as the local market alone could support.

The value of a single international flight can be several times greater than the average domestic flight. LAX Master Plan Alternative D would result in employment gains by 2005 that equal those projected for the other LAX Master Plan alternatives. However, by 2015, Alternative D would yield slightly lower economic contributions due to productivity gains made during the time period. There is a direct correlation between the number of passengers served and the character of the passengers (domestic vs. international) at LAX and the airport's contribution to the local and regional economy.

LAX's international gateway role is crucial to the economies of Los Angeles and Southern California. The international gateway role is threatened in the future by limited facilities at LAX and the other regional airports. Except for Ontario, the other airports in Southern California would have limited market strength and facilities to supplement LAX's role. Other competing U.S. cities and regions stand to benefit from this limitation because of their growing market base and their available or planned infrastructure.

 What documentation exists to demonstrate this strong statement?

2 Alternative D Development and Refinement

Alternative D was developed as a new alternative in response to public comment on Master Plan Alternatives A, B, C, and the No Action/No Project Alternative. **Figure 2.0-1** presents the relationship between Alternative D and the Master Plan alternatives described in the 2001 documents.

To ensure that the communities' full range of priorities were represented, Alternative D would be developed to offer a regional airport development alternative for LAX. Alternative D would be designed to serve approximately 78 MAP, which is similar to the activity level identified in the scenario adopted by SCAG for LAX. The Alternative D design would encourage other airports in the region to develop facilities to accommodate regional demand beyond the level served at LAX. In the short term, LAX would continue to serve as the region's predominant airport for international passenger and cargo operations due to the specialized facilities developed over time to serve the international demand.

In response to increased security threats, Alternative D would protect all airport users and critical airport infrastructure from security threats, incorporate Transportation Security Administration (TSA) recommendations, avoid concentrations of people in public areas, enhance on-airport law enforcement presence and surveillance capabilities, and enhance emergency response. Protection of people is paramount in all areas of the airport. The facilities in the CTA and the surrounding ground access network have been identified as infrastructure components critical to airport operations. The objective of Alternative D is to provide a facility that can continue to operate under the highest security levels with minimal impacts to the passenger processing experience. The facilities in the CTA and the surrounding ground access network have been identified as infrastructure components critical to airport operations. Refer to **Appendix I** for a detailed assessment of the security and safety features of Alternative D.

As a result, the ground access network would be redeveloped to limit vehicle access to the CTA and to remove vehicle parking from this area. All facilities would be designed to minimize vulnerability of people to security threats. Passengers and employees would access the CTA via the Landside Automated People Mover (APM) system that would be developed as part of Alternative D.

The limitation of growth at LAX is an impetus to growth in other regional airports ONLY outside of those owned/operated by LAWA.

Four new terminals would be developed as part of Alternative D. The new terminals would be located in the area currently occupied by the CTA parking structures and would be capable of 100 percent automated Explosive Detection System (EDS) baggage screening. The advanced planning and design for the four new terminals would be coordinated with the TSA. As the TSA develops new airport security standards, LAWA would work to incorporate these standards to the greatest extent possible.

The project would include new Aircraft Rescue and Firefighting (ARFF) facilities to increase fire response capabilities and a new police headquarters with convenient access to airport facilities. These new facilities would enable increased coordination between emergency response teams. The increase in support facilities and the improved coordination capabilities would enhance the safety and security of LAX.

Between the runways on the north and south airfields, Alternative D would provide parallel taxiways to reduce the potential for runway incursions. In addition, the airfield reconfigurations would provide unrestricted movement for New Large Aircraft (NLA) on the north airfield and in the areas around the terminal. The airfield modifications for Alternative D would maintain the existing capacity and would improve the level of service at LAX by reducing delays and enhancing the safety and security of passengers and aircraft at LAX.

As part of the terminal and infrastructure reconfiguration, Alternative D would include modifications of the ground access or landside system. Consolidated parking and curbside areas at a new Ground Transportation Center (GTC) would improve the landside level of service at LAX. All rental car facilities at the airport would be in one location, referred to as the Consolidated Rental Car Facility (RAC). improve passenger access to these services. In addition, a new Intermodal Transportation Center (ITC) would provide a more efficient connection from the existing Metropolitan Transportation Authority (MTA) Green Line light rail to the CTA.

The No Action/No Project Alternative depicted in **Figure 2.0-2**, was developed by LAWA to describe changes that would occur at LAX without the Master Plan.

The descriptions of the Alternative D facilities contained in this section refer to, and are compared to, the No Action/No Project Alternative. The primary components of the Alternative D plan are shown in **Figure 2.0-3** and would include changes to the existing airfield, the existing terminal facilities and the ground access system. **Appendix H** contains development sketches and original concepts demonstrating the evolution of the Alternative D concept.

All D calls for high density mixed use called for west of Sepulveda between LaTijera and Westchester Parkway adjacent to residential areas!

2.1 AIRSIDE FACILITIES - ALTERNATIVE D

The airfield modifications for Alternative D would improve the level of service, reduce delays, reduce the potential for runway incursions and consequently enhance the safety and security of passengers and aircraft at LAX. Alternative D in 2015, as shown in Figure 2.0-3, would maintain the existing four-runway system with modifications to the north and south airfield runways. Center taxiways would be constructed between the runways on the north and south airfield to reduce the potential for runway incursions.

The Boeing 747-400 was used as the design aircraft (Group V), with operational and modified Group VI solutions for the anticipated operation of limited numbers of the NLA. Figure 2.1-1 highlights each of the Alternative D airside improvements that are described in the following sections. Refer to Chapter III, Section 3.2.6 of the LAX Draft Master Plan (January 2001), for a complete description of the modified Group VI aircraft design standards.

2.1.1 NORTH AIRFIELD FACILITIES

- ◆ **Extend Runway 6L/24R:** Runway 6L/24R would maintain its current location; however, it would be extended approximately 1,495 feet to the west for a total length of approximately 10,420 feet. This would be used primarily as an arrival runway in both east and west flow, with occasional departures. This is similar to the way Runway 6L/24R is used today. This runway is shown remain at 150 feet wide through the 2015 horizon of the Master Plan because it is not envisioned to be fully reconstructed in that time. However, a benefit-cost analysis may later determine that this runway should be widened to 200 feet during its life-cycle reconstruction. The basis of this widening would be assessed in relation to the number of Group VI operations taking place at LAX in the future. Discussions with Airbus representatives indicate that a 150-foot wide runway with 50-foot wide paved shoulders for jet blast protection is adequate for the operation of the planned Airbus A380 (a design Group VI representative aircraft also referred to herein as a NLA).
- ◆ **Relocate, Extend and Widen Runway 6R/24L:** Runway 6R/24L would be reconstructed approximately 340 feet south of the existing runway centerline to allow for the construction of a new parallel taxiway between the runways. Runway 6R/24L would be extended approximately 135 feet west and approximately 1,280 feet to the east. The total runway length would be approximately 11,700 feet long and 200 feet wide. Runway 6R/24L would be used primarily as a departure runway.

Date: 7/13/2003 10:33:23 PM
WOW another runway change potentially done NOT in the present budget estimate! Will it be 50' north or south?

- ◆ **New Parallel Center Taxiway:** A new taxiway would be constructed between Runways 6L/24R and 6R/24L to reduce the potential for runway incursions and enhance the safety of operations at LAX; currently, there is 700 feet between runways. The new taxiway would be used to access both Runways 6L/24R and 6R/24L. The new taxiway would be a 10,420- by 100-foot full-length, modified Group VI parallel taxiway located 520 feet north of relocated Runway 6R/24L and 520 feet south of Runway 6L/24R. The new taxiway would be used to access both Runways 6L/24R and 6R/24L including two high-speed exit taxiways in west flow, and two high-speed exit taxiways in east flow, spaced to minimize the runway occupancy time reduce airfield and airspace delays for passengers at LAX. Constructing the taxiway would require the demolition of Terminals 1, 2, 3 and the north concourse of the Tom Bradley International Terminal (TBIT). A linear concourse would west of TBIT be constructed to replace some of the lost gates. Section 2.2 contains a complete description of terminal changes.
- ◆ **Relocate and Widen Taxiway E:** Taxiway E would be relocated 340 feet south of its current location and would be located 400 feet south of the realigned Runway 6R/24L. Taxiway E would be widened to 100 feet.
- ◆ **Extend, Widen and Realign Taxiway E17:** Taxiway E17 would be realigned and extended north approximately 1,085 perpendicular to the centerline extended off Runways 6L/24R and 6R/24L.
- ◆ **Relocate, Extend and Widen Taxiway D:** Taxiway D would be relocated approximately 370 feet south (at the intersection with Taxiway Y), and would be approximately 770 feet south of realigned Runway 6R/24L. The taxiway would be extended approximately 7,105 feet from the intersection of Taxiway S west to Taxiway E17, and would be 100 feet wide. The proposed new separations and pavement width would meet full Group V taxiway standards and would also provide modified Group VI separation for taxiing aircraft approaching the departure ends of Runway 6R/24L.
- ◆ **Service Roads:** Portions of the service road network at the west end of the north airfield would be removed to allow for the westward extension of Runways 6R/24L and 6L/24R.

2.1.2 SOUTH AIRFIELD FACILITIES

- ◆ **Existing Runway 7L/25R:** This runway would not be modified for Master Plan Alternative D.
- ◆ **Relocate and Widen Runway 7R/25L:** Runway 7R/25L would be moved approximately 50 feet south of the existing Runway 7R/25L centerline to allow for the construction of a new parallel taxiway between the south airfield runways. The runway would be 11,096

Would removal of this service road complex make parking VIP aircraft on the north impractical?

ALTERNATIVE D DEVELOPMENT AND REFINEMENT

feet long and 200 feet wide. Runway 7R/25L would be used primarily as an arrival runway. Because this project is considered early in the Master Plan development sequence, an operational plan for Group VI aircraft would be developed in conjunction with the Federal Aviation Administration (FAA) Air Traffic Controllers, pilots and airline representatives to ensure safe and efficient movement of these airplanes on the ground. The goal would be to minimize airfield disruption while providing safe taxiway paths for NLA.

- ◆ **New Parallel Center Taxiway:** A new 11,096-foot long by 100-foot wide full-length Group V parallel taxiway would be constructed between Runways 7L/25R and 7R/25L to reduce the potential for runway incursions and enhance the safety of operations at LAX. The taxiway would be located 400 feet north of Runway 7R/25L and 400 feet south of Runway 7L/25R. The new taxiway would have four high-speed exit taxiways in west flow and two high-speed exit taxiways in east flow. This taxiway is proposed to be constructed 100 feet wide to provide operational areas for Group VI aircraft prior to the completion of the north airfield development. One proposed approach for Group VI movement on the redesigned south airfield would be to use this taxiway for arriving aircraft to taxi into position for crossing the inboard runway. To allow continued runway operations during a taxiway crossing, a taxiway bypass west of 7L/25R and 7R/25L outside of the Runway Safety Area (RSA)¹ from Taxiway A to Taxiway B may be required.

¹ Runway Safety Area (RSA) – A defined surface surrounding the runway prepared or suitable for reducing the risk of damage to airplanes in the event of an undershoot, or excursion from the runway.

Table 2.1-1
ALTERNATIVE D - LOWEST APPROACH MINIMUMS

Runway	West Arrivals		East Arrivals	
	Decision Height	Visibility (SM)	Decision Height	Visibility (SM)
6L/24R	CAT IIIb	RVR 06	200 feet	1/2 mile
6R/24L	200 feet	1/2 mile	200 feet	RVR 18
7L/25R	200 feet	1/2 mile	200 feet	RVR 18
7R/25L	CAT IIIb	RVR 06	200 feet	1/2 mile

2.1.4 FAA RUNWAY DESIGN AND LAYOUT RECOMMENDATIONS

Improvements to the south airfield runway and taxiway layout were designed using current FAA guidelines and recommendations for airfield safety areas and zones. The proposed Runway Protection Zones (RPZ)² and RSA meet the FAA's current recommended dimensions. In addition to expanding the airports safety areas and zones² Declared Distances would be implemented to make the best use of the airport's constrained site.

FAA's established mechanism for allowing existing constrained airports to continue operating unimpeded is through the declaration of safe aircraft operating parameters known as Declared Distances.

Declared Distances would be particularly beneficial for LAX Master Plan Alternative D because the airport would satisfy FAA design standards, control project costs, and minimize the physical impacts of airport reconstruction on its neighbors. Guidance on the application of this methodology is contained in FAA Advisory Circular (AC) 150/5300-13 - Airport Design. Appendix 14 of this AC states:

"The use of Declared Distances for airport design shall be limited to cases of existing constrained airports where it is impracticable to provide the RSA, the Runway Object Free

² RPZ - Runway Protection Zone - An Area off the runway end to enhance the protection of people and property on the ground.

T

Area (ROFA)³, and the RPZ in accordance with the design standards in Chapters 2 and 3 [of AC 150/5300-13].”

The general principal in the application of Declared Distances is the independent treatment of each of the four aircraft runway performance distances:

- ◆ Take-Off Run – The distance to accelerate from brake release to lift-off, plus safety factors.
- ◆ Take-Off Distance – The distance to accelerate from brake release past lift-off to start of takeoff climb, plus safety factors.
- ◆ Accelerate Stop Distance – The distance to accelerate from brake release to V₁⁴ and then decelerate to a stop, plus safety factors.
- ◆ Landing Distance – The distance from the threshold to complete the approach, touchdown, and decelerate to a stop, plus safety factors.

The Airport Layout Plan (ALP) is used to specify the available runway length for each runway in each direction of use. FAA reviews and approves the ALP and publishes Declared Distances in its Facility Directory for use by pilots and airline dispatchers. The following are the four types of Declared Distances:

- ◆ Take-Off Run Available (TORA) – The length of runway declared available and suitable for satisfying takeoff run requirements.
- ◆ Take-Off Distance Available (TODA) – The TORA plus the length of any remaining runway or clearway beyond the far end of the TORA available for satisfying takeoff distance requirements.
- ◆ Accelerate Stop Distance Available (ASDA) – The length of runway plus stopway declared available and suitable for satisfying accelerate-stop distance requirements.
- ◆ Landing Distance Available (LDA) – The length of runway declared available and suitable for satisfying landing distance requirements.

Under LAX Master Plan Alternative D, clearways⁵ would be identified off of five of the eight runway ends. The identification of clearways

³ Runway Object Free Area (ROFA) – An area on the ground centered on a runway centerline provided to enhance the safety of aircraft operations by having the area free of objects, except for objects that need to be located in the OFA for air navigation or aircraft ground maneuvering purposes.

⁴ For turbojet aircraft, “V₁” is the maximum speed during takeoff that the pilot may abort the takeoff and stop the airplane within the accelerate-stop distance.

⁵ A “clearway” is a clearly defined area connected to and extending beyond the runway end available for completion of the takeoff operation of turbo jet-engined airplanes. The Clearway is a plane, extending out and up from the runway end with a slope of no greater than 1.25%. The clearway plane is required to be 500 feet wide and has a practical length of no greater than 1,000 feet. No object or terrain may penetrate the clearway plane.

 Does this "clearway" define the area for 25L where the cargo buildings are along Aviation and Century? What values are acceptable?

ALTERNATIVE D DEVELOPMENT AND REFINEMENT

allows for the increase of an aircraft's gross takeoff weight without extending the physical runway pavement. This would result in airport cost savings through the reduction of airport reconstruction impacts while allowing aircraft operators to maximize their aircraft utilization.

On the North Airfield, Runway 6L/24R would have a physical pavement length of 10,420 feet. The west end of the runway would have a 1,000 foot displaced threshold in order to provide the recommended 1,000 foot Runway Safety Area. A 500-foot clearway would extend off of the west end of the runway increasing Runway 24R TODA while a 1,000-foot clearway would extend from the east end increasing TODA for aircraft departing Runway 6L. 

Also on the North Airfield Runway 6R/24L would have a physical pavement length of 11,700 feet. Both runway ends would have displaced thresholds of 1,000 feet to accommodate the recommended 1,000-foot RSA. A 300 foot clearway would extend from the west end of the runway increasing TODA for Runway 24L to 12,000 feet.

On the South Airfield, Runway 7L/25R would have a physical pavement length of 12,091 feet. Runway 7L/25R is the only runway at LAX that would not be modified under Master Plan Alternative D. The east end of the runway would have a displaced threshold of 957 feet. The 25R arrival threshold displacement allows the runway's approach path to clear Air Freight Building #3 (Building 415 on the Sheet 3 of the ALP Package). A 1,000-foot clearway would be extended from the west end of the runway allowing for increased TODA for westbound departures from the runway. 

Also in the South Airfield, Runway 7R/25L would have a physical pavement length of 11,096 feet. Runway 7R/25L does not have displaced thresholds at either end. A 1,000-foot clearway would be identified at the west end of the runway allowing increased TODA for westbound departures from the runway.

The statement is that there is a 1000' clearway on the west end for 25L but isn't that blocked by the new employee parking structure?

2.2 TERMINAL/PASSENGER PROCESSING FACILITIES - ALTERNATIVE D

The passenger processing facilities for Alternative D consists of four major distinct types of facilities each serving its own varying purpose. Those facilities include the redeveloped CTA, the GTC, the ITC, and a RAC. The redeveloped CTA would be the primary passenger check-in and processing center and serve as the transition point to and from the new landside facilities.

The GTC, ITC, and RAC facilities are designed to accommodate a specific type of activity, and to distribute the landside demand over a wider geographic area. A more detailed description of each facility is included below.

Consistent with Alternatives A, B, and C the LAWA FlyAway program would be expanded under Alternative D.

RECONFIGURED CENTRAL TERMINAL AREA

The existing CTA would be reconfigured for Alternative D. The new terminal buildings and modifications to existing terminal buildings would be developed to meet all TSA recommendations and directives and provide the highest level of passenger safety and convenience. The CTA reconfiguration would prohibit private and commercial vehicle access to the area, eliminating the threat of vehicular blast at the curbfront, which exists today in the CTA. All public parking facilities in the CTA would be relocated, further eliminating the current threat of blast from parked or moving vehicles adjacent to the terminal facilities.

2.2.1 NEW TERMINALS 1 THROUGH 4

Four new terminals (Terminals 1 through 4) would be provided within the CTA as indicated in **Figure 2.2-1**. The new terminals, designated Terminals 1, 2, 3, and 4, would provide the highest level of passenger security and convenience available. These facilities would incorporate TSA directives to the greatest extent possible, including 100 percent EDS screening of all checked bags. The EDS system would be fully automated, utilizing the most current EDS equipment. The system would separate bags that fail the initial screening process to an isolated blast proof room for further investigation before integration with any outbound baggage matrix.

The existing parking garages currently occupy the CTA land envelope identified for the new passenger and baggage processing facilities (terminals). The new terminals would be multi-level

T

passenger processing facilities replacing all ticketing, baggage claim, ¹FTS facilities, ²inbound/outbound baggage sortation, screening and distribution systems. The new terminals would also contain the APM system (discussed further in Section 2.4), platforms and new secondary passenger security screening areas. The new terminals would be designed to meet current dimensional criteria for large international terminals. Current CTA deficiencies such as inadequate ticket lobby depths, baggage claim circulation, undersized security screening areas, and insufficient passenger queue space would be eliminated.

The existing initial sorting and outbound/inbound baggage systems at Terminals 4 through 7 and Concourse 8 would be reconfigured to support delivery of bags to and from apron areas. ³New baggage ⁴functions would be provided in the new terminal facilities and in the landside facilities. **Figures 2.2-2 and 2.2-3** depict a conceptual illustration of the new CTA facility.

The new terminals and reconfigured CTA would be connected to the GTC, ITC, and RAC via the APM. The landside components of Alternative D are described in Sections 2.3 and 2.4.

⁵A baggage tunnel running below the existing Lot C area and located below the public right-of-way east of Airport Boulevard would connect the new terminals to the GTC. This tunnel would allow passengers to check baggage at the GTC. Passengers arriving at LAX could use the system to re-check their baggage back to the GTC. ⁶

The new terminals would be equipped with video surveillance systems monitoring all activity, particularly at secondary passenger screening areas. ⁷Any security breach would immediately be compartmentalized allowing only a portion of a facility to be evacuated and searched so passengers can be re-screened. ⁸The entire new terminal area can be evacuated to the exterior without any disruption to any airport operation.

^{1/} To standardize the definition of "gate" and to provide a consistent means for evaluating apron utilization, the Narrow Body Equivalent Gate (NBEG) index was developed. This index converts the gate requirements of diverse aircraft - from small commuters to new large aircraft - so they are equivalent to the apron capacity of a typical narrow body aircraft gate. The amount of space each aircraft requires is based on maximum wingspan; the aircraft is classified according to FAA Taxiway Design Groups.

Explain why the number of gate types handling larger aircraft does not increase capacity to handle passengers and cargo. Since airline space is being increased about 60% explain how it will limit to existing capacity. What are the present gate configurations? This is based on 1996 data. What about all of the upgrades implemented since?

2.2.7 AIRCRAFT GATES

A comparison of the existing number of gates to those proposed in Alternative D is contained in **Table 2.2-2**. Alternative D would provide a total of 153 contact and commuter gates in 2015. The 2015 gate facilities are shown on **Figure 2.2-4**. There are more gates available in 2005 (163) but these include the remote jet and commuter gates, which offer a lower level of service than the contact gates. The remote commuter gates are located in two locations, the United maintenance ramp and to the east of the American Airlines low bay hangar. These facilities are accessed via shuttle buses from Terminal 7 and 4 respectively. The facilities have limited amenities in terms of holdrooms, concessions, and airline club lounges.

The remote jet gates are located at the west pad facility at the west end of the airport north of World Way West. The west pad facility is a complex of 19 aircraft parking positions, 9 of which have remote boarding gate structures and 10 positions without. These facilities are used primarily for international flights and are scheduled for use on a regular basis. Passengers and their carry on baggage are transported to and from the aircraft via a LAWA operated shuttle bus. The remote boarding facilities do not contain any concessions, holdrooms or restroom facilities.

Alternative D would require the use of fewer gates to achieve the same level due to the higher utilization rates of contact gates at a level of service that exceeds the No Action/No Project Alternative. The number of existing gates was reduced from 165 (Table 2.2-1 Existing 1996) to 163 (Table 2.2-2 Existing 2002) due to the consolidation of four narrowbody domestic gates into two Group V international gates.

Table 2.2-2

ALTERNATIVE D
EXISTING VS. PROPOSED AIRCRAFT GATES

Gates	Existing (2002) Gate Positions	2015 Gate Positions
Commuter	32	32
Narrowbody (Group III)	51	40

If most of the commuter gates are added on the back of the western terminals will Southwest be moved there? If commuter flights are more frequent, won't moving these gates to the far end of the runways make them less accessible?

ON-AIRPORT GROUND TRANSPORTATION FACILITIES

The on-airport landside system would be composed of three primary facilities: the GTC, ITC, and RAC facilities.

2.2.8 GROUND TRANSPORTATION CENTER (GTC)

The new GTC would be created north of Century Boulevard and south of Arbor Vitae Street, between Aviation and La Cienega Boulevards. This facility, in conjunction with the ITC, would serve all commercial and private vehicular traffic for departing and arriving passengers at LAX.

The GTC is designed to provide a conventional airport landside environment for air passengers at a separate location from the CTA. The layout is also designed to address a variety of safety and security issues as well as improve the landside system that currently exists in the CTA. Alternative D would separate the commercial and private vehicle landside components from the passenger terminal facilities and gates in the CTA. This would eliminate the threat of blast in close proximity to large congregations of queuing passengers at functions such as ticketing and baggage claim. As the primary pick-up and drop-off point for the airport, all vehicles approaching the GTC would be closely monitored by video surveillance. The access roadway is designed to provide a single access point to the GTC. While the threat of a vehicular blast can never be fully eliminated, limiting large congregations of passengers by moving ticketing, security screening, and baggage claim to the CTA would improve passenger safety and security.

Passengers would be subjected to a first level security screening process at the GTC. It is anticipated that the process would include a random checking of baggage and passengers using sniffing dogs, video surveillance systems, and other security devices. Second level passenger security screening would occur at the CTA; however, the GTC would be designed to accommodate second level security screening at any time.

The following major functions are anticipated to be included the GTC:

- ◆ Short-term and long-term parking
- ◆ E-kiosk check-in
- ◆ Curbside interface for buses, private autos, taxis, limos, etc.
- ◆ Skycap baggage check-in
- ◆ First level passenger security screening
- ◆ APM interface
- ◆ Baggage re-claim (optional for re-checked bags)
- ◆ Compressed Natural Gas (CNG) fueling station

Why is the CNG station being placed in an area near all of the passengers?

While the CTA is anticipated to be redeveloped as a complex split by the APM into four terminal facilities, and as the identity for the Gateway to Los Angeles, the GTC would be a facility that primarily serves O&D passengers. The GTC would be divided into two parallel passenger-processing facilities, called "piers", with adjacent parking facilities and a commercial vehicle holding area. These pier structures would provide an orientation point for passengers to access the APM, which is connected to the CTA. The architectural design intent for the GTC is to create partially climate controlled open-air structures to help diffuse potential blast impacts at the curbside by eliminating glass curtain walls.

Passengers would enter or exit vehicles with their baggage at a multi-lane GTC curbside in front of each pier. Two piers flanked by multi-level parking structures would be provided. Due to space limitations and the demand for curbside interface, these facilities are anticipated to be developed as multi-level structures with enplaning/departures functions on the upper level and deplaning/arrivals functions on the lower level. The APM would be located at an interstitial level between the departures and arrivals level. Parking structures serving each curbside would be directly adjacent and clearly visible, with convenient parking entrances for vehicles directly from the curb lanes. Access to both parking and the APM would be provided via interstitial bridges and ramps, which would facilitate passenger movement with a minimum of level changes, and roadway crossings. Both the north and the south piers would have two, bi-level curb frontages, one on each side of the pier building. Therefore, each pier building face would have an upper level curb for departures and a lower level curb for arrivals.

Both departing (Skycap checked) and arriving (re-checked from the CTA) baggage would move between the GTC and the CTA via secured baggage tunnels, which may contain high-speed baggage systems (such as bulk Destination Coded Vehicles (DCVs)). A common-use outbound baggage sort system is anticipated to be located on the lower level of the new CTA terminals to provide for 100 percent EDS baggage screening.

2.2.8.1 DEPARTURE LEVELS (GTC)

Passengers may arrive via one of several modes: Private auto, bus, taxi, limousine, etc., and enter the GTC from either the parking structures or the upper level curbside. They then move into the upper level of the GTC where e-ticketing/check-in and Skycap check-in facilities would be available. Passengers that do not use Skycap baggage check-in may carry baggage on the APM to the CTA. Bags carried by passengers on the APM would need to be checked by the appropriate airline in the CTA. No airline agents are initially anticipated to be located at the GTC. Since most passenger

processing and congregating would occur in the CTA and not the GTC, it is anticipated that passenger assembly would be limited to the APM platform.

Each pier would be signed by carrier on the upper level curbside similar to traditional terminal facilities; however, any curbside would be able to accommodate departing passengers since all passengers would be destined to the APM station for access to the new terminal facilities in the CTA. The departure level of each ground transportation pier would provide flight information, e-ticketing kiosks, public restroom facilities and limited concession space. Before boarding the APM, departing passengers would access the APM station through multiple high capacity vertical circulation cores and  ramp system capable of accommodating all departing passengers, their carry-on baggage as well as baggage to be checked. It is also assumed that luggage carts would be allowed on the APM and highly utilized in the transfer of people and baggage. One conceptual illustration of the GTC departure level is depicted in Figure 2.2-5.

2.2.8.2 ARRIVALS LEVEL (GTC)

Arriving passengers would board the APM from their carrier's assigned station at the CTA and transported to a specific pier within the GTC. Each airline would be assigned to a specific pier/arrivals curbside. Trains leaving the CTA would stop at two stations within the GTC; one station within each pier.

Passengers arriving at the GTC from the CTA via the APM leave the APM at the interstitial level station where they may access parking and curbside (including private auto pick-up, buses, limos, taxis, etc.) and potential baggage reclaim facilities. Arriving passengers wishing to access parking would move from the APM station to the parking structures via interstitial level bridges which would be located between the upper and lower levels of the roadways at the GTC. This arrangement would eliminate the need for passengers to cross active roadways. Arriving passengers needing to claim re-checked baggage move one level down from the APM station using a high capacity vertical circulation core and ramp system to baggage reclaim areas where re-checked baggage may be retrieved. Passengers would then access either the parking structures via the interstitial bridges, or proceed directly out to the arrivals (deplaning) curbside where buses, taxis, limos, and private auto access would be available.

Meeters and greeters would be either encouraged or directed to short-term parking facilities designed to allow passengers to conveniently find their parties. Meeters and greeters would be allowed to use the APM to meet their parties at the main terminal in

 Does this mean that people will retrieve their luggage on arrival in the CTA and then recheck their bags to the GTC? How will this massive exercise be accomplished?

the reconfigured CTA or would also be allowed to meet their parties within the arrivals level lobby of the individual piers. Passenger conveniences such as restrooms and public seating areas would be provided to allow people to wait for their parties' arrival via the APM.

2.2.8.3 APM LEVEL (GTC)

Each pair of piers as shown in **Figure 2.2-6** would share an APM station located at a level between the departure and arrival levels. Further refinement and development would determine the exact location of the APM. The APM platform would be designed in a manner which helps diffuse potential blast impacts at the curbside and protect passengers.

The GTC complex would have a pedestrian concourse that would provide passage between all curbside piers, APM stations, parking structures and the commercial vehicle holding area. The pedestrian concourse/transfer level would be equipped with proper signage, information, and passenger conveniences such as power walks and restrooms. In addition, a limited number of concessions may also be provided at this level.

One additional feature of the GTC would be the placement of the commercial vehicle holding/staging area at the far northern end of the site along Arbor Vitae Street. Commercial vehicles would use the arrivals and departures curbside on each pier's north side. Both private and commercial vehicles would use the two curbs on the north side of each pier, whereas only private vehicles would use the curbs on the two piers' south sides. Signage within the CTA and onboard the APM trains would direct the commercial vehicle patrons to the correct station stop at each pier. One conceptual illustration of the GTC interior views is depicted in **Figure 2.2-7**.

Los Angeles International Airport Master Plan

Alternative D
 Ground Transportation Center (GTC)

Figure
 2.2-6

2.2.9 INTERMODAL TRANSPORTATION CENTER (ITC)

An ITC would be located at the northeast corner of Imperial Highway and Aviation Boulevard, and would provide airport access for Green Line and chartered bus passengers. The ITC, like the GTC would be a partially controlled open-air structure to help diffuse blast impacts from the adjacent parking structure. All vehicles approaching the ITC and entering the parking structure would be monitored using video surveillance systems. The primary ITC elements would be:

- ◆ APM and MTA Green Line access 
- ◆ Short-term parking
- ◆ Chartered bus access

The ITC would serve the premium short-term parking needs of the airport. Internal to the facility would be a curbside for pick-up/drop-off of passengers prior to parking their vehicles. The first level of the ITC would provide flight information, e-ticketing kiosks, public restroom facilities, and concession space. It is anticipated that passenger processing at the ITC would include a random checking of baggage and passengers using sniffing dogs, video surveillance systems, and other security devices. Second level security screening would occur at the CTA; however, the ITC would be designed to accommodate second level security screening at anytime. The ITC would also provide a curbside that would specifically accommodate large buses, such as charter and tour buses. An enclosed pedestrian connection with power walks would cross over Imperial Highway and under I-105 to connect to the MTA Green Line station at Aviation Boulevard. MTA regional buses would also be accommodated at the Green Line station. An illustration of the ITC interior views is depicted in Figure 2.2-8.

2.2.10 CONSOLIDATED RENTAL CAR FACILITY (RAC)

RAC facilities in Alternative D would be located on a consolidated campus that is bordered by Nielsen Park to the north, Airport Boulevard to the east, 98th Street to the south and Sepulveda Boulevard to the west in existing Lot C. Primary elements of the consolidated RAC would be:

- ◆ APM interface
- ◆ RAC drop-off
- ◆ RAC pick-up
- ◆ Ready/return and Quick Turnaround Area (QTA) facilities 
- ◆ RAC storage and maintenance support

Vehicle access would be provided from the north, east and south. The facility would include a direct pedestrian bridge to the APM system. A customer service facility would be provided adjacent to the

APM station and the ready/return garage. The ready/return garage would consist of a four-level facility that would accommodate 9,000 ready/return spaces.

Customers picking up vehicles would walk across the APM platform to the second level of the customer service building, where they would complete their transactions and proceed to the garage for their vehicles. The walking distance from the customer service building would be minimized to each side of the garage. They would then exit out of the west side of the garage onto 96th Street or east out of the garage onto Airport Boulevard southbound. Rental car returns would enter on the east side of the garage off Airport Boulevard into the ready/return garage.

A common-use QTA would be located adjacent to the ready/return garage. Cars would exit down the northeast side of the garage, circulate through the QTA and then queue into the garage on the northwest side of the QTA facility. The QTA facility would include fueling, vacuuming and car wash facilities.

Based on preliminary program requirements as identified in **Table 2.2-4**, the RAC would provide adequate space to accommodate the rental car operators at LAX. However, these estimates are subject to refinement and would require analysis of each rental car company's operations to determine accurate space and operational requirements. An illustration of the RAC exterior view is depicted in **Figure 2.2-9**.

TABLE 2.2-4

**RENTAL CAR FACILITY PLANNING
PRELIMINARY PROGRAM REQUIREMENTS**

	Units	Acres
<u>Ready/Return and Customer Service</u>		
Ready/Return Parking (spaces)	9,000	62.50
Customer Service Building (square feet)	150,000 	3.44
Bus Plaza (square feet)	82,300	1.89
Landside APM Station (square feet)	30,000	.69
<u>Exclusive Use Service Centers</u>		
Storage/Overflow Parking (spaces)	17,100	83.36
Car Wash (bays)	20	0.41
Fueling/Vacuum (stations)	80	0.69
Queuing lanes (includes car wash and fuel/vacuum)	20	1.05
Maintenance Buildings (square feet)	120,000	2.75
<u>Open Space (Landscape Requirements)</u>	N/A	23.88
Total Program Requirements	N/A	180.66

Notes:

1. The total number of ready/return spaces was determined based on comparison of the top five airport car rental markets.
 2. Acreage estimates for ready/return were based on 350-square foot/car for ready spaces and 200-square foot/car for return spaces. Total acreage includes 10 percent for internal circulation.
 3. Acreage estimates for storage spaces based on 200-square foot/car for storage spaces and include 10 percent for internal circulation.
 4. Customer service building includes exclusive and common use space for RAC agencies, lobby/circulation, mechanical/security and unassigned/expansion areas.
 5. Customer service and maintenance buildings square footage estimate based on comparable markets with a consolidated rental car facility/customer building.
 6. The number of storage spaces was determined by multiplying the total number of ready/return spaces by 1.9.
 7. Maintenance buildings include all space for service buildings, maintenance bays and employee parking.
 8. Landscaping estimated to be 15 percent of the total site.

The views of the ITC show very large open spaces and long, open areas. Will there be any moving sidewalks or other support for people who can't walk long distances? The illustration is populated with a small number of people. What numbers are anticipated to arrive at one time? If, for instance 5 buses and a train arrive at the same time will people be able to drive carts holding luggage? I note that there are no carts for luggage visible. Where and how will they be disbursed and controlled?

2.3 GROUND ACCESS AND PARKING – ALTERNATIVE D

2.3.1 OVERALL LANDSIDE APPROACH

Modifications to the landside system in Alternative D would enhance the safety and security of the airport by protecting the airport's critical infrastructure components. Alternative D eliminates the threat of vehicular blast in close proximity to congregations of queuing passengers at functions such as ticketing and bag claim. Alternative D decentralizes ground access and creates four landside access points and a controlled airport road connected directly to the local freeway system to mitigate the existing city/street traffic congestion leading to the single access point on the CTA roadway.  Discussed in Section 2.2, the new system would be composed of four primary facilities: the CTA, GTC, ITC, and RAC. These facilities are depicted in **Figure 2.3-1**.

The landside surface transportation approach and methodology for Alternative D consists of decentralizing the vehicular traffic associated with the airport over a large geographic area. Decentralizing the vehicle traffic creates an improved level of service compared to the existing operation in the CTA. The existing roadway access system is congested. The CTA curbside, Sepulveda tunnel, Sepulveda/I-105 interchange, and Sepulveda/Century Boulevard interchange are existing landside impediments to customer convenience. The Landside APM is a key element linking several facilities to the CTA. In addition, the new access system provides the opportunity to control and monitor all access into the CTA, GTC, ITC, and the RAC.

This section provides a description of the overall landside access and parking system for Alternative D.

2.3.2 ON-AIRPORT ROAD ACCESS

Alternative D meets the overall roadway access demand for the airport by distributing the majority of vehicles serving the airport to the GTC, ITC, and RAC, which are linked to the CTA via the APM. Alternative D allows for direct on-airport access via eastbound Century Boulevard, southbound La Cienega Boulevard, northbound Aviation Boulevard, and Imperial Highway. The existing on-airport roadway access to the CTA would be limited. See Section 2.3.2.4 for a detailed description of the access plan to the CTA. **Figure 2.3-2** provides a depiction of the ground access plan to the passenger processing facilities. A description of the access to each facility is provided below.

Author: Denny Schneider
Subject: Note
Date: 7/21/2003 12:15:59 PM

What about VIP Limos, etc for entry to the CTA? How will these be accommodated? Will VIPs be required to access via the GTC whereas Flyaway buses will go into the CTA? Will Flyaway buses be diverted to the ITA so that only the emergency and cleared vehicles will enter the CTA roadway system?

for passenger drop off. Commercial vehicle traffic on the lower level would be restricted to Curbs 1 and 3, which would be designated for passenger pick-up. A direct connection between the holding area and the two commercial curbs would be provided via a separate connector ramp.

A commercial vehicle holding area would be provided adjacent to the GTC for staging of taxis, door-to-door vans, limousines, and other commercial vehicles. Commercial vehicles would access this lot using the main entrance road to the GTC and the entrance located near the intersection of Arbor Vitae Street and Aviation Boulevard. The commercial vehicle holding area would provide a location for parking and queuing of commercial vehicles prior to and after deployment to the GTC curbs. The holding area limits the amount of time that commercial vehicles are driving around on area roadways waiting to pick up passengers. By providing a place for commercial vehicles to stage, it reduces traffic congestion to surrounding communities and roadways.

The single approach multi-lane roadway system allows a greater opportunity to monitor all vehicles, approaching the GTC. An illustration of the approach to the GTC from the primary entrance road is provided in **Figure 2.3-3**. The use of video surveillance systems to monitor activity and the ability to pre-screen vehicles before they approach the GTC would be an integral part of the security of this facility. The roadway security plan would extend beyond the on-airport roadways to the surrounding regional highway and arterial roadway network. This would provide for additional time and distance to identify and preview potential vehicle hazards. Vehicles that are to be inspected would be directed into a vehicle checkpoint area for inspection. Multiple checkpoint locations would be incorporated into the final ground access plan. For a more detailed description of the GTC functions, refer to Section 2.2.

2.3.2.3 INTERMODAL TRANSPORTATION CENTER (ITC)

Access to the ITC would be provided from the east and west sides of the facility. The ITC would be accessible via 111th Street and Imperial Highway along a proposed at-grade roadway. Traffic signals would be provided at these intersections and at the entrance/exit to the ITC. On the west side of the ITC, cars and buses would be allowed to exit directly onto Aviation Boulevard at-grade, with a traffic signal provided at this location.

The ITC would also provide curbside for charter, regional and other bus activity. For a more detailed description of the ITC functions, please refer to Section 2.3 of this document.

What direction is the view? If this is west, then I assume the ITA is on the left and GTC on the right. The distances shown on the illustration is much greater. How will the parking be invoked to allow short travel distances? How will baggage be handled to get from the Green Line to the ITC and then to the APM?

2.3.2.4 CONSOLIDATED RENTAL CAR FACILITY (RAC)

The RAC significantly improves passenger convenience by locating **all off-airport rental car facilities into one central location.** The consolidated RAC facility would include a direct pedestrian bridge to the APM system. All passengers would access the RAC facility to and from the CTA by using the Landside APM system. This has the distinct advantage of eliminating all rental car busses from the arterial roadway network. Primary vehicle access to the consolidated RAC facilities would be via Airport Boulevard and 98th Street.

Passengers returning their vehicles from the south and the east would access the facility via a left turn from northbound Airport Boulevard to westbound 98th Street. Passengers returning their vehicles from the northwest would access the facility via a right turn from southbound Airport Boulevard near 98th Street via a new dedicated ramp into the facility. There would be two primary exits ramps from the facility. One exit ramp would be onto southbound Aviation Boulevard and the other would be to westbound 98th Street. **Figure 2.3-4** depicts the location of the RAC Facility.

2.3.2.5 AIR CARGO ROADWAY

The cargo roadway network would provide direct access for cargo vehicles from the surrounding arterial street network. This would reduce congestion on the arterial roadway network. There are four separate cargo complexes in Alternative D that require direct access off of the arterial roadway network:

- ◆ Century Cargo Complex: Access to the Century Cargo Complex would be accommodated from Century and Aviation Boulevards. In total there are seven access points to the Century Cargo Complex, six from Century Boulevard and one from Aviation Boulevard.
- ◆ Imperial Cargo Complex: Access to the Imperial Cargo Complex would be accommodated from Imperial Highway and Aviation Boulevard.
- ◆ South Cargo Complex East: Access to the South Cargo Complex would be accommodated from Imperial Highway.
- ◆ South Cargo Complex West: Access to the South Cargo Complex West would be accommodated from Imperial Highway and I-105.

2.3.3 OFF-AIRPORT PUBLIC ROAD ACCESS

Alternative D would include a series of improvements to the off-airport transportation network; it would accommodate the shift in traffic patterns associated with the relocation of the primary passenger destination from the CTA to the GTC and the ITC. Various

General cargo traffic notation: How will this cargo traffic get out of the area? Will it all be directed to the 105 Fwy? What about N-S destinations?

intersection improvements would be made to the off-airport transportation network to accommodate the shift in traffic patterns from the CTA to the GTC and ITC areas. Alternative D proposes that one northbound lane would be added on La Cienega Boulevard from 111th Street to Arbor Vitae Street, and one southbound lane would be added from Arbor Vitae Street to 104th Street. The intersection of La Cienega Boulevard and Lennox Boulevard would be designed to restrict traffic from traveling between Lennox Boulevard and the on-airport roadways. These improvements are strategically designed to improve those intersections that would experience the primary increase in traffic as a result of the plan.

2.3.4 TRANSIT

The existing MTA Green Line station is located at the southeast corner of Aviation Boulevard and Imperial Highway. Alternative D would provide an enclosed pedestrian connection with moving walkways between the Green Line station and the ITC. The walkway would cross above Imperial Highway and below I-105 freeway. Transit users would access the CTA from the ITC via the APM system. The MTA Green Line station would also serve as the destination for airport bound passengers that would be using the future rapid bus line from downtown Los Angeles.

2.3.5 PUBLIC PARKING

Public parking would be provided in three separate locations: GTC, ITC, and in an expanded Lot B. Parking locations and number of stalls is depicted in **Figure 2.3-5**. In the GTC, three garages would provide approximately 7,515 stalls. Parking Garage 1 (P1) would have five levels. Parking Garages 2 and 3 (P2, P3) would each have three levels. Of the 7,515 GTC stalls provided, 4,253 would be priced for short-term parking, while the remaining 3,262 stalls would be priced for long-term parking. The parking structures in the GTC would be designed to help diffuse blast impacts from surrounding vehicles.

The parking facilities at the ITC would provide approximately 9,127 stalls, with all stalls priced for short-term parking. These stalls would be provided in three separate levels within the ITC.

The surface lot north of 111th Street would be incorporated into Lot B and would provide 5,470 long-term parking stalls. A shuttle bus would transport people between this lot and the ITC for access to the CTA via the APM.

Total	21,426	22,112
Off-Airport Stalls	12,500	12,890
TOTAL	33,926	35,002

NA – Not Applicable
 Source: Landrum & Brown, Inc.

2.3.6 EMPLOYEE PARKING

Alternative D employee parking would be provided in two locations: the West Employee Parking Garage and the existing garage on the southeast corner of Avion Drive and Century Boulevard. Both locations are shown in Figure 2.3-5.

A 12,400-stall garage would be constructed on the west side of the airport, south of World Way West. Employees would access this lot via World Way West by way of Pershing Drive. The new employee garage would be designed to help diffuse blast impacts from surrounding vehicles. It would be designed with a security-screening checkpoint for all employees using the garage. Employees parking in this garage would be shuttled on World Way West or on the Airport Operations Area (AOA) to their places of employment.

The existing garage on the southeast corner of Avion Drive and Century Boulevard would provide approximately 1,200 stalls. Employees would access this parking garage via Century Boulevard. Employees parking in this garage would be shuttled to the RAC Landside APM station for access to the CTA, GTC, or ITC.

Sequence number: 1

Author: Denny Schneider

Author: Denny Schneider

Subject: Note

Date: 7/21/2003 5:03:55 PM

How will the employee entrance be screened at the CTA? Why would employees be shuttled away from LAX to take a people mover back?

2.4 AUTOMATED PEOPLE MOVER - ALTERNATIVE D

Alternative D would include two people mover systems: a Landside APM system and an Airside APM system. The Landside system would become the primary connections between the landside facilities and the terminal facilities at LAX. The Airside system would connect the TBIT and the new West Satellite Concourse. The APM system would be continually monitored by security personnel utilizing video surveillance to identify potential threats. Redundancy would be an integral part of assuring the continued operation of the system in the event of a mechanical failure or threat. The CTA would be able to be accessed by passengers through a busing operation should it be necessary. Figure 2.4-1 depicts the alignment of these systems.

2.4.1 LANDSIDE AUTOMATED PEOPLE MOVER SYSTEM

The Landside APM would be the primary mode of transportation for passengers and employees to access to the CTA. The system would provide service between the CTA and the GTC, ITC, and RAC. The Landside APM would also provide a continuous connection between the MTA Green Line and the CTA.

2.4.1.1 LANDSIDE SYSTEM ROUTES

To balance the passenger loads, two Landside APM routes were designed to operate independently, with one route serving only the CTA and GTC and a second route serving the CTA, RAC, and ITC. Although a direct non-stop route connecting the ITC and CTA is desirable, it would require a fourth pair of guideways, which cannot be accommodated in the CTA.

2.4.1.1.1 CTA-GTC Route

Riders on CTA-GTC route would include arriving and departing passengers who: (a) are dropped off or picked up by third parties, (b) park in the airport GTC parking garage, (c) use commercial transportation to arrive or depart at the airport, and (d) airport employees. Meeters/greeters and airport visitors would also park at the GTC and ride the Landside APM to and from the CTA.

The CTA-GTC route would connect six stations, the four stations in the CTA and the two in the GTC. Starting in the CTA in Terminal 3, trains would go to the Terminal 4 station, then to the station in the South Pier of the GTC, then to the station at the North Pier and then return to the CTA to stations in Terminal 1 and Terminal 2. The train would return along this route in the opposite direction on the other track. The route is highlighted in Figure 2.4-2. By repeating the route in the opposite direction, the Landside APM system would allow passengers to board the Landside APM at any station and go to any station without concern about being on the correct side.

Sequence number: 1
Author: Denny Schneider

On the second, extensive APM route from the ITC & RAC how long will it take? What additional stops are contemplated to accommodate the hotels, businesses, and rental car activities.

Sequence number: 2
Author: Denny Schneider
Subject: Highlight
Date: 7/21/2003 5:14:44 PM

Sequence number: 3
Author: Denny Schneider
Subject: Note
Date: 7/21/2003 5:21:25 PM
Since the train is going on one side of the CTA and then to the GTC and completing the circle, if you got on the "A" train instead of the "B" it could take an enormous time to get to the might take to get to a particular terminal without a major walk. What is to be done to preclude this?

The proposed CTA-GTC route would have two guideways, providing redundancy and allowing for the most direct trip for all passengers. If there is a failure at a station, or at one point along the guideway, failure management switches would permit bypass loops or shuttle routes to be implemented for the system to carry at least half the normal capacity.

Traveling from a west CTA station to the first GTC station would take about 5 minutes. The train length would be varied by operating period to meet the fluctuating passenger loads, so that the operating headway (time between trains) would remain at approximately 2 minutes during all periods, resulting in an average waiting time of 1 minute. Thus the total typical trip between the CTA and GTC would be less than 6 minutes.

2.4.1.1.2 CTA-RAC-ITC Route

Riders on this route would include arriving and departing air passengers who are: (a) parking at the ITC, (b) using the Green Line light rail transit system or regional buses to the ITC station (c) parked in the long-term surface lot west of La Cienega Boulevard and are shuttled by buses to and from the ITC, (d) charter bus users, and (e) airport employees. Meeters and greeters who park at the ITC or use the Green Line would also ride this route.

Arriving air passengers renting cars would ride the system from the CTA to the RAC, and passengers returning rental cars would ride the system to the CTA to catch a flight. Airport users going to or from the hotels and other businesses along 98th Street could take this route and use connecting shuttle buses at the RAC station. A potential collector APM serving these hotels and the RAC station might be part of the future development in the Century Boulevard corridor.

The CTA-RAC-ITC route would run from a western station between the new landside Terminals 2 and 3 to a second CTA station between Terminals 1 and 4, then on to the RAC and ITC. There, trains would reverse and return to the CTA stations via the RAC. This would give direct service to the RAC users and service to the ITC with one intermediate stop. The route described is highlighted in **Figure 2.4-3**. In addition, airport and airline employees working in the CTA would take the Landside APM after being shuttled by a bus to the RAC station from the employee parking lot.

The scheduled travel time between the western CTA station and the ITC would be about 7.5 minutes. Again, the train length would varied by operating period and the operating headway would remain about 2 minutes during all periods, resulting in an average wait time of 1 minute. A typical trip time between the ITC and western CTA station, including headway, would be less than 9 minutes.

There are no stops noted. Verbal statements have been made about stops not yet assigned. What are the stops to be implemented and why? Signage, etc.

2.4.1.2 LANDSIDE SYSTEM CAPACITY

The Landside APM capacity requirements were developed based on the number of passengers that would be riding the system in the peak period. The results of the analysis determined that three pairs of guideways would be required to serve the CTA. Combining the GTC and RAC riders would overload a CTA-RAC-GTC route, and a route serving the CTA-ITC would operate well below capacity.

The CTA-GTC route would be designed to carry up to 13,500 passengers per hour per direction (pphpd) in the peak hour with full baggage loads, and 19,500 pphpd with carry-on baggage in a six-car train. The RAC-CTA link capacity would be about 8,700 pphpd in the peak hour. The RAC-ITC link would carry 9,600 pphpd in the peak hour. Capacities on these two links of this route vary due to different baggage characteristics of the ITC and RAC riders.

2.4.1.3 LANDSIDE SYSTEM STATIONS

Landside APM stations would be designed as flow-through stations to separate passengers entering and exiting the trains. This station layout would minimize cross flow of passengers and congestion at the train doors. It would also shorten the station dwell time and would best accommodate baggage carts as passengers travel between airside and landside facilities. **Figure 2.4-4** depicts typical station layout options. The flow-through option at the top of the figure would be the station layout for the landside system.

Station widths would be adequate to accommodate passenger queuing at platform doors and vertical circulation elements. Station lengths would be based on the ultimate train length, which could be up to 300 feet long, plus circulation space. Vertical circulation would be provided to accommodate level changes between the stations and ticketing, baggage claim and curbside. Elevators, escalators, ramps and stairs would be used for vertical circulation.

2.4.1.4 LANDSIDE SYSTEM ALIGNMENT

Both Landside APM routes would be designed to minimize interference with existing facilities, and with existing and planned roadways. The two routes would include three pairs of guideways at-grade in the CTA. As the CTA-GTC guideway transitions out of the CTA, it would be elevated above Sepulveda Boulevard and continue elevated for the remainder of its route. This guideway would run along Century Boulevard to Aviation Boulevard and turn north into the GTC complex. **Figure 2.4.5** depicts potential APM views from Century Boulevard.

The CTA-RAC-ITC guideway would run north along Sepulveda Boulevard and then east along 98th Street to the RAC station. From

Date: 7/23/2003 11:28:51 AM

What is the peak number of passengers in an hour? How does this relate to 78 MAP? What about if there's 100 MAP?

78 MAP/365= 213,700 peo. per day
with 50% over nominal in an hour it is 11,870 people

the RAC station, the guideway would continue along 98th Street and turn south along Aviation Boulevard. As the guideway approaches the ITC, it would split into an upper and lower pair of guideways. The upper guideways would serve the ITC station and the pedestrian link to the MTA Green Line. The lower guideway would serve the Landside APM maintenance and storage facility.

Approximately six traction power substations with a footprint area of approximately 50 by 50 feet would be located along the guideway at 5,000-foot intervals.

2.4.1.5 FLEET, MAINTENANCE AND STORAGE REQUIREMENTS

Assuming a typical 40-foot rubber-tired Landside APM vehicle, up to 189 cars could be needed to meet the 2015 demand. At the peak hour, approximately 11 trains would be running between the CTA and GTC and 7 trains between the CTA, RAC, and ITC. 

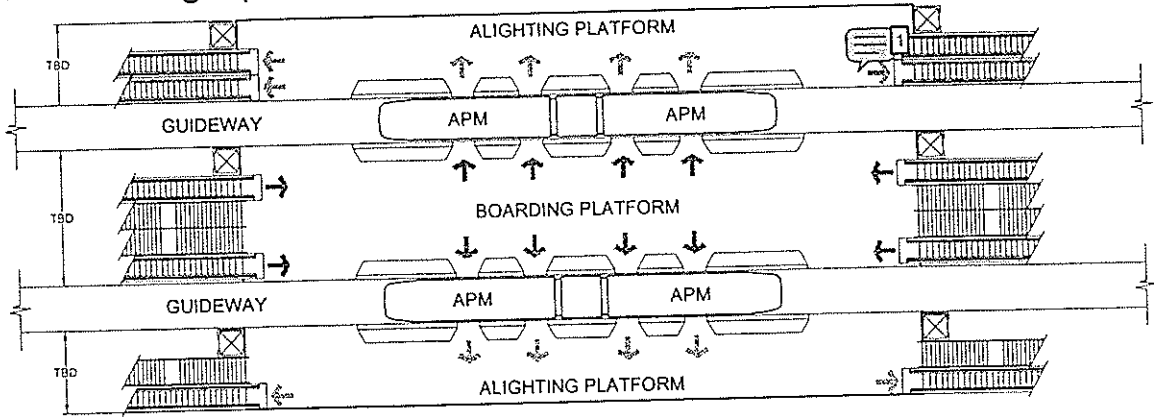

The Landside APM maintenance and storage facility would be in the basement of the ITC. It would contain vehicle maintenance, open shops, spare parts, tool and equipment storage and a cleaning area. Other functions of the facility include central control, offices, a traction power substation, loading dock with a shipping/receiving area and staff facilities.

Sequence number: 1
Author: Denny Schneider
Subject: Note

 Does this picture imply that the APM is moving buildings to accommodate the APM? If so, which ones and how many?

2.4.2 AIRSIDE AUTOMATED PEOPLE MOVER SYSTEM

The Airside APM system would be the primary means of access to the West Satellite Concourse. The Airside APM would consist of a dual lane shuttle system, with two trains connecting the CTA with the TBIT and the West Satellite Concourse. This 3-station system would be located in a tunnel, passing under the apron, taxiways and buildings with stations located beneath the facilities being served. This system would be used for access to/from aircraft gates and the CTA. Arriving passengers would use the system to reach baggage claim and public meet/greeter areas. Depending upon the final configuration and location of FIS facilities, the Airside APM could also transport passengers headed to customs from the West Satellite Concourse to the CTA and TBIT. 

2.4.2.1 AIRSIDE SYSTEM ROUTES

The route would be designed as a short distance system with two trains operating in separate guideways to allow for low headways and high capacities. Riders would include ticketed passengers departing to/arriving from gates in the TBIT or the West Satellite Concourse, as well as the employees working in these facilities. This system would be in the "secure" area of these facilities.

2.4.2.2 AIRSIDE SYSTEM CAPACITY

Depending on peak ridership, the trains could be up to six cars long, but would probably not be longer than four cars. Based on travel distance and speed, the trains would operate with headways of approximately 2.7 minutes. This would result in an average wait time of about 1.4 minutes and an average trip time just over 4 minutes. Using maximum length trains, this system could carry up to 9,000 passengers in a peak hour. 

In this short distance and dual lane shuttle configuration, cable systems could be a viable alternative to self-propelled vehicles. An operating speed of 25 to 30 miles per hour has been assumed, which is within the range of both cable propelled systems and lower-speed self-propelled systems.

2.4.2.3 AIRSIDE SYSTEM STATIONS

Because this system is located entirely underground, access to and from the stations platforms would require significant vertical circulation elements. Elevators, escalators, ramps and stairs would be provided at every station. Station widths would be adequate to accommodate passenger queuing at platform doors and vertical circulation elements. Station lengths would depend on train length,

Sequence number: 1
Author: Denny Schneider
Subject: Note

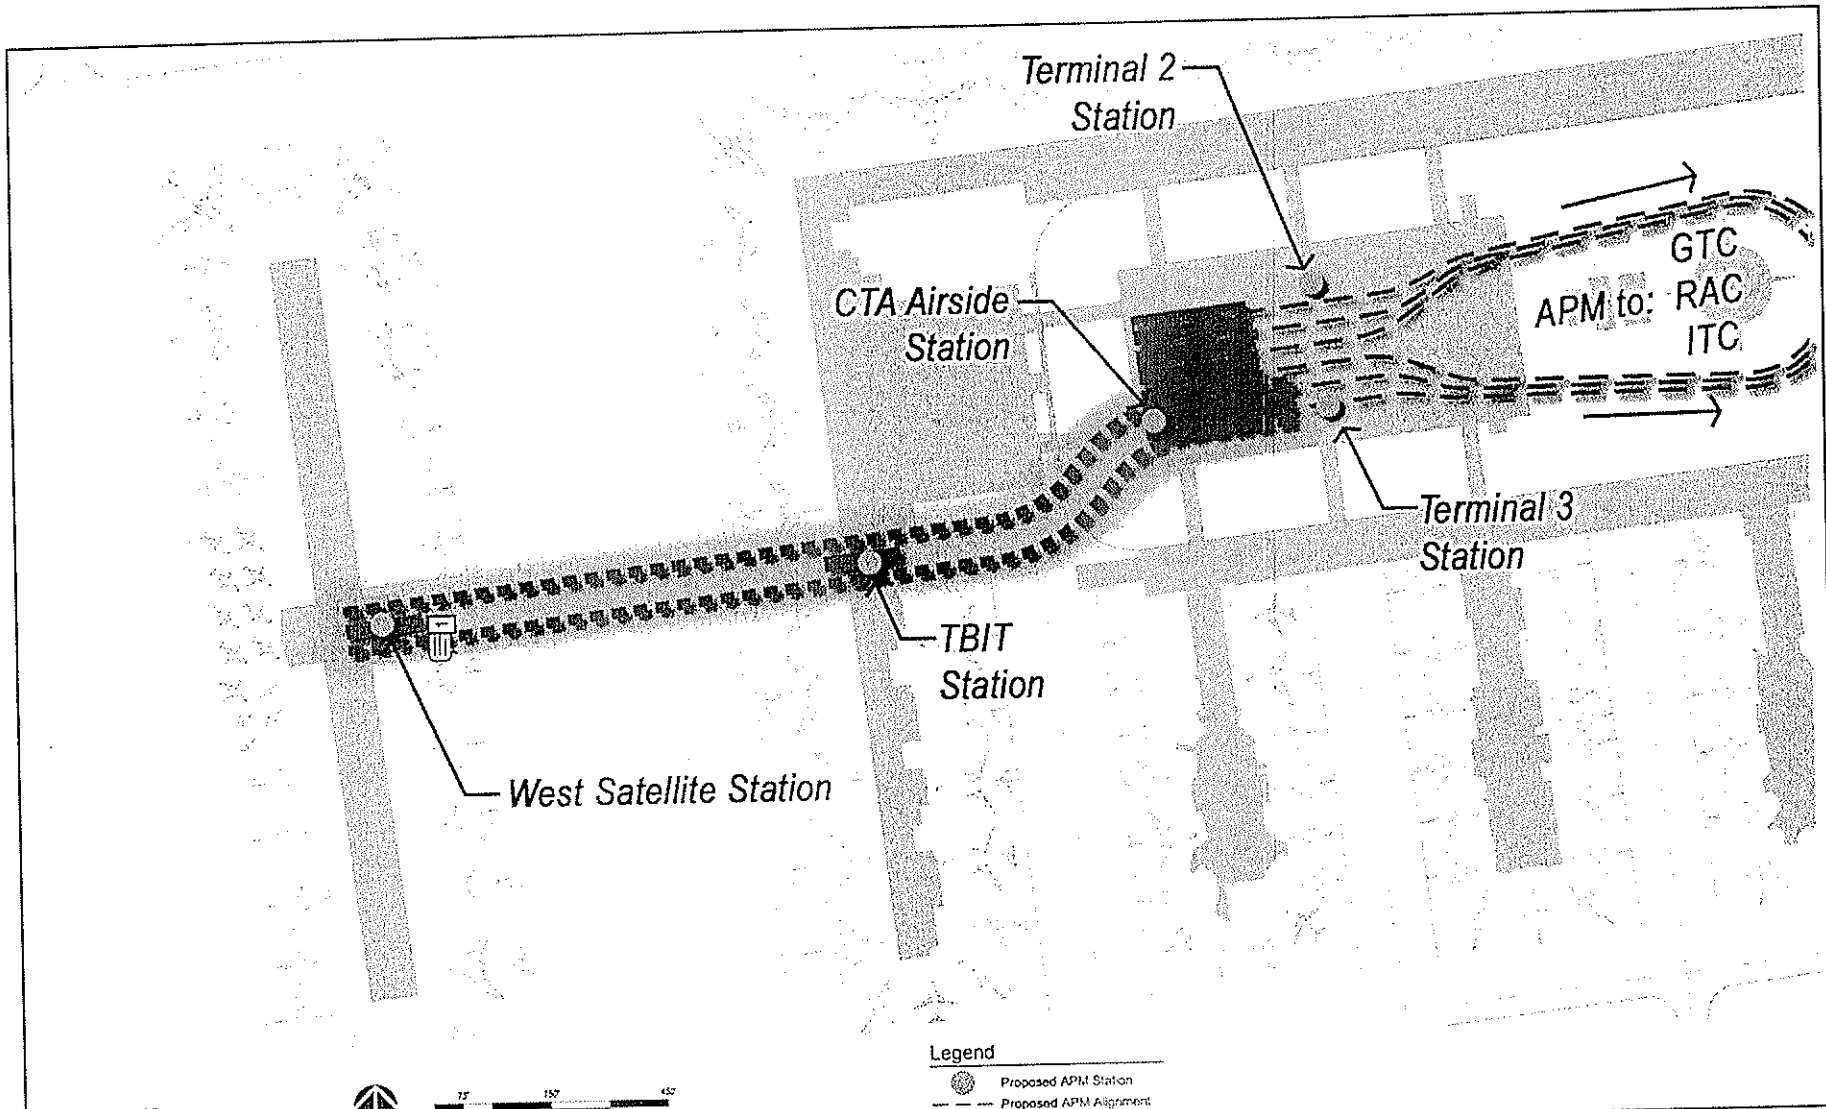

Date: 7/23/2003 12:13:06 PM

If a single set of APM lines are going to the West Satellite Concourse, what kind of internal transportation will facilitate movement from one end of the terminal to the other?
Since it is to be at a different level, how will people be moved from one level to another? Since people may need carts to carry luggage (not everything is always checked), how will this be done?

Sequence number: 2
Author: Denny Schneider
Subject: Note

Date: 7/23/2003 12:15:24 PM

Will these APM cars be the same as the other system? How will they be maintained? If the western end maintenance facility is insufficient how will more cars be brought in?

Sequence number: 1

Author: Denny Schneider

Subject: Note

Date: 7/23/2003 12:17:15 PM

If most of the commuter gates are consolidated all the way in the back, isn't this causing more people to ride this airside APM and making it less convenient?

2.5 CARGO FACILITIES— ALTERNATIVE D

The Alternative D Cargo plan would provide approximately 2,342,000 square feet of cargo building space, which would include mostly existing cargo facilities and some new and reconfigured cargo facilities. The Alternative D cargo facilities would accommodate approximately 3.1 MAT of cargo by 2015. The amount of sort space available for cargo carriers would be fully utilized by the year 2015 and would likely limit processing capability beyond 3.1 MAT.

Alternative D would retain all cargo facilities in the Imperial Cargo Complex and South Cargo Complex East, and remove buildings in the South Cargo Complex West and Century Cargo Complex. The removed buildings would be replaced with newer cargo facilities and would provide a more traditional and efficient ramp area layout at each of the facilities. The four cargo complex areas, and the existing and proposed cargo buildings within those areas, are depicted in Figure 2.5-1 and summarized below. New cargo security requirements are currently being developed by TSA. Further accessibility restrictions would likely be required of the cargo facilities located at airports like LAX. LAWA would incorporate any new TSA requirement into the cargo facilities as those standards are developed. The new standards may or may not require additional building space.

- ◆ **Century Cargo Complex:** Would consist of nine existing buildings and one new building constructed on the site of a building that would be demolished. The Century Cargo Complex would provide approximately 953,000 square feet of cargo building space and 173,000 square feet of mail sort space on approximately 2,110,000 square feet of real estate. Mail sort facilities are excluded from the cargo space utilization calculations to be consistent with the analysis provided for the other Master Plan alternatives.
- ◆ **Imperial Cargo Complex:** Would remain in its present condition with eight buildings, totaling approximately 498,000 square feet on 1,649,000 square feet of real estate.
- ◆ **South Cargo Complex West:** Would consist of four buildings, of which, two are existing and two are new. One of the new buildings would be built on the site of the existing Imperial Terminal while the other would be built on the site of the existing LAWA Police Lost and Found facility. The Imperial Terminal and LAWA Police Lost and Found facility would be demolished. This complex would provide approximately 199,000 square feet in four buildings on approximately 1,189,000 square feet of real estate.

If the subject buildings are there by FAA height requirement waiver now, will these new buildings also be waived? What is the basis of the waivers? If new TSA/FAA standards are added to require additional building space where does LAWA intend to put them? Will an EIR be done or another incremental improvement be used?

Sequence number: 5
Author: Denny Schneider
Subject: Highlight
Date: 7/23/2003 12:53:20 PM

- ◆ **South Cargo Complex East:** Seven buildings would be retained totaling approximately 692,000 square feet on 2,874,000 square feet of real estate.

Table 2.5-1 provides a summary of the total cargo space organized by cargo complex. Table 2.5-2 provides a detailed list of new or redeveloped cargo facilities and existing cargo facilities that would remain.

A limited amount of automobile parking would be provided for the cargo complexes to serve customers and staff. A ratio of approximately one stall per 1,000 square feet of building area would be provided on site. Additional parking at the ratio of 0.5 stalls per 1,000 square feet of building would be provided in the airport employee parking areas and accessed via airport shuttles.

The Alternative D cargo facilities would encompass 2,342,000 square feet of building area (excluding mail facilities) and 3,386,000 square feet of apron area on approximately 197 acres of real estate. The new and reconfigured cargo space would account for approximately 6 percent of the total 2,342,000 square feet of cargo building space available at the airport. See Section 3.2.4 for a discussion on cargo space utilization and the cargo processing capabilities at LAX under Alternative D.

Public parking, some employee parking, landscaping, circulation space, and other support for cargo operations would be provided within the site boundaries (depicted with dashed lines on Figure 2.5-1).

What proportion of cargo is handled in each complex presently and what is anticipated for Alt D? Is some more accessible than other? Is there adequate truck access to each area for the anticipated amount of MAT handled? How will the trucks be routed away from LAX and where are they going?

2.6. ANCILLARY FACILITIES - ALTERNATIVE D

The ancillary facilities in Alternative D are depicted on **Figure 2.6-1** and summarized below. All areas are based on facility footprint measurements.

2.6.1 AIRLINE MAINTENANCE

Alternative D would require the removal of the existing American Airlines, TWA and US Airways maintenance complexes on the west side of the airport (551,000 square feet of building space). Two existing facilities on the west side of the airport and south of World Way West would be retained (612,000 square feet of building space). One existing 164,000-square foot facility would be retained on the west side of the airport, north of World Way West. In addition, two new facilities totaling approximately 300,000 square feet would be located on the west side of the airport, south of World Way West. Five existing maintenance facilities totaling 292,000 square feet located south of Century Boulevard, east of Sepulveda, and west of Airport Boulevard, would be retained. Total airline maintenance facilities would encompass 1,368,000 square feet of building space in Alternative D.

2.6.2 GROUND RUN-UP ENCLOSURE (GRE)

Alternative D would include two new 90,000-square foot Ground Run-up Enclosures (GRE) at the airport. A GRE is a three-sided open-air structure designed to absorb noise associated with aircraft engine tests. A GRE would reduce noise impacts to surrounding communities impacted by aircraft engine tests. A GRE is capable of reducing the standard noise signature by 15 to 18 dBA. Today, all run-ups are conducted on the ramp area near the maintenance facilities. **Figure 2.6-2** depicts a typical GRE. One GRE would be located on the west side of the airport, south of World Way West and east of the airline maintenance complex. An additional GRE would be located on the east side of the airport, south of the existing Delta airlines maintenance facility.

2.6.3 FUEL FARM

The overall fuel farm site footprint would be reduced from 662,000 square feet to 591,000 square feet to accommodate the north airfield modifications for Alternative D, described in Section 2.1. The fuel farm would retain its existing capacity and would remain at its existing location on the west side of the airport, north of World Way West. On-site modifications would be required due to the redevelopment of the north airfield complex.

Sequence number: 1
Author: Denny Schneider

If the fuel farm remains the same capacity, how will it handle the expanded requirements for fuel?

2.6.4 LOS ANGELES WORLD AIRPORTS ADMINISTRATION AND MAINTENANCE

LAWA administrative offices would remain in the existing 42,000-square foot facility at the former airport traffic control tower and the 40,000-square foot facility on the west side of the airport, north of World Way West. 

The existing LAWA maintenance yard and storage facilities are comprised of three complexes totaling 135,000 square feet. These facilities would remain in the existing location on the west side of the airport, north of World Way West. These buildings serve maintenance, storage and administrative functions.  Consolidation of these facilities and/or reconfiguration may be considered as the existing facilities reach the end of their useful life. 

2.6.5 FEDERAL AVIATION ADMINISTRATION (FAA)

The FAA tower facility would not be affected by Alternative D. The existing 13,000-square foot air traffic control tower is located in the CTA.  A security-screening checkpoint would be developed on the Park One site, adjacent to Terminal 1, for employees within the CTA.  FAA employees may be required to screen through this facility prior to gaining access to the FAA tower.

2.6.6 FLIGHT KITCHENS

The two existing flight kitchens located north of Imperial Highway and east of Main Street would remain, providing a total of 98,000 square feet. Existing airline catering located in airline maintenance facilities would be relocated and incorporated into the new airline maintenance facilities. In addition, there are currently 90,000 square feet of flight kitchens located off-airport which would not be affected by Alternative D. 

2.6.7 GROUND SERVICE

Six existing ground handling facilities, totaling 158,000 square feet, located north of Imperial Highway and east of Main Street, would be retained. Additional ground handling functions would be located on the apron and in the terminal area.

2.6.8 GENERAL AVIATION

Alternative D would accommodate two general aviation facilities that encompass 265,000 square feet. The existing 144,000-square foot facility north of Imperial Highway and east of Sepulveda Boulevard would remain. A new 121,000-square foot facility would be located north of Imperial Highway and west of Sepulveda Boulevard.

At what angle will these enclosures be placed?

**2.6.9 AIRCRAFT RESCUE AND FIREFIGHTING
(ARFF)**

Fire Station 51 and 80 would be expanded to accommodate the future ARFF requirements and increase response capabilities at LAX. Fire Station 51, located west of Sepulveda Boulevard and south of Century Boulevard, would remain at its current location and be expanded from 9,000 square feet to 18,000 square feet. Fire Station 80 would be expanded from 14,000 square feet to 18,000 square feet and relocated due to the construction of the new Taxiways S and Q. This new ARFF facility would be located east of the fuel farm and north of the U.S. Coast Guard facility. The 9,000-square foot Fire Station 95, at the southeast corner of Century Boulevard and International Road between Airport and Aviation Boulevards, would remain the same.

2.6.10 AIRPORT POLICE

The existing LAWA police headquarters, located on West 96th Street and west of Sepulveda Boulevard, would be removed and relocated to accommodate Alternative D.

A new 110,000-square foot airport police headquarters facility would be built at the northwest corner of Westchester Parkway and Emerson Avenue to accommodate the increased staffing levels due to enhanced safety and security requirements. The new facility would provide convenient access to the airport. The new facility would be located across the street from the newly relocated City of Los Angeles Fire Station No. 5 to facilitate easy communication between members of the emergency response team. The Police Lost and Found function would be located in the new LAWA police headquarters facility. Additional police substations would be located in both terminal and landside facilities to further enhance public safety, security, and police responsiveness.

2.6.11 UNITED STATES COAST GUARD

The existing 39,000-square foot U.S. Coast Guard facility, including the apron and helicopter landing area, would remain in its existing location on the west side of the airport, north of World Way West.

2.6.12 CENTRAL UTILITY PLANT

The existing 18,000-square foot central utility plant would remain in its current location within the CTA. A security-screening checkpoint would be developed on the Park One site, adjacent to Terminal 1, for employees within the CTA. Central utility plant employees may be required to screen through this facility prior to gaining access to the plant.

How would these fire stations have easy access to Manchester Square, the RAC, or ITC? How will these fire stations coordinate with the new City FD in the Northside

Development shown in figure 2.6-1?

How will disaster victims be transported and to where?

**2.6.13 COMPRESSED NATURAL GAS/LIQUID
NATURAL GAS FACILITIES**

The existing LAWA Liquefied Natural Gas/Compressed Natural Gas (LNG/CNG) facility would remain in its present location. It consists of a core facility of approximately 8,000 square feet located on an approximately 131,000-square foot (3-acre) site at 7350 World Way West. Access to the LNG/CNG facility would be controlled by a security checkpoint along World Way West adjacent to the new employee-parking garage. 

The 22,000-square foot off-airport CNG facility, located south of 104th Street and east of Aviation Boulevard, would be removed and space would be provided for  new 22,000-square foot facility at the southeast corner of Arbor Vitae Street and Aviation Boulevard.  Access to the new CNG facility would be controlled via the security monitoring systems along the GTC entrance roadway. A remote security gate may be developed on the entrance road to the facility to control access.

**2.6.14 TRANSPORTATION SECURITY
ADMINISTRATION (TSA)**

Alternative D would accommodate and facilitate the needs and directives of the TSA at LAX. At this point, the requirements of the newly formed TSA are continually evolving. LAWA officials are currently working with the TSA to determine and accommodate the needs of the administration. Alternative D was designed to be flexible in accommodating all existing and future federal security requirements.

2.6.15 SUMMARY

 What amount of CNG will be stored there? This is located at the NW corner of Manchester Square. Will access be only from Arbor Vitae/Aviation or from within the GTC entrances? How will security be maintained? What level of traffic is this expected to generate and of what type?

2.7 LAND ACQUISITION – ALTERNATIVE D

Major infrastructure projects like the LAX Master Plan often require the purchase of property in order to construct new facilities. Every effort was made during the planning of Alternative D to limit property acquisition to the minimum area required to implement the plan. Alternative D would require a combination of full and partial parcel acquisitions, as well as easements across certain parcels in the project area.

The Master Plan alternatives would require various amounts of property acquisition to provide space for airport facilities and improvements. Various businesses and other properties would need to be acquired under Alternative D. The land acquisition and easement areas are depicted in **Figure 2.7-1** and summarized in **Table 2.7-1**. In addition, **Table 2.7-2** provides a more detailed description of each parcel. Figure 2.7-1 contains reference numbers for each parcel that are keyed to the map reference number appearing in the first column of Table 2.7-2.

The timely acquisition of property is a key element to the Master Plan Alternative D phasing schedule. All land acquisition identified within this section would need to be completed in the first five years after the Record of Decision for the EIR/EIS. Section 2.8 and Section 2.10 provide the sequence for acquisition activities to accommodate this schedule.

LAWA is in the process of acquiring the Airport/Belford and Manchester Square areas east of, and adjacent to, the airport under the Aircraft Noise Mitigation Program (ANMP). Some residents in those areas approached the airport staff and requested that their properties be acquired rather than soundproofed. Should the ANMP land acquisition for the Airport/Belford and Manchester Square areas not be completed by the time the Master Plan is approved, the City of Los Angeles would use the most appropriate and practical measures available (e.g., voluntary acquisition, leasing, and/or public condemnation⁶), to ensure that the designated areas are vacated to accommodate the Construction Sequencing Plan for the selected Master Plan alternative. Land purchases or LAWA terminated ground leases associated with Master Plan Alternative D are listed below.

- ◆ Approximately 77 acres² of property.

⁶ These measures would be available to be used for all build alternatives to pursue any needed acquisition that cannot be obtained through negotiations.

² Excludes LAWA-owned on-airport properties.

Who will decide what to condemn and when?

LAX Master Plan Addendum

- ◆ Institutional uses on approximately 6 acres including the former Community Aviation College (now Hollywood Cinema Production Resources Training School) and the Westchester Neighborhood School.
- ◆ Acquired commercial property with approximately 36 businesses including light industrial, office, retail, and one hotel.
- ◆ Approximately 3,676 remote, off-airport parking spaces.
- ◆ Approximately 9 acres of rental car space.
- ◆ Approximately 147,000 square feet of freight/warehousing building space.

Easements would be required over property owned by the Atchison, Topeka and Santa Fe Railway and four private property owners.

Table 2.7-1

ALTERNATIVE D - SUMMARY STATISTICS OF ACQUISITION AREAS

Area	Total No. of Bus.	Parcel Acreage	Building (sf.)				No. of Hotel Rooms	Airport Parking Stalls
			Light Industry	Office	Retail	Residential

Does this include lands north of Arbor Vitae? Are all of the other 36 businesses within Manchester Square? If 3676 private parking spaces are removed, are they being replaced? The 9 acres of rental car space is also west of Manchester Square. What is it's use? Does the easements of the MTA line along Aviation and 4 property owners preclude future extension of the Green Line? If not, why not. How will the future Green Line extension be protected? What is planned for these properties that are not inside Manchester Square?

Sequence number: 2
Author: Denny Schneider
Subject: Note
Date: 7/23/2003 3:20:55 PM

This table assumes all of residential areas of Manchester Square and Belford Area are already procured. Since they are not included in this table, what is the anticipated cost for procurement of these housing units?

2.8 RELOCATION - ALTERNATIVE D

2.8.1 PRELIMINARY PROPERTY ACQUISITION AND RELOCATION PLAN

This section describes how the LAX Master Plan would relocate residences and business in accordance with applicable statutes designed to minimize community disruption, limit adverse economic impacts and protect human rights. A final relocation plan would be developed during Master Plan implementation. Applicable statutes include the Federal Uniform Relocation Assistance and Real Property Acquisition Act of 1970, as amended in 1987 (hereinafter the Uniform Act), and the regulations implementing the Act (49 Code of Federal Regulation (CFR) Part 24). These regulations require the project sponsor to compensate landowners and tenants fairly for the acquisition and to assist in their relocation. The regulations support relocating businesses to nearby areas to maintain the economic and employment benefits to the economy.

2.8.1.1 RESIDENTIAL USES

At this time it is anticipated that no residential properties would be acquired under Alternative D. However, if necessary, all procedures for residential acquisition and relocation would be identical to those now employed by the LAWA Residential Acquisition Program conducted under the Airport Noise Abatement Plan in accordance with the Uniform Act.

2.8.1.2 BUSINESS USES

Similar to residential owners, business property owners would be compensated for their property and/or provided relocation assistance in accordance with the Uniform Act. This can be a time consuming and complicated process. In addition to the value of the land and buildings, the value of the business itself must be appraised and evaluated. Each business would be evaluated separately and individual negotiations would occur.

2.8.1.3 LAX NORTHSIDE AND MANCHESTER SQUARE

Alternative D of the LAX Master Plan calls for the development of the LAX Northside Plan as currently entitled and modified with reduced traffic activity. All businesses identified for acquisition or relocation in Alternative D can be accommodated either on LAX property, or in the surrounding business community within the City of Los Angeles. At this time, without a final relocation plan, it is impossible to say precisely which businesses would relocate to the LAX Northside and what their space needs would be. However, it is possible to provide a preliminary list of businesses that would be compatible to relocate to

Note: Equivalent to Tables A-1, B-1, and C-1 in Appendix P of the Draft LAX Master Plan

2.8.1.6 BUSINESSES REQUIRING RELOCATION ASSISTANCE

All office, hotel, retail, commercial and light industrial uses acquired under this alternative can be relocated to the LAX Northside Development or absorbed in the local community.

To address these specific properties and to facilitate all business relocations to LAX Northside, the Relocation Plan envisions the establishment of a Business Relocation Program under the auspices of the LAWA Business Development Bureau. This program would administer compliance with the provisions of the Uniform Act and other regulations and would provide assistance to individual business owners.

2.8.1.7 SURVEY OF OWNERS, RESIDENTS AND BUSINESS OPERATORS

A face-to-face survey of every affected property owner would be conducted as soon as possible to determine attitudes toward acquisition and special needs.

Such a survey was conducted as the first step in the development of the Relocation Plan for the Airport/Belford and Manchester Square areas. A similar survey of business owners is essential to determine the willingness to relocate to the LAX Northside and the potential costs, time frames and special needs.

2.8.1.8 UTILITY RELOCATIONS

The acquisition areas contain a variety of above- and below-ground utility lines and facilities. Investigation and planning for these relocations would be required to complete the work on time.

2.8.1.9 WESTCHESTER SOUTHSIDE DEVELOPMENT

Alternative D of the LAX Master Plan identifies the LAX Northside Development as the baseline for additional development north of the airport.

2.8.1.10 SEQUENCE OF ACQUISITION

Master Plan property acquisition would need to be completed in the first stage of Master Plan implementation. Relocation sites would need to be available before the acquired property can be vacated and redeveloped. The land acquisition process can take many years and it is recommended that certain planning actions, categorically exempt from the California Environmental Quality Act (CEQA) and categorically excluded from National Environmental Policy Act (NEPA), be undertaken at the earliest possible time.  A detailed acquisition and phasing plan would be developed in conjunction with the preparation of the Final EIS/EIR.

2.8.1.11 FINAL RELOCATION PLAN

The final Relocation Plan would be developed and approved in concert with the Master Plan and EIS/EIR as they progress through the LAWA and City of Los Angeles' approval process.

2.8.2 RELOCATION ASSISTANCE

The Uniform Act, as amended, governs the relocation of individuals and businesses displaced by projects paid for in whole or part with federal funds. Since Alternative D requires the purchase of property in order to complete construction of the project, the Uniform Act establishes minimum standards for relocation assistance and compensation as follows:

- ◆ Relocation advisory and financial assistance shall be available for individuals and businesses that must relocate as a result of the public acquisition of property; and
- ◆ Basic standards and requirements for appraisals and acquisition shall be followed in acquiring real property.

The provisions of the Uniform Act are set forth in the Code of Federal Regulations, 49 CFR Part 24, for federal and state agencies that are either acquiring the property or providing the financial assistance to do so. In order to comply with Federal, State and City of Los Angeles regulations, LAWA would establish a relocation assistance program with the following components:

2.9 COLLATERAL DEVELOPMENT- ALTERNATIVE D

The LAX Northside Development Plan would develop approximately 340 acres of airport-owned land for various uses in Alternative D.

The LAX Northside Development would be compatible with and serve the needs of the Westchester residential community. A Village Area would be developed as a new town center. The Village Area would be pedestrian oriented and heavily landscaped to provide an attractive and prosperous commercial center for the residents and airport visitors. On the east end, the project would include about 1,360,000 square feet of office space, 650,000 square feet of hotel use (1,000 rooms) and 100,000 square feet of retail/restaurant space. This new Village Area would be the proposed new town center to serve the Westchester residential community.

The LAX Northside Development would include a business park with additional office, retail and hotel space, which would be located east of the existing golf course. The business park would house compatible airport facilities and light industrial uses relocated from the acquisition areas. The proposed development would likely include 1,580,000 square feet of office space, 870,000 square feet of hotel use (1,400 rooms) and 130,000 square feet of retail/restaurant uses. The LAX Northside Development would also include 1,170,000 square feet of research and development business park use and 750,000 square feet of airport related uses.

The original LAX Northside Development (see **Figure 2.9-1**) provided entitlements for 4.5 million square feet of development, subject to a limitation on the total number of daily vehicle trips (a "trip cap"). Alternative D includes a proposed reduction in the existing trip cap included in the original LAX Northside Development. The reduced trip cap would limit the amount of total daily traffic generated by the LAX Northside Development to a level comparable to that associated with the Westchester Southside Development proposed under Alternatives A, B, and C. The total development of the subject property shall not generate more than 3,152 project-related outbound vehicle trips in the a.m. peak hour, and 3,040 project-related outbound vehicle trips in the p.m. peak hour, resulting in a reduction of 50 percent from the approved LAX Northside trips of 6,340 in the a.m. and a reduction of 57 percent from the approved LAX Northside trips of 7,000 in the p.m. The amount of trips generated by a project shall be based on the trip generation rates used in the June 2003 Supplement to the Draft EIS/EIR transportation analysis and on square footages of the proposed development, under the LAX Northside Development. Estimates of the number of trips generated by specific projects shall be made prior to issuance of building permit and shall be documented so that the total number of trips generated

2.10 CONSTRUCTION SEQUENCING PLAN - ALTERNATIVE D

The following is a general overview of the sequence of activities that would be required to complete the phased development of Alternative D. Construction on a large scale can cause vehicle and pedestrian congestion, increasing security vulnerability. Planning of each construction phase would include actions to alleviate vulnerabilities. This narrative establishes a phasing and sequencing plan broken down into three distinct phases. This sequencing plan was developed independent of financial, operational and existing lease constraints. The chronology for these facilities is depicted in an order that is consistent with the priorities established by the LAWA staff. **Figure 2.10-1** graphically depicts the Phase I projects associated with Alternative D.

Phase I

1. Reconstruct and recrown Runway 7R/25L approximately 50 feet to the south, construct new full-length parallel taxiway between Runways 7R/25L and 7L/25R, and relocate Nav aids associated with Runway 7R/25L. 
2. Redevelop the Continental City lot into a new ITC containing 9,127 parking stalls. This facility would provide short-term parking and would contain a physical link to the existing Green Line transit station at the corner of Aviation Boulevard and Imperial Highway. The link would provide power-assisted moving walkways to assist passengers transferring to and from the Landside APM system.
3. Reconfigure the existing long-term parking lot west of and adjacent to La Cienega Boulevard (southeast surface parking). This facility would contain approximately 5,470 parking spaces. Passengers using this lot would be shuttled to the ITC via a busing operation and transferred to the Landside APM for transit to the CTA. 
4. Relocate existing off-site utility infrastructure impacted by development program.
5. Construct a baggage tunnel from the site of the future GTC to the existing CTA. 
6. Construct a new access roadway system east of Aviation Boulevard including Century Boulevard overpasses. These roads provide access to and from the ITC and GTC. 
7. Construct a new RAC facility in the general location of the existing long-term parking lots C and D. A 150,000-square foot

Date: 7/30/2003 4:05:13 PM

As with the other Phase I, how will the RAC be done before lands are purchased? The RAC facility appears to need some of the area between 98th and 96th streets.

customer service center including a 9,000-stall, four-level ready/return parking garage would be located north of 98th Street. This project would be completed in two phases. Upon the completion and opening of the GTC, the public parking component of Lot C would be transferred to the GTC, and a series of maintenance facilities and vehicle storage lots would be distributed to the north of the service center. In the period between the completion of the RAC service facility and the opening of the GTC, rental car companies would shuttle vehicles from the existing lots to the new customer service/ready return garage. 

8. Construct the West Employee Parking Garage containing 12,400 parking stalls. A consolidated employee security screening facility could be developed as part of this project. Shuttle buses would transport employees between this lot and their respective employer locations.
9. Demolish the existing parking structures in the CTA, relocate necessary utilities and complete site preparation for new terminal facilities. 
10. Construct off-site roadway improvements required for Alternative D as per the approved Transportation Improvements Phasing Plan for Alternative D of the Master Plan.
11. Construct four new terminals in the area currently occupied by the parking garages in the CTA.
12. Construct a new above ground Landside APM from the CTA to the GTC, ITC, and RAC. An associated Landside APM maintenance facility and test track would be located in the basement of the ITC.
13. Install new baggage security and distribution systems in the CTA and the GTC, including linkage between the two facilities.
14. Construct the GTC north of Century Boulevard and south of Arbor Vitae Street, between Aviation and La Cienega Boulevards. This would also include the construction of three new parking garages containing a total of approximately 7,515 parking spaces. A new commercial vehicle staging area would be developed north of the northern-most parking structure at the GTC.

location of airport facilities to accommodate projected air traffic demand. Thus, airport facility planning is a local government function. Local agencies plan for efficient and compatible airports and surrounding land use in their communities with the least amount of external impacts on people and the environment.

The starting place for the facility design concept for Alternative D was to design basic airport and ground access facilities that enhance airport safety and security while retaining the ability to serve aviation activity equivalent to the projected No Action/No Project level while reducing the impacts associated with the No Action/No Project Alternative. This design approach was an iterative process that reapplied projected market forces to the constrained facilities to forecast the changes that would likely occur at LAX if this policy and the associated facilities were developed. Finally, the airport and ground access facilities were refined, as necessary, to best reflect the forecast for the constrained market changes.

The most constraining component of an airport defines the practical capacity² of the entire airport. An airport is a complex system made up of components through which passengers and aircraft flow in a sequential order. Aircraft arriving at the airport pass through the airspace, land on the runways, travel on the taxiways and proceed to the terminal gates to unload and reload passengers. Once loaded and ready for departure, the aircraft pass through these same components in reverse order.

Passengers move through the system in a similar set of sequential steps. Departing passengers travel on local roadways and on-airport roads, arrive at the terminal from the curbside, parking, or other shuttle facility, are processed in the terminal and proceed to the designated aircraft gate for boarding. Arriving passengers generally proceed through these steps in reverse order upon arrival at an airport. Exceptions for arriving passengers include domestic connecting passengers who board other flights, international arrivals who move through FIS facilities and baggage claim before they connect to other flights or use ground transportation facilities.

Each component of the airport system, the airfield, terminal passenger facilities and the curbside, has an operational or passenger capacity that is a function of the physical characteristics of the component. The annual passenger level served by the overall airport system is related to the hourly capacity of its weakest component. The relationship between hourly aircraft operations,

² The "unconstrained aviation demand forecast profile" refers to both the volume and manner in which airline operations are conducted.

This section describes what a constraint is, but not what they are. How were market forces taken into consideration with regard to development of a real regional solution? The assumptions should be enumerated in a concise, direct way. Page 3-4 says that they are in Chapter 3 of the 2001 document. This is another level of action for the document that we are told is self contained.

airport activity profile. It is reasonable to compare historical aviation activity statistics among several airports; however, it is of little value to compare forecast levels of passenger and cargo activity without knowing the above listed market factors for each airport in the comparison. [An extensive historical record and forecasting effort to define each of these parameters and their application at LAX was undertaken as a part of the LAX Master Plan (see Chapter 3 of the Draft LAX Master Plan, January 2001). It is from this body of information that detailed design day forecasts have been developed for each of the LAX Master Plan alternatives.]

A projected design day and annual performance measure of total passengers and total cargo has been computed for each Master Plan alternative. Alternative D has a passenger and cargo activity level that is determined by the ability of facilities in that alternative to serve the unconstrained market demand. Figure 1.2-1 summarizes the Master Plan alternatives and their corresponding activity levels. The No Action/No Project Alternative is limited by the capacity of the curbside in the CTA where passengers are dropped-off and picked-up in front of the existing terminals. The resulting annual passenger performance measure of this alternative is approximately 78.7 million. Alternatives A and B include a fifth runway and were designed to serve the 2015 passenger demand forecast. Alternative A and B would accommodate approximately 97.9 MAP.⁴ Alternative C's projected annual passenger activity level served is limited by the capacity of the four-runway system and is forecast to be approximately 89.6 million. [The constrained activity profiles for Master Plan Alternatives A, B, and C are discussed in Chapter V of the Draft LAX Master Plan in Section 3.3.2. Extensive analysis is included in that document, establishing the levels of passengers that each alternative is designed to accommodate. Alternative D was designed to accommodate approximately the same level of passenger activity as the No Action/No Project Alternative.]

3.3 2015 ALTERNATIVE D ACTIVITY

The following sections discuss the activity levels associated with Alternative D in 2015. The plans have been developed to provide gate facilities that would promote a regional solution to air travel for the Los Angeles region.

⁴ The "unconstrained aviation demand forecast profile" refers to both the volume and manner in which airline operations are conducted.

The statement is made that Alt D was designed to accommodate approximately No Action/No Project, but which version of Alt D? There are numerous alternative tacts discussed in this plan. Which one is the one that limits to NANP? Is there a common constraint that is the limiting factor? What is it and how is it justified?

Sequence number: 6
Author: Denny Schneider
Subject: Note
Date: 7/30/2003 9:11:18 PM

What does the statement "developed to provide gate facilities that would promote a regional solution to air travel" really mean?

3.3.1 AIRCRAFT ACTIVITY

Alternative D peak hour aircraft operations activity was projected based on the capacity of the existing four-runway system at LAX in usual operating conditions. Given that the airport was operating with high peak hour delays and a significant number of cancelled flights during poor weather conditions in 1996, peak hour operations in the 2015 activity scenario were projected not to exceed the 1996 levels. However, operations were projected to increase in other hours as warranted by market demand.

The resulting total daily aircraft operations are forecast to be the same as the No Action/No Project Alternative and less than Alternative C. This difference in total operations is due to the fact that Alternative D would not be designed to accommodate the same level of cargo activity as Alternative C (and the other build alternatives). It is also projected that design day cargo aircraft operations levels would be below the unconstrained forecast operations demand.

3.3.2 PASSENGER ACTIVITY

As stated previously, Alternative D would be designed to accommodate the same design day aircraft operations as the No Action/No Project passenger level. The passenger activity that would be expected in 2015 with Alternative D was determined based on the design of the Alternative D gate facilities and the projected airline response to the constrained facilities. The following sections describe the steps taken to develop the Alternative D constrained design day forecast schedule.

A passenger capacity analysis was conducted to allow aircraft size (as measured by enplanements per departure) to increase beyond 1996 and 2000 levels without significantly exceeding the 2015 unconstrained forecast enplanements per departure for each air service region. This enabled the enplanements per departure ratios for the domestic and international fleet to grow to a level between the 2010 and 2015 Master Plan forecast. The average commuter fleet size (again measured by enplanements per departure) was able to grow to the 2015 unconstrained forecast level. On average, the proportion of air carrier and commuter operations results in an enplanements per departure ratio similar to the No Action/No Project Alternative. The ability to increase aircraft size, thereby increasing passenger levels, was limited by the number and type of gates available under the Alternative D terminal design. By comparison, Alternative C was designed to test the limit of the market to serve passenger and cargo demand within the constraint of a four-runway system at LAX. Gate space is provided in Alternative C as necessary to accommodate the projected increase in average fleet size that serves both the

☞ An assumption was made that the airport operated with high peak hour delays and significant number of cancelled flights during poor weather. Why is this appropriate for LAX? What are the peak hours and how many are there? How many hours of peak activity/capacity can be sustained at LAX?

Sequence number: 4

Author: Denny Schneider

Subject: Note

Date: 7/30/2003 9:26:11 PM

☞ Why is the assumption of total daily aircraft operations remaining the same valid? Alt D is presumed to be less cargo than C. Why assume that cargo capacity will increase at all? Any increase in facilities needs to be added to a new plan since it is fixed as is from the 1982 one. What is the basis of the statement that "the design day cargo aircraft operations levels would be below the unconstrained forecast?" Cargo is projected to go from present levels of 2 MAT to 3.5 MAT. This can't happen without increased cargo handling facilities being built.

☞ Explain how the aircraft mix combination remains comparable relating to ratios of commuter vs other air operations since the gate mix is being changed significantly toward larger aircraft.

international and domestic markets. As the projections in the following section indicate, the design of Alternative D would encourage airlines to choose the most efficient use of the gate facilities at LAX and supplement high-frequency domestic service at other airports in the region.

3.3.3 AIR SERVICE CHANGES

Alternative D is projected to meet 87 percent of the unconstrained 2015 O&D passenger demand forecast and 82 percent of the 2015 international passenger demand forecast. **Figure 3.3-1**, **Figure 3.3-2**, and **Figure 3.3-3** present a comparison of forecast air service operations between the No Action/No Project, Alternative D, and unconstrained demand at LAX. The forecast of air service changes at LAX, as a reaction to the airport facilities available under Alternative D, is based on the following projections and expectations:

- ◆ High priority would be given by the airlines to accommodating O&D passengers. However, it would still be important to maintain a minimum level of connecting passengers to maintain LAX's role as a hub and an international gateway. Accommodating O&D passengers would be maximized to the extent possible within these guidelines; resulting in 87 percent of the 2015 unconstrained O&D demand forecast being accommodated in Alternative D. The projected number of Alternative D O&D passengers as a percent of total passengers would be similar to the forecast for Alternative C.
- ◆ Commuter operations would likely be reduced from 1996 levels, consistent with the forecasts for No Action/No Project Alternative and Alternative C, in order to maximize the number of passengers that could be served with a limited number of operations. It is also projected that some of the forecast commuter O&D demand would be served by domestic air carrier flights.
- ◆ Domestic air carrier connecting passengers would decrease from 2015 forecast levels to reflect the projected loss of connecting passengers from commuter flights.
- ◆ The domestic air carrier hourly profile would be de-peaked and service would be reduced from 2015 unconstrained forecast levels in the Central, Eastern, and Asia-Pacific regions to reflect the projected response from the airlines to the airfield constraints. The airlines would adjust their schedules to allow for more profitable and less flexible international operations to be scheduled at peak periods. Time zone and airport operating restrictions at international destinations in both Asia

How is the projected percentage of O&D passengers remaining the same whether capacity is increased by alt C, alt D, or no action since the push by this upgrade plan is to change the mix?

and Europe place limitations on the arrival and departure times for flights to these world regions.

- ◆ The percentage of domestic and international air carrier O&D passengers would increase as the airlines attempt to serve the unconstrained forecast O&D demand with fewer operations. As a result the projected percentage of connecting passengers would decrease.
- ◆ The average aircraft size would increase from existing levels without significantly exceeding the unconstrained forecast seats per departure for each air service component. This is reflective of the already large fleet size serving LAX. 
- ◆ Cargo operations would be equivalent to those forecast in the 2015 No Action/No Project Alternative. 
- ◆ Total general aviation activity would remain at 1996 and 2000 levels and operations would move out of peak hours to avoid excessive arrival and departure delays.

Table 3.3-1 contains a comparison of the resulting 2015 Alternative D aviation activity forecast, the actual 1996 and 2000 aviation activity, the unconstrained 2015 forecast and the forecasts for the other Master Plan alternatives. The corresponding aircraft operations and passenger activity profiles are contained in Appendix F.

3.3.4 CARGO ACTIVITY

The Alternative D cargo activity is determined by the amount of cargo sort space available to process cargo tonnage. This sort space would be measured in square feet of cargo building space. The Alternative D cargo facilities would be sized to accommodate approximately 3.1 MAT, which is the total cargo volume forecast in the constrained No Action/No Project Alternative.

The effective constraint on cargo activity in Alternative D would be the lack of sufficient cargo building space to process the unconstrained cargo activity forecast. The most effective representation of this constraint is illustrated by the utilization rates, or tons per square foot, for the available warehouse space. A common benchmark in the industry is to process approximately 0.9 to 1.0 annual ton of cargo for each square foot of cargo warehouse space available. Higher space utilization rates, ranging from 1.1 to 1.42 annual tons per square foot, are expected for domestic and express cargo, with lower space utilization rates, ranging from 0.5 to 0.6 annual ton per square foot, expected for international freight due to the added time associated with customs clearing and fewer available flights.

☒ Explain how the cargo operations would be equivalent to No Action. We are told that cargo is currently highly utilized. Without an unauthorized increase of facilities the magnitude of cargo increase forecast by by Alt D can't occur.

ALTERNATIVE D CONSTRAINED ACTIVITY

The space utilization rate (excluding air mail) calculated for Alternative D is 1.22 tons per square foot. This rate is based on 2.3 million square feet of cargo building space and approximately 3.1 MAT of cargo. It is the weighted average of the domestic and express cargo (approximately 2.09 tons per square foot) and international cargo (approximately 0.8 tons per square foot). Based on current cargo activity, the split is 32 percent domestic and 68 percent international. 

The cargo space utilization rates for Alternative D exceed both the industry benchmark rates and the high utilization rates already experienced at LAX. Improvements in cargo technologies and building efficiencies would be needed to realize the future utilization rates projected for Alternative D. If regional air cargo demand forecasts are achieved, additional cargo demand pressure will be placed on other regional airports to process a greater proportion of the regional cargo activity closer to the source of the demand.

1997. Physical conditions were represented as they existed in 1997 and in more current years when feasible and appropriate, to provide more up-to-date information.

- ◆ **Adjusted Environmental Baseline:** This baseline comprises the same on-airport historical airport activity (1996) and physical facilities (1997) as in the Environmental Baseline - Existing Conditions, but it includes off-airport land use activity and regional traffic development anticipated for the planning years of 2005 and 2015. Except for these two factors, the Adjusted Environmental Baseline Conditions are identical to the Environmental Baseline - Existing Conditions. This scenario was developed in accordance with CEQA guidelines, to satisfy the CEQA need for determining project impacts.

A.1.2 BASELINE UPDATE

In considering an updated comparison of the Draft EIS/EIR baseline year, 2001 constitutes an anomalous year due to the September 11, 2001 terrorist attacks on the World Trade Center and Pentagon. Those events had a profound impact on aviation as almost all domestic aviation activity after September 11, 2001 was driven downward by those events. In response to the attacks, Congress approved the Aviation and Transportation Security Act. The Act required that all security checkpoints be non-privatized and operated by federal employees hired by the newly formed Transportation Security Administration (TSA) and 100 percent baggage screening be performed at all commercial airports by newly purchased Explosive Detection System (EDS) machines. LAX coordinated with the TSA to meet Congress' deadlines for federally operated security checkpoints (November 2002) and 100 percent baggage screening (December 2002). The heightened level of security at checkpoints also required the increase in the number of passenger through lanes. This was accomplished by purchasing additional Electronic Trace Detection (ETD) machines which allowed more efficient passenger processing.

- ◆ Since LAX traffic is projected to eventually fully recover, 2001 baseline-related data tends to overestimate project impacts for many disciplines.
- ◆ Further, although the typical month for the design day schedule (August) would be unaffected by September 11, 2001, the ratio of peak month activity to annual activity is exceptionally high, due to the overwhelming fourth quarter decline in activity. This tends to underestimate environmental impacts for many disciplines.

What are the off-airport land use and regional traffic development that was anticipated?

For these reasons, the use of 2001 data as representative of current comparison conditions is inappropriate.

The most recent "normal" year for which a complete dataset is available is 2000. That year is evaluated in this report as the basis for consideration and comparison of how "current" conditions have evolved to some extent from the baseline conditions analyzed in the Draft EIS/EIR. The report also assesses whether the passage of time from the publication of the Draft EIS/EIR has had any material effect on the nature of the "No Action/No Project" alternative.

This change in aviation activity is discussed in detail in the following sections of this memorandum.

A.2 ACTIVITY CHANGES

A.2.1 NATIONAL TRENDS (1996 to 2000)

- ◆ In the five-year period between 1995 (a year for which FAA annual data was readily available) and 2000, total enplanements of U.S. commercial airlines increased from 544.9 million to 660.6 million, an increase of 21.2 percent. During this same period, domestic traffic grew from 496.3 million to 605.8 million, or 22.1 percent. International traffic for U.S. airlines grew from 48.6 million to 54.8 million, a 12.8 percent increase. The cause of this commercial airline passenger increase is largely attributed to the continued growth of the U.S. economy; the Gross Domestic Product (GDP) grew from \$7.5 trillion in 1995 to \$9.2 trillion in 2000. During this period the average annual economic growth rate (as determined by GDP) remained over 3 percent; an indicator that passenger traffic should increase at a similar rate. In fact, as measured in constant dollars, the GDP grew at an Average Annual Rate of 4.1 percent between 1995 and 2000. 
- ◆ A number of trends were apparent in commercial air travel during the 1996 to 2000 period, the most noteworthy being the continued keen competition among airlines. A number of "low-fare" airlines initiated service and while some failed, others were more successful. One of the original "low-fare" airlines, Southwest, continued to expand during the period at a faster rate than most other airlines. The "full-service" airlines such as American, Delta, and United also continued to offer innovative service and expand their route systems to blanket the country and the world. Airline alliances between domestic carriers and foreign flag airlines slightly lowered costs for the members of each alliance.

Why were national trends used instead of actual data for LAX?

Sequence number: 2
Author: Denny Schneider
Subject: Note
Date: 8/1/2003 4:12:27 PM
The use of the economic data for this period appears to be selective comparisons to result in reduced impacts. Economic conditions in the 1990's appears to be far more positive than presently seen; therefore the growth seen is very optimistic, not the opposite as justified by xxxxxxxxxx.

- ◆ Another reason the number of air passengers continues to expand is that the average cost to fly (ticket price or "yield" in airline language) continued to decline from 1996 to 2000. One reason for the decline in fares was the use of newer and more efficient aircraft, as well as the continued reduction in airline ticket sales and distribution costs. Therefore, as the costs of operation to the airlines continues to decline, the airlines have chosen to pass these economics on to the passengers in the form of lower rates. 
- ◆ Turboprop aircraft continue to be replaced by regional jet aircraft. Passengers perceive this type of aircraft as providing a safer, quicker and more pleasant experience. Regional/commuter passenger traffic grew during the 1996 to 2000 period at approximately twice the rate of all air passengers, partially as a result of this trend. 
- ◆ Air cargo traffic also continued to grow during the 1995 to 2000 period. Revenue Ton Miles (a ton of air cargo flown 1 mile) increased from 23.2 trillion in 1995 to 30.1 trillion in 2000. International traffic grew at about twice the rate of domestic air cargo, but both benefited as consumers and businesses continued to insist upon "just-in-time" delivery of goods. 

A.2.2 REGIONAL TRENDS

- ◆ In the period from 1996 through 2000, the roles of the airports in the Los Angeles Basin remained constant. In 2000, LAX continued to serve as the dominant air service airport with almost 70 percent of the domestic enplanements and virtually all of the international enplanements in the region, serving 67.3 million annual passengers (MAP) or 76.0 percent of the regional total; up from 74.3 percent in 1996. It is expected that the market share will decrease over time, however, the number of passengers using LAX will continue to increase. In 2000, a total of 150 destinations were served from LAX: 84 domestic; 5 transborder (Canadian); and 61 other international. John Wayne (SNA), Ontario (ONT), and Burbank-Glendale-Pasadena (BUR) airports augment the air service of LAX. In 2000, SNA served 7.8 MAP, representing 8.8 percent of the region's traffic; down from 9.4 percent in 1996. Physical and policy constrained to limit growth at SNA. The cities served from SNA and ONT are principally western U.S. markets and select mid-continent hub airports. ONT gained international service to Canada and Mexico during the period and likely has the most potential of the secondary airports to accommodate future growth. ONT passenger traffic increased to 6.8 MAP in 2000, yet its market share fell from 8.0 percent in

To use the Mayor Hahn analogy, trend impacts changed since Sept. 11. Economy of scale was the dominant reason give for concentration. Now the opposite is true. The risks need to be spread and the cargo destinations are becoming more disbursed.

APPENDIX A - EXISTING BASELINE COMPARISONS ISSUES - 1996 to 2000

1996 to 7.6 percent in 2000. Passenger traffic at BUR declined slightly between 1996 and 2000, dropping its market share to 5.4 percent. The only BUR market east of the Mountain Time zone is Dallas/Fort Worth.

Palm Springs (PSP) and Long Beach (LGB) continued to serve a very limited passenger air carrier role in the region. PSP traffic increased from 1.1 MAP to 1.3 MAP, but its market share remained at 1.4 percent. PSP offered service to 13 domestic and 2 transborder destinations in 2000. Despite its relatively convenient location, scheduled air service at LGB expanded to six markets in 2000 from one in 1996. LGB's market share remains at less than 1 percent.

Oxnard (OXR) and Palmdale (PMD) have historically provided only commuter flights to LAX. There has been no scheduled service from PMD since April 1998.

Table A-1, Passenger and Operations Comparison, 1996 vs. 2000, presents the passengers and aircraft operations at the region's airports in 1996 and 2000.

Since 1996 several military base closures have facilitated conversion of military airports to commercial use. These are not even shown in the commercial airports.

- ◆ Growth at many of the regions' airports continued to be limited by caps on daily or annual air carrier aircraft operations, the maximum number of terminal gates, and voluntary/involuntary operating curfews. Terminal congestion and roadway delays also continued to influence future demand and the allocation of demand among the regional airports. 
- ◆ The wholesale use of regional jets has not been experienced in the Los Angeles Basin, even though regional jets have been deployed at airports across the country for most flights under 300 miles, except for the densest markets. Turboprop aircraft have become almost extinct at many airports. Regional jets are highly desired by the traveling public over turboprop aircraft due to the availability of cabin service and lavatory facilities, reduced cabin noise, and a perception of safer operation. Most regional jets are configured with 50 seats, although models range from 36 to 70 seats. Regional jets are also frequently used to replace small narrow body aircraft in markets where demand is lower. Often the use of regional jets in place of narrow body aircraft in 'thin demand' markets results in better air service due to an increase in the number of daily scheduled departures. Even so, there was no scheduled service on regional jets from LAX in 2000 and the number of regional jet departures at the other regional airports had dropped 64 percent since 1996. 
- ◆ Turboprop and prop aircraft represented a smaller percentage of the regional fleet in 2000 compared to 1996. Wide body (twin-aisle) aircraft maintained their share of the regional fleet between 1996 and 2000. The workhorse class of aircraft in the region remains the narrow body (single-aisle) jet. Narrow bodies can be as small as 60 seats (Fokker F28) or as large as a single class Boeing 757 with 226 seats. Narrow body jets expanded their share of the fleet between 1996 and 2000. The reduction in small turboprop/prop and regional jet aircraft operations and the increased use of narrow body jets, resulted in an increase of 11 percent in the average number of seats on scheduled aircraft, from 120 to 133 seats in the region (125 to 137 at LAX). 
- ◆ This increase in average gauge (seats per departure) means more passenger seats are available for the same number of aircraft operations. In the region, PSP provides the most vivid example. Scheduled departures declined 13 percent in the 1996 to 2000 period while gauge increased 30 percent, resulting in an increase of departing seats of 13 percent.
- ◆ At the same time that the average gauge was increasing, the length of the average scheduled flight segment from the regional airports also increased. The average length of haul

increased by 20 percent between 1996 and 2000, from 864 miles to 1,038 miles (1,025 to 1,208 miles from LAX).

A.2.3 COMPARISON OF 2000 TO 2001 AND BEYOND

Although 2001 has not been used as an update comparison year for the LAX Draft EIS/EIR, it is useful to acknowledge trends that were observed prior to the September 11, 2001 terrorists attacks to analyze how traffic is recovering and to determine the impact of the recession that began in 2001.

Nationwide Impact of September 11, 2001 and Economic Recession

◆ Following September 11, 2001, air travel declined at most U.S. airports; in addition, the economic recession exacerbated the schedule cuts. For the industry as a whole, revenue passenger miles declined 32 percent in September 2001 compared to the previous year. Compared to 2000, traffic decreased 26 percent in October and 20 percent in November. During the holidays (December 20 to January 2) traffic declined 12 percent compared to the holiday season a year ago.¹ As shown in **Figure A-1**, Revenue Passenger Miles (RPM) Percent Decrease from 2000 to 2001, all of the top 10 carriers experienced decreases in traffic in the fourth quarter of 2001, with the exception of Southwest Airlines.

◆ While individual airports have been affected differently, activity at most airports appears to be recovering. A review of individual airport statistics shows that the industry averages reflect a wide range of airport traffic fluctuations (see **Table A-2**, Los Angeles International Airport Scheduled Seats Comparison). The cost reduction measures of the airlines have disproportionately affected certain airports, while other airports recovered quickly and are now back to pre-September 11, 2001 activity levels. Particularly hard hit have been the large coastal airports such as LAX, which had much overlap in competing airline service to certain markets, and small spoke airports, which often were marginally profitable. Many of the small "spoke" airports have seen commercial jet service downsized

Where in this document does it draw any inferences of cause of aircraft seat reduction? Since CA is continuing to experience a serious economic downturn and has not yet turned around, explain what future will look like for various economic conditions.

- ◆ In spite of the aforementioned events and economic downturns, air travel has followed a general upward trend since the 1960s, increasing by an average of over 10 percent annually. An analysis of the major events mentioned above shows that declines in air travel (or very limited growth) were typically followed by robust recovery. The general longer-term growth trend holds true despite these temporary dips. While none of these events is comparable to what occurred on September 11, 2001, the trends observed from these occurrences can provide insight into the future. The new millennium brings a recession and a new "war against worldwide terrorism" that presents its unique set of uncertainties. However, if aviation history provides any guidance, the current downturn will be offset by a pronounced rebound. 

- ◆ Two of the nation's major air carriers, US Airways and United Airlines, filed for bankruptcy protection in the second half of 2002. Most of the major airlines were losing money before the events of September 11, 2001 due to reductions in business travel brought on by the economic recession. The protracted duration of the recession has led many industry observers to believe that full-fare business travel may never return to the levels experienced in the 1990s. Business travel has experienced a fundamental shift to advance purchase tickets, extending trips to take advantage of lower fares that require Saturday night stays, and conducting more meetings via video conferences.

LAX Activity 2000 to 2001

- ◆ Prior to September 11, 2001, the number of passengers served at LAX was relatively constant with 2000 levels; after the terrorist attacks, LAX was one of the disproportionately affected airports in the U.S. LAX passenger traffic declined by 25 percent for the fourth quarter of 2001 compared to the same period in 2000. As shown in **Figure A-4**, 2000 and 2001 Total Passenger Comparison, LAX is showing gradual recovery; traffic was down 33 percent in September, improving to a decrease of 20 percent in December. During January and February 2002, passenger traffic was down only 17.5 percent, compared to the same two months in 2001. 

In October of 2001, the airlines introduced regional jet service at LAX. The introduction of regular regional jet service was likely a reaction to reduced passenger demand following September 11, 2001 and the demise of United Shuttle.

The assumption of major rebound is possibly right, but not supported. The proportion of business travel is changing with the advent of the internet, teleconferencing, etc. What proportion of the passenger travel demand does this represent? It has been 3 years since 2000 and the increases are not being seen at LAX--except for cargo. More definitive explanation of the future needs should be provided.

Sequence number: 2

Author: Denny Schneider

Subject: Note

Date: 8/2/2003 6:54:51 PM

One explanation for the sharp decline at LAX might be the high profile concentration of air traffic for all of Southern California and the fear of terrorist attack. Explain how expanding the capacity at LAX will alleviate this reduction.

Sequence number: 3

Subject: Note

Date: 8/2/2003 6:58:39 PM

This paragraph notes that Jan-Feb of 2002 was ONLY down 17.5% compared to the same period in 2001. A reduction of less magnitude is still in the wrong direction. This is far from a rebound. Explain why this continued decrease is a positive sign that a rebound is occurring.

This observation that regional jet service was introduced in 2001 is not addressed several pages earlier which noted that no scheduled regional jet service exists at LAX. How is this justified?

Since this was being prepared in 2003, why not include more recent data?

Regional jets continued to operate at LAX into 2002. In August of 2002, regional jets were scheduled to serve 13 markets, with over 59 flights per day.⁶ In 2000, all but two of these markets (Fresno and Santa Barbara), were exclusively air carrier markets and were not served by commuter aircraft. It is expected that regional jet activity at LAX will continue to increase in the future.

A.2.4 AVIATION AT LAX

In support of the baseline year comparison update for various environmental impact analyses, a year 2000 design day flight schedule was developed. This schedule was developed based on LAX Air Traffic Control Tower (ATCT) daily airport operations counts, LAWA traffic statistics, radar data, and the Official Airline Guide (OAG) published schedule of arrivals and departures.

Background Assumptions in the 2000 Design Day Schedule

The ATCT daily activity counts from January through December 2000 were used to define the volume of annual operations that correspond to the design day. The daily counts were reviewed to identify the peak activity month and to compare fluctuations in activity volumes by day of the week. August was identified as the peak month with 68,871 total operations. Operations for the Peak Month Average Weekday (PMAWD) in August were calculated to be 2,277. 

The daily operations counts for all weekdays in August were reviewed to identify the day that would serve as the base for the preparation of the flight schedule. Wednesday was considered a good candidate day because it is a "busy" day, has a good representation of international activity, and is not likely to be affected by potential peculiar service patterns such as Monday or Friday. Wednesday, August 16, 2000, was selected as the representative day for air carrier and commuter activity for the 2000 design day flight schedule. The OAG schedule for this day was then modified as follows: 

- ◆ United Shuttle typically scheduled more flights each day than would actually operate. Forty (40) flights were removed to adjust for this (737-300 and 737-500 aircraft only). The number of flights to remove was determined by comparing the number of actual flights to scheduled flights from the OAG.

- ◆ Saturday is the typical peak day for international operations. To fully reflect international service, 12 international flights from the

Is the number of "operations" FAA or LAX counts? FAA includes all aircraft movements--ground or *to* and landings whereas LAWA is only take offs and landings. How does this value of 2277 compare with the theoretical max? If I assume 1.5X average hourly rate this is about 140+ during peak time.

Sequence number: 2

Author: Denny Schneider

Subject: Note

Date: 8/2/2003 8:06:26 PM

If the development of a typical day was to be in August, why wasn't August 2001 also calculated? This was the highest values prior to Sept 11. Then a Peak Month Average Weekday could be more appropriately compared for 2002 trending as well.

Saturday, August 19, 2000 OAG schedule were added to the design day schedule.

- ▶ Three charter flights were added to represent typical operations.

August 3, 2000 was selected as a representative day for all-cargo operations. This was the busiest day of the month for cargo operations. Design day cargo operations increased from 76 in 1996 to 117 in the 2000 design day schedule.

- ◆ August 3, 2000 was also used for general aviation operations. The hourly distribution of general aviation operations was adjusted to correspond to the average hourly distribution for general aviation operations for August. Design day general aviation activity remained at 104 operations in 2000.

Highlights of the 2000 Design Day Schedule

The resulting 2000 flight schedule totaled 2,275 operations, some 40 more than the 1996 baseline schedule and an increase of slightly more than 1 percent. Commercial passenger operations remained similar to the levels observed in 1996 (2,055 in 1996, 2,054 in 2000). The principal increase in design day operations from 1996 to 2000 was in all-cargo activity, which mainly occurs in off-peak hours.

Several changes occurred between 1996 and 2000 in the level of activity for each air service category, primarily in the level of commuter activity. **Table A-3**, 1996 and 2000 LAX Design Day Activity, shows the number of design day operations and passengers for each air service category in the 1996 and 2000 schedules. **Tables A-4**, Hourly Forecast Design Day - Arrival Operations By User - Year 2000, **A-5**, Hourly Forecast Design Day - Departure Operations By User - Year 2000, and **A-6**, Hourly Forecast Design Day - Total Operations By User - Year 2000, show the hourly distribution of the 2000 schedule by region. Commuter activity was somewhat lower in 2000 than it was in 1996, while domestic air carrier and international traffic was higher.

Author: Denny Schneider
Subject: Note
Date: 8/2/2003 8:19:57 PM

Of the 117 cargo operations of the "design day" in 2000 were these pure cargo versus cargo in the cargo hold? The subsequent paragraph implies that these are pure cargo. It would be appropriate to do additional monitoring of cargo flights since this component continues to increase while the others remain decreased.

According to the load factor comparisons the loading is increasing. Based on the new Alt D approach of restricting gates instead of the present traffic constraint then more flights will bring in more people based on an equal number of flights. Explain how the load factor and frequency, as well as size of aircraft will not increase capacity given a fixed number of gates. Note that Alt D already calls for a mix of gates that increases the size of aircraft.

A.2.5 LAND USE

The Geographic Information Services (GIS) off-airport land use database used in the Draft EIS/EIR has already been updated to reflect year 2000 data. That database identified parcel-level information and consisted of two major components: off-airport land uses and sensitive receptors (non-residential):

Although the original off-airport land-use data was derived in 1994, it was updated in early 2000 with data purchased from TRW.¹⁰

Working with Psomas, PCR and Landrum & Brown cooperatively updated and refined the sensitive receptors database from October 1999 to February 2000. As a result, all GIS land-use and noise grid-point databases are consistent throughout the Draft EIS/EIR.

Through similar research techniques, PCR plans to verify and update the sensitive receptors previously identified in early 2000 (e.g., schools) if needed. Other off-airport land uses could also be updated through the purchase of GIS data from a vendor such as TRW.

A.2.6 GROUND TRANSPORTATION

On-Airport Traffic

Airport-generated vehicle trips are primarily a function of O&D passengers, not connecting passengers. They are measured and analyzed during the peak hour of airport activity, which is 11:00 a.m. to Noon during the airport's peak month/average weekday, which is a Friday in August. As a result, vehicular traffic is only indirectly related to MAP, and the changes in vehicular traffic between years can

¹⁰ PCR communication with Matt Caraway of Psomas, 2002.

Off-airport land use data updated in early 2000 was using data from what time period? Any data has some lag time between gathering and actual conditions. There has been a substantial change since 1996. What changes have been documented? What are they? There were substantial problems with the numbers of impacted residents in the original 2001 study. How has this been improved? Where in this massive document are the details of this upgraded information?

Sequence number: 2

Author: Denny Schneider

Subject: Note

Date: 8/2/2003 9:27:07 PM

Earlier in the document a Wednesday was chosen as a busy, typical day because Fridays were so variable. Why, here, does the analysis use a Friday?

appear counter-intuitive when comparing to MAP changes during those same years.

To determine the change in airport-generated vehicle trips between 1996/1997 and 2000, Central Terminal Area (CTA) traffic count information was collected from LAWA's in-pavement traffic count program. The peak hour of commuter traffic is from 8:00 a.m. to 9:00 a.m. and from 5:00 p.m. to 6:00 p.m. The 1996 airport peak hour traffic data was collected in August, while the commuter peak hour traffic count data was collected in March 1997. Both inbound and outbound CTA traffic counts were collected at that time.

To obtain year 2000 traffic count information for comparison to the 1996/1997 traffic count data, the corresponding data was obtained for the airport peak hour on Friday, August 4, 11, and 18, 2000. The data was averaged to produce traffic volumes from a representative Friday in August. A similar methodology was used to estimate the inbound and outbound CTA volumes for the commuter peak hours. That data was obtained on March 17 and 24, 2000. The 1996/1997 CTA traffic counts were then compared to the updated (year 2000) traffic counts.

The inbound and outbound CTA traffic volumes fluctuated according to peak hour aviation activity. During the airport peak hour, CTA traffic was approximately 7 percent higher in 2000 (see **Table A-18, CTA Traffic Comparison, 1996 to 2000**). During the morning commuter peak hour, CTA traffic was about 6 percent lower, and during the evening commuter peak hour, it was about 2 percent higher. These trends accurately reflect LAX aviation activity, whose hourly peaking characteristics were adjusting between 1996 and 2000, as discussed in the "Highlights of the 2000 Design Day Schedule" in Section 2.4, *Aviation at LAX*. Although the daily passenger activity increased, the activity occurring during the morning commuter peak hour decreased, as activity shifted to adjacent hours.

Sequence number: 1
Author: Denny Schneider
Subject: Note

Date: 8/3/2003 9:12:35 AM

into CTA traffic is not the only airport generated traffic. Many people park in the large, private lots and are shuttled into LAX. Also, rental car and hotel parking traffic exists. Also visits to LAX for people going through LAX is another factor.
Explain why all data was taken on Fridays where as the argument made earlier in this document was for using a Wednesday as the "design day."

Table A-18

CTA Traffic Comparison, 1996 to 2000

Time Period	CTA Traffic ¹		Total
	Inbound	Outbound	
August 1996 Airport Peak Hour ²	5,910	5,380	11,290
March 1997 A.M. Commuter Peak Hour ³	4,100	3,280	7,380
P.M. Commuter Peak Hour ⁴	4,160	4,480	8,640
August 2000 Airport Peak Hour ⁵	6,500	5,600	12,100
March 2000 A.M. Commuter Peak Hour ⁶	3,760	3,170	6,930

Off-Airport Traffic

Off-airport traffic analyses use the Adjusted Environmental Baseline scenario to determine traffic impacts and mitigation under CEQA. The Adjusted Environmental Baseline scenario does not use baseline off-airport traffic conditions. Rather, it combines future off-airport traffic conditions with baseline on-airport traffic conditions. Therefore, the off-airport traffic analysis is only dependant on the baseline year as it pertains to the on-airport traffic, which is discussed above. As a result, unlike the analyses for the other disciplines, which use an existing baseline condition, the potential changes in off-airport conditions that may have transpired since 1996 are irrelevant for the off-airport surface transportation analyses.

However, even though the Adjusted Environmental Baseline Alternative uses only future traffic conditions, the regional traffic facilities that are incorporated into the modeling of these alternatives; roadway lanes, turning lanes, traffic signal improvements, etc. should reflect the most recent changes in the area's road network. Therefore, in coordination with the Los Angeles Department of

Sequence number: 1

Subject: Note
Date: 8/3/2003 9:26:55 AM

Off-airport road changes were determined to only be Lincoln @ Venice by LADOT during the period of 1996 to 2000. What about all of the CalTrans, MTA, and LA Bureau of Public Works projects? Freeway off-ramps at Howard Hughes and La Tijera were improved during this time, for instance. Since the traffic count info is assumed to be based on on-airport instead of baseline why wasn't more recent data used as a "sanity check" since many area changes have been in process since 2000.

Transportation (LADOT), the roadway network facility improvements that were implemented after 1996 were identified. A lane configuration change on Lincoln Boulevard at Venice Boulevard was the only change that took place on off-airport roadways since 1996.

A.3 AIRPORT FACILITY CHANGES

The baseline year used in the current analyses is defined as the airport activity that existed in 1996 and the facilities that existed in 1997, which is the year of the Notice of Intent (NOI)/NOP. The facility changes at LAX which have become operational since 1997 are illustrated on **Figure A-9**, Changes in Existing Conditions 1997 to 2000. These facility changes are briefly summarized below.

A.3.1 AIRPORT PROPERTY

Since 1997, LAWA has acquired property under the Aircraft Noise Mitigation Program (ANMP) in two areas, Manchester Square and the Belford area. The land uses in the property acquisition areas are primarily residential and have remained fairly static. Changes that have occurred between 1997 and 2000 are:

LAWA has acquired approximately 289 units of 2000 total units in Manchester Square, which is bounded by Century Boulevard to the north, Arbor Vitae Street to the south, Aviation Boulevard to the east, and La Cienega Boulevard to the west.

LAWA has acquired approximately 245 of 585 units in the Belford Area, which is bounded by Arbor Vitae Street to the north, 98th Street to the south, Bellanca Avenue to the east, and Airport Boulevard to the west.

Land acquisition for the ANMP is on-going, and LAWA does not intend to use these parcels for aviation purposes in the No Action/No Project Alternative.

A.3.2 AIRFIELD

Since 1997, no changes were made on the north airfield and seven modest modifications were made to the taxiways on the south airfield:

- ◆ New Taxiway A4 was constructed and began operation in 2000. Taxiway A4 connects Runway 7R and Taxiway A and is 100 feet wide.
- ◆ New Taxiway C3 was constructed and began operation in 2000. Taxiway C3 connects Runway 25R to Taxiway B and is also 100 feet wide.

As no north airfield changes were identified, when were all of the new gates added subsequent to 1984? Are the added gates west of Bradley considered north side? These gates are noted as 1997 additions in Figure A-9.

A.3.3 TERMINAL

There have been several reconstruction and renovation projects within the existing terminal buildings during the period from 1997 to 2000. These projects focused principally upon adding international arrivals processing facilities or Federal Inspection Services (FIS) facilities and improvements to passenger convenience. ¹ These improvements did not create additional passenger handling capacity. A brief description of the terminal improvements completed between 1997 and 2000 are provided below:

Terminal 1

- ◆ Terminal 1 modifications have been limited to relocations of airline ticket counter positions, airline gate positions, and ATO Office space. Several concessionaires have been replaced and updated with new concession opportunities. In 1996, six commuter aircraft affiliated with US Airways operated out of Gate 14. In 1999, USAir Express and States West (the commuter affiliate of TWA Airlines in Terminal 3) ³ constructed a commuter aircraft facility containing five aircraft parking positions in the TWA maintenance facility west of the Tom Bradley International Terminal (TBIT) for joint-use. This new facility was never utilized and the regional component of these airlines is now being served via United Express as part of the United Airlines Commuter Facility located in the United Maintenance Area. Gate 14 at Terminal 1 is currently being used by Southwest Airlines. There have been various concessions redevelopment within the terminal, which resulted in no new net additional square footage to the terminal building.

Terminals 2, 3, and 5

- ◆ No additional aircraft parking positions or net square footage have been added to Terminals 2, 3, or 5. However, like Terminal 1, airlines have relocated to and within these terminals, and there has been concessions redevelopment in each.

Tom Bradley International Terminal (TBIT)

- ◆ The Tom Bradley International Terminal had a concessions expansion and renovation project completed in 1998, although no aircraft gates or parking positions were added. This project added approximately 15,000 square feet of terminal area, representing a 1.5 percent addition to the existing 993,244 square feet. This area was limited to news and gifts stores, food and beverage concessions and seating areas. As part of this redevelopment the security screening areas were modified to accommodate new passenger circulation. On the arrivals level a

 If a commuter aircraft facility was created "in Terminal 3 containing five aircraft parking positions" why is this not classified as adding capacity?

new Interline Baggage Recheck facility was expanded to provide a better level of service for passengers transferring from international flights to domestic flights.

Terminal 4

- ◆ In 1999, America Airlines constructed a remote commuter apron area with 13 aircraft parking positions in the area immediately east of their low-bay hangar west of the TBIT building. These aircraft parking positions were previously located in the apron area around Gate 46. This provided American Airlines one additional gate position upon the relocation of the commuter aircraft. This terminal is also undergoing a renovation project that will be completed in 2002. The project includes expanding the ticket lobby and baggage claim areas; and adding holdroom seating space, concessions areas, and an FIS processing area to accommodate international flights. A separate environmental analysis done prior to commencement of this project determined that there was no capacity increase inherent in the project.

Commuter Terminal

- ◆ United Airlines commuter operations located in the maintenance area east of Sepulveda Boulevard remained unchanged from its configuration in 1997.

A.3.4 ROADS AND PARKING

The only roadway change at LAX was the realignment of Avion Drive, which provides internal access to the Century Cargo Complex located south of Century Boulevard. The primary circulation roadway (World Way West) and the primary access roads (Lincoln Boulevard, Sepulveda Boulevard, Westchester Parkway/Arbor Vitae Street, Pershing Drive, and Imperial Highway) remain unchanged.

The number of short-term parking spaces in the CTA increased due to the construction of Parking Structure 6. Located adjacent to Terminal 6, the structure was opened in 2000. This hourly/daily-rate garage includes 989 stalls; however, it adds only 686 new spaces to the CTA since it replaced a 295-stall surface parking lot. This parking garage was accounted for in the Draft EIS/EIR as part of the future No Action/No Project alternative.

A.3.5 CARGO

Some changes have occurred in the Century Cargo Complex and the South Cargo Complex East. The existing cargo facilities are concentrated in four areas: the Century Cargo Complex (located between Century Boulevard and the south airfield), the Imperial

Sequence number: 1
Author: Denny Schneider
Subject: Note
Date: 8/3/2003 9:47:59 AM

Again, why is a project that adds ticket lobby and baggage claim areas; and adding holdroom seating space... not an improvement? On what basis does an environmental analysis prior to the project determine "no capacity increase?" If a gate can be used for more flights then it IS capacity enhancement. In some cases this might not be bad, but it must be acknowledged.

Weren't there also roadway improvements on the south side to accommodate changes to the cargo facilities?

Cargo Complex (on the northwest corner of Imperial Highway and Aviation Boulevard), the South Cargo Complex West (along Imperial Highway west of Sepulveda), and the South Cargo Complex East (along Imperial Highway east of Sepulveda). Changes that have occurred since between 1997 and 2000 are:

- ◆ Singapore Airlines Cargo Building – New 64,000–square foot building located in the South Cargo Complex East and opened in 1999.
- ◆ Mercury Air Cargo Building – Renovated 176,000–square foot building located in the Century Cargo Complex and opened in 1998.
- ◆ FedEx Expansion – 73,000–square foot expansion of the existing facility located in the South Cargo Complex East and opened in 1999.
 - ▶ Cargo Building A – New 153,000–square foot building located in the Century Cargo Complex replaced Cargo Buildings 5 and 6 and opened in 1999.

All of these cargo changes were accounted for in the Draft EIS/EIR as part of the future No Action/No Project alternative.

A.3.6 ANCILLARY FACILITIES

Two new ancillary facilities have come online between 1997 and 2000:

- ◆ USAir Express and States West (the commuter affiliate of TWA Airlines in Terminal 3) constructed a commuter aircraft facility in 1999 containing five aircraft parking positions in the TWA maintenance facility west of the TBIT for joint-use. This new facility was never utilized by the airlines and is now being used by the LAWA Emergency Coordinator and the LAPD.

- ▶ A new United States Post Office opened in 1999 on the corner of Arbor Vitae Street and Airport Boulevard. 

A.3.7 COLLATERAL FACILITIES

Collateral facility changes focus primarily on the Manchester Square and Belford areas. These changes are discussed in the Airport Property section above.

- ◆ A new 9,000-square foot First Flight Child Development Center was constructed on vacant land in 1997 to 1998. It opened in 1999 and is located at 9320 Lincoln Boulevard. 

Sequence number: 1

The First Flight Child Development Center opened at 9320 Lincoln is stated to be part of the Manchester Square and Belford areas. This location is NOT even adjacent to MS or Belford. What other properties were procured by LAWA during this period?

A.4 OPERATIONAL CHANGES

A.4.1 NOISE ABATEMENT

Under FAA guidelines, aircraft noise analysis must be conducted for the average annual day, and not for the design day. The issues presented below recognize this FAA requirement.

Changes in Fleet Mix (Encompassing Stage 2 Phase Out and Conversion to Heavies)

- ◆ Since 1996, heavy aircraft operations increased by only seven per day (351 operations per day in 1996 and 358 operations per day in 2000). Prop aircraft have been reduced from 705 per day in 1996 to 560 in 2000, with a commensurate increase in medium and light jet operations (from 1,021 daily in 1996 to 1,228 per day in 2000). Note that these fleet mix statistics differ from the design day schedule information presented earlier in the "Highlights of the 2000 Design Day Schedule" section of this report. This is due to the fact that the design day schedule is based on the Peak Month Average Weekday and was modified for the analysis to include several heavy international flights that occur on Saturdays, as explained in that section. By contrast, the aircraft noise analysis is based on the Average Annual Day fleet mix.

The "4Q2000" input files used in LAWA's Quarterly Report for the final quarter of 2000 were obtained and served as the basis for the baseline contours for 2000, after quality control checks and insertion of ground noise sources. With the exception of 21 jet aircraft not subject to the phase out provisions of ANCA, the jet fleet was composed of Stage 3 aircraft. Therefore the noise levels would be expected to be reduced from previous years, particularly in those areas principally impacted by noise from departing aircraft. Using this assumption, a comparison of the flight portion of the 2000 contour with the 1996 baseline reveals the following observations (see **Figure A-10**, Comparison of Year 2000 and 1996 Noise Exposure Contours).

- ◆ The noise contours along the approaches to both the north and south runway complexes were somewhat longer under the 2000 baseline condition than they were under the 1996 baseline. This is likely a function of the addition of approximately 200 more jets to the operational mix each day and a shift of traffic to the evening and night hours.
 - ▶ Conversely, the noise contours to the north and south of the airport were narrower under 2000 conditions than in 1996. This is a direct result of the completion of the phase out of

Sequence number: 1

Subject: Note

Date: 8/3/2003 10:00:11 AM

Great story line about noise! This report assumes aircraft are coming straight in not spread around the area. Ground contours of the area are not considered for impact to the movement or amplification of noise.

Sequence number: 2

Author: Denny Schneider

Subject: Note

Date: 8/3/2003 10:02:11 AM

The lengthening of the contour is accounted for by addition of 200 more jets. The shift to more evening and night hours is also acknowledged. What remains missing from this is the noise frequency range changes. Much more low frequency noise is being generated.

- ▶ Stage 2 jets, which were noticeably louder on takeoff than are Stage 3 jets. Impact computations have not yet been conducted.

Additional assessments will be completed as impact calculations are prepared.

Changes of Runway Loadings

- ◆ Since 1996, there has been a slight shift of landings from the inboard runways to the outboard runways, and of takeoffs from the outboard to the inboard runways during both the nighttime and 24-hour period. It is unlikely that these shifts will present substantive effects on the shape of the baseline noise contour pattern.

Changes in Time of Day Distributions

- ◆ An evaluation of the distribution of operations between the day, evening and night hours indicates a modest shift of between 2 percent and 4 percent of daytime operations into the evening and nighttime hours among all three primary aircraft groups (heavy jet, medium/light jet, and propeller aircraft). Owing to the penalty on evening and night activity imposed by the CNEL noise metric, this shift may result in a tendency to increase the contour size from 1996 baseline conditions. However, this tendency is likely to be over-shadowed by the contour reduction occasioned by the completion of the conversion from Stage 2 to Stage 3 jets at the end of 1999, particularly along the sidelines of the contour in El Segundo and Westchester. The contour extensions to the east are less changed because the Stage 2 to Stage 3 conversion is less pronounced along flight tracks that are predominantly used for landings.

Changes in Run-Up Activity and Location

- ◆ Ground noise for the baseline condition was estimated based on the assumptions of the future No Project/No Action conditions. 1
Because LAWA no longer maintains records of the ground run-up activity at the airport, ground noise can no longer be based on records of actual activity.

Potential Changes in Land Use Patterns and Availability of 2000 Census for Impact Determination

- ◆ As discussed in the Land Use section above, the land use patterns used as underlays for the noise maps were last updated in 1999 to 2000. 4
The land uses in the impact areas are largely built out, and therefore fairly static. The United States Census for 2000 has become available since the Draft EIS/EIR was released for public

The assumptions that areas are largely built out and static is invalid. The Westchester-Playa del Rey Community Plan Update investigations showed marked increases in population due to increased density from replacement of existing buildings.

review. Year 2000 population and dwelling unit information for the 2000 year have been developed. 

Changes in Traffic Routes With Impacts from Changes in Flight Tracks

- ◆ Although the air traffic routes from LAX have been modified since 1996, the noise contour patterns developed by LAWA for the preparation of the "4Q2000" Quarterly Report do not indicate that areas of the South Bay communities would be affected at noise levels in excess of 60 CNEL. 

Changes in Night Traffic/East Flow Characteristics

- ◆ During 2000, the number of over-ocean arrivals during the late night hours increased by approximately 10 percent. This percentage change did not result in a corresponding reduction of the number of late night arrivals over land. This was because total nighttime landings increased from 129 to 141 nightly.
- ◆ The number of departures to the east at night increased. The Automated Radar Terminal System (ARTS) data files used in the development of the Quarterly contours for 2000 indicate that the number of east departures at night averaged 1.7 per night (614 annually) in 1996, as compared to 2.9 per night (1,069 annually) in 2000. 

A.4.2 AIR TRAFFIC CONTROL

From an airspace and air traffic control perspective, the years between 1996 and 2000 have seen minimal changes:

The combination of five major approach control facilities, four from the immediate Los Angeles metropolitan area and the San Diego facility, have produced little in the way of airspace modifications. The combination of these facilities, completed in late 1996, has not resulted in substantive modification to routes or procedures. The internal coordination among the facilities has been enhanced by the imposition of a single management team; however, airspace boundaries between the five facilities have changed little.

- ◆ There have been six airspace changes since 1996. The two principal changes include an actual change in the airspace structure and a change in how airspace is managed. The first change involved a modification to the Los Angeles Class B airspace that occurred on July 7, 1997. This modification involved an extension of the Class B airspace to the southeast to better contain turbojet and turboprop departures. Since much of this modification took place offshore, there has been little impact on the general aviation operation. A smaller airspace modification

An average of 2.9 eastern departures per night! What is the value subsequent to 2000?

occurred in 1998 with the closure of Marine Corps Air Station (MCAS) El Toro. As a result of the relocation of the Marine aviation units to MCAS Miramar, the El Toro Class C airspace was rescinded, thus making additional airspace available east of John Wayne Airport.

A jurisdiction change was made in airspace between the Los Angeles ARTCC (ZLA) and Southern California TRACON (SOCAL). Airspace east of LAX in the vicinity of ARNES intersection was redelegated from ZLA to SOCAL. A new sector was established within SOCAL. This sector is identified as East Feeder. As part of the operating procedures for this sector, a new arrival route (Paradise 4 Arrival) was established. This provided SOCAL an opportunity to fine-tune arrivals from the east and determine, at a much earlier stage, what runway complex would be utilized for the final approach and landing.

Another procedural change has been the elimination of some of the confusion surrounding initial altitude assignments to LAX departures. Depending on enroute traffic offshore, LAX departures were subject to departure restrictions of either 2,000 feet or 3,000 feet. The 2,000-foot restriction has been removed and all departures now climb to 3,000 feet. This has eliminated coordination for the controller and reduced the confusion that sometimes surrounded this procedure.

Air traffic has established a Visual Flight Rules (VFR) route over the eastern boundary of LAX. Los Angeles ATCT controls this route for several hours in the early morning, and the rest of the time the route is controlled by SOCAL. The intent of this route was to allow departures to climb to a higher altitude; however, this has not become reality. The major stumbling block at this point is a debate between the Tower and SOCAL as to how much control tower staffing is required to make this procedure effective. This must be solved in order to get LAX departures climbing as rapidly as possible.

Runway incursions have plagued LAX for the last seven years, with the airport ranking among the highest in the nation for runway incursions. As a result, a new approach to the control of arriving aircraft has evolved. Prior to 1996 SOCAL often assigned runway complexes convenient to where the arrival aircraft would park. This often resulted in an overloaded south runway complex. The concern for runway incursions and the establishment of the East Feeder Sector at SOCAL has resulted in a more balanced runway assignment for arriving aircraft. Though this sometimes has a negative impact on the ground movement of aircraft, it provides airborne efficiencies.

Technological advancements have not materialized to the point that airspace capacity has been enhanced. The Center-Terminal Automation System (CTAS) has been installed at SOCAL, but it is not

Appendix B

2000 BASE AIRSIDE SIMULATION ASSUMPTIONS AND RESULTS

The airside performance of existing conditions at Los Angeles International Airport (LAX) was originally defined by the Master Plan based on 1994 aircraft activity. Due to changes in the volume and characteristics of aircraft operations at LAX between 1994 and 1996, the airside performance baseline was updated to reflect 1996 activity in 1998. The airside performance baseline was updated again in 2002 to reflect 2000 conditions.

The assumptions and results of the 1994 airside performance analysis are documented in Chapter II of the Draft LAX Master Plan - Existing Conditions Working Paper. The 1996 airside performance analysis is documented in Appendix D of the Draft LAX Master Plan. This appendix presents the assumptions and results of the 2000 baseline airside performance analysis for LAX.

B.1 OPERATING ASSUMPTIONS

Airside performance was defined in terms of aircraft taxi time, delay, and throughput, using simulation modeling. The FAA's SIMMOD model was used for the simulations. The assumptions about the LAX operating environment are the same as those used in the 1994 and 1996 airside simulations including the following:

- ◆ Primary Runway Operating Configurations
- ◆ Noise Abatement Procedures
- ◆ Airspace Operating Assumptions
- ◆ Airfield Operating Assumptions

These assumptions are described in detail in Chapter II of the Draft LAX Master Plan. 

The design day schedule used for the 2000 baseline simulations was developed based on actual operations from August 16, 2000. This day was selected as representative of the Peak Month Average Weekday (PMAWD) in 2000. The 2000 design day schedule assumptions and activity are described in Appendix A - Existing Baseline Update Document - 1996 to 2000.

Sequence number: 1

Author: Denny Schneider

Subject: Note

Date: 8/3/2003 10:35:54 AM

Operating assumptions are stated to have been the same for 1994, 1996, and 2000 simulations. The assumptions are not in this document, but instead are Chapter II of the Draft LAX Master Plan.

Appendix C

LOS ANGELES REGION'S SECONDARY AIRPORTS

The following sections discuss the existing conditions and published plans for each of the secondary airports in the Los Angeles Region. **Figure 1.3-1**, located in Section 1.3 of this document depicts the following facilities in their geographic location.

C.1 ONTARIO INTERNATIONAL AIRPORT

Ontario International Airport (ONT), owned by the City of Los Angeles and operated by LAWA, is located approximately 35 miles east of downtown Los Angeles. About one-third of the airport's 1,463 acres is available for future expansion. The airport is well located within the regional ground transportation system, lying between the I-10 Freeway on the north and the SR-60 Pomona Freeway on the south; it is also accessible via a well-developed system of arterial and local roadways. ONT has two parallel runways, both of which are capable of accommodating large jet aircraft, but are too closely spaced to permit independent aircraft arrivals. The 26-gate terminal was designed to allow for future expansion that could add 13 more jet gates.

ONT's air service has grown over the past 15 years as development in the region has expanded into the eastern end of the Los Angeles region, known as the Inland Empire, and air travel demand in the area has correspondingly increased. ONT served 6.8 MAP in 2000. Scheduled passenger service remains predominantly short-haul (68.7 percent) in 2002, but medium-haul now represents 27.6 percent and long-haul 3.7 percent. ONT is the only secondary airport to offer international non-stop air service. ONT offers service to two Mexican cities: Guadalajara and Hermosillo. Service to Hermosillo was added in 2002.

An update of the master plan for Ontario is currently underway. The ONT master plan will recommend the needed improvements to meet the projected demand. The local community supports the airport's growth, and Ontario has the potential to capture a much larger share of total regional demand.

The draft demand passenger forecast for the ONT master plan update includes both regionally unconstrained and constrained scenarios. The unconstrained forecast represents the demand generated within the airport's catchment area. The regionally constrained scenario assumes that other airports in the LA region will be constrained to capacities less than their collective shares of regional demand. Collectively, LAX, Long Beach, John Wayne, and

Subject: Highlight

Date: 8/3/2003 11:53:52 AM

1

Urban airports are expected to reach their capacity and/or policy limitations between 2010 and 2015.

The regionally constrained scenario assumes that local passenger demand in excess of the capacity of the other airports in the region would flow, in part, to ONT. Even if ONT captures a larger share of the local LA region O&D demand, significant passenger activity would still be lost to airports outside of the LA region. Some connecting passengers would be routed over other domestic hubs and international gateways in other cities.

Through 2010, the regionally unconstrained and the regionally constrained forecasts for ONT are identical. O&D traffic at ONT is forecast to increase significantly between 2010 and 2015, when other regional airports would no longer be able to accommodate growth.

The ONT master plan forecast presents projected activity levels for years 2010, 2020, and 2030. The regionally constrained scenario projects passenger demand to be 9.9 MAP in 2010 and 25.4 MAP in 2020. An interpolation of passenger demand between 2010 and 2020 results in an activity level of 15.9 MAP in 2015¹. This 2015 activity level represents an increase of approximately 4.1 MAP over the regionally unconstrained scenario.

Just as LAX today serves a larger percentage of regional demand than the demand generated within its catchment area, under the regionally constrained scenario ONT is forecast to absorb a portion of the unserved demand from the constrained airports in the region beginning between 2010 and 2015. This level of captured passenger demand is forecast to reach approximately 11 MAP in 2020 and 13 MAP in 2030.

The ONT master plan forecast assumes that the percentage of domestic connecting passengers would be maintained at the historical level of 6 to 7 percent throughout the forecast horizon. International passengers are forecast to increase from 40,447 in 2002 to 1.9 MAP by 2030.

The regionally constrained scenario is recommended for use in future planning for ONT. Should the capacity issues at other LA region airports be resolved, planned improvements at ONT could be scaled back or not implemented.

¹ Since the ONT forecast does not present interim year passenger data for 2015, an interpolation was performed to calculate the 2015 value. The interpolation assumed a constant average annual compound growth rate between 2010 and 2020 of 9.8 percent. The 2010 forecast of 9.9 MAP, increased for each of 5 years at 9.8 percent results in an activity level of 15.9 MAP in 2015. Growing the 2015 interpolated forecast of 15.9 MAP each year for 5 years results in the 2020 forecast demand of 25.4 MAP.

T

C.2 JOHN WAYNE AIRPORT-ORANGE COUNTY

About 28 percent of the region's 2015 domestic O&D demand (23.8 MAP) will be located within John Wayne Airport-Orange County's 60-minute access zone, but only 5.6 MAP in its catchment area. The airport served 7.8 MAP in 2000. The airport has only one relatively short air carrier runway (and a general aviation runway), limited facilities, significant environmental constraints, and severe policy restrictions. A court order issued in 1985 restricts passenger activity to 8.4 MAP and caps daily air carrier operations until 2005. The Orange County Board of Supervisors and the Newport Beach City Council adopted an amendment to this settlement agreement that will add 6 terminal gates and allow annual passenger activity to grow to 10.8 MAP through 2015. The FAA has agreed to the amendment of the 1985 settlement agreement that continues limits on the number of daily commercial operations. Based on these factors, the airport is expected to continue to provide service primarily to short-haul markets (59.6 percent in 2002), with limited service to major medium- and long-haul markets (32.6 percent and 7.8 percent in 2002, respectively).

C.3 BURBANK-GLENDALE-PASADENA AIRPORT

Burbank's catchment area is the second largest in the region, with 17.7 percent of the region's 2015 domestic O&D demand (14.9 MAP). Approximately 24 million domestic air travelers are projected to originate their trips within the 60-minute access zone in 2015. However, the forecast that was prepared as part of the recently completed Part 161 study shows Burbank with an activity level of only 7.2 MAP in 2020. The forecast took into account the physical constraints of the airport's infrastructure and the policy constraints of the governing body that owns the airport. The forecast found that the airport has environmental, physical, and policy constraints that will severely limit its ability to fully serve the demand potential of its market area. Scheduled passenger service remains almost exclusively short-haul (68.7 percent) and medium-haul (17.0 percent) in 2002, with only 1.3 percent of scheduled departures destined for a long-haul market (Honolulu).

C.4 LONG BEACH AIRPORT

Approximately 43 percent of the region's domestic O&D market is projected to fall within Long Beach's 60-minute access zone by 2015, making it the airport most accessible to the greatest number of the region's O&D passengers after LAX. However, the catchment area for Long Beach overlaps the 60-minute access zones for LAX and

What about cargo for the area? What does the evaluation and constraints say about cargo? Can a significant increase in cargo also occur? If not, why not?

Sequence number: 2

Author: Denny Schneider

Subject: Note

Date: 8/3/2003 12:29:22 PM

Does the review of this airport usage reflect policy of the airport, of the airlines serving it, or physical constraints? If policy changes were to be invoked, could Burbank airport serve more medium and long-haul passengers? What can be done to accommodate this? What about cargo at this airport?

John Wayne Airport, both of which have more extensive existing airline service. Long Beach's potential to attract additional passenger activity is further constrained by the current City of Long Beach policy limiting air carrier flights to 41 per day. With new service by jetBlue Airways and renewed interest from American Airlines, the airport will be close to its policy limit of air carrier flights in early 2003. The airport's scheduled service in 2002 is split fairly evenly among short-haul (25.0 percent), medium-haul (32.6 percent), and long-haul (42.4 percent) destinations. 

C.5 PALM SPRINGS INTERNATIONAL AIRPORT

This airport is located 105 miles from Los Angeles in Riverside County, at the edge of the Los Angeles region, and is a resort destination--not an alternative arrival location for Los Angeles. Palm Springs' scheduled air service is limited to commuter aircraft (89.3 percent) and only 3.6 percent of departures bound for destinations east of the Pacific and Mountain Time zones. Palm Springs served 1.3 MAP in 2000. 

C.6 OXNARD AIRPORT

Oxnard Airport is located approximately 65 miles from downtown Los Angeles. Oxnard's catchment area in 2015 is forecast to contain 3.9 MAP in 2015. The airport consists of a single short runway with limited terminal, parking, and ground access facilities. The airport's only scheduled air service is to LAX. Increased air service at Oxnard will depend primarily on local demand and the willingness of airlines to establish service to other markets. In addition, the airport sponsor has no plans to improve airport facilities, thus limiting the airport's potential to provide direct service to most markets. About 80,000 passengers used the airport in 2000.

C.7 PALMDALE REGIONAL AIRPORT

Palmdale Regional Airport is located on land leased from the Air Force at the Palmdale Production/Test Installation Air Force Plant No. 42, a military installation. This facility is separate and apart from the adjacent 17,000 acres purchased by the City of Los Angeles in the 1960s for future airport development. Civilian use of the Plant 42 airfield is permitted under a joint use agreement with the Air Force. The airfield includes two air carrier-length runways. The terminal facilities on the Plant 42 property consist of one 9,000-square foot terminal with two aircraft parking positions. The airport is approximately 61 miles from the Los Angeles Central Business District with access from State Route 14 (no direct freeway access is provided).

A premise is that LA would lose O&D to another international airport if LAX doesn't expand. Only one airport, SFO, is capable of accepting passengers at a west coast destination that could travel semi-conveniently to Southern California. Explain how these other airports could possibly become more convenient in place of another SoCal destination.

The 3 cargo values can't be the same if it is assumed that cargo will increase from 2 MAT to 3.5 MAT! If the assumption is larger aircraft, how will LAX handle these aircraft.

D.1 2005

A 2005 activity profile for Alternative D was developed for use in the airside simulations. The output of the 2005 Alternative D airside simulations was used to provide input to the SEIS/EIR noise analysis. 

The Alternative D activity profile was developed based on the capacity of the alternative in 2005. Runway 25L would be closed for construction in 2005 and LAX would consist of a three-runway airfield. No new gate facilities would be constructed by 2005 with Alternative D and the available gate facilities would be the same as the No Action/No Project Alternative.

If Alternative D had four runways in 2005, its capacity and resulting activity profile would be equivalent to the No Action/No Project Alternative. The No Action/No Project Alternative would have the ability to accommodate 71.2 MAP and 779,500 annual operations. 

With only three runways available, airfield capacity would be reduced. It is assumed that the airlines would choose to not schedule a portion of the commuter activity in response to the constraint. In addition, it is assumed that general aviation activity would be reduced from the 2005 No Action/No Project Alternative levels in response to the delays and congestion that would result from the closure of Runway 25L/7R.

The capacity of a three-runway airfield was determined through an iterative process that involved testing the 2005 No Action/No Project activity profile against the three-runway airfield using the FAA's Airport and Airspace Simulation Model (SIMMOD). This testing process determined the hourly profile of activity that could be accommodated on a three-runway airfield at reasonable delay levels. Delays were permitted to increase beyond the maximum range of 10 to 15 minutes per operation (the range used in the development of the 2015 activity profiles for Alternative D and the other Master Plan alternatives) because the runway closure would be a temporary condition. It is assumed that the airlines would accept higher delays on a temporary basis in order to serve demand. See Appendix E for a discussion on the airside simulation assumptions for 2005.

Based on the capacity of a three-runway airfield, Alternative D in 2005 would have the ability to accommodate 70.8 MAP and 745,000 annual operations.

Where is the back up data for these interim periods? What is the aircraft mix assumed? What changes are assumed to get each interim value? How is the noise analysis used with regard to flight track noise? What assumptions of runway use, alternative routes, etc. are part of the noise analysis? What about topological and weather conditions? Does the increase of aircraft operations add pollutants which makes the noise conditions worse?

Sequence number: 2

Author: Denny Schneider

Subject: Note

Date: 8/3/2003 2:47:25 PM

The statement that 2005 Alt D conditions are NOT equivalent to NANP. In the earlier portion of this Appendix D it calls for closure of 25L. NANP doesn't have this closure in place.
At this point no air-field gates or other runway action is supposed to have occurred. This means that at a minimum the often repeated 78 MAP inherent value for NANP applies, not 71.2. Whenever the north runway work is started then there will be a temporary change to account for the reduced number of runways.
Since the current constrain is traffic at Century and Sepulveda not air or gate ops, the theoretical capacity of LAX would actually go up because this constraint would be eliminated.

D.2 2008

A 2008 interim year activity profile was developed for Alternative D to assist in the landside modeling for the SEIS/EIR. The following sections present the capacity constraints associated with Alternative D in 2008 and the expected impact on air service.

D.2.1 AIRCRAFT OPERATIONS CAPACITY CONSTRAINTS

Alternative D consists of a four-runway airfield in 2008. Similar to the 2015 case, the 2008 Alternative D peak hour aircraft operations activity was defined based on the capacity of the existing four-runway system at LAX in visual operating conditions. Peak hour operations in the 2008 activity scenario were assumed not to exceed the levels observed in 1996 and operations were permitted to increase in other hours as warranted by market demand. 

D.2.2 PASSENGER CAPACITY CONSTRAINTS

There would be no new gate or landside facilities constructed by 2008 with Alternative D. The level of passengers that could be expected in 2008 with Alternative D was therefore determined based on the ability of the existing ramp to accommodate larger aircraft and the ability of the existing landside facilities to accommodate a higher level of origin and destination (O&D) passengers. Alternative D in 2008 would have the ability to accommodate the 2008 unconstrained forecast fleet size by making use of the remote west pad for aircraft parking. The existing landside facilities would have the capacity to process the activity generated by the runways and gates. 

D.2.3 CARGO CAPACITY CONSTRAINTS

The cargo facilities available in 2008 for Alternative D would be equivalent to the those available in 2015. Therefore, cargo activity for Alternative D in 2008 was assumed to be equivalent to 2015 Alternative D cargo levels (3.1 million annual tons). 

D.2.4 AIR SERVICE IMPLICATIONS

The air service impacts of the above constraints for Alternative D in 2008 are summarized below:

- ◆ High priority was given to accommodating O&D activity. By limiting the amount of connecting activity, Alternative D would be

Date: 8/3/2003 3:04:52 PM

Alt D talked about upgrading and adding cargo facilities in the south and west areas. How is the capacity equivalent at the intermittent times?

able to accommodate 100 percent of the 2008 unconstrained forecast O&D demand.

- ◆ Commuter operations were reduced (from 1996 levels) consistent with the No Action/No Project Alternative and Alternative C. In order to maximize the number of passengers that could be served with a limited number of operations, it was assumed that some commuter service would be replaced by air carrier service. It was also assumed that commuter connecting service through LAX would decrease in order to meet 100 percent of forecast O&D demand. This results in 38 percent of forecast commuter connecting passengers not being served at LAX in 2008. 
- ◆ Air carrier connecting activity was decreased from 2015 forecast levels to reflect the loss of connecting passengers from commuter flights.
- ◆ The domestic air carrier hourly profile was de-peaked and service was reduced from 2015 forecast levels in the Central, Eastern, and Pacific regions to reflect the response from the airlines to the airfield constraints. It is assumed the airlines would adjust their schedules to allow for more profitable international operations to be scheduled at peak periods. 
- ◆ It is assumed that the percentage of domestic and international air carrier O&D passengers would increase as the airlines attempt to serve the unconstrained forecast O&D demand with fewer operations. As a result the percentage of connecting passengers would decrease.
- ◆ The average aircraft size was increased from existing levels without significantly exceeding the 2008 unconstrained forecast seats per departure for each air service component.
- ◆ General aviation activity was maintained at 1996 and 2000 levels, although activity was moved out of peak hours.

Alternative D would have the ability to serve 73.3 MAP and 781,000 annual operations in 2008. Alternative D would meet 100 percent of the unconstrained 2008 forecast O&D passenger demand and 90 percent of the 2008 forecast international passenger demand in 2008. Cargo facility constraints would prevent Alternative D from reaching the forecast 2005 annual cargo tonnage demand level in 2008.

How is the commuter ops going to be limited?

Sequence number: 2
Author: Denny Schneider
Subject: Note
Date: 8/3/2003 4:04:55 PM
Isn't there a difference between peaks of domestic and international? If the peaks differ, then they're not mutually exclusive and there is no expectation that the airlines will reduce operations.

E.1.1.2.1 2015 Terminal Facilities

In Alternative D, due to the relocation of Runway 24L and its associated parallel taxiways, existing Terminals 1, 2, 3, and Tom Bradley International Terminal (TBIT) north concourses would be demolished and reconfigured into one east/west linear facility with a total of 18 gates. TBIT would be expanded to accommodate aircraft on the west side of the terminal. A new West Satellite Concourse would be constructed west of TBIT and would contain 43 aircraft gates. In total, there would be 32 commuter positions and 121 jet positions in 2015.

E.1.1.2.2 2005 Terminal Facilities

None of the new terminal facilities would be constructed by 2005. Therefore, the 2005 terminal facilities would be identical to the No Action/No Project Alternative (see Appendix J of the Draft LAX Master Plan for a description of the No Action/No Project terminal facilities). Gates located at the terminal would include 3 commuter positions and 112 jet positions. There would be 29 remote commuter positions and 19 remote jet positions.

E.1.1.3 CARGO AND GENERAL AVIATION AREAS

In 2015, one building in the South Cargo Complex would be removed to make room for a proposed general aviation facility. There would be a total of two general aviation facilities in Alternative D. The existing facility north of Imperial Highway and east of Sepulveda Boulevard would remain and a new facility would be located north of Imperial Highway and west of Sepulveda Boulevard. 

This development would not be completed by 2005. Therefore, the 2005 cargo and general aviation facilities would be identical to the No Action/No Project Alternative.

E.1.2 DESIGN DAY ACTIVITY

Design day flight schedules were developed for Alternative D for 2005 and 2015. The methodology and assumptions for assigning gates to the flights are discussed in Section 3 of this appendix. Detailed profiles of hourly aircraft operations for Alternative D are contained in Appendix F. The resulting design day operations are summarized in **Table E-1**. For a detailed discussion of the methodology and assumptions used to derive the design day schedules see Section 3 of the Draft LAX Master Plan Addendum and Appendix D.

Why are two general aviation facilities being built. If the objective is to push toward larger aircraft why is another GA being built?

Table E-1
DESIGN DAY ACTIVITY SUMMARY COMPARISON

	Design Day Operations	
	2005	2015
Air Carrier	1,113	975
Commuter	435	532
Hawaii	51	53
Total Domestic	1,599	1,560
International	380	498
Total Commercial	1,979	2,058
Cargo	117	117
GA and MI	82	104
Total	2,178	2,279

Note: Canadian passengers and operations are included in the international totals

Commercial operations would be lower in 2005 than in 2015 due to the closure of Runway 25L. Without the use of Runway 25L in 2005, the airlines would most likely choose to schedule fewer flights than they would with four runways available. It is assumed that fewer commuter flights would be scheduled as a result of the temporary runway closure. In addition, general aviation activity is assumed to be lower due to the congestion that would result from the runway closure. If Runway 25L was open, the 2005 No Action/No Project schedule would serve as the 2005 Alternative D schedule.

In 2015, Alternative D would have the same number of total commercial operations as the No Action/No Project Alternative and Alternative C (refer to Chapter V, Section 3.3.2 of the Draft LAX Master Plan for a description of the activity associated with the final iteration alternatives). Alternative D cargo and general aviation operations would be the same as the No Action/No Project Alternative.

E.1.3 AIRCRAFT GATE ASSIGNMENTS

Flights in the design day schedules were classified into general airline groups for the purpose of assigning the aircraft to the gates and allocating passengers to the terminal area. Similar to the other alternatives, the airline groups were formed by classifying the airlines in the schedule according to operating characteristics, while maintaining the dominance of some single carriers at LAX. The airline groups are listed in Appendix A of the Draft LAX Master Plan. The resulting layout, gate size, and airline allocation for Alternative D

Similarly in the next paragraph of E.1.2 where is the authorization for expansion of cargo facilities?

for 2015 and 2005 are illustrated in **Figures E-3 and E-4** respectively. Alternative D in 2005 maintains the same gate layout used for the No Action\No Project schedule.

Table E-2 shows the number of gates that can be accommodated in Alternative D in 2015. See Appendix A, Section 3.1 and 3.2 of the Draft LAX Master Plan for the gate layouts and number of gates that can be accommodated in the final iteration alternatives. Alternative D provides fewer gates than the No Action/No Project Alternative (153 compared to 163), however the Alternative D layout would include 6 NLA positions. Alternative C also has six NLA positions but can accommodate more passengers than Alternative D with 168 total gates at a larger overall size.

All flights in the 2005 and 2015 design day schedules for Alternative D were assigned to a gate to determine future terminal loadings and to simulate airside operations. Aircraft gate assignments were made based on the user allocation and maximum gate size assumptions. Ranges of minimum intergate times, dependent on airline group, were assumed between gate uses. The minimum intergate times used in the other alternatives (see Appendix A of the LAX Draft Master Plan) were also applied in this alternative.

The results of the Alternative D gate assignments are illustrated on **Figures E-5 and E-6**. The utilization of each gate throughout the day is shown by solid flight bars that mark the total time that a flight occupies the gate. Upside down triangles at the beginning and end of each bar denote an arrival and departure operation, respectively. The absence of a triangle indicates a tow operation. The aircraft type is displayed on the flight bar, as space permits. The flight bars are color coded by airline group.

If the gate layout will be according to the type of aircraft, how many of the airlines will have to move their operations to be in multiple terminals based on the layout of the gate capacity types?

The assumptions used for the Alternative D simulations are described in this section.

E.1.4.1 RUNWAY OPERATING CONFIGURATIONS

Simulations were conducted for the three primary¹ runway operating configurations at LAX at the 2005 and 2015 levels of activity:

- ◆ West Flow Visual Approaches (Visual)
- ◆ West Flow VFR Instrument Approaches (ILS/LDA)
- ◆ West Flow IMC (IFR)

The anticipated use of the runways for arrivals and departures under each operating plan for the final iteration alternatives and Alternative D in 2015 and 2005 is shown in **Figures E-7** and **E-8**.

All alternatives with four runways would operate like the existing airfield. This is the case for 2015 Alternative D, Alternative C, and the No Action/No Project Alternative. The primary use of the runways is assumed to be arrival operations on the outboard runways 24R/6L and 25L/7R and departure operations on the inboard runways 24L/6R and 25R/7L. Simultaneous approaches to the outboard and inboard runways are conducted only in west flow under visual approach procedures.

In 2005, Alternative D would have only three runways due to the temporary closure of Runway 25L for construction. The north runways, 24R/6L and 24L/6R would operate similar to the assumptions used in the four runway cases. Runway 24R/6L is assumed to be primarily an arrival runway, and Runway 24L/6R a departure runway. Runway 25R/7L would be operated as a mixed operations runway with both arrivals and departures.

E.1.4.2 AIRSPACE OPERATING ASSUMPTIONS

Airspace routes for Alternative D would be the same as the No Action/No Project Alternative and Alternative C. Airspace arrival routes were defined from each arrival fix to the runway ends and departure routes were defined from each runway to each departure fix. Routes were also defined for local traffic from Ontario, Santa Ana, Santa Barbara and Burbank Airports. 

¹ East flow performance was not modeled due to its low annual occurrence. Rather, east flow performance was estimated based on previous simulations.

Subject: Note

Date: 8/3/2003 5:06:22 PM

If there is a substantial difference (388' movement south) between NANP and Alt D runways on the north side why is it assumed that the patterns to approach will be the same?
Also, if cargo will be increased and moved along with a different mix of aircraft for various airlines how will the "efficient" runway be used to assure landing nearest the gates?

E.1.4.2.1 West Flow

Figure E-9 illustrates the primary airspace routes from and to the airspace fixes as well as the local airports for west flow. Existing patterns at Santa Monica, Hawthorne, and El Monte Airports are included in these illustrations as a reference. These locations were identified as the most likely to be impacted by changes to the LAX airspace.

The routes correspond to anticipated patterns under instrument approaches. In visual procedures, the north approach may be intercepted about 5 or 6 nautical miles closer to the airport. The arrival routes in Alternative D would be the same as the No Action/No Project Alternative where an addition of a second Civet outer fix has been incorporated.

E.1.4.2.2 East Flow

Figure E-10 illustrates the primary airspace routes from and to the airspace fixes as well as the local airports for east flow. The east flow airspace assumptions are similar to that of the west flow. The east flow performance was estimated based on the performance of the west flow ILS configuration and final iteration simulated east flow cases (see Appendix J of the Draft LAX Master Plan) and the east flow airspace was not modeled for Alternative D.

E.1.4.3 AIRFIELD OPERATING ASSUMPTIONS

For the simulation of Alternative D in 2005 and 2015, assumptions were made about the direction traffic would flow on the taxiways and about how flights should be gated within the simulation. These assumptions are discussed in the following sections.

E.1.4.3.1 Taxi Flows

The anticipated flow of aircraft between the runways and the terminal gates assumed for the 2015 and 2005 simulation analysis is illustrated in **Figures E-11 and E-12** respectively. These taxi flows are based on the visual west flow operating plan. These general routings are applicable to all of the west flow operating plans. The anticipated taxi flows for east flow are shown in **Figures E-13 and E-14**. The east flow condition was not simulated for Alternative D, rather performance was estimated based on previous simulations.

In eastern ops the north takeoffs make a hard left to the north which is not shown. The south side turns slightly to the south for spacing. These general flows doesn't help with the analysis of impact on local communities or areas as much as 10-15 miles out where aircraft are already on descending approaches at 3000' and less. Where are these analyses in this report document? How are the impacts taken into consideration and at all mitigated? This is especially true for eastern ops when takeoffs are done exclusively over highly populated areas instead of an ocean.

runways was used for arrivals and departures in the VFR visual west flow configuration.

The runway use in 2015 is similar to Alternative C. As shown, Civet and Filmore traffic is split between the complexes due to the high number of flights originating from these fixes. All four runways were used for arrivals and departures in the VFR visual west flow configuration.

In general, arrivals from any fix would be able to reach any of the available approaches as needed, in order to balance demand and minimize delay. Departure traffic to the Thermal outer fix was primarily assigned to the south runways. As needed, Thermal departures were diverted to Dagget and assigned to the north or south runways to balance departure demand and minimize delay. Departures to Exert outer fix were assigned primarily to the north runways but were diverted to the south runways, as needed to minimize delay.

E.1.5.2 AIRCRAFT DELAY AND TAXI TIME

The average annual all weather delay for Alternative D and the final iteration alternatives is summarized in **Table E-3** and illustrated in **Figure E-17** for 2015.

Table E-3

2015 ALL WEATHER AVERAGE DELAY AND FLIGHT CANCELLATIONS

<u>Alternative</u>	<u>Average Delay</u>	<u>Cancelled Flights</u>
No Action/No Project	13.34	29
Alternative A	9.86	45
Alternative B	10.88	26
Alternative C	13.82	46
Alternative D	11.56	28

Note: Delay is expressed in minutes per operation

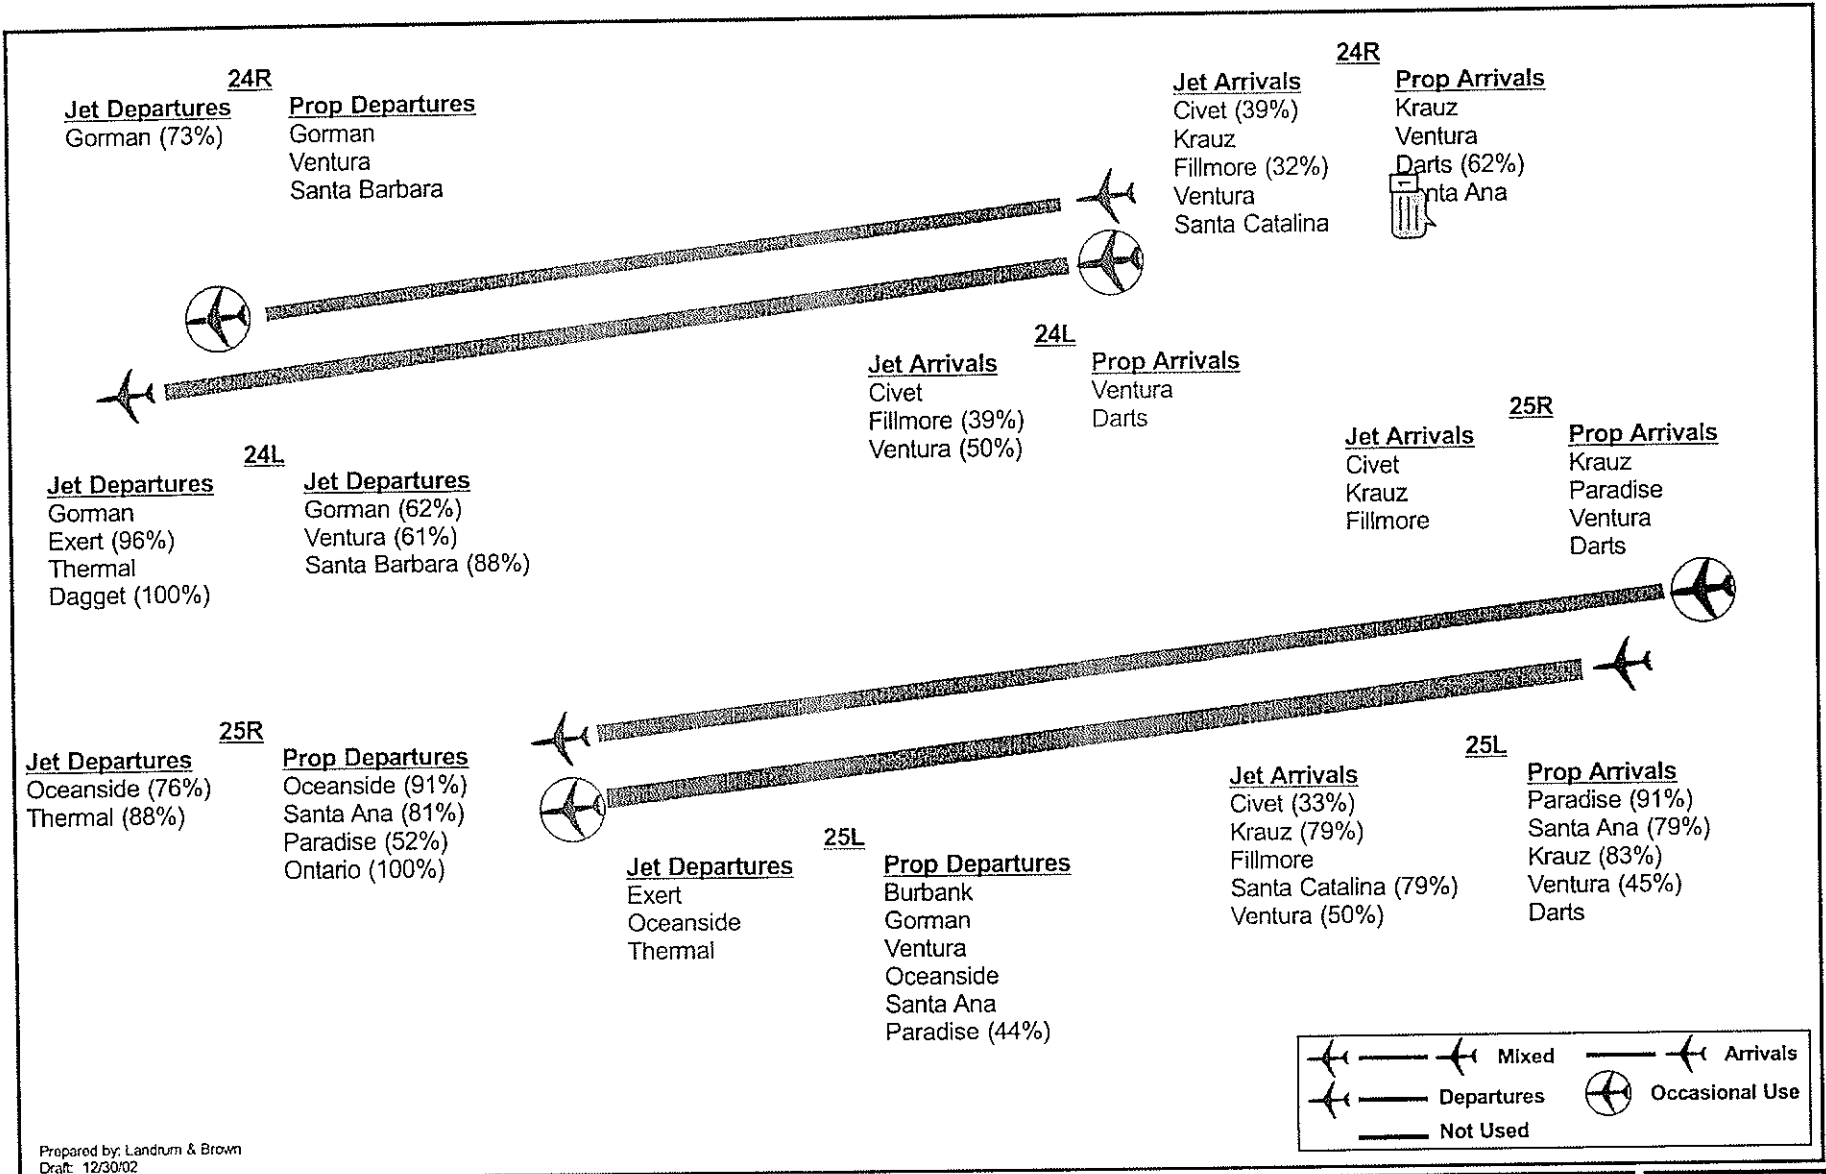

As in the final iteration analysis, flow control and flight cancellations were modeled in cases that result in excessive arrival airspace delays. In these cases the flight schedules were submitted through a flow control process before running the airside simulations in the SIMMOD model. Flights were cancelled, as needed, in order to process all arrivals prior to midnight. Alternative D in 2015 would require flight cancellations during non-visual configurations.

The average peak hour throughput values are close for several alternatives. What is the statistical significance values?

E.2 ALTERNATIVE D ADDITIONAL INTERIM YEAR AIRSIDE ANALYSIS

The DEIS/EIR required the analysis of additional interim years for Alternative D. The year 2008 was determined to be the peak traffic year for construction and airport traffic, thereby requiring design day flight schedules with gate assignments for the traffic modeling (but not airside simulations). The year 2013 was defined as the peak emissions year for air quality analyses in the DEIS/EIR. The facilities available and the resulting activity levels in 2013 would be similar to 2015. Therefore, airside performance was estimated for 2013 based on the 2015 analysis in order to provide data for the air quality modeling. Detailed simulations were therefore not necessary for 2013.

The following sections discuss the 2008 and 2013 Alternative D analysis. For a detailed discussion of the interim year activity refer to Appendix F.

E.2.1 2008 ALTERNATIVE D

By 2008, the construction in the south airfield would be completed and a parallel taxiway between the south runways would be open. The north airfield facilities would remain unchanged from the existing airfield.

No new terminal facilities would be available in 2008 with Alternative D. The NLA would be required to park at the remote gates in the west pad area. Alternative D in 2008 would retain the existing cargo and general aviation facilities.

A design day flight schedule was developed for Alternative D in 2008.  The methodology and assumptions used to derive the design day schedule are discussed in Appendix D. A detailed profile of hourly aircraft operations for Alternative D in 2008 can be found in Appendix F. Alternative D would have the ability to serve 73.3 MAP and 781,000 annual operations in 2008.

As discussed in Section 1.3 of this appendix, flights in the design day schedules were classified into general airline groups for the purpose of assigning the aircraft to the gates and allocating passengers to the terminal area. The resulting layout, gate size, and airline allocation for Alternative D in 2008 are shown in **Figure E-18**.

Sequence number: 1

Author: Denny Schneider

Why are the max taxi periods at strange hours (ie 2 AM, 5 AM) for arrivals and more steady, but high all the time for departures?

Appendix H

CONCEPT DEVELOPMENT

H.1 INTRODUCTION

The following figures document the genesis and development of the Alternative D concept. The development of Alternative D was an iterative process that included Los Angeles World Airports (LAWA) senior management, and members of the consulting team.

H.2 INITIAL CONCEPTS

In the initial concept classification category, five (5) concepts were developed (**Figures H-1 through H-5**). These concepts were focused in the area defined as north of Imperial Highway, east of Aviation Boulevard, south of Arbor Vitae, and west of Interstate 405. The intent of the concepts were to:

- 1) Remove private and commercial vehicles from the Central Terminal Area (CTA),
- 2) Create new permanent passenger pick-up and drop-off facilities,
- 3) Increase short and long term parking capacity;
- 4) Provide a direct automated people mover (APM) system to connect to the CTA and the Metropolitan Transit Authority (MTA) Green Line Station.

The initial concepts were developed without consideration given to the following hard constraints:

- 1) Available land (not currently owned by LAWA),
- 2) FHWA coordination requirements,
- 3) Commercial, and industrial property acquisition limitations,
- 4) Environmental processing and mitigation requirements

It was determined through several meetings with LAWA senior management and members of the consulting team that the only viable locations for passenger pick-up and drop-off facilities were identified as Manchester Square and the land envelope defined as the area bounded north of Imperial Highway, east of Aviation Boulevard, south of 104th street, and west of La Cienega Boulevard.

Interesting assumptions that were not of consideration. Also, why were the APM developed to the accept Green Line passengers instead of facilitating Green Line going north to a check in facility?

It was concluded that these were the two most viable sites given the following factors:

- 1) Accessibility to the arterial street network,
- 2) Curbfront requirements,
- 3) Building height and use restrictions within the runway protection zone,
- 4) Commercial, and industrial property acquisition limitations

At the completion of the initial concept development it was determined that the land envelope defined as the area bounded north of Imperial Highway, east of Aviation Boulevard, south of 104th Street, and west of La Cienega Boulevard was not feasible because of significant access constraints due to close proximity to the Interstate 405 and 105 interchange and the limited space for queuing, circulation, and storing of vehicles on the surrounding roadways. In addition, the site area has several height restrictions due to FAA airspace criteria.

H.3 ALTERNATIVE DEVELOPMENT

As Manchester Square emerged as the preferred location for passenger pick-up and drop-off facilities, six (6) new alternatives were developed. These alternatives entailed various configurations to accommodate facilities that included:

- 1) Passenger pick-up and drop-off facilities,
- 2) Terminal facilities,
- 3) Parking facilities,
- 4) APM stations,
- 5) Access roadways,
- 6) MTA facility

Alternative 1 (**Figure H-6**) – creates a multi-passenger pick-up and drop-off facility campus around a central parking core. While this concept met the curbfront demand it was determined that a closed ring roadway circulation system was a disadvantage and created similar congestion and vehicular circulation problems that currently exists within the CTA. In addition, the terminal configuration would require multiple APM stations causing longer transit times beyond acceptable standards.

So Manchester Square was decided upon in the initial considerations whereas the southern portion was unacceptable for reasons opposite to MS desirability.

Alternative 2 (**Figure H-7**) – creates a single passenger pick-up and drop-off facility with adjacent parking. To meet the curbside requirement, the facility would need to be three levels. This presented significant issues related to accessibility from arterial streets and vehicular flow within the access system.

Alternative 3 (**Figure H-8**) - attempted to de-centralize the passenger pick-up and drop-off facilities with adjacent parking in order to meet the curbside demand. The concept was deemed inefficient requiring multiple APM stops and considerable land area. Also, it was determined that passenger facilities located in the runway protection zone were not recommended. The de-centralization of facilities also created significant signage and passenger way finding challenges.

Alternatives 4 and 5 (**Figures H-9 and H-10**) - were two similar ideas of a concept to utilize Manchester Square as the primary location for passenger pick-up and drop-off facilities. No parking adjacent to these facilities was associated with this concept. All short and long-term parking would be located north of I-105, south of 104th Street, west of La Cienega Boulevard, and east of Aviation Boulevard. It was determined that separating long and short-term parking facilities from the primary passenger pick-up and drop-off areas was not advantageous.

Alternative 6 (**Figure H-11**) - was based on the ideas generated in Alternatives 4 and 5 including both long and short-term parking facilities associated with the passenger pick-up and drop-off facilities. Commercial and private vehicles would access these facilities with upper and lower level curbsides. In order to get the necessary curbside linear footage, parallel piers were developed. The arrangement was set at an angle to allow for proper turning radii for consistent vehicular flow in and out of the system. Initially the Intermodal Transportation Center (ITC) connecting the MTA Green Line to the APM was located at the corner of Century Boulevard and Aviation Boulevard. Further refinement of Alternative 6 relocated this facility closer to the MTA Green Line at the northeast corner of Aviation Boulevard and I-105.

Alternative 6 was selected to move forward based on its ability to meet the curbside demand on a land envelope large enough to accommodate both parking and passenger facilities that was accessible to the arterial street network and not within a runway protection zone. The concept was refined into Alternative D based on significant landside analysis creating an access system capable of delivering the most efficient vehicular flow in and out of the facilities.

 What was the basis for the refinement to move the APM connection south? How much curb space is needed?

H.4 CTA SECURITY MODIFICATION ANALYSIS

An analysis was conducted which looked primarily at the existing CTA evaluating opportunities which existed for modifications to the infrastructure to accommodate the primary APM component of Alternative D. The intent was to modify the existing CTA terminals to accommodate the need for expanded outbound baggage make-up areas for 100% Explosives Detection System (EDS) screening as well as increased areas for security screening and passenger processing. These options maintained the parking structures in the CTA and the existing road structures. In some cases additional roads were built at a third level to help with vehicular circulation.

While it was determined that the CTA could be modified to accommodate security mandated directives, these approaches failed to address the threat of private and commercial vehicles present to the facilities and gates. In addition, all of the approaches failed to make any significant changes to undersized and aging passenger processing facilities.

Option 1 (**Figures H-12 and H-13**) – shows in plan the components of Alternative D with an additional 50'-0" bay built on to the backside of all terminals to help accommodate the additional areas needed for passenger security screening and the 100% EDS screening of all checked baggage. The APM would be located atop existing parking structures with pedestrian bridges connecting stations with the terminal facilities. 

Option 2 (**Figures H-14 and H-15**) shows a modified CTA, which places new baggage claim facilities on the roof of existing or rebuilt parking garages. A new third level arrivals curb would be located adjacent to baggage claim with the APM at a level above. Moving baggage claim to a new facility would allow the lower level of the CTA to be utilized primarily for 100% automated EDS screening of all checked bags as well as opportunities for expansion of concessions and a limited amount of passenger processing.

Option 3 (**Figure H-16**) is a variation of Option 2 placing the third level arrivals curb on the opposite side of baggage claim in an elevated structure.

Option 4 (**Figure H-17**) is a variation of Option 2 that re-builds all the parking structures with an integrated arrivals hall, and a baggage claim facility at the second level. The existing open space between the existing arrivals curb and parking structures

Author: Denny Schneider

Subject: Note

Date: 8/4/2003 9:48:08 AM

Why is the 100% EDS screening being done in the CTA instead of at the time baggage is first checked resulting in a one-time review. This way people will not have to carry all of their luggage from the GTC to the CTA.

Not to Scale

This option talked about replacement gates but the north side is shown intact. Was this an accident in the first option that was just overlooked?

would support an expanded second level roadway system for a new arrivals curb.

Option 5 (**Figures H-18 and H-19**) moves the APM to the upper level roadway of the existing CTA. The existing upper level roadway would be maintained for emergency vehicle access. A new departures curb and ticketing hall would be built atop of the reconfigured or rebuilt parking garages.

Option 6 (**Figures H-20 and H-21**) moves the APM to the upper level roadway of the existing CTA. A new ticketing hall and baggage screening system would be built at the second level of the existing or rebuilt parking structures. The upper level roadway access would be maintained for emergency vehicle access. The existing open space between the arrivals curb and the parking structure would support an expanded second level roadway system for a new departures curb. Departing passengers would use an overhead pedestrian bridge to access the gates. The area in the existing terminals previously used for ticketing and airline ticket offices would be converted to concession areas.

Figures H-22 and H-23 show a recommended approach for modifications in the CTA including a renovation of the existing processors for expanded ticketing, security screening, and baggage screening by creating a third level accessible across the roadway system to the APM.

While the CTA can accommodate some changes in its infrastructure to adapt to future security and security related space expansion requirements, the landside will continue to be constrained. All of the options had considerable drawbacks related to cost/benefits, implementation and phasing. Each of these options considered allowing private and commercial vehicles into the CTA, a threat that Alternative D eliminates.

2 was determined through meetings with LAWA senior staff and the consultant team that any recommended security modifications within the CTA be consistent with the long-term planning for all Master Plan Alternatives. 

H.5 ALTERNATIVE D REFINED CONCEPTS

As part of the refinement of Alternative D, additional concepts were evaluated to determine which elements, and their corresponding configuration, warranted further analysis. The following figures depict several configurations that were considered for Alternative D.

East Land Envelope Constraints Diagram (**Figure H-24**) – depicts the hard and soft constraints surrounding the east land envelope. The consultant team was given direction by senior LAWA staff as to which facilities were to be considered as hard constraints. Every attempt was made to avoid impacts to the following areas:

- ◆ Hotel and commercial area located at the northwest corner of Century and La Cienega Boulevard,
- ◆ Hotel, commercial, and industrial area located at the southwest corner of Century and La Cienega Boulevard
- ◆ U.S. Customs facility located at the northwest corner of La Cienega Boulevard and 111th Street, and
- ◆ Commercial area located at the northwest corner of La Cienega Boulevard and Imperial Highway, up to 111th Street.

Alternative D1 (**Figure H-25**) – “Alternative D Airfield” key features include:

- ◆ Relocation of existing Runway 24L to the south and lengthening to east over Sepulveda Boulevard
- ◆ New centerline taxiway between Runways 24L and 24R
- ◆ Taxiway Alpha extension
- ◆ New north CTA gates (removal of Terminals 1, 2, and 3)
- ◆ New Midfield Satellite and Tom Bradley International Terminal (TBIT) gates
- ◆ Primary curbside and consolidated rental car facility located in Manchester Square
- ◆ New parking structure located at the northeast corner of Imperial Highway and Aviation Boulevard (old Continental City property)
- ◆ APM connection between the CTA, Manchester Square, and parking structure at the old Continental City property
- ◆ Green Line connection

From an operational and customer service perspective, the best design is Option 1. It involves constructing the customer service building and ready/return area on the current Budget, Avis and National sites. Though it would require relocating those companies to Lot C, there are a number of key advantages to this option:

1. The customer service building would be used in the final phase long-term consolidated rental car facility.
2. The ready/return area is located directly across the street from Hertz, Avis, National and Budget, which makes shuttling vehicles quick and easy. Those companies represent 66% of the LAX rental car market (based on 2000 figures).
3. The site could accommodate approximately 2,500 ready/return spaces. To increase capacity and reduce shuttling, it may also be possible to deck the site and construct a quick turn around facility (QTA) where vehicles can be quickly washed, vacuumed and fueled. This area could then be used as a storage site once the final phase long-term consolidated rental car facility is built.
4. Double busing is minimized which is beneficial from both a customer service and environmental perspective.

Ultimately, the biggest advantage to this option, and the others as well, is the fact that they all involve the use of a common busing operation. Common busing would drastically reduce curb congestion and traffic in the terminal core. At Houston George Bush Intercontinental Airport, for example, the rent-a-car (RAC) industry uses 125 vehicles to transport rental car customers. A common bus fleet of only 24 Gillig 40-foot low floor buses is replacing those vehicles. Logically, this also improves air quality. Dallas/Fort Worth International Airport estimates that the common busing operation at its consolidated rental car facility has reduced particulate emissions by more than 460 tons each year.

Site Accessibility (Figure H-34)

The general site area that was considered for the Phase I – Consolidated Rental Car Options includes Lot C, existing rental car areas west of Airport Boulevard, and the Belford Area (LAWA  owned). Primary access to the site is via Sepulveda Boulevard, Airport Boulevard, 96th and 98th Street and Arbor Vitae Street.

Sequence number: 1

Subject: Note

Date: 8/4/2003 10:36:59 AM

The Belford area, like Manchester Square, is not LAWA owned--yet.

Appendix I

COMPARATIVE SECURITY ANALYSIS OF ALTERNATIVE D AND THE NO ACTION/ NO PROJECT ALTERNATIVE

1 EXECUTIVE SUMMARY

Alternative D, the Enhanced Safety and Security Alternative, provides Los Angeles International Airport (LAX) a much higher degree of safety and security than the No Action / No Project (NA/NP) Alternative in the proposed LAX Master Plan. Alternative D allows for the dispersal of people and security processes away from critical points on the airport complex. This allows for consistent levels of screening, an increased ability for law enforcement and security personnel to respond to threats, and the protection of people and critical facilities essential to the continued operation of the airport.

The postulated threat against LAX is terrorist actions, particularly those using a vehicle or truck bomb. LAX's primary function is the movement of passengers and cargo into and out of the airport. The level of security implemented at LAX must not limit the ability of the Airport to accomplish its primary function. Analysis shows that the potential of a vehicle bomb to cripple LAX and inflict a high number of casualties is the primary vulnerability and focus of security planning.

Alternative D's unique effectiveness as an enhanced safety and security plan lies in the establishment of a new and more effective concept of security operations for LAX. This concept involves the use of multiple concentric rings of security that provides security measures around each primary LAX facility. The establishment of these multiple concentric rings of security will allow LAX to begin its security process long before any passenger or vehicle enters the Central Terminal Area (CTA). The use of concentric rings in the development of a deterrent and mitigation strategy is based upon the concept of protecting, detecting, assessing, and responding (PDAR) to threats to passengers and the airport. This is best accomplished through the dispersal of potential hostile events in such a manner as to allow increased distance and time from a threat to give law enforcement and security personnel time to assess the threat and respond to it.

Author: Denny Schneider
Subject: Note
Date: 8/8/2003 8:22:17 AM

The entire theory of security expounded upon by this Appendix I of the Alt D Addendum corresponds to the SAIC study report of concentric levels of security. It also states that LAX is too small to be secure and need the additional land of Manchester Square, Belford Square, and all of the other areas out to the 405 freeway to implement the security strategy. Explain why the present land mass is insufficient and why some of the less used areas can not be secured in place of more land being added. Explain why the lesser used cargo must be further developed to allow for an increase of 1.5 MAT

5 THREAT

5.1 LOS ANGELES INTERNATIONAL AIRPORT (LAX) AS A TARGET

LAX is a potential target for a terrorist attack due to its significance as an international gateway and the third-busiest airport in the United States. LAX accounts for \$60 billion in the Southern California economy and one in twenty jobs in Southern California is attributed to LAX operations.

5.1.1 POTENTIAL ADVERSARIES

The obvious and primary adversaries to LAX are transnational terrorist groups and the criminal element. Both need to be considered in developing the final concept and design for Alternative D. The external threats to all elements of the airport, but particularly at the CTA, include terrorist and non-terrorist groups using traditional bombing tactics, such as the following events:

- ◆ On April 19, 1995, at 9:02 AM, a large vehicle bomb containing approximately 4,800 pounds of an ammonium nitrate and fuel oil (ANFO) mixture concealed in a 1993 Ford F700 20-foot cargo van detonated at the north side of the Alfred P. Murrah Federal Building in Oklahoma City, Oklahoma. The investigation revealed that Timothy McVeigh had conducted pre-attack analyses of numerous Federal buildings looking for one that met his requirements. He developed a three-pronged targeting criterion that called for a building occupied by children as well as agents of the Federal Bureau of Investigation (FBI) and the Bureau of Alcohol, Tobacco, and Firearms (BATF) as retribution for the Waco, Texas incident a year earlier. He was also looking for a target with minimal protective measures. He selected the Murrah building because it represented an extremely soft target that allowed him to park his vehicle within 10 feet of the building. The Murrah Federal Building bombing proved that a small group of anti-government individuals can cause significant loss of life and damage to property using relatively unsophisticated explosive devices.
- ◆ The 1993 World Trade Center (WTC) bombers used a truck bomb to cause significant damage to the WTC. This attack, in addition to the Murrah building bombing in Oklahoma City, supports the concern about the vulnerability of a facility to an unsophisticated

EXECUTIVE SUMMARY

Introduction

This document is the Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) for the proposed Los Angeles International Airport (LAX) Master Plan. It has been prepared to describe a new alternative for the LAX Master Plan and provide data and analyses related to the reasonably foreseeable environmental impacts of the new alternative. In response to the public comments received on the Draft EIS/EIR and the changing conditions after the September 11, 2001 terrorist attacks, a new alternative, "Alternative D - Enhanced Safety and Security Plan," has been added to the range of alternatives being considered by the Federal Aviation Administration (FAA) and the City of Los Angeles - Los Angeles World Airports (LAWA) for the proposed Master Plan.

In January 2001, the FAA and City of Los Angeles published a Draft EIS/EIR addressing three build alternatives for the Master Plan, identified as Alternatives A, B, and C, as well as the No Action/No Project Alternative. That Draft EIS/EIR was made available for public review and comment from January 18, 2001, to November 9, 2001. During that time, substantial public input was received regarding alternatives to be considered for the LAX Master Plan. Additionally, the terrorist attacks of September 11, 2001 have had a substantial influence on how airports now operate, including increased attention to, and provisions for, airport safety and security. Alternative D was subsequently formulated and refined in 2002 to provide an additional option for the LAX Master Plan. 

This Supplement to the Draft EIS/EIR serves to integrate Alternative D into the existing environmental review process for the LAX Master Plan, providing a level and extent of analysis comparable to that which was previously prepared for the other alternatives addressed in the January 2001 Draft EIS/EIR. It also serves to present certain supplemental information and analysis that apply to all of the alternatives. Such information and analysis are based upon the availability of new or updated information since publication of the Draft EIS/EIR in January 2001. 

This draft environmental analysis is being widely distributed to the public and to various local, state and federal government agencies so that they may comment on Alternative D and the new impact analysis during public hearings and in writing. LAWA and FAA will prepare written responses to the comments. In preparing the Final EIS/EIR, LAWA and FAA will assess and consider comments both individually and collectively, and will respond by modifying alternatives, developing and evaluating new alternatives, supplementing the analysis, making factual corrections, or explaining why the comments do not warrant further response, citing appropriate authority and reasons. LAWA and FAA will also respond by one or more of these means to the comments made on the Draft EIS/EIR and will provide their responses to comments on the Draft EIS/EIR and Supplement in the Final EIS/EIR.

Purpose and Need Statement for the Project

The purpose and need for the LAX Master Plan has not changed since the publication of the Draft EIS/EIR. An overarching consideration during the planning process has been to achieve the project objectives in an environmentally sound manner. In particular, the Master Plan project objectives are to:

- ◆ Respond to **local and regional demand** for air transportation during the period 2000-2015, taking into consideration the amount, type, location, and timing of such demand.
- ◆ Ensure that new investments in airport capacity are efficient and cost-effective, maximizing the return on **existing infrastructure capital**. 
- ◆ Sustain and advance the international trade component of the regional economy and the **international commercial gateway** role of the City of Los Angeles.

Description of Alternatives Studied in Detail

The alternatives evaluated in the Draft EIS/EIR and this Supplement to the Draft EIS/EIR are the end result of eight years of the Master Plan process, ongoing scientific study, several hundred informal community meetings and an extensive formal public comment period for identification of project issues for the environmental analysis (scoping). In addition to the No Action/No Project Alternative, the Supplement to the Draft EIS/EIR and the Draft EIS/EIR analyze a total of four "build" alternatives.

Summary of Comments on SEIS 00 Main Document v05 final 06 17 2003.PDF

If "the purpose and need for the LAX Master Plan has not changed since the publication of the Draft EIS/EIR" and there have been significant political event changes in addition to the Mayor's no expansion pledge, why is one of the three major project objectives to "Ensure that new investments in airport capacity are..." Also, we are told that the major emphasis is for "Security and Safety." Why is this not even mentioned in the list of project purpose and need?

Executive Summary

Table ES-1, Summary of Activity - Comparison of Alternatives, and Table ES-2, Summary of Features - Comparison of Alternatives, present key physical characteristics and projected activity levels of each build alternative as an aid to comparison to the No Action/No Project Alternative, the CEQA Environmental Baseline, and the "unconstrained" airport (e.g., number of runways, number of passengers accommodated, tons of air freight accommodated, daily flights, land acquisition, relocation of homes and businesses).

Note: Discrepancies occur between Summary of Features - Comparison of Alternatives, of The Executive Summary of the Draft EIS/EIR, and Table 3-4, Los Angeles International Airport Master Plan Summary of Facilities by Alternatives - 2015, within Chapter 3 of the Draft EIS/EIR. The information presented within Table ES-2 of the Supplement to the Draft EIS/EIR, is consistent with that of Table 3-4 of the Draft EIS/EIR, unless otherwise noted to reflect further updates and corrections. To the extent that discrepancies exist between the table in the Executive Summary of the Draft EIS/EIR, Table ES-2 in the Supplement to the Draft EIS/EIR, and Table 3-4 in the Draft EIS/EIR, Table 3-4 and Table ES-2 are controlling.

¹ NA/NP = No Action/No Project
² Estimated future building space requirement. Actual building size will be refined as part of project-level design activities.
³ Excludes LAWA-owned on-airport properties.
⁴ MSF = Million Square Feet
⁵ This information has been revised since publication of the Draft EIS/EIR. This table uses consistent methodology for calculating NBEG based on a wingspan size factor for each nominal gate position based on the largest aircraft that can be accommodated on a particular gate. NBEG calculations in the Draft EIS/EIR converted terminal frontage to NBEG regardless of existing gate positions and their associated fixed infrastructure. Both methodologies are acceptable practice and the methodology presented herein better reflects the limitations of the existing remaining gates.
⁶ Under Alternative D, the existing vehicle trip cap for LAX Northside would be reduced to limit vehicle trips to a level comparable to that of the Westchester Southside project. As such, full development of the 4.5 million square feet of uses currently entitled for LAX Northside would not occur under Alternative D. As the exact nature and amount of land uses have not been specified to correspond with this cap, it is assumed, for purposes of impacts analysis that LAX Northside would be fully built out relative to all environmental topics except traffic and traffic-related issues such as air pollutant emission and noise.
⁷ This information has been revised since the publication of the Draft EIS/EIR. Under Alternative A, Manchester Square is assumed to be redeveloped with commercial/light industrial uses independent of the Master Plan.
⁸ Modified since publication of the Draft EIS/EIR to correct an error in the Draft EIS/EIR. This modification does not alter the conclusions of the Draft EIS/EIR.
⁹ Only ready-return (does not include storage support).
¹⁰ Includes airport police, central utility plant, LNG/CNG station, ground run-up enclosures, and Coast Guard building.

 If LAWA doesn't own Manchester Square, why does it assume airport use in all but Alternative A? How is it going to be procured? Eminent Domain? Why is it in conflict with the W-PdR Community Plan?

The following mitigation measure from Section 4.21, *Design, Art and Architecture Application* of this Supplement to the Draft EIS/EIR, shall be implemented to reduce visual effects from construction:

◆ **MM-DA-1. Construction Fencing (Alternatives A, B, C, and D).**

The following mitigation measure from Section 4.21, *Design, Art and Architecture Application/Aesthetics*, of this Supplement to the Draft EIS/EIR, shall be implemented to reduce potential impacts resulting from the alignment of the LAX Expressway on residents on Thornburn Street:

◆ **MM-DA-2. LAX Expressway View Analysis (Alternatives A, B, and C).**

The following mitigation measures from Section 4.21, *Design, Art and Architecture Application/Aesthetics*, of this Supplement to the Draft EIS/EIR, shall be implemented to reduce potential impacts resulting from development of the Scattergood Fuel Farm on residents on Loma Vista Avenue:

◆ **MM-DA-3(a). Scattergood Visual Effects (Alternative B).**

◆ **MM-DA-3(b). Scattergood Visual Effects (Alternative B).**

The following mitigation measures from Section 4.10, *Biotic Communities*, of this Supplement to the Draft EIS/EIR, shall be implemented to reduce potential impacts resulting from installation of navigational aids in the Los Angeles/El Segundo Dunes:

◆ **MM-BC-10. Replacement of State-Designated Sensitive Habitat (Alternative A).**

◆ **MM-BC-11. Replacement of State-Designated Sensitive Habitat (Alternative B).**

◆ **MM-BC-12. Replacement of State-Designated Sensitive Habitat (Alternative C).**

◆ **MM-BC-13. Replacement of State-Designated Sensitive Habitat (Alternative D).**

The following mitigation measure from Section 4.11, *Endangered and Threatened Species of Flora and Fauna*, of this Supplement to the Draft EIS/EIR, shall be implemented to reduce potential impacts resulting from the installation of navigational aids on the El Segundo Blue Butterfly Habitat Restoration Area:

◆ **MM-ET-2. El Segundo Blue Butterfly Conservation: Habitat Restoration (Alternatives A and B).**

◆ **MM-ET-4. El Segundo Blue Butterfly Conservation: Habitat Restoration (Alternative D).**

The following mitigation measure from Section 4.18, *Light Emissions*, of this Supplement to the Draft EIS/EIR, shall be implemented to reduce potential light and visual impacts on nearby residents resulting from development of the LAX Expressway:

◆ **MM-LI-1. LAX Expressway Lighting Assessment (Alternatives A, B, and C).**

4.2.9 Level of Significance After Mitigation

4.2.9.1 Alternatives A, B, C, and D

The level of significance after mitigation as described for Alternatives A, B, and C in Section 4.2, *Land Use* (subsection 4.2.9), of the Draft EIS/EIR has been modified to include revised and new mitigation measures as presented in Section 4.1, *Noise* (subsection 4.1.8), and *Land Use* (subsection 4.2.8), of this Supplement to the Draft EIS/EIR. The new and revised measures add specificity, clarify language, and address exposure to significant single event noise levels that could result in nighttime awakenings and classroom disruption. After accounting for these new or revised mitigation measures, which also apply to Alternative D, certain areas affected by aircraft noise associated with the proposed action would still be faced with impacts that would, under CEQA, remain significant after mitigation. Impacts that would remain significant after mitigation include:

- ◆ **1** Impacts where aircraft noise levels of 75 CNEL or greater affect residential properties with exterior cognizable private habitable areas such as backyards, patios, or balconies as well as other outdoor community areas where noise would interfere with speech and other activities (this would not occur under Alternative C).

Greater outside impacts under Alt D. Why? What specific areas?

4.2 Land Use

- ◆ Interim impacts that would occur prior to completion of noise insulation or recycling of incompatible land use associated with exposure to 65 CNEL or greater noise levels, 94 dBA SEL or greater noise levels, and single event overflight noise resulting in classroom disruption as defined by MM-LU-4.
- ◆ [1]ome school uses would still be exposed to significant single event noise impacts even after incorporation of MM-LU-4 due to high single event noise levels that would result in classroom disruption when classroom activities take place outdoors.
- ◆ Impacts on incompatible uses ineligible for insulation due to inconsistent zoning or land use designations (i.e., residential uses on land designated for industrial use);
- ◆ [2]oise impacts on substandard housing units that are not feasible to insulate due to structural [3]onstraints or other factors associated with bringing properties into compliance with building codes.
- ◆ High construction noise levels would occur at residential and noise-sensitive land uses within 600 feet of construction sites.

[5]lthough increases in outdoor noise levels within the 65 to 75 CNEL contours would occur under the build alternatives, these increases would not exceed thresholds of significance. However, it is acknowledged that such increases may be perceptible and could affect outdoor speech and the quality of certain outdoor activities.

4.3 Surface Transportation

4.3.1 On-Airport Surface Transportation

4.3.1.1 Introduction

The on-airport surface transportation section addresses traffic-related issues inside the airport boundaries as more fully described in Section 4.3, *Surface Transportation* (subsection 4.3.1), of the Draft EIS/EIR. Additionally, Technical Reports 2.a, *On-Airport Surface Transportation Data* and 3.2, *On-Airport Surface Transportation Technical Report*, of the Draft EIS/EIR provide detailed supporting data regarding existing transportation operations, traffic modeling efforts and analysis of future on-airport conditions for the No Action/No Project Alternative and Alternatives A, B, and C. Technical Report S-2a, *Supplemental On-Airport Surface Transportation Technical Report*, of this Supplement to the Draft EIS/EIR, contains detailed information regarding existing transportation operations, traffic modeling efforts, and analysis of future on-airport conditions for Alternative D.

4.3.1.2 General Approach and Methodology

The analysis of On-Airport Surface Transportation presented below is based on the general approach and methodology described in Section 4.3.1, On-Airport Surface Transportation (subsection 4.3.2), of the Draft EIS/EIR. In addition, the analysis completed for this Supplement to the Draft EIS/EIR includes consideration of updates to the baseline conditions (see Section 4.3.1.3 below), and the scope of analysis for construction traffic affects of Alternative D. Changes in the general approach and methodology incorporated into this Supplement to the Draft EIS/EIR include the following:

- ◆ Existing airport conditions were defined by a traffic data survey conducted in 1995, plus additional traffic data collected in 1996 and 1997. To ensure that this data remains valid, traffic volumes entering and exiting the CTA were tabulated for the Year 2000 and compared to the original data. The findings of that comparison are described below in Section 4.3.1.3, *Affected Environment/Environmental Baseline*.
- ◆ The construction analysis for Alternative D follows the same general approach and methodology as used in the Draft EIS/EIR evaluation of the other alternatives; however, given that Alternative D involves substantially more modifications to the CTA and the related on-airport surface transportation system than the other alternatives, the analysis of Alternative D includes a more extensive evaluation of impacts to this system during the peak construction period. Based on the anticipated construction phasing of the components of Alternative D, the peak construction period would occur in the year 2008, whereas the assumptions for Alternatives A, B, and C addressed in the Draft EIS/EIR provided a basis to evaluate construction impacts for those alternatives in the years 2004 and 2013.

In addition to construction traffic, the number of origin and destination (O&D) passengers affects ground transportation forecasts. The airport traffic volumes used in this analysis represent peak summer airport operations. For Alternative D, the peak construction period traffic demands were determined to occur in the second quarter of 2008 and, similar to the approach used in evaluating the other alternatives, were added to the airport peak period traffic demands on an average summer weekday. The resulting traffic volumes and impacts depict the highest construction traffic scenario.

Evaluating construction impacts required two primary tasks: adding the construction traffic to the airport-related ground access demands, and reviewing the routes of the construction traffic model to determine where construction projects would adversely impact the on-airport ground access operations (e.g., detours, road closures, etc.). The construction scenario was analyzed in particular for capacity deficiencies that are expected to occur during this period.

To conduct the capacity analyses for the construction phases of Alternative D, traffic conditions were modeled with the Advanced Landside Performance Simulation (ALPS)TM computer modeling program used for the analysis of 2015 on-airport traffic conditions. Assumptions were made for the construction model with respect to the transportation network, trip generation, and trip distribution.

Table S4.3.1-1

CTA Traffic Comparison, Baseline to Year 2000

Time Period	CTA Traffic		
	Inbound	Outbound	Total
A.M. Commuter Peak Hour			
March 1997 ¹	4,100	3,280	7,380
March 2000 ²	3,760	3,170	6,930
Percent Increase/(Decrease) between 1997 and 2000	(8.3%)	(3.4%)	(6.1%)
Airport Peak Hour			
August 1996 ³	5,910	5,380	11,290
August 2000 ⁴	6,500	5,600	12,100
Percent Increase/(Decrease) between 1996 and 2000	10.0%	4.1%	7.2%
P.M. Commuter Peak Hour			
March 1997 ⁵	4,160	4,480	8,640
March 2000 ⁶	4,390	4,410	8,800
Percent Increase/(Decrease) between 1997 and 2000	5.5%	(1.6%)	1.9%
Combined Peak Hours			
1996 / 97	14,170	13,140	27,310
2000	14,650	13,180	27,830
Percent Increase/(Decrease) between 1996/97 and 2000	3.4%	0.3%	1.9%

¹ Peak hour defined as 8:00 a.m. to 9:00 a.m.; Source: Update Existing Conditions to 1996, On-Airport Transportation; June 9, 1998; Leigh Fisher Associates.

² Average of peak hour traffic on March 17 and 24, 2000

³ Peak hour defined as 11:00 a.m. to 12:00 noon.; Source: Update Existing Conditions to 1996, On-Airport Transportation; June 9, 1998; Leigh Fisher Associates.

⁴ Average of peak hour traffic on August 4, 11, and 18, 2000

⁵ Peak hour defined as 5:00 p.m. to 6:00 p.m.; Source: Update Existing Conditions to 1996, On-Airport Transportation; June 9, 1998; Leigh Fisher Associates.

⁶ Average of peak hour traffic on March 17 and 24, 2000

Source: Los Angeles World Airports, LAX AVI Traffic Count Data; Landrum & Brown, 2003.

The results of the surveys completed for Year 2000 conditions showed no material or consistent change in traffic growth or reduction in on-airport traffic since August 1996/March 1997. Although some traffic did shift between peak hours, the overall change in traffic was minimal. The slight increase in the combined peak hour traffic volumes (1.9 percent for total traffic) indicates that the continued use of the 1996/97 traffic volumes as the baseline for analysis is a conservative approach, since the lower existing volumes would result in a larger change in traffic resulting from the projects. This would lead to an indication of more impacts resulting from the build alternatives. Further, there were no material infrastructure changes that were not already anticipated between 1996/97 and 2000 (i.e., improvements that were already planned and approved, as accounted for in the No Action/No Project Alternative).

- ◆ The airport provides both close-in and remote parking for short-term and long-term parking patrons, as illustrated in **Figure S4.3.1-2, Existing (1996) Parking Levels of Service**. **Table S4.3.1-2, Public Parking Comparison, Baseline to Year 2000**, provides a comparison of the public parking demands at LAX from the August 1996/March 1997 baseline to Year 2000. Similar to the CTA traffic comparison, there is no material or consistent change in the parking demand between the baseline years and Year 2000. The March comparison shows that parking slightly decreased between the baseline year and 2000, while the August analysis shows that parking slightly increased during that month.
