- ▶ If the Automated People Mover concept is to be pursued, we ask that LAWA consider the possibility of building a grade level (surface) operation, with blast diffusion techniques and materials applied to a protective wall and an armored one-way-transparent canopy for the length of the track
- ▶ Overall this part of the Plan is conceptual and idealistic. It lacks data that is essential to show how and when the processes interconnect and will be successfully negotiated while achieving safe dispersal objectives. If the main part of the Addendum (Page 2-35) is correct in its description of the intended screening activity (i.e., "*random checking of baggage and passengers using sniffing dogs, video surveillance systems and other security devices*") then the Automated People Mover will be vulnerable. Acceptance of that risk is a matter for public policy debate, but moving walkway bridges would obviate need for the Automated People Mover. We request comment and discussion on each of the points raised in this item.

Discussion of the Expanded FlyAway (Ch. 6.7.1) attempts to instill confidence in a speculative system to protect buses from becoming unwitting vehicles for terrorist attack. We have already expressed our doubts on this topic, including the considerable physical spread of the security requirement, the attendant cost, and serious questions as to the ability to control bus security within remote stations and in transit. The FlyAway bus operations would come inside the concentric circles, and it is unclear how the protection would be achieved. The technology to address these

concerns (such as under-vehicle inspections) is simplistic and conceptual. Please provide more detail concerning this system, with discussion of the attendant human resource requirements.

In the Chapter 8 Summary, Appendix I uses a subtitle 'Alternative D Advantages and Disadvantages.' It then lists five primary advantages followed immediately by three 'potential enhancements'. We request that LAWA provide more explanation of each, as we believe they merit greater priority. Note that the first suggests the provision of a Vehicle Inspection Center. We have already made reference to the need for this in roadway planning.

We believe that the Remote Delivery Facility will become a reality for many critical government facilities in the United States over the next 5 years, closely followed by other critical infrastructure sectors including commercial airports. It is already operating policy for a variety of private and public sector facilities in different parts of the world, and has seen an increase since the Anthrax mail attacks of late 2001. Accordingly, we ask that LAWA give serious consideration to an extension of this prospective facility to include an Identification and Authorization Processing Center, including some discussion in the response to this comment.

During this review we have established an unquantifiable but extensive (potentially massive) future demand for data input, retrieval, analysis, interpretation and sharing. The data will be diverse, covering audio & visual, electronic signaling, text, numerical, pictorial, computer code, identification systems, people, vehicles, transactions etc. etc. Our understanding of the transactional volume and complexities for a busy international airport shows that a dedicated Identification and Authorization Processing Center is justified to monitor the demand for access to different parts of the airport. This security-controlled service provides identification and clearance for individuals and vehicles, engaging electronic tagging, biometrics, and the administration of airport asset and airside vehicle tracking. Variables allow for individual issue of identification and access control media whether the subject is escorted or unescorted, permanent or temporary, urgent or routine. This facility should be off-airport, based on long established methods employed overseas. The processes will relate directly to the interests of law enforcement agencies and the security resource. This facility should be located close to the planned new police headquarters. Please comment on the possibility of incorporating these suggestions into the Master Plan.

The third enhancement described in Appendix I relates to the Automated People Mover, previously discussed in this review. There is, however, *a distinct and in fact total, absence of listed disadvantages relating to Alternative D security.* Our concerns are deepened by the fact that Appendix I lists 5 disadvantages of the No Action/No Project Alternative and then proceeds to mix conceded points with counter argument on 5 other points, thereby maintaining absolute opposition to the No Action/No Project Alternative. A similarly critical eye needs to be cast upon all alternatives. The current approach significantly weakens the value and integrity of the discussion as a comparative analysis, and echoes the concerns for bias and lack of full disclosure that we have stated elsewhere. We request that LAWA provide a full discussion of the disadvantages associated with the proposed security plans for each of the project Alternatives.

4.1.6 Other Security Considerations

In a project of this size, with a title of the Safety and Security Alternative, the County of Los Angeles would expect the LAX Master Plan Alternative D to embrace a total security concept. It is

therefore notable that the documentation does not elaborate on plans to secure areas that are known to have major security implications, such as cargo, maintenance hangars and facilities, fuel farm operations, and the perimeter fence lines. During an airport environs tour, the review team saw many security exposures at the west end of LAX and witnessed extreme weaknesses in access control allowing commercial delivery vehicles to enter facilities unchecked (in one instance by simple tailgating). This unauthorized access provided close quarter observation and potential access to parked wide body passenger aircraft in the vicinity. Please comment on this apparent lack of existing security at the west end, and any plans to remedy the situation.

We are aware that in a September 2002 press release, Mayor Hahn announced installation of more than 1,200 video cameras throughout the airport complex. We are unsure whether the word 'complex' refers to all LAWA managed airports, or just LAX; please clarify. We also request discussion of the current status of this project; is it correct that bids have been invited for installation of surveillance technology on the LAX perimeter? With respect to perimeter areas, we offer the following comments, along with a request that LAWA respond to each:

- The Alternative D Plan provides a substantial, expensive (albeit imperfect) protection system for the 'front door' to LAX. But it leaves the back door wide open.
- LAWA should give much more effort to security planning for the individual cargo area, the maintenance and fuel farm complex and roadways, and for the entire perimeter. Otherwise there is a danger that the environmental impact will not receive public scrutiny or will consume unacceptable time when that becomes urgent and essential.
- It is evident that LAX is vulnerable and that security improvements are relatively urgent. LAWA should prioritize the work so that the new security enhancements, when selected, come on stream as early as practicable. Special need exists for a thoughtful security risk management program during construction.
- Serious consideration should be given to the permanent closure of Pershing Drive to public access, and to introduction of a controlled, partially-automated access and egress system for vehicles with legitimate business in the maintenance, fuel farm and employee parking areas.
- In 1994 the Irish Republican Army fired four mortar bombs onto the runway at London Heathrow from a pick-up truck parked outside the perimeter fence. Two bombs hit the runway but failed to detonate. Two more recent attempts to attack aircraft with rocket-propelled grenade have occurred in Africa and at a military air base in the Middle East. The vulnerability arising from use of surface-to-air missiles is acute at the western end of the LAX airport environs. The location of the Segundo Blue Butterfly Habitat/Reserve, the topography and rough shrub cover, is almost perfect for the launch of shoulder-fired missiles and offers target range proximity to ascending and descending aircraft. As disturbing as it may be to be so candid, it is necessary to point out that a passenger, cargo and fuel laden wide-body passenger aircraft heading out for a long haul trans-Pacific flight could be attacked without sufficient time to implement successful counter measures. The suicidal nature of modern day terrorist attack reduces the notional response time even further. We recommend that an urgent and intensive review be undertaken to address this vulnerability and to proffer solutions that meet both public safety and environmental review requirements.
- Security and law enforcement personnel requirements merit discussion, as the number and need for specialized training would increase under Alternative D. For the sake of efficiency and public safety, this review should consider ways to reduce potential for jurisdictional and operational law enforcement conflict. It is our understanding that senior officers of the Los

Angeles Police Dept. in 1991 proposed a merger of policing entities for the airport, but without progress at that time. This may be a good opportunity to revisit that proposal.

4.2 THE ENVIRONMENTAL JUSTICE ASSESSMENT IS DEFICIENT

Presidential Executive Order 12898, issued in February 1994, requires all federal agencies to analyze environmental justice impacts when proposing public projects. The analysis is intended to determine whether minority and low-income communities are unfairly burdened by project impacts, with the goal of using mitigation measures to create a level playing field. In 1999, Senate Bill 115 was passed making environmental justice a requirement of CEQA as well (PRC §.72000-72001).

Despite the importance of this subject, the original Draft EIS/EIR was found to lack even the most elementary NEPA requirements for this topical issue. Review of the Supplement to the Draft EIS/EIR indicates that many of the same deficiencies in the analysis remain. The impacts associated with Environmental Justice demand a far more rigorous analysis than has been provided in the 2001 and 2003 environmental reviews. As discussed below, NEPA requires that information be included in the EIS if costs of obtaining the information are not exorbitant. Where such costs are exorbitant, NEPA requires that the EIS: (1) state that the information is complete or unavailable; (2) state the relevance of the information to the analysis; (3) summarize credible scientific information about the impacts; and/or (4) use other methods of assessing impacts that are generally accepted by the scientific community. CEQA also addresses the issue of analytic detail, requiring that an EIR provide information and analyses with a sufficient level of detail to permit informed decision-making and public participation. LAWA must apply these very basic NEPA and CEQA requirements to the SDEIS/EIR assessment of Environmental Justice.

We are also concerned about the method used to compare alternatives in the environmental justice analysis. In both the 2001 and the 2003 documents, the No Project Alternative incorporates future planned improvements that were not actually being built, and overstates the capacity of existing facilities. Consequently, the No Project Alternative appears to have far more environmental impacts than any of the proposed Build Alternatives.

Further, the 2003 Supplemental Draft EIS/EIR describes Alternative "D" as an option that would limit growth to 78 MAP. However, as described previously in § 3.1, Alternative D provides 153 fully functional, high capacity gates and does not remove concrete areas that can be used for aircraft parking. By parking aircraft, Alternative "D" can function as though it has over 200 gates. In overstating the capacity of the No Project Alternative and minimizing the capacity of the build alternatives, the impacts relating to air emissions, air toxics, noise, and traffic are all underestimated for the build alternatives. *Underestimating these impacts skews the environmental justice assessment.* This is particularly true for Alternative "D," which shifts many of the impacts toward the more economically disadvantaged communities east and northeast of LAX.

Finally, in designing runway extensions and facilities to the east under Alternative D, this plan appears to protect biological resources (especially the El Segundo Blue Butterfly) at the expense of residents in Lennox, Inglewood & Manchester Square. As part of the Environmental Justice assessment, a revision to the 2003 Supplemental Draft EIS/EIR needs to be made that compares the disproportionately high and adverse human health and environmental effects that will be incurred by

minority and/or low-income communities in order to protect a limited habitat area on the coast (see also our discussion under § 3.4.5). Our concerns are discussed further in the sections below.

4.2.1 Results of Scoping Outreach Must Be Discussed

Scoping is a public process, required by NEPA, that should be conducted as early as possible after a Lead Agency decides to prepare an EIS. The scoping process is designed to determine the scope of issues to be addressed in an EIS, and should be conducted as early as possible after a Lead Agency decides to prepare an EIS. It is intended to be an open process, incorporating the views of other agencies and the public regarding the scope of an EIS.

Environmental Justice issues are usually a major component of the scoping process, and the 2001 Draft EIS/EIR does list 126 outreach efforts with low-income and minority communities and Appendix S-D of the 2003 Supplemental Draft EIS/EIR includes copies of the material (in both Spanish and English) handed out during these outreach efforts. The 2003 SDEIS/EIR also lists four additional Environmental Justice Workshops conducted in 2001. However, neither the 2001 DEIS/EIR nor the 2003 SDEIS/EIR provides an indication of concerns or issues raised by those that were contacted, or details of what transpired during these meetings. The public is thus unable to assess whether or how LAWA may have used the information developed through these efforts. The County of Los Angeles hereby requests that the 2003 SDEIS/EIR be expanded to include specific descriptions of the efforts made to gather information from low-income and minority communities, with a table that identifies the specific concerns raised by each of these groups and discusses LAWA's steps to address those concerns.

4.2.2 The Level of Analytic Detail is Inadequate²³

Many potential Environmental Justice impacts were not fully evaluated, reportedly because LAWA was unable to quantify the impacts. NEPA states that when information is incomplete or unavailable, the Lead Agency must obtain that information unless costs are exorbitant.²⁴ According to CEQA, the analysis must be specific enough to permit informed decision-making and public participation. The following subsections include some of the impact discussions considered inadequate.

In discussing Air Quality and Health Effects, the 2001 Draft EIS/EIR and the 2003 Supplement both state: "Due to the lack of available background data and limited information on the cumulative effect of multiple air pollutants, the effect of the Master Plan on cumulative health risks among minority and low-income population cannot be quantified or fully analyzed." NEPA regulations do not permit such a deferral of obligation. All available data must be included, consistent with the mandate of NEPA, and the report must document the efforts made to obtain needed data. Where data is found to be unavailable or limited, the report should identify the cost associated with developing original data and indicate why such cost was determined to be exorbitant in the context of overall project costs.

The 2001 Draft EIS/EIR further asserts, "*Due to the lack of available background data, the cumulative or synergistic health effects of [toxic air pollutants (TAP)] emissions associated with the*

²³ 2001 Draft EIS/EIR, Section 4.4.3.

²⁴ NEPA Guidelines ; 40 C.F.R. § 15022.22.

build Alternatives and other environmental hazards could not be quantitatively analyzed within the scope and timeframe of this Draft EIS/EIR.” The 2003 SDEIS/EIR dropped this discussion and did not provide new information related to cumulative or synergistic health effects. The 2003 Supplemental Draft EIS/EIR could and should have made assumptions in order to determine such impacts. The County asks that LAWA develop and apply these assumptions to a quantitative analysis of the cumulative and synergistic health effects of TAP emissions associated with the build Alternatives and other hazards.

4.2.3 The Relocation Plan and Requirements are Unsubstantiated²⁵

The 2001 Draft EIS/EIR stated that, *“Minority-owned businesses or businesses with a high proportion of minority employees or minority/low-income customers may face special challenges that need to be considered in developing a Business Relocation Plan”* but provided no explanation or definition of “special challenges.” LAWA needs to clarify this term and indicate how these challenges would be considered in developing a business relocation plan.

The 2001 Draft EIS/EIR further stated that, *“Data is currently not available regarding the number of minority owned businesses or minority employees that might be affected by proposed acquisition.”* In fact, the referenced data is generally available and can be obtained with reasonable effort. LAWA must obtain and analyze this data in the SDEIS/EIR.

The 2003 assessment of Alternative D relocation impacts includes this statement: *“While it is possible that certain of these businesses may be minority owned, they are mostly airport related uses or uses that serve the largely non-minority/non-low-income community of Westchester-Playa del Rey.”* This statement is unsubstantiated by any facts presented in the 2001 Draft EIS/EIR or the 2003 SDEIS/EIR. Neither of these documents presents data showing how many businesses are minority owned or serve minority communities. The County requests that LAWA present such information in the SDEIS/EIR.

4.2.4 Noise Impact Mitigations Require Further Discussion

Both the 2001 and 2003 environmental documents assert that *“Certain areas affected by noise would still be faced with significant impacts due to constraints that apply most directly to minority and/or low-income communities. These include residential areas ineligible for mitigation due to inconsistent zoning or land use designations and substandard housing that may be infeasible to insulate.”*²⁶ At the very least, the 2003 Supplemental Draft EIS/EIR needs to clearly delineate the location of these impacted areas. A more appropriate solution would be to identify and implement specific mitigation measures to reduce impacts on minority neighborhoods; the document did not contain any noise mitigation measures, as discussed in detail later in this report.

4.2.5 LAWA Must Develop a Build Alternative Based on Community Input

Scoping is intended to be an open process, incorporating the views of other agencies and the public regarding the scope and focus of the EIS. CEQ regulations require Federal Agencies to identify an environmentally preferable alternative in the record of decision.²⁷ When the agency has identified a

²⁵ Discussion in this section is based on 2001 Draft EIS/EIR, §4.4.3 and SDEIS/EIR §4.4.3.

²⁶ 2001 Draft EIS/EIR, Section 4.4.3, Page 4-423; Supplemental Draft EIS/EIR, Section 4.4.3, Page 4-323.

²⁷ NEPA Guidelines: 40 C.F.R. § 1505.2(b)

disproportionately high and adverse human health or environmental effect on minority and/or low-income populations, as occurs in the 2001 and 2003 EIS/EIR documents, NEPA requires that the distribution as well as the magnitude of the disproportionate impacts should be a factor in determining the environmentally preferable alternative. This mandate is evidence in the following excerpt from the CEQ Environmental Justice Guidance document:²⁸

“Agencies should encourage the members of the communities that may suffer a disproportionately high and adverse human health or environmental effect from a proposed agency action to help develop and comment on possible alternatives to the proposed agency actions as early as possible in the process.”

To conform to these requirements, LAWA and FHWA must develop an environmentally superior alternative based in part on input from members of minority and/or low-income communities that may suffer a disproportionately high and adverse human health or environmental effect. The 2001 Draft EIS/EIR and the 2003 Supplemental Draft EIS/EIR are void of any evidence indicating that comments or input offered by impacted members of minority or low-income communities were considered in developing an environmentally superior alternative. LAWA must revise the 2003 SDEIS/EIR to incorporate an environmentally superior alternative.

4.2.6 The Area of Analysis is Arbitrarily Limited

The Environmental Justice analysis of existing conditions and impacts focuses only on census tracts surrounding LAX. LAWA completed no regional analyses, although it was stated that the area of included the region as a whole. The analysis needs to be expanded to incorporate the region that is referenced in § 2 titled the Purpose and Need for the Proposed Action in both the 2001 Draft EIS/EIR and the 2003 Supplemental Draft EIS/EIR.

4.2.7 Environmental Justice Mitigation Measures are Vague and/or Deferred²⁹

The 2003 Supplemental Draft EIS/EIR describes Environmental Justice mitigation in vague terms, deferring some of the mitigation to future studies. For example, aircraft noise mitigation measure MM-LU-1 (2003 SDEIS/EIR) states that LAWA will revise the Aircraft Noise Mitigation Program (ANMP) to include:

“Aspects that are particularly relevant to addressing the unique issues and conditions in minority and low-income areas include provision by LAWA of additional technical assistance to local jurisdictions to support more rapid and efficient mitigation, and the reduction and elimination of structural and building code compliance constraints to mitigation of substandard housing.”

Although the language suggests that LAWA has addressed this problem, the measure does not in fact commit LAWA to any definable actions that would reduce impacts. The 2003 SDEIS/EIR also describes future studies as mitigation. Of particular concern is mitigation measure MM-LU-3 calling for a study of the relationship between aircraft noise levels and the ability of children to learn:

²⁸ Environmental Justice Guidance Under NEPA, Section 5, page 15.

²⁹ Discussion is based on review of 2003 Supplemental Draft EIS/EIR Section 4.2.8.

“This measure requires that LAWA conduct a comprehensive study to determine the relationship between learning and the disruptions caused by aircraft noise with the intent to set a threshold of significance for classroom disruption due to aircraft noise”

This description suggests that the children of disadvantaged communities may be subjected to harmful noise levels in order to define thresholds of significance. A more responsible and conservative approach is needed that does not have the potential to do additional harm.

While the 2003 Supplemental Draft EIS/EIR elaborates on mitigation concepts more fully than the 2001 document, in many cases the mitigations still do not commit LAWA to definable actions that meet the CEQA and NEPA requirement to avoid, minimize, rectify, reduce, or compensate for adverse project impacts. All identified adverse impacts need to be accompanied by specific and defined mitigation measures. LAWA must evaluate the efficacy of the proposed measures in reducing identified primary and secondary impacts. The EIS/EIR should clearly identify impacts for which no measures are proposed, and should provide an indication of their severity. LAWA should then offer the amended analysis for public review and comment as part of a revised (or entirely new) Draft EIS/EIR. Only by these means can the EIS/EIR achieve adequacy with respect to the analysis of Environmental Justice.

4.3 TRAFFIC ASSESSMENT

4.3.1 The LAX Interchange at Lennox Boulevard

If Alternative D is chosen for the LAX Master Plan, the County of Los Angeles recommends the LAX Interchange be constructed on the 405 Freeway at Lennox Boulevard. The LAX Interchange would provide direct access between the 405 Freeway and LAX and significantly reduce the traffic impact of LAX on the unincorporated Lennox community and surrounding area. The name “LAX Interchange” is recommended, rather than Lennox Interchange, is to avoid the impression that motorists on the 405 Freeway can exit the freeway and travel to Lennox. Additionally, some form of interchange at Lennox Boulevard is recommended regardless of the plan chosen for LAX. Traffic demand at LAX is expected to increase steadily to the 78.9 MAP, even under the no-build scenario. Therefore, intersection or interchange improvements will be needed to mitigate LAX’s traffic impact on the Lennox community and nearby area.

County staff has met with Mr. Bruce McDaniel, Superintendent of the Lennox School District, and his staff to consider the School District’s input about the LAX Interchange. In response to their concerns, County staff informed the School District that the EIR/EIS for the LAX Interchange would include a noise study of the proposed interchange ramps. County staff also informed Mr. McDaniel the study would consider Lennox School District’s new pre-school recently constructed at the west end of 106th Street. Mr. McDaniel also expressed concern that the LAX Interchange may affect the visibility of signs to be installed on Lennox School District property adjacent to the LAX Interchange. Public Works referred the School District’s concern about the signs to LAWA’s representatives for their review and response.

4.3.2 Traffic Model Questions

A. C. Lazzaretto retained Mr. Terry Austin of Austin Foust and Associates to review the traffic model used in the LAX traffic study. Public Works staff coordinated its traffic review with Mr. Austin, and agrees with the questions and concerns raised by Mr. Austin in the discussion below.

Trip Generation: The trip generation table (Attachment A in Technical Report S2B) gives information by activity component but is hard to follow for the “Airport Miscellaneous” category. For example, what items represent the trip generation for the 12,400 space west employee parking structure and the 1,300 east employee parking structure? With respect to the employee trips, why are 54 percent assigned to the east parking structure with 1,300 spaces and only 46 percent to the 12,400-space west parking structure? (See Page 22 of the Supplemental On-Airport Surface Transportation Technical Report).

Trip Distribution: The trip distribution diagram (Figure B-1) is difficult to follow (while not labeled, it appears to be airport peak hour trips). Is there information that can more clearly show the trip distribution? The methodology discussion suggests that employee/other trips have a different trip distribution than air passenger trips. This would certainly be appropriate, but there does not appear to be any elaboration on this or any quantitative description.

General: There does not appear to be a reference for a description of the traffic model. There presumably is such a report which describes the model and provides a peak hour intersection level validation. Other questions that are also presumably addressed in that document pertain to the intersection forecasting process. For example, does the traffic model use post-processing for year 2015, and if so, is it 2000-2015 or some other interval? If there is no post-processing, then considerable reliance is being placed on the raw modeled data for 2015. This is particularly critical for peak hour intersection turn movement volumes.

4.4 NOISE ASSESSMENT

The County previously submitted to LAWA a lengthy set of comments on the noise analysis contained in the 2001 Draft EIR/EIS for the LAX Master Plan. The prior comments addressed noise impacts associated with the project Alternatives (A, B and C) under review at that time. The 2003 SDEIS/EIR expands on analyses contained in the original EIR/EIS to cover the new preferred project, Alternative D. The SDEIS/EIR also contains an analysis of single event noise impacts on sleep disturbance as well as an expanded analysis of noise impacts on schools. The sleep disturbance and school noise impacts analyses were prepared in response to CEQA litigation on the Oakland International Airport Master Plan commonly known as “Berkeley Jets.” The SDEIR/EIS presents Year 2000 noise data for comparison in addition to the Base Year 1996 data.

The comments presented here are ones made specific to the analysis of Alternative D and the sleep and school analyses that are presented in the supplemental EIR/EIS. The comments submitted in 2001 concerning Alternatives A, B and C also apply to Alternative D. Accordingly, we have organized the following review to include all of the comments originally submitted in 2001, as well as the new comments appropriate to Alternative D as described in the SDEIS/EIR.

4.4.1 Restatement of Critical Review Submitted in 2001

It is important to note that the findings of the Draft EIS/EIR include a finding of significant noise impact that cannot be mitigated to a point of insignificance. The issues raised in our analysis do not change this finding of significance. The comments presented here address whether or not the Draft EIS/EIR adequately discloses the extent and magnitude of the impact and whether or not mitigation issues are addressed adequately.

Determination of Potentially Significant Impacts: CEQA requires that the Draft EIR identify all impacts that could arise to significant levels and must employ the proper “thresholds of significance” to make that identification. CEQA also requires that the document “challenge” and “update” thresholds that may not be current or protective of the public interest. This notion includes the idea of setting thresholds that will improve the quality of life of residents. As it relates to the impacts identified below, LAWA should seize this opportunity to push the SDEIS/EIR beyond mere minimum standards or code compliance, and assert a more conservative approach to identifying significant impacts. The following identified impacts relate to the use of minimum standards.

CEQA does not mandate, require or endorse a specific decibel standard or noise metric to determine if a project engenders a significant adverse environmental impact with respect to aircraft noise. However, a significant aircraft noise impact is said to have occurred if one or both of the following conditions exist:³⁰ (a) noise sensitive areas (such as residences, churches, and hospitals) are newly exposed to 65 CNEL or greater; and/or (b) noise sensitive uses in the 65 CNEL contour of a “build” alternative experience an increase of 1.5 CNEL or greater compared with the environmental baseline conditions.

The Airport Noise Compatibility Planning guideline³¹ is the primary Federal regulation guiding and controlling planning for aviation noise compatibility on and around airports. It establishes, for most land uses and noise sensitive uses, the standard of < 65 day-night average noise level (DNL or Ldn) as “acceptable,” although it recognizes that local communities may choose to mitigate impacts below the Ldn of 65 dB.

The Federal Interagency Commission of Noise has identified 65 Ldn as the 24-hour day-night average sound level at which most people become highly annoyed by noise. However, FICON has acknowledged that people may and do become highly annoyed by noise levels well below 65 Ldn. Indeed, many commentators and acoustic researchers are seriously questioning the validity of the 65 dB Ldn criteria for planning purposes: research has shown that at this level about 15% of the population remains “highly annoyed” and that the standard is an average sound level, not a measurement of individual sound events that tend to affect people more than average levels.

The SDEIS/EIR should have employed these conservative criteria to allow a survey of a larger area and reveal the true pervasiveness of sound that was not identified in the Draft EIS/EIR. This would be important in the discussion of impacts and mitigation of noise to show that “average” threshold levels were not sufficient to show the chronic and long-term effects within the LAX flight path. It is likely that there will be exacerbated and disproportionate levels of impacts on unincorporated neighborhoods under the flight path approaches to LAX.

³⁰ California Aircraft Noise Standards, Title 21 of the California Code of Regulations.

³¹ Title 14 of the Code of Federal Regulations, Part 150.

Number of People Impacted by Noise: There is a significant discrepancy in the number of dwelling units and population impacted between the EIS/EIR baseline year impacts and data published by LAWA. Under California law, the airport must publish a quarterly report that describes the noise impact of the airport. This law has been in effect since the early 1970s and LAWA has published the Quarterly Reports as required. Appendix D of the EIS/EIR states that the base year noise impact is based on data published by LAWA in the 1996 Fourth Quarter Report.³² Chapter 4, § 4.1.3.1.2 states that the EIS/EIR relies on the Fourth Quarter 1996 operational data but does adjust the EIS/EIR contours to reflect the noise monitoring data that are collected by the airport. The difference between the impacts as defined by the EIS/EIR and the impacts as identified by LAWA in its Quarterly Report is dramatic and significant. The following data compare the number of dwellings and population impacted as defined by LAWA in the 1996 Fourth Quarter Report and as defined in the EIS/EIR for baseline year 1996.

Table 4
Difference Between Draft EIS/EIR Noise Impact and LAWA 1996 Quarterly Report

	Dwellings Inside 65 CNEL	Population Inside 65 CNEL
LAWA 1996 Fourth Quarter Report	31,968	85,907
EIS/EIR Table 4.1-2 For 1996	16,900	49,000
Difference	15,068	36,907

The differences shown in Table 4 are not presented, reconciled, or explained in the SDEIS/EIR. The population and dwelling data shown in the LAWA 1996 Quarterly Report are not mentioned in the Supplement to the Draft EIS/EIR even though the Quarterly Report shows noise impacts nearly twice as large as those reported in the SDEIS/EIR. Section 4.1.3.1.2 and Appendix D § 2.2 discuss the LAWA Quarterly Reports and the fact that noise contours in the Quarterly Reports are adjusted to reflect noise monitoring data. Appendix D presents the difference between the noise monitoring results and the EIS/EIR noise model results in the terms of dB CNEL in Table 5. The average difference between the two is presented as an under-prediction in the model of approximately 1.1 dB. Examination of the data shows that the noise monitor sites east of the airport, primarily in Inglewood, consistently show noise levels nearly 3 dB greater than the EIS/EIR noise modeling predicts. While the differences are smaller in other communities, the bulk of the population impacted is in the area where monitors show that the noise model has under-predicted the impact.

LAWA operates a permanent noise monitoring system as required by the California Airport Noise Regulations that has been approved by the State of California Division of Aeronautics. LAWA has been monitoring noise on a continuous basis and submitting Quarterly Reports since the early 1970's and every Quarterly Report includes noise impact data based on noise contours that have been adjusted to match noise monitoring data. Nevertheless, the Draft EIS/EIR relies on a noise computer model output that has not been adjusted to reflect the noise monitoring data even though the noise monitoring data show a consistent 3 dB bias in the east approach corridor to LAX.

³² Appendix D Section 2.1, Appendix D Section 2.2.

There is no doubt that there is a consistent bias in modeling data in the Inglewood approach corridor; the size of the difference in the Inglewood area compared to the system accuracy is significant. Appendix D, in the paragraph just below Table 6 makes the misleading and inaccurate statement that the SDEIS/EIR noise contours “were generally confirmed by the actual noise measurements.” This statement is based on the overall average difference at all sites, and fails to recognize the bias in the Inglewood approach corridor. The Draft EIS/EIR contours under-predict the noise impact as measured by the number of dwellings and population within the 65 CNEL contour by an amount that makes it difficult to establish a credible disclosure statement to the general public.

The SDEIS/EIR does not attempt to examine the reason for the under-prediction of aircraft noise by this noise model. Instead, the SDEIS/EIR rationalizes the lack of contour adjustment by stating, “draft FAA Order 1050.E indicates that measurements should not be used to calibrate noise contours;”³³ the cause of the discrepancy is not identified. The difference may be due to errors in input data to the noise model, not a calibration issue. Failure to adequately account for flight track dispersion could cause the kind of discrepancies the data shows. The model has the capability to report noise levels by aircraft type at each location. Such data should be compared to measurement data for those aircraft and a rational and detailed explanation of the model/measurement differences should be made. At the least, the source of the difference would then be identified (i.e., input data errors, model database differences, or model algorithm shortcomings).

The FAA has a history of being reluctant to adjust noise contours based on measurement data. This policy was based on historical attempts to use short term monitoring data to make adjustments that are not statistically justified. Such a policy is justified, in particular when attempts are made to use a few hours of monitoring data as a basis for moving noise contours. In this case, however, LAWA operates noise-monitoring sites 24 hours a day, measuring every aircraft, and has been doing so for over 20 years. These data do warrant adjustment to the noise contours; either by correcting input errors or modifying model databases (such as noise curves and aircraft profiles). FAA does not prohibit these changes and, in fact, FAA provides a mechanism for user changes to the database. The “INM Users Guide,”³⁴ contains Appendix B, “FAA Profile Review Checklist.” The first paragraph of that appendix contains the following statement,

“The Office of Environment and Energy (AEE) requires prior written approval for all user changes to the Integrated Noise Model (INM) standard profiles for FAR Part 150 studies. A similar requirement under National Environmental Policy Act (NEPA) will take effect pending FAA Order 1050.1E”.

Following that paragraph is a detailed list of information required for the FAA review of user made changes. It is not known if any attempt was made to seek FAA approval of changes needed to make the model better match measurement data. If there was no attempt, the decision should be explained. This last comment is especially appropriate if input errors have already been eliminated as a possible source of the difference.

Change in Number of People Impacted by Noise: The Draft EIS/EIR relies on the noise model to identify relative changes between baseline and future Alternative conditions. The Draft states, “*the*

³³ Appendix D, Page 17.

³⁴ For INM Version 6, dated September 1999.

modeled noise levels associated with environmental baseline conditions will have consistent relative relationships to future noise patterns prepared with the INM."³⁵ This statement, while possibly true for changes in noise level, is not accurate with respect to the area of noise impact, the number of dwelling units, and the population within the noise contours. The implication of the statement quoted above is that the increased number of people identified as impacted will be the same whether or not the noise contours are adjusted to reflect results of noise monitoring. This is not true and fails to reflect that area, dwelling units, and population are second order functions of the size of the contour. The change in the number of people residing inside the 65 CNEL contour will be much larger than reported in the Draft EIS/EIR. The percent change may remain nearly constant, but the absolute magnitude will be larger.

If LAWA does not adjust the Draft EIS/EIR contours to reflect monitoring data then the document should attempt to estimate the correct number of dwellings and people inside the contours by using an adjustment factor based on the differences identified for the baseline conditions. While this is far less satisfactory than adjusting the contours, the impacts identified would be a far better disclosure of the magnitude of the impact than is now included in the document.

Use of 1996 as Base Year: There is reason to question the validity of 1996 as the baseline year. Use of the 1996 baseline appears to underestimate the impact of the project (in addition to the contour adjustment issue identified above). To demonstrate this concern, the following table compares 1996, 1999, and Year 2000 noise impacts at LAX:

**Table 5
LAWA 1996, 1999 and 2000 Quarterly Report Noise Impacts**

	Dwellings Inside 65 CNEL	Population Inside 65 CNEL
1996 Fourth Quarter Report	31,968	85,907
1999 Fourth Quarter Report	26,422	78,026
2000 Fourth Quarter Report	27,312	80,211

The above data show that the use of the 1996 baseline, with its larger impact area, would result in underestimating impacts compared to using 1999 or 2000. The difference in the number of people impacted for the year 1996 and the year 2000 is potentially large enough to change the conclusions as to whether future year contours impact a larger or smaller number of people than baseline conditions. As a result, LAWA should update the noise study to a more current year.

Project Description/Operational Assumptions: The noise analysis is a comprehensive analysis that attempts to identify cumulative and single event noise impacts as well as detailed tables of time above specific thresholds. However, in addition to failing to adjust the contours to reflect noise monitoring data, there is substantial uncertainty associated with the future operational assumptions. The operational assumptions are in many cases counterintuitive and lack justification. This makes any analysis of the noise impacts speculative, and potentially under-predicts the impact. The following are examples of areas of concern and point to a need to do a "worst case" analysis in the

³⁵ Appendix D, Page 17.

event that these assumptions cannot be assured or justified. The following data were taken from the Executive Summary, Pages ES-9 and ES-10.

Passengers Per Departure: The baseline passengers per departure are 90.76 while Alternative C assumes 145.09. It is not explained how LAWA expects the project to result in a relocation of short haul operations to some other airport and an increase in average aircraft size. There is no component of Alternative C that results in a nearly 60% increase in passengers per departure. This increase is extraordinarily large given that no part of the project forces commuter or short haul aircraft to move or even includes a design feature that discourages these aircraft. In light of this, the Draft EIS/EIR should contemplate the noise impacts if this assumption proves to be false and commuter and short haul carriers do not move to some other airport. Further, the extent to which the passenger per departure increase is due to increased load factors needs to be addressed and a discussion of whether or not this increase in load factor (expressed as an increase in aircraft weight) was included in the INM input for the future case scenarios needs to be explored.

Cargo Activity/Cargo Building Space: The baseline cargo activity is 1.9 million tons of cargo using 1.9 million square feet of space. Alternative C activity is 4.1 million tons using 5 million square feet. The future ratio assumes that new cargo facilities are no more efficient than the old LAX facilities and fails to recognize that modern facilities may handle twice the amount of cargo per square foot. LAWA does not provide the basis for this assumption. The noise analysis should be based on the potential impact of far more cargo traffic than is currently estimated.

Maximum Airside Capacity: The Draft EIS/EIR nearly doubles the terminal space but assumes a very modest increase in passengers and operations. This is based on the assumption that future technology will not increase the capacity of existing runways. However, LAWA should also explore the opposite: what would result if improved technology results in increased airside capacity? Given the increase in terminal space, how much air traffic could those terminals handle? LAWA should disclose noise impacts for air traffic estimates based on maximum terminal capacity for the proposed project.

Peak Hour Operations/Delay: The All Weather Peak Hour Operations are identified as 150 for the baseline condition and 145 for Alternative C. The All Weather Average Delay is identified as 8.69 minutes while the Alternative C delay is identified as 13.59 minutes. This statement is counterintuitive and, at the very least, challenges the credibility of the aviation forecasts upon which the noise analyses are based. Please explain the basis for these findings.

Terminal Space/Number of Gates: Alternative C increases terminal space from 4 to 7.3 msf while gates increase from 165 to 172 (186 to 228 narrow body equivalents). The narrow body equivalent ratio increases from 21,500 sq. ft. per narrow body equivalent gate (baseline) to 32,000 square feet per gate, which is nearly a 50% increase. It appears that the project will have a larger gate capacity than is being reported and, if so, this needs to be accounted for in the noise analysis.

Regional Issues: The project is primarily a landside development project (terminals and roads) with no new runways. A major assumption in the document is that some other airport in the region will absorb the unmet aviation demand. The Draft EIS/EIR does not identify which airports will meet this demand or any mechanism to ensure that this assumption is valid. LAWA, as proprietor of multiple airports is lead agency for the EIR and the FAA is a lead agency for the EIS. Both agencies have the ability to commit to or fund airport projects outside of LAX. The document

needs to address the noise issues in the event that future airport capacity is not developed elsewhere in the region. The SDEIS/EIR should include an Alternative that meets aviation demand for the region – either through committing to a regional solution or anticipating additional runways in Alternative C – and discloses the noise impact of that Alternative.

Health Effects of Noise Technical Report: Technical Report 14b contains a general discussion of the effects of noise on people. In the last paragraph of §1 the report concludes with the statement, “It is, therefore, assumed that compliance with the compatibility criteria is sufficient to protect human health.” The statement in itself is correct, but is misleading in its implication that LAX complies with the compatibility criteria. The report fails to make a most important conclusion related to health effects of noise: LAX does not comply with the compatibility criteria. Based on this factor, it can then be concluded that noise levels associated with aircraft operations at LAX have adverse health effects on people. This should be addressed in the Technical Report and the DEIS/EIR should identify the health effects associated with high noise levels including the fact that in 1996 over 85,000 people resided in areas that exceeded the compatibility criteria.

Mitigation of Noise Impacts: The proposed project includes no noise mitigation recommendations for the proposed project. It should be noted and clearly recognized that LAWA has for many years conducted an ongoing noise mitigation program and has periodically introduced new programs as appropriate. What is not clear is why the proposed project does not address any new noise mitigation programs. Several mitigations are discussed in detail in Appendix D but not recommended for adoption by LAWA. Appendix D includes the following measures that LAWA should consider for inclusion as recommended programs for the proposed project:

- ▶ Shorten the downwind leg approach to reduce the number of overflights to communities well east of the airport.³⁶
- ▶ Eliminate early turns over El Segundo.
- ▶ Reevaluate the benefit of restricting outboard runways to arrivals only in terms of number of people and dwellings inside the 65 CNEL contour.

The analysis in Appendix D describes benefits and impacts in only general terms of change in noise level but not in area impacted. Further, the analysis appears to rely on questionable economic data to estimate mitigation costs. Specifically, the analysis assumes that the delay of 2-4 minutes associated with the measure would apply to all flights independent of time of day. It would be more logical to assume that the delay would be longer during peak periods and shorter during off peaks.

An important aspect of the existing LAX noise mitigation program is the preference for west flow departure operations. The project assumptions presented in Appendix D appear to assume some degradation in the amount of time that the airport is in west flow for departures. Figure 10 of Appendix D shows 5.71% of operations in east flow for the proposed project. Table 3 of Appendix D indicates that less than 1% of departures are to the east for baseline conditions. Figure 10 and Table 3 are in different formats, so the above comparison may not be fair; however, the SDEIS/EIR does not provide assurance that the project will not result in an increase in east flow departures.

A final mitigation that should be given consideration is expansion of the sound insulation program to homes within the 60 CNEL contour. Such a program may not qualify for traditional Federal

³⁶ Exhibit 29 of Appendix D.

funding but there may be an opportunity to use passenger facility charge (PFC) funding for such a program. Because community concerns about the impact of aircraft noise goes so far beyond the boundary of the 65 CNEL contour (particularly when the contour is not adjusted to match noise measurement data), consideration of expanding the program should be given a thorough evaluation in the Draft EIS/EIR. Figure 4.2-5 shows the 1992 65 CNEL contour upon which the insulation program is based. The Draft EIS/EIR should compare this contour with the project 60 CNEL contour and evaluate the cost of expanding the program to include the 60 CNEL contour.

Miscellaneous Noise Comments:

Data Sources and Assumptions: In §2.1, the third from last sentence, 2nd paragraph states, “this EIS/EIR will rely on the results of the Noise Management Bureau’s system in the definition of environmental baseline noise levels (per the 4th Quarter 1996 Report).” This statement is categorically wrong and misleading. It implies that the report relies on the calibrated noise contours produced by LAWA. The report relies on uncalibrated noise contours generated by the noise model that are considerably smaller than the contours presented in the 4th Quarter 1996 Report.

Environmental Baseline vs. Quarterly Noise Report: Discussion in §2.2 attempts to downplay differences between the Quarterly Report contours and the baseline contours in the SDEIS/EIR. The first paragraph cites a Figure³⁷ that would help the reader understand that the Draft EIS/EIR baseline is considerably smaller than the Quarterly Report contours, but the figure is missing from the report. The statistical analysis of the noise measurement data and noise model results from Table 6 is completely inadequate and fails to identify the bias in the noise model to under-predict noise levels in the approach corridor over Inglewood. Please address this concern.

Impact on Schools: §3.3 of Technical Report 14b (Health Effects of Noise) has a footnote explaining the 1980 lawsuit settlement with the school district. The analysis appears to assume that because of this settlement there is no impact on schools. Please identify which schools have been insulated, which schools remain to be insulated, and how many more schools will need to be insulated as a result of the project.

Federal Standards: § 4.1.4.1.2 in the last sentence states that the “...FAA has adopted standards and guidance governing airport noise compatibility.” The FAA has only published land use compatibility guidelines and has not adopted noise standards. It is up to the local authorities to adopt noise/land use compatibility standards.

Construction Noise: § 4.1.4.3.1 should reference the City of Los Angeles and the County of Los Angeles Noise Ordinances which contain noise limits and limits on the hours of activity. The County requests that LAWA identify noise limits in the ordinance as a threshold of significance, and provide analyses in accordance with that threshold.

Operations Data: In the discussion on noise patterns,³⁸ the first bullet point outlines an increase in heavy aircraft and a decrease in small aircraft. There is no explanation as to how Alternative C accomplishes this transition and there are no explicit features of Alternative C that would appear to

³⁷ Figure 2.3.

³⁸ Section 4.1.6.1.2.2, Alternative C, Aircraft Noise Pattern at 2015.

encourage it. If the assumption cannot be justified, the noise analysis should be revised to reflect the trend toward a fleet mix that does not rely on heavy aircraft for achieving the passenger demand.

Construction Scheduling: The City and County of Los Angeles have ordinances that limit the hours of construction activity. § 4.1.8.3, MM-N-9, should reference those ordinances and identify the hours that construction is permitted.

Location Impact Analysis: The last sentence of the last paragraph on Page 87 states that only CNEL and DNL have a regulatory function. This is a very limiting assumption and fails to recognize that for some types of impacts, these metrics may be inadequate. Specifically, FICON identifies these metrics as potentially inadequate for assessing noise impacts on sleep or noise impacts on the classroom environment. FICON recommends use of supplement metrics for analysis of these impacts; the County requests that LAWA use the metrics to analyze these impacts. While the document does present some Sound Exposure Level (SEL) contours and tables of time above data at specific points, the Draft EIS/EIR fails to use these data to assess sleep disturbance or school impacts.

No-Action/No Project Comparisons: The first sentence of § 5.1.3 identifies that 11 grid points will be exposed to increases of 1.5 dB. This comparison of the number of grid points is used throughout the analysis. This type of analysis fails to account for the land use that may occur at the grid points. In effect, the grid points, while regularly spaced, are located on random land uses. It would be more accurate to use INM to construct a different contour that shows all areas exposed to a change of 1.5 dB or more; the County requests that LAWA use this contour to quantify the land use impact. The INM has the ability to construct such a different contour.

Noise Mitigation: The first sentence of §7 identifies the need for mitigation of significant impacts. Since the project is shown to have a significant impact, the County requests that LAWA propose appropriate noise mitigation measures.

Alternative C Figures: Alternative C, Figure 11, does not use flight track dispersion in the noise model; however, LAWA has radar-tracking ability. Please provide a 24-hour period of actual radar tracks as an example of the extent of track dispersion over the affected areas.

Area Wide Flight Paths: Please supplement Alternative C, Figure 17 with one chart for existing conditions so the reader can identify differences. At a minimum, the text should describe how this chart changes paths relative to existing conditions.

Appendix D: Table 7 of Appendix D identifies the forecast year 2005 baseline as 2,107 operations per day and year 2015 as 2,124 operations per day.³⁹ The Quarterly Report for the 4th Quarter of the year 2000 shows that current operation levels are 2,280 operations per day (201,347 quarterly operations). Existing operations are already exceeding the 10 and 20-year projections for the No Action/No Project case. Please revise the noise analyses and comparisons to reflect realistic descriptions of future no project conditions.

Reduced Impact of Approach Overflights: Exhibit 29, Reduced Impact of Approach Overflights, shows (and the accompanying text contains) an analysis of this approach procedure and there

³⁹ Table 8.

appear to be community benefits to this procedure. Therefore, it is concerning as to why it is not included as a recommended mitigation measure.

4.4.2 New Comments on the Supplemental EIR/EIS for Alternative D

The following comments are provided based on an analysis of EIR/EIS § 4.1, "Noise," and Appendix S-C1, "Supplemental Aircraft Noise Technical Report:"

Noise Modeling: Section 2.1 implies that noise monitoring and flight track system data were used to generate noise contours, but should be revised to state that the noise analysis and noise contours were based entirely on a computer noise model. The noise data presented in the Supplemental EIR/EIS do not use any of the noise data collected by the airports noise monitoring system. The airports noise monitoring and flight track system was used only to obtain operations and runway utilization data. In fact, there is a significant conflict between the noise monitoring data published by the airport and the noise modeling done as part of the EIR/EIS.

Noise Contour Errors: § 2.1.7 The noise contours presented in the SDEIR/EIS for the year 2000 are smaller than the noise contours published by the LAWA in its Year 2000 Q4 report. No attempt is made in the SDEIS/EIR to examine the reason for the noise model under-predicting aircraft noise. The Supplemental EIS/EIR rationalizes the lack of contour adjustment by stating, "draft FAA Order 1050.E indicates that measurements should not be used to calibrate noise contours." However, no attempt is made to identify the cause of the discrepancy. The difference could be due to errors in input data to the noise model, not a calibration issue. Failure to adequately account for flight track dispersion could cause the kind of discrepancies the data shows. The model has the capability to report noise levels by aircraft type at each location. LAWA should compare the data to measurement data for those aircraft and offer a rational and detailed explanation of the model/measurement differences. At the least, the source of the difference would then be identified (i.e., input data errors, model database differences, or model algorithm shortcomings).

Noise Contours Require Adjustment: The FAA has a history of being reluctant to adjust noise contours based on measurement data. This policy was based on historical attempts to use short term monitoring data to make adjustments that are not statistically justified. Such a policy is justified, in particular when attempts are made to use a few hours of monitoring data to move noise contours; however, in this case LAWA operates noise monitoring sites 24 hours a day, measuring every aircraft and has been doing so for over 20 years. These data do justify adjusting the noise contours either by correcting input errors or modifying model databases, such as noise curves and aircraft profiles. FAA does not prohibit these changes. The FAA provides a mechanism for user changes to the database. The "INM Users Guide"⁴⁰, contains Appendix B, "FAA Profile Review Checklist." The first paragraph of that appendix contains the following statement, "The Office of Environment and Energy (AEE) requires prior written approval for all user changes to the Integrated Noise Model (INM) standard profiles for FAR Part 150 studies. A similar requirement under National Environmental Policy Act (NEPA) will take effect pending FAA Order 1050.1E." Following that paragraph is a detailed list of information required for the FAA review of user made changes. It is not known if any attempt was made to seek FAA approval of changes needed to make the model better match measurement data. If there was no attempt, LAWA should explain the decision—particularly if input errors have already been eliminated as a possible source of the difference.

⁴⁰ For INM Version 6, dated September 1999.

Mitigation Must Reflect Validated Contours: The Supplemental EIR/EIS should explicitly show the difference in noise contour location and the number of dwellings and population for the Year 2000 noise contours contained in the Quarterly Report published by LAWA and the Year 2000 noise contours contained in the Supplemental EIR/EIS. The Supplemental EIR/EIS further rationalizes the use of the noise modeling information in spite of the differences to the measurement data by stating that future measured contours will be used to adjust mitigation area. If noise mitigation programs will be based on noise measurement validated noise contours, then the mitigation measures should include a specific commitment to use such validated contours.

Assumptions Concerning Future Noise Contours lack Validation: The supplemental EIR/EIS further states in § 2.1.7 of S-C1 that using the smaller computer generated contour will result in showing greater noise impacts. This latter statement is based on the erroneous assumption that the noise contours presented for future conditions are accurate and that the noise contours for 1996, 2000 and the future no project case are underestimated. On what basis does the Supplemental EIR/EIS conclude that the future noise contours are more correct than the existing noise contours when the same model and methodology are used for each?

Inadequate Number of Flight Tracks for Modeling: Footnote 3 of § 2.1.3 states that the 74 flight tracks were adequate to produce an adequate noise model input. What data did LAWA use to draw this conclusion? Why did LAWA not complete a sensitivity analysis to determine if the discrepancy between measured noise data and modeled result differences was due to inaccurate or insufficient number of flight tracks used in the INM model? In particular, why weren't additional flight tracks used to simulate track dispersion for aircraft approaches? In the absence of supporting data, footnote 3 is misleading and should be eliminated.

Table S11 is Mislabeled: The title of this table indicates it is a comparison of single event noise. It is in fact a table of runway utilization data during runway construction. Please revise the title to Table S11 accordingly.

Sleep Disturbance Data Require Clarification: In § 6.1.1, the threshold of significance for sleep disturbance is based on the 94 SEL contour which represents a 10% awakening rate for noise events that occur at least once every 10 days. The number of awakenings presented in the data tables is not the total number of people awakened but the number awakened within the 94 SEL contour. In fact, at lower noise levels there is still sleep disturbance, albeit at a lower rate. For example, the FICAN curve shows that for an interior noise level of 45 SEL (58 SEL exterior noise level with windows open) about 1% of the population will be awakened. The awakening rate of 1% is quite low, but when applied to a large population such as that located in a 58 SEL contour, would produce a large number of people awakened. The Supplemental EIR/EIS should make it clear that the sleep disturbance data presented are not total awakenings, but awakenings within a specific contour. The methodology used in the EIR/EIS allows the comparison of alternatives within a contour that can be practically estimated and appears to be a fair basis for comparison.

Sleep Disturbance Flight Tracks Must be Identified: Analysis of single event for sleep disturbance does not make it clear whether or not the analysis relied on the same flight tracks as used for developing the CNEL model. Did LAWA use the same flight tracks? If so, then the sleep analysis fails to account for flight track dispersion, and given that the significance threshold is based on an event that occurs at least once every 10 days, the results are misleading. If flight track dispersion is not included in the analysis then the County requests that LAWA describe the results

as comparing the number of awakenings within a specific SEL contour for aircraft flown on the nominal flight tracks and aircraft flight deviations that occur on other tracks would cause further awakenings.

Sound Insulation Eligibility: §6.1.3 adds an important criterion to the eligibility program for sound insulation. The sound insulation area is now based on ANMP CNEL contours and this section adds the SEL contour map. Is this a proposed formal policy that is clearly stated in the mitigation measures (including the requirement that the location of the 94 SEL contour be verified by measurements)? Has the cost of insulating the additional homes been included in the reported costs for the Master Plan improvements? If single event contours are underestimated relative to measured noise as is the case with the CNEL contours, how would this affect the study results? How many more homes and schools would be impacted if the SEL noise is underestimated by the same amount that the CNEL contours are underestimated (as measured by comparing baseline model results to baseline year measurement results)?

Lennox Preschool Mitigation Required: The Lennox School District operates a preschool at 10417 Felton. The site of this school is affected by both aircraft noise and roadway noise. The SDEIR/EIS addresses only aircraft noise at this site and does not address roadway noise. How does the combined noise from aircraft and motor vehicles affect impact this school? Further, how would roadway improvements in the vicinity of this site affect roadway noise levels and what would be the corresponding impact on the school? The SDEIR/EIS identifies a significant impact for Alternative B, but fails to address noise level changes that may result from roadway improvements that will occur with other alternatives. Similarly, in §6.2.3 the statements on school mitigation contain no commitment to mitigate identified impacts, only a commitment to study further. The County requests affirmative commitment from LAWA for the full mitigation of noise impacts at all affected schools in the project area.

Soundproofing Homes to Reduce Noise Impacts: LAWA has outlined a number of important noise attenuation goals in Mitigation Measures MM-LU-1, MM-LU-2, MM-LU-3 and MM-LU-4. However, it is not clear how or when or even if the goals would be achieved because many of the implementation components lack definition. We are particularly concerned about the following:

MM-LU-1: Implement Revised Aircraft Noise Mitigation Program.

- ▶ Under the measure calling for 'Accelerated rate of land use mitigation to eliminate noise impact areas in the most timely and efficient manner possible,' LAWA calls for "*Increased annual funding by LAWA for land use mitigation.*" Please specify an annual dollar amount for which LAWA is willing to make a commitment.
- ▶ Under the same measure, LAWA calls for "*Reevaluating requirement for granting of avigation easements with sound insulation mitigation.*" Please specify the performance criteria that LAWA would use in this reevaluation. Under what conditions would LAWA waive the requirement for granting of avigation easements with sound insulation?
- ▶ Under the same measure, LAWA calls for "*Reduction or elimination, to the extent feasible, of structural and building code compliance constraints to mitigation of sub-standard housing.*" Please define the criteria that would justify a reduction of code compliance constraints, and the criteria that would justify the elimination of code compliance constraints. Please also estimate the proportion of currently code-constrained units that would become eligible with application of these criteria, including a specific estimate for the community of Lennox.

MM-LU-2: Incorporate Residential Dwelling Units Exposed to Single Event Awakenings Threshold into Aircraft Noise Mitigation Program:

- ▶ Although this measure adds a large number of homes to the insulation program, none of the additional units is located on unincorporated land even though many impacted homes are in Los Angeles County jurisdiction: please explain why this mitigation omits County homes.
- ▶ MM-LU-2 includes the following commitment, “*actual adjustments to the ANMP contour would be based on periodic reevaluation of the 94 dBA SEL noise contour by LAWA.*” The statement implies, but does not actually state that measurements will be used to make the actual adjustments. Please incorporate the word ‘measurements’ into this commitment.

MM-LU-3: Conduct Study of the Relationship Between Aircraft Noise Levels and Ability of Children to Learn. This measure commits LAWA to a program to reevaluate the single event threshold for schools and using results to select “*an acceptable replacement threshold of significance for classroom disruption.*” What group or groups will provide peer review of these studies and judge the acceptability of proposed significance thresholds?

MM-LU-4: Provide Additional Sound Insulation for Schools Shown by MM-LU-3 to be Significantly Impacted by Aircraft Noise. Please see the comment above concerning a key aspect of this mitigation measure calling for “*acceptance of results by peer review of industry experts.*” Again, the measure does not indicate which agencies will be involved in the selection of the industry experts for the peer review. Please indicate whether and which of the affected cities, county, and school districts will have a role in selecting the experts for the peer review.

4.5 AIR QUALITY ASSESSMENT

4.5.1 Review of Ambient Air Quality Data used in the 2001 Draft EIS/EIR

Ambient air quality data were used for two purposes in the 2001 study. One purpose was to define baseline conditions and the other was to estimate background concentrations. Baseline conditions in this case were defined as the maximum air quality concentrations in the vicinity of the airport for existing conditions (an approximate 1996-98 timeframe). Background concentrations, on the other hand, were defined as the concentrations present in the absence of nearby sources. In other words, the concentrations due to multiple small sources and distant large sources were not directly accounted for in the air quality impact assessment. Estimates of background concentrations were used in the analysis to add to the concentration estimates generated by computer dispersion models for the airport and other nearby sources to arrive at estimates of total ambient concentrations.

Data from two air quality monitoring stations were used to characterize both baseline and background ambient air quality conditions. One station was located onsite and immediately to the east of the airport runways in the South Airfield Complex. LAWA operated this station for approximately 7.5 months, from August 1997 until March 1998, and measured carbon monoxide (CO), nitrogen dioxide (NO₂), sulfur dioxide (SO₂) and particulate matter (PM₁₀). The other station was located approximately 0.6 mile south of LAX. This station, located in Hawthorne and designated as Station No. 094, was operated by the South Coast Air Quality Management District (SCAQMD) and measured ozone (O₃), lead (Pb), sulfates, CO, NO₂, SO₂ and PM₁₀.

The 2001 Draft EIS/EIR did not provide any justification for the location of the onsite ambient air quality monitoring station or any information concerning the primary purpose of the station. Typically, a monitoring station will be located and operated to either measure background concentrations or maximum source impact. Given the location of the station with respect to the prevailing wind direction and the airport runways, the station appears to be situated near the likely maximum source impact area. Data from the station are used to describe "Environmental Baseline" conditions, which apparently refers to maximum source impact for existing conditions. In most cases, computer modeling would be used to identify the locations of maximum concentrations for baseline conditions, and then one or more monitoring stations would be positioned at these locations. If the onsite monitoring station was not positioned at the expected location of maximum concentration, then it is possible that concentrations higher than those reported at the station occurred in the area.

The 2001 DEIS/EIR did not discuss this, but maximum concentrations from the nearby SCAQMD station are comparable to the concentrations reported onsite by LAWA for the same timeframe. This suggests either that maximum concentrations do not vary significantly in the area or that both stations are similarly affected by nearby sources. The document shows that the maximum concentrations from the onsite monitoring station actually occurred when the station was upwind of the airport.⁴¹ Thus, the maximum 1-hour CO concentration shown as the Environmental Baseline value in Table 4.6-11 was apparently due to other sources in the area and not the airport. This needs to be rectified.

LAWA needs to explain the basis for siting of the onsite ambient air quality monitoring station. If it was located at or near the expected location of maximum concentration (for all pollutants), please explain how this location was selected. It is also unclear whether data from the onsite monitoring station characterized true maximum baseline concentrations in the area or only the maximum concentrations at the monitoring site location. If the data did not characterize the maximum concentrations, please identify them. Finally, the Environmental Baseline concentrations shown in the 2001 DEIS/EIR Table 4.6-11 need to identify whether they represented maximum impacts from the airport emissions or if they are due to other sources in the area.

4.5.2 Review of Ambient Air Quality Data used in the 2003 Supplement to the Draft EIS/EIR

Additional baseline data is provided in the Supplement to the Draft EIS/EIR. Baseline data are taken to include background plus contributions from airport and non-airport sources. This additional baseline data includes measurements by the SCAQMD for the period 1998 through 2000 at a nearby monitoring station. Previously, baseline data were reported for 1996 through 1998 at the same SCAQMD station and also for on-site measurements collected during 1997-98. These data are presented together in Table S4-6.5, so presumably they are reasonably comparable.

Together, these two data sets comprise approximately five years of data. No discussion of the comparison of the two data sets is provided in the Supplement DEIS, but one obvious thing to look for is data trending. In comparing the data reported in Table S4.6-5, it appears that there has been little change or a slight increase in air pollution levels during the five-year period. Elsewhere in the Supplement to the DEIS/EIR future background concentrations of air pollutants are assumed to decrease substantially over time. Although it is possible that future area-wide emission reductions

⁴¹ Technical Report 4, Attachment Y.

will be greater than achieved during this five-year period, the ambient monitoring data do not appear to support a significant reduction in background concentrations during the next several years. Most of the comments and questions offered previously regarding ambient air quality data are still relevant and applicable.

Suggested Questions / Comments for LAWA

- ▶ The trends in baseline ambient air quality data given in Table S4.6-5 do not support the substantial decrease in background concentrations that are assumed to occur in future years. Can LAWA explain this and can the forecast reductions in future background air pollution levels be relied upon?

4.5.3 Review of Emission Data used in the 2003 Supplement

Baseline emissions data are given in Tables S4.6-6 and S4.6-7 for 1996 and 2000 on-airport emissions sources, respectively. The 1996 data have been updated while the 2000 estimates are new in the Supplemental DEIS. It is worth noting that the estimates for 1996 given in the Supplemental DEIS are all higher than the values given in the DEIS, and in the case of VOC and sulfur dioxide, the increases are very substantial. Compared to the original estimates given in the DEIS, the estimated emissions of VOC and sulfur dioxide are more than two times higher. The revised emission estimates for future scenarios have also increased compared to the original estimates given in the DEIS. Again, this is particularly so for VOC and sulfur dioxide which are now two to three times higher than the previous estimates.

Suggested Questions / Comments for LAWA

- ▶ The estimated emissions for on-airport sources given in the SDEIS/EIR have changed substantially from the estimates given in 2001. Can the estimated emissions for on-airport sources given in the Supplemental DEIS be relied upon to be reasonably accurate?

4.5.4 Review of Meteorological Data used in the 2003 SDEIS/EIR

The Supplemental DEIS indicates that the revised analyses were performed using upper air data from a location near San Diego.

Suggested Questions / Comments for LAWA

- ▶ Is the upper air data from the San Diego Miramar Weather Service Contract Meteorological Observatory representative of the LAX area?
- ▶ Other comments offered previously concerning the use of 10-m onsite wind data for modeling off site impacts are still applicable.

4.5.5 Appropriateness of the Analysis Methodology

General Approach: As commented in the previous review, the Supplemental DEIS includes the results of computer modeling for future scenarios only. No analysis of the existing/baseline situation is provided, which could provide a benchmark of how well the models were performing.

Suggested Questions / Comments for LAWA

- ▶ Why did LAWA not model the existing/baseline situation and compare the results to existing ambient air quality monitoring data to get a benchmark of how well the models were performing?

Aircraft Operations: The comments and questions provided previously appear to remain applicable. Perhaps the most important of these is that it remains unclear how aircraft queuing was estimated, which is critical to the accuracy of the analysis. Also, it is not clear whether the reduced airport capacity during IFR conditions has been considered in the evaluation of worst-case air quality conditions.

The Supplement to the DEIS indicates that an updated version (Version 4.11) of the EDMS model has been used to evaluate Alternative D impacts. In so doing, the version used for the previous assessments (Version 3.2) was applied to Alternative D, and a ratio of the resulting estimated emissions for the two versions was computed for each air pollutant. These ratios were then used to estimate impacts for the other alternatives based on the results originally obtained with the older version of EDMS.

The EDMS model performs two major functions for airport sources. It estimates emissions and it calculates atmospheric dispersion. In updating the EDMS model, changes were made to both sections of the model. Hence, simply 'ratioing' the previous results based on the old and new emission estimates will not account for any changes in the dispersion algorithms. Thus, use of the developed ratios to update the previous results may not be appropriate.

Suggested Questions / Comments for LAWA

- ▶ How was aircraft queuing estimated? Is this critical to the air quality impact analysis?
- ▶ Did LAWA consider IFR conditions in evaluating air quality impacts and the effect this could have on reduced runway capacity and increased aircraft queuing?
- ▶ Did the 'ratioing' technique that was used to update the previous air quality impact analyses generated by EDMS account for all changes in the model or does it only account for changes in the emission algorithms?

Off-Airport Motor Vehicles: In the previous review, it was commented that use of wind data from a height of 10-m at the airport may not be representative of winds at off-airport intersections and that using only four receptors at each intersection may also result in underestimated maximum concentrations. These comments appear to remain applicable for the Supplemental DEIS.

4.5.6 Accuracy of the Analysis

The accuracy of the air quality analyses will depend to a large extent on the computer models used and the input data for the models. Presumably, the use of the updated EDMS model for the airport sources has resulted in improved accuracy for Alternative D compared to the previous analyses. Simple ratios were developed and applied to the previous analyses in an attempt to update the results for the other alternatives. If the ratios are based on the old and new emission estimates only, which appears to be the case, it is doubtful if the predicted concentrations for the other alternatives will be very accurate. This is because the new version of the model includes changes to both the emissions and the dispersion algorithms, and the 'ratioing' of predicted concentrations based on the emission ratios would account for changes to the emission components only. Some of the resulting concentration estimates for the other with-project alternatives given in Table S4.6-12 are considerably higher than those for Alternative D. It is conceivable that a complete assessment of these other alternatives with the new version of EDMS might yield different results.

As commented before, the accuracy of the predicted impacts from the airport sources will depend to a large extent on the aircraft queuing estimates and the estimated airport runway capacity, especially during IFR conditions. It is not clear from the analysis how these issues were addressed.

The unmitigated off-airport impacts for carbon monoxide given in Table S4.6-13 appear unreasonably low. Presumably, traffic approach volumes at many of these intersections are at least several hundred vehicles per hour and perhaps several thousand during peak hours. Yet, the predicted maximum concentrations are only marginally higher (and in some cases even equal to) the estimated background concentration. Assuming that the background concentration estimates are accurate, then maximum concentrations near congested roadway intersections could be expected to be substantially higher.

The accuracy of the predicted maximum concentrations at both on- and off-airport locations depends to some extent on the validity of the assumed substantial decrease in background concentrations of some air pollutants over the next several years. If the projected decrease in background concentrations turns out to be too optimistic, the projected maximum concentrations will likely be too low.

4.5.7 Gaps in the Analysis

The lack of an analysis of existing conditions using the same computer models and methodologies that were used to evaluate future scenarios continues to be a shortcoming. Without doing this, it is difficult to judge the accuracy of the predicted future conditions. Further, the 'ratioing' technique that was used to update the analyses of airport sources for Alternatives A, B and C and for the no-project case makes it difficult to fairly compare the alternatives.

4.5.8 Appropriateness and Adequacy of Mitigation Measures

Tables S4.6-6 and S4.6-7 provide emission estimates by source category for on-airport sources for the years 1996 (baseline) and 2000. Emission estimates are provided later in Table S4.6-9 for future years and project alternatives, but these estimates are not given by source category. Only the totals for the various air pollutants are shown. In Tables S4.6-14 and S4.6-16, it indicates that NO_x and SO₂ emissions from on-airport sources will be significant. In developing a mitigation plan to

address this, it would be very useful to know what the major sources of on-airport NOx and SO2 are so that mitigation measures could be focused where they will be the most effective. Tables S4.6-6 and S4.6-7 indicate that aircraft emit a substantial portion of the NOx and SO2 emissions for the baseline and year 2000 cases. Thus, it seems probable that this will be true for the future scenarios, too. Table S4.6-18 provides a long list of proposed mitigation measures, but none of these involve measures to reduce aircraft emissions.

4.6 LAND USE ASSESSMENT (Transportation)

Information within the 2003 Supplemental Draft EIS/EIR on each of the project build alternatives relating to consistency with the 2002 Regional Transportation Plan (RTP) and Regional Aviation Plan (RAP) are too vague to draw meaningful conclusions. Of the four build alternatives in the LAX Master Plan, only Alternative D has any discussion of consistency with the current RAP and this discussion is contradictory. As an example, the 2003 Supplemental Draft EIS/EIR in discussing compatibility with the SCAG Regional Comprehensive Plan and Guide states that: *"Under Alternative D additional job opportunities, infrastructure growth, and indirect housing demand would occur."* However, in discussing compatibility with the SCAG RAP it states that: *"Under Alternative D, the LAX Master Plan would be consistent with the policy of the Regional Aviation Plan, which calls for no expansion of LAX."*⁴²

How is it possible that infrastructure growth would occur at LAX without expansion of LAX? The fact of the matter is that massive infrastructure expansion would occur under Alternative "D". The result of the infrastructure expansion provides 153 fully functional, high capacity gates and does not remove concrete areas that can be used for aircraft parking. By parking aircraft, Alternative "D" can function as though it has over 200 gates and the capacity of LAX is greatly expanded. As such, Alternative "D" is incompatible with the SCAG RAP.

Revisions to the LAX Master Plan EIS/EIR need to be made that discuss compatibility of the build alternatives to the SCAG RTP and RAP including a discussion of either how Alternative "D" can be made compatible to the current RAP, or explain why it is not feasible for Alternative "D" to be made compatible. Without these discussions, meaningful analysis of this issue is not possible.

4.6.1 Master Plan Commitments Lack Substance

The referenced Neighborhood Compatibility Program⁴³ is vague. The details and "teeth" of this commitment must be clarified in order to allow an assessment of its value. The Program should be linked to the Mitigation Monitoring Program, including identification of a formal role for neighborhood review in the formulation and monitoring of specific development plans at the airport/neighborhood interface.

4.6.2 Other Land Use Inconsistencies

Discussion on Page 4-189 of the 2001 Draft EIS/EIR asserts that Master Plan Commitments LI-1 and DA-2 will reduce land use impacts of the Ring Road on the apartments on Morley Road to less than significant levels; however, these measures are not described in the 2001 Draft EIS/EIR or

⁴² 2003 Supplemental Draft EIS/EIR, Section 4.2.6.5, page 4-169

⁴³ 2001 Draft EIS/EIR, Section 4.2.5, Page 4-116.

2003 Supplemental Draft EIS/EIR, but only referenced. In fact, throughout the 2001 Draft EIS/EIR text §§ 1 through 7, references are made to impacts and mitigation measures described in Appendix K, without any explanation or summary describing such impacts and mitigation measures. The 2003 Supplemental Draft EIS/EIR also provides no discussion of this issue. Since the LAX Expressway and State Route 1 (SR 1) improvements are integral features of the build Alternatives A through C, the 2003 Supplemental Draft EIS/EIR should be revised to incorporate this information in the body of the text.

The 2003 Supplemental Draft EIS/EIR presents additional analysis of single event noise levels as mandated by a recent court ruling by the California Court of Appeal (*Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners*, (2001) 91 Cal. App .4th 1344.). It is commendable that LAWA chose to include this evaluation so critically important in assessing impacts to land uses surrounding airports. Of particular concern are single event noise levels as they relate to school disruptions. However, inconsistencies again appear in this evaluation: Table S4.2-2 in the Land Use Section shows that 29 schools would be affected by single event noise levels, whereas Table S4.1-2 in the Noise Section shows that 50 schools would be affected by single event noise levels. These inconsistencies need to be reconciled.

4.6.3 The Land Use Assurance Letter should be Disclosed

The contents of the Land Use Assurance Letter⁴⁴ should be summarized in the text and the document should describe how conflicts would be avoided. This discussion emphasizes noise compatibility considerations and minimizes the combined effects of noise, safety, air quality, lighting, and aesthetics. After acknowledging that land use compatibility is a function of these types of combined effects, very little discussion of combined effects is included in the 2001 Draft EIS/EIR or the 2003 Supplemental Draft EIS/EIR. Please identify properties that are subject to such combined effects.

4.6.4 Key Mitigation Measures may Not be Implemented

Substantial reliance is placed on Mitigation Measure MM-LU-1 "Implement Revised Aircraft Noise Mitigation Program." This measure is broad in scope, and depends upon the cooperation and funding of agencies outside of LAWA. Consequently, there is no assurance that LAWA will be able to implement this measure in a timely manner. Moreover, LAWA does not have an outstanding track record, as a number of commitments to properties already included within the current boundaries of the ANMP have not been fulfilled. A discussion of unmet commitments from prior actions should be provided along with an evaluation of the impacts that would result if LAWA were unable to fulfill the new commitments described in the 2001 Draft EIS/EIR and 2003 Supplemental Draft EIS/EIR.

Mitigation Measures MM-LU-3 and MM-LU-4 dealing with single event noise levels disrupting school sessions are of particular concern. Mitigation Measure MM-LU-3 commits LAWA to conduct a study of the relationship between aircraft noise levels and the ability of children to learn that in essence allows single event noise levels to continue and monitors the effects of these impacts on schoolchildren in the affected classrooms. As stated earlier, this approach may harm the

⁴⁴ 2001 Draft EIS/EIR, Appendix E.

children. A more responsible and conservative approach is needed that does not have the potential to do additional harm. Mitigation Measure MM-LU-4 states that:

“Upon completion of the study required by Mitigation Measure MM-LU-3 and acceptance of its results by peer review of industry experts, any schools found to exceed a newly established threshold of significance for classroom disruption shall be incorporated into the ANMP administered by LAWA. Based on the Master Plan alternative that is ultimately approved and thresholds set forth in § 4.1, Noise, that address single overflight event noise and the ability of children to learn in the classroom, and subject to modification based on the study required by MM-LU-3 those schools listed . . . may be eligible for sound insulation.”

Although the mitigation reads as though it is addressing the problem, it does not commit LAWA to any definable actions that would reduce impacts other than a vague reference that schools may be eligible for sound insulation. LAWA must describe mitigation measures in enough detail to commit the lead agency to an action that reduces the impact. Further, mitigation measures must be defined in enough detail to analyze the potential environmental impacts that may result from the implementation of the mitigation measure.

4.7 SOCIOECONOMIC ASSESSMENT

4.7.1 Productivity Variables are based on Flawed Assumptions

The 2001 assessment of Employment and Socioeconomic Impacts (and therefore the Growth Inducement Analysis as well) was substantially flawed by assumptions made at the outset of the analysis concerning productivity gains. This conclusion is directed largely at the assumption made in 2001 that productivity gains would be the same for all of the build Alternatives. In fact, productivity rates are variable over time and highly sensitive to changes in the economy's overall rate of growth. These cycles are evident in statistics over the past 50 years, which show national annual productivity growth in the range of 2.8% from 1948-1973, compared with 1.2% during the economic slowdown of 1992-1995.⁴⁵ When Gross Domestic Product growth is decelerating, productivity slows. Given the repeated emphasis throughout the 2001 Draft and 2003 Supplement to the Draft EIS/EIR that failure to pursue the expansion project would have a negative ripple effect throughout the southern California economy, it would have been more logical to link the No Project Alternative with productivity gains lower than those associated with the build Alternatives. Similarly, to the extent that Alternative D resembles the No Project Alternative it too would be associated with productivity gains lower than those associated with the remaining build. Accordingly, the SDEIS/EIR should reassess Employment and Socioeconomic impacts for Alternative D and the No Project Alternative using a lower estimate of productivity gains.

4.7.2 Productivity Forecasts Require Further Justification

The Socioeconomic Technical Report (provided only in the 2001 Draft EIS/EIR) made note of the labor-intensive nature of many service industries, and identified the tendency toward stable or reduced productivity (and resulting job growth per unit of service) in hotels, restaurants, and numerous high-end personal, household and business services.⁴⁶ At the same time, assumptions in

⁴⁵Alejandro Bodipo-Memba, "U.S. Productivity Surged During 1998, Hinting at Escape from 25-Year Slump," Wall Street Journal, February 10, 1999.

⁴⁶ Section 3.2.3.

the Draft and 2003 Supplement to the Draft regarding the No Project Alternative show passenger volumes increasing from 71.2 MAP in 2005 and 78.7 MAP in 2015 (about a 10% gain). The Technical Report noted that the services and tourism/entertainment sectors showed the most substantial employment gains between 1972-1992 and again between 1992-1997.⁴⁷ Finally, the Report allocated substantial passenger spending on these services, particularly for hotels and dining facilities, through the 2015 horizon.

In combination, these facts would point to positive employment gains in at least those sectors for which productivity is forecast to slow – eating and drinking establishments, hotels, and amusement and recreation facilities at a minimum. Nevertheless, and in apparent contradiction of its own assessment, the Socioeconomic Technical Report forecast losses in direct LAX-related employment for both sectors between 2005 and 2015 under the No Project Alternative. Eating and drinking establishments were forecast to sustain job losses on the order of 1,725 (a 4% drop); hotels were forecast to sustain job losses on the order of 3,467 (a 7.5% drop); and amusement/recreation facilities were forecast to sustain losses on the order of 4,514 (a 14.8% drop).

An explanation is needed to justify the Technical Report forecasts of job losses that conflict with the discussion of anticipated productivity trends for hotels, restaurants, and services. Job growth in the specified service sectors should be projected.

4.7.3 Definition of the No Project Alternative is Artificially Narrow

The artificially narrow definition of the No Project Analysis weakens the analyses contained in the Socioeconomic Technical Report. As discussed previously, the 2001 Draft EIS/EIR and the 2003 Supplement both assume that under the No Project Alternative there would be no new improvements at LAX beyond those now underway, planned, or programmed. Both CEQA and NEPA favor “worst case” assessment. In this light, it would be more reasonable and informative to anticipate that LAWA would pursue a wide range of additional improvements that would in turn boost direct and indirect employment and spending, with far different socioeconomic impacts than indicated in Technical Report estimates for the No Project Alternative. The analysis of Employment and Socioeconomic impacts should be revised to incorporate the expanded assessment of actions that may in the future be taken by LAWA in the event the project is not approved and the outcomes that could reasonably be expected to result from such actions should be addressed.

The 2003 discussion of socioeconomic effects associated with Alternative D repeats a form of the unsupportable syllogism described in § 3.3.2. In the current section, Alternative D is concluded to have beneficial socioeconomic effects, Alternative D is described as substantially the same as No Action, and No Action is found to have adverse socioeconomic effects. In fact, an increase in construction jobs is the only socioeconomic difference between No Project and Alternative D that is acknowledged in the Supplement to the Draft EIS. Again, we believe that the inconsistency is due to misrepresentation in the description of alternatives – particularly Alternative D and the No Project Alternative.

⁴⁷ Section 4.1.1.

4.7.4 Distribution of Passenger Spending Requires Explanation

In estimating the distribution of passenger spending, §3.4.3.1 of Technical Report 5 indicated that it was assumed that LAX would represent the sole source for international traffic, based on historical data for the years 1985-1994. Additionally, the Section noted that:

“As a working assumption, it was assumed that there was no connecting traffic at any of the other 4 major airports in the region...the single exception to this rule results from the fact that Ontario ‘International’ Airport did serve an estimated 50,000 international passengers during late 1993 and early 1994.”

It is unclear how the “working assumption” and exception were applied in estimating future contributions under the 2005 and 2015 scenarios. Did the analysis treat the 50,000 international passengers as a one-time event, or did it assume that Ontario would continue to serve 50,000 international passengers (per year) through 2015? In either case, the document should have explored the factors that allowed Ontario to successfully enter this competitive market, with the goal of assessing Ontario’s ability to accept future unmet need in the region as a whole. This analysis would have been especially relevant to the socioeconomic analyses of the No Project Alternative, and may have resulted in far different conclusions. If the Socioeconomic Technical Report did base its 2005 and 2015 No Project Alternative scenarios on the assumption that Ontario would serve 0 or 50,000 international passengers (but no more), the analysis should provide a more detailed assessment of the potential role of Ontario in meeting international travel demand.

In general, and although the Technical Report promised such an assessment, the Socioeconomic Technical Report did not make any substantive effort to determine the degree to which the No Project Alternative might result in a redistribution of air services and associated economic activity to other airports in the region. As it stands, the analysis shines a very bright light on variables influencing the LAX growth scenarios, but does little to apply its powerful tools on the potential future role of other facilities in the region. This approach shortchanges the No Project Alternative. It also shortchanges the newly-proposed and preferred Alternative D. As noted above, the only socioeconomic difference between ‘No Project’ and Alternative D, according to the SDEIS/EIR, is construction employment. If true, then Alternative D would also be similar to No Project in its potential to redistribute non-construction air services and economic activity to other airports in the region. LAWA should expand the Supplement to the Draft EIS/EIR to take a closer look at this issue, considering the amount and type of activity that could reasonably be expected to shift within region, and the direct and indirect economic effects that might result.

4.7.5 Distribution of Regional Spending Requires Explanation

§3.4.3.1 of the 2001 Draft EIS/EIR noted,⁴⁸

“Parking costs are the only local impacts attributed to Resident passengers in the current analysis...[and to] the extent that such passengers spend money at restaurant and retail establishments during the time they spend in one of the region’s airports, this analysis may, to a small degree, have underestimated the impacts of Resident passengers.”

⁴⁸ In Footnote 32.

The analysis also discounted resident expenditures on transportation to and from the airport:

“To the extent that such transportation is provided by a private taxicab, limousine or shuttle service will cause some additional impacts on the local economy. This does not apply to connecting and visitor passengers, for whom these impacts have been measured.”

On the surface, these assumptions would be expected to impact regional spending estimates in a neutral manner, because it is applied to all airports in the region. However, since the analysis: (1) assumed that facilities other than LAX will be essentially limited to resident passengers; (2) discounted the retail, restaurant and travel expenditures of these passengers; and (3) measured such expenditures for connecting and visitor passengers, the net effect is to disproportionately minimize the regional spending contributions of airports other than LAX. Once again, the assumptions would cast an artificially unfavorable light on the No Project Alternative (though not, apparently, on Alternative D, though it is presented as equivalent apart from construction impacts).

4.8 REGIONAL TRANSPORTATION

All of the alternatives, including the No Action Alternative, call for a 41% increase in passenger activity and a 60% increase in air cargo at LAX. Passenger volume would increase from 56 MAP to 79 MAP, and air cargo would increase from 1.95 million tons to 3.2 million tons in only 12 years. Those amounts are greater than 95% of all other national airports and are greater than all the other Los Angeles regional airports combined!

If indeed the LAX Master Plan aims to promote meaningful growth at other regional airports, then realistic growth control measures must be included. The inland airports have abundant capacity and are crying for air service, and the LAX Master Plan must include measures that lead to region wide cooperation to move air service to those areas. The City of Los Angeles has refused to participate in activities of the Southern California Regional Airport Authority, which has generated several proposals to promote such efforts. Without active measures to move air traffic to other airports, the Master Plan serves only to create another incremental step in the unabated growth of LAX. We understand that LAWA has recently hired a consultant to market Ontario International Airport,⁴⁹ and would request that LAWA outline the goals of that marketing plan.

4.9 BIOLOGICAL RESOURCES

4.9.1 Review of Baseline Conditions

The SDEIS/EIR identifies eight distinctive biotic communities without clearly distinguishing among the following: naturally occurring communities; man-influenced/modified natural communities; man-created biotic situations; or areas under complete development, which no longer have biotic value for sensitive plant and animal species. The acreages of biotic habitats were rates in terms of value for sensitive species, and compared with marginal habitats, non-native habitats, and areas that are developed and no longer supporting habitats. The review indicated that the airport is largely developed, with open areas that are highly disturbed and offers little or no viable

⁴⁹ Press Enterprise Newspaper, “Still awaiting takeoff,” September 21, 2003.

habitat for sensitive plant and animal species. The Los Angeles/El Segundo Dunes and, to a lesser extent, the non-restructured dunes north of this area stand out as the only areas having high biological value that merits recognition and a conservation effort by LAWA. It is therefore recommended that the Master Plan include a "conservation element" dictating how the Los Angeles/El Segundo Dunes will be managed. This goes beyond the requirements to manage the Habitat Restoration Area for the El Segundo Blue Butterfly.

4.9.2 Review of Mitigation Measures

Several mitigation measures are listed in § 4.10.8 that would, if successful, reduce potential impacts to sensitive biological resources to a less than significant level. The selection of mitigation measures will depend on which Alternative is chosen. It is expected that a mitigation monitoring program (MMP) will be developed and implemented. However, we recommend that LAWA separate the biological mitigation measures from the larger MMP and create a Conservation Program that focuses on the Los Angeles/El Segundo Dunes and surrounding areas. This would enhance the biological program and provide LAWA with a stronger negotiating position with United States Fish and Wildlife Service on future projects.

Section 4.11.2 mentions that LAWA initiated a formal Section 7 consultation with USFWS on September 5, 2000. The remainder of § 4.11 discusses several mitigation measures that will be implemented to reduce impacts to listed species to below a significant level. It is not clear whether these mitigation measures are the basis for the formal Section 7 or if they have been included in the required Biological Assessment. Although completion of the Section 7 consultation process by the FAA is not required to be a part of the Draft EIS/EIR analysis, the level of analysis and detail presented in this Draft would suggest that it has been included.

Apparently, USFWS and LAWA have not come to terms on the level of mitigation required to mitigate impacts to the Riverside Fairy Shrimp and its habitat. There is a brief mention of this divide at the top of page 4-691. The FAA is rightly concerned that the creation/restoration of fairy shrimp habitat (vernal pools) will create significant safety issues for aircraft by attracting birds (bird air strike hazards). However, the final endangered species mitigation measures and/or conservation management strategies will depend on final resolution of this issue between USFWS and the FAA.

The Draft EIS/EIR does not give an indication whether the present mitigation measures will be satisfactory to USFWS, or whether these measures will allow the FAA to complete its obligations under the Endangered Species Act. If this is the case, it should be clearly stated. If it is not, the reader needs to know that the mitigation measures have not been approved by USFWS and could change significantly before the Section 7 consultation process is completed and a Biological Opinion is issued by the USFWS.

As discussed above under comments for § 4.10.5 Master Plan Commitment, all biological mitigation measures should be integrated into a Conservation Program for LAWA with focus on the Los Angeles/El Segundo Dunes and the Riverside Fairy Shrimp.

4.9.3 Wetlands Concerns Must be Integrated

Only U.S. Army Corps of Engineers jurisdiction was found to occur within the Air Operation Area or the Los Angeles/El Segundo Dunes; no California Department of Fish and Game (CDFG)

jurisdiction was determined to occur. The permanent conversion/loss of the 1.3 acres of atypical wetlands is a significant impact that will require a 404 permit. It will also require a Section 7 consultation between the Corps and USFWS because of the presence of embedded Riverside Fairy Shrimp cysts in soil samples.

The biological concerns associated with wetlands should also be included in a Conservation Program rather than addressed as a separate biological issue for which no Master Plan commitments are made. Although there is very limited natural habitat at LAX, any loss of these remaining natural habitats will be considered significant by USFWS, CDFG, and local wildlife protection groups. It would seem an opportune time to develop a long-term management plan for biological resources on airport lands. Once in place, this plan/strategy would set policies and procedures (officially approved by the resources regulators) for the next several years. As the Draft EIS/EIR currently reads, LAWA has identified several biological concerns that are being addressed separately and on a one-time basis. This would leave LAWA vulnerable to future challenges as unanticipated development/programs are proposed.

4.9.4 Reference to 2001 Comments from Land Protection Partners

During 2001, the Land Protection Partners (LPP) submitted a comment letter to LAWA entitled "Review of Biological Resources Analysis in LAX Master Plan Draft Environmental Impact Statement/Environmental Impact Report" as a review of the 2001 LAX Master Plan Draft EIS/EIR. Based on a preliminary assessment of points made in the LPP letter, the County of Los Angeles has concluded that their comments raise some significant issues regarding incomplete or vague project descriptions of the build alternatives, outdated CEQA analyses, questionable survey methods, questionable El Segundo Blue Butterfly population counts, underestimating impacts, and inadequate mitigation. Many of Land Protection Partners' comments echo concerns raised in this comment letter, but with a particular focus on how the concerns impact the assessment of potential biological impacts. The County endorses the points raised by LPP, which are briefly summarized below, and looks forward to reviewing LAWA's responses:

Vague and Confusing Descriptions of the Build Alternatives: LPP noted that the Draft EIR/EIS does not give a complete project description of the build alternatives. Within the extent of the LAX Master Plan boundaries, it is unclear how LAWA proposes to use certain areas of biologically significant property. Designations such as "Airport Related" are useless in evaluating the potential biological impacts associated with that designation.

Outdated CEQA Analysis: The Draft EIR/EIS describes the LAX Northside Project as "Collateral Development" that previously was entitled through a 1983 CEQA process. No new or updated analysis is found in the Draft EIR/EIS, even though development of this project appears to be contingent on the project alternative selected for LAX. In this light, reliance on 1983 CEQA documentation that did not consider LAX as a contingent project is problematic at best.

Questionable Survey Methods: Land Protection Partners' document raised questions concerning survey results, particularly with respect to the incorrect choice of survey methods. LPP noted that LAWA did not conduct general biological surveys in all habitats within the proposed project site. LPP also references impacts to 100 acres of the El Segundo Dunes habitat that was not surveyed by

LAWA, even though it would be converted to a golf course under the Westchester Southside Project described in the 2001 Draft EIR/EIS.

Questionable El Segundo Blue Butterfly Population Counts: Land Protection Partners suggests that the surveys conducted by LAWA did not use the best available scientific methods for calculating population numbers of the Federally-endangered El Segundo Blue Butterfly (ESBB). In overestimating the ESBB population, the Draft EIR/EIS gives the false impression that the ESBB is able to sustain viable populations on limited habitat, and confuses the analysis by downplaying the need for land to be kept as conservation areas.

Underestimation of Impacts of the Proposed Project Alternatives: The methods used to determine impacts to habitat were misleading and not used accurately. LPP concluded that the combined affect of not surveying all potential habitat, using questionable survey methods, and overestimating ESBB populations resulted in a misleading impact assessment.

Inadequate Mitigation Measures: LPP found that use of a point system to rate 'habitat units' resulted in inadequate mitigation for lost habitat. For example, the Draft EIR justifies preserving smaller areas of prime habitat in exchange for the conversion of larger areas of occupied but marginally disturbed habitat. LPP noted that species need both the space and the quality of habitat, concluding that 10 acres of prime habitat may not be adequate to sustain a population that had previously lived on 50 acres of marginally disturbed habitat.

4.9.5 General Comments

The 2001 Draft EIS/EIR and 2003 Supplemental Draft EIS/EIR do not give complete project descriptions of the build alternatives. Within the extent of the LAX Master Plan boundaries, it is unclear what the disposition of certain areas of biologically significant property will be indicating designations such as "Airport Related" which are useless in evaluating the potential biological impacts associated with that designation.

LAWA did not conduct general biological surveys in all habitats within the proposed project site. As an example, the 2001 Draft EIS/EIR and 2003 Supplemental Draft EIS/EIR describe impacts to 100 acres of the El Segundo Dunes habitat that was not surveyed and would be converted to a golf course under the Westchester Southside Project.

Unfortunately, given the amount of time and effort devoted to assessing baseline biological conditions, the remaining step of integrating and folding this information into a long-term Conservation Program is missing. This may be a conscious choice by LAWA management and the City of Los Angeles; however, this approach may deprive LAWA of the opportunity to gain long-term control of its own biological resources.

4.10 ADDITIONAL ISSUES

4.10.1 Historical Resources

Illustration of the different impacts associated with the Single v. Split Viaduct LAX Expressway Alternatives should be carried forward from the Appendices to the Historic/Architectural section of the Supplemental Draft EIS/EIR.

The commitment to have a qualified architectural historian supervise noise abatement of historic properties does not assure that the historic values and character of such properties will not be altered or lost. The SDEIS/EIR should discuss this possibility and attach alternate mitigation measures or a revised significance finding, if appropriate.

The 2003 Supplemental Draft EIS/EIR concludes for all the build alternatives that:

“The demolition of a historic/architectural resource is considered a significant impact at the state level that cannot be mitigated to a less than significant level without abandoning the project. A Statement of Overriding Considerations would be necessary to address unavoidable impacts on the International Airport Industrial District.”⁵⁰

This is insufficient information to support an override. Revisions to the SDEIS/EIR need to explain why demolition of this historic/architectural resource is required to implement the project and what benefits will result from the project that override this significant impact.

4.10.2 Human Health

The analyses indicated that aircraft emissions account for about 97% of total emissions and also contribute most to emissions of individual Toxic Air Pollutants,⁵¹ yet none of the mitigation measures address aircraft emissions. Many of the mitigation measures would be expected to occur regardless of what happens with the proposed Master Plan – for example, parking pricing policies to encourage single trips or to minimize idle time at the curb, steps to encourage employee telecommuting, and expanded off-airport intermodal services to other airports. Others would have no air quality benefit – for example, where unmitigated impacts result in payments to a trust fund for unrelated community improvements.

In this context, it is difficult to understand how the HHRA determined that the build Alternatives, with mitigation, would have no significant human health impacts at either horizon year. A clarification of the assumptions that were made in order to reach this conclusion is necessary to validate this conclusion.

The California Office of Environmental Health Hazards Assessment (OEHHA) evaluates non-cancer risks and has established maximum reference exposure levels (REL) for each TAP. No adverse health effects are foreseen for exposures at or below the REL. The exposure of TAP at concentrations equal to the REL represents a non-cancer hazard index level of 1.0. Exposure above

⁵⁰ 2003 Supplemental Draft EIS/EIR, Section 4.9.1, page 4-443

⁵¹ Technical Report 14a, Section 3.3.

a hazard index of 1.0 is considered a significant impact by OEHHA. The relationship for non-cancer health effects of Toxic Air Pollutants is shown in the following equation:

HI = C / REL, where:

HI = Hazard Index; an expression of the potential for non-cancer health effects

C = Annual average TAP concentration (ug/m₃)

REL = Reference exposure level (REL) for TAP; the TAP concentration at which no adverse health effects are anticipated

The Supplemental HHRA Technical Report provided as Appendix 9a in the 2003 Supplemental Draft EIS/EIR states that the REL for acrolein used in the HHRA is 0.19 ug/m₃.⁵² This same document further states that under Alternative "D", total acrolein concentrations might range between 14 ug/m₃ and 87 ug/m₃ with an overall average of 23 ug/m₃.⁵³ Using the OEHHA equation for determining the hazard index as shown above, the resulting hazard index would range between 73.68 and 457.90, well above the OEHHA threshold of significance set at a hazard index of 1.0. Evaluation of all scenarios indicates that the hazard index for acrolein are all above the OEHHA threshold, even in the existing condition and while the Supplemental HHRA indicates that Alternative D has the lowest exposure levels of all these scenarios it is nevertheless above the threshold of significance set by OEHHA. How is it that both the 2003 Supplemental Draft EIS/EIR determined that this impact is less than significant? Revisions to the SDEIS/EIR need to be made that disclose this significant impact and either mitigate to less than significant or provide the evidence that supports a Statement of Overriding Consideration for this significant impact.

4.10.3 Environmental Action Plan

Many of the key Master Plan Commitments and mitigation measures in the Environmental Action Plan (EAP) are broad and programmatic in nature. Many will require further study, with choices among specific options deferred to the Final EIS/EIR and other stages of the decision making process. The EAP needs to be expanded to identify when and where such subsequent environmental reviews will be required, with discussion as to how these timeframes relate to the improvement phasing plan set forth by LAWA, and to the sequence for FAA and LAWA consideration of required discretionary actions. The EAP, including all Master Plan Commitments and mitigation measures, should be refined and detailed to adequately serve as the CEQA Mitigation Monitoring Program, pursuant to Public Resources Code 21081.6.

4.10.4 Video-Conferencing

In the § 1.3 discussion of Alternatives to air travel, the 2001 Draft EIS/EIR notes a study by Apogee Research that contains key findings that video-conferencing has potential to satisfy (1) from 5-30% of non-discretionary travel; and (2) less than 5% of discretionary travel. The discussion in § 1.3 concludes with: "Given that 50% of LAX users are leisure travelers, it is projected that less than 5% of air travel demand at LAX could be satisfied by communication technologies in 2015. These amounts were factored into the assumptions of the LAX Master Plan forecasts." The Supplement to the Draft EIS/EIR did not resolve this error. The total amount of air travel demand at LAX that

⁵² Technical Report 9a, Section 5.1

⁵³ Technical Report 9a, Section 6.1.2

could be satisfied by communication technologies should equal the combined amounts for discretionary travel PLUS non-discretionary travel (i.e., [5-30% of demand x 50% of travel = 2.5% to 15%] + [$<5\%$ of demand x 50% of travel = $<2.5\%$] = $\sim 2.5\% - 17.5\%$). It seems that a higher number should be factored into the assumptions of the LAX Master Plan forecasts.

4.10.5 Sixty-Minute Access Zone

The Zone Boundaries shown in Figure 1-3 of the 2001 Draft EIS/EIR showing the 60-minute travel time accessibility zones for airports in southern California appear to overstate driving times for at least some of the airports shown. The assumptions used in developing this map need to be discussed and clarified in order to support the map, as drawn.

4.10.6 Weather Conditions

The 2001 Draft EIS/EIR notes that only one of the four runways is sufficiently long to serve the largest aircraft when fully loaded under adverse weather conditions (hot days with little wind).⁵⁴ However, there is no discussion as to how many days of the year, on average, are characterized by these adverse weather conditions. There is also no discussion as to how many runways can accommodate the largest aircraft when fully loaded. Both of these issues require further explanation and investigation by LAWA.

4.10.7 Remote Terminals

The 2001 Draft EIS/EIR includes discussions of the possibility of remote terminals. However, no analysis is undertaken to determine their location or impacts. Alternative "D" described in the 2003 Supplemental Draft EIS/EIR includes a Ground Transportation Center connected to the main terminal buildings by an Automatic People Mover that appears to fit the descriptions of remote terminals mentioned in the 2001 Draft EIS/EIR. However, it is unclear whether or not the Ground Transportation Center within Alternative "D" is the remote terminal mentioned in the 2001 Draft EIS/EIR. LAWA should clarify this in revisions to the Supplemental Draft EIS/EIR, and if there are other possibilities for remote terminals, then include a full characterization of these other remote terminals as well as a description of the baseline setting for the proposed locations, the impacts of their construction and use, and mitigation measures to address any adverse effects.

4.10.8 Hydrology and Water Quality

Section 4.7 of the SDEIS/EIR inadequately addresses SUSMP and drainage issues. The environmental document does not provide sufficient information to determine what drainage impacts, if any, the project may have on County facilities (MTD 992, storm drain Project Number 5241, 647, 670, etc.). To properly assess drainage and SUSMP impacts and to determine appropriate mitigation, a Drainage Concept/SUSMP report will be required. We recommend that the applicant prepare a Drainage Concept/SUSMP report showing the extent of drainage and SUSMP quality impacts, and if necessary, provide mitigation acceptable to the County. The analysis should address increases in runoff, any change in drainage patterns, treatment method proposed for SUSMP regulations, and the capacity of storm drain facilities.

⁵⁴ 2001 Draft EIS/EIR, Section 2.2.2, Page 2-6.

We also recommend that the Drainage Concept/SUSMP report should be reviewed and approved by the County of Los Angeles Land Development Division - Subdivision Plan-checking Section before the City considers its own approval. Once approved, a copy of the final Drainage Concept/SUSMP report should be included in the environmental document.

4.10.9 Solid Waste Generation and Landfill Capacity

Chapter 4 of the Master Plan Supplement to the Draft EIS/EIR, identifies the amount of solid waste generation as a result of construction and demolition activities of alternatives No Action/No Project, A, B, C, and D. The tonnage of waste generated from construction and demolition activities alone for Alternative D – the LAWA staff-preferred alternative – is well over 130,000 tons. Although LAWA states that it will require that contractors recycle a “specified” minimum percentage of waste materials generated during construction and demolition, a significant commitment is necessary to insure adequate mitigation of the scale of impact resulting from waste generated by this project. Therefore, the minimum percentage should be specified within the EIR, with a target of at least 50 percent of the waste diverted from disposal. Similarly, the percentage of minimum recycled content for materials used on site, and the specific diversion goals that will be required of lessors, should also be specified in the EIR.

Under heading of Master Plan Commitments (§4.19.5, p. 4-534), the SDEIS/EIR proposes implementation of a more aggressive recycling program, by expansion of the existing terminal recycling program to all terminals; lease provisions requiring that tenants meet specific diversion goals; and preference for recycled materials during procurement. The document should expand the discussion to include the type of material that might be targeted and the overall recycling goal.

The environmental document recognized that due to the uncertainty regarding future landfill capacity, impacts associated with cumulative increases in solid waste generation would be potentially significant (Sections 4.19.7 and 4.19.8, pages 4-537 and 4-538). Augmentation of landfill capacity is listed as a mitigation measure, however, the responsibility for implementing this mitigation measure is left to State, County, and local solid waste planning authorities. This discussion should be revised to indicate what measures the City of Los Angeles will implement to provide for the disposal of residual solid waste generated by this project and future projects within the City of Los Angeles considering the City’s stated interest to close all landfills within the City’s boundaries by 2006.

5.0 CONCLUSIONS

There is no doubt that Los Angeles International Airport is vitally important to the City of Los Angeles, to the County of Los Angeles, to the region, and to California generally. There is an obvious and pressing need for improvements at LAX, most particularly to ensure the safety and security of future air travel. However, the County of Los Angeles believes that LAWA is proposing to implement a flawed project and that the process is further compromised by an inadequate environmental review. As documented throughout this report our concerns include (a) an inadequate security planning effort, (b) misleading statements regarding growth potential, resulting in fundamentally flawed environmental analyses, (c) improper choice of a Supplement to propose and assess an entirely new preferred project, (d) use of an unwieldy and confusing document format, (e) continued reliance on a baseline that is outdated and serves to undermine rather than illuminate understanding of project impacts, (f) wholly inadequate consideration and disclosure of

Environmental Justice issues coupled with a scoping process that considered neither 2001 nor the 2003 preferred project options, (g) language suggestive of bias and advocacy and an absence of full disclosure, (h) incomplete analysis of noise and air quality and the absence of studies to establish baseline or impact-level toxic air emissions, (i) inadequate and misleading assessment of impacts on biological habitat, and (j) the failure to provide an alternative that meets stated goals and also avoids or minimizes significant impacts in the identification and assessment of Alternatives.

The problems with the 2001 and 2003 environmental documents are so serious, pervasive, and universal that the only practical remedy is to start the process over again and prepare a truly comprehensive revised EIS/EIR. The revised document would need to provide comprehensive scoping, an updated and consistent baseline, identify and assess a reasonable range of feasible alternatives, be free of internal inconsistencies, offer proper levels of analysis and explanation, and present an entirely new impact assessment that does not defer critical decisions. Only with these extensive modifications can the LAX Master Plan and associated EIS/EIR be rendered adequate.

October 20, 2003

SAL00019

Review of Biological Resources Analysis in Supplement to Draft Environmental Impact Statement/Environmental Impact Report for LAX Master Plan

This review pertains to the Federal Aviation Administration/Los Angeles World Airports Supplement to Draft Environmental Impact Statement/Environmental Impact Report (“SDEIS/EIR”) for the LAX Master Plan. The scope of this review is limited to biological resources, and consequently addresses Sections 4.10 (Biotic Communities), 4.11 (Endangered and Threatened Species of Flora and Fauna), 4.12 (Wetlands), 4.14 (Coastal Zone Management and Coastal Barriers), and 4.18 (Light Emissions). The review was prepared by Dr. Travis Longcore and Catherine Rich, who are experts in the ecology and history of the natural communities that would be affected by the proposed airport expansion and in the assessment of environmental impacts under the California Environmental Quality Act, National Environmental Policy Act, and California Coastal Act. Dr. Longcore has co-authored several peer-reviewed scientific articles on the El Segundo dunes and the Los Angeles coastal prairie (including its vernal pools),¹ which both would be adversely affected by the proposed project.

The SDEIS/EIR complements, but does not replace, the original Draft Environmental Impact Statement/Environmental Impact Report (“DEIS/EIR”) for the LAX Master Plan. The SDEIS/EIR does nothing to improve the fatally flawed assessment methodology for direct impacts to sensitive biological resources that was presented in the DEIS/EIR. Rather, the SDEIS/EIR provides only a trivial and meaningless change in the name of the methodology from “modified Habitat Evaluation Procedure” to “Mitigation Land Evaluation Procedure” (“MLEP”). The SDEIS/EIR attempts to improve the analysis of indirect impacts on biological resources, including the effects of light, noise, and air pollution, but the analysis is illogical and unsupported by the literature. Finally, the SDEIS/EIR presents impact analysis for the newly-formulated Alternative D.

With the exception of the analysis of Alternative D, which triggered the preparation of a Supplement, the new biological resources analysis appears to consist primarily of responses to comments on the DEIS/EIR, including those of the resources agencies and perhaps our own.² In our 2001 review, we noted the failure of the DEIS/EIR to provide an adequate assessment of the effects of light and noise on biological resources, illustrated the gross inadequacy of the “modified Habitat Evaluation Procedure,” and identified contradictions in the project description. Because many of the problems that we identified in our 2001 review have not been addressed in the SDEIS/EIR, we incorporate our earlier comments by reference (see attached without appendices). This review evaluates the updated analysis of biological impacts and associated mitigation measures presented in the SDEIS/EIR.

1.0 Project Description

The maps of land use for the airport properties are updated in the Supplement to depict the four Alternatives. These maps are somewhat clearer than those in the DEIS/EIR about the land use of the ~100 acres of El Segundo dunes not included in the Habitat Restoration Area. While the DEIS/EIR included maps depicting this area as a golf course or resort hotels,³ the SDEIS/EIR identifies that area as "Airfield/Airport Open Space."⁴ The description of Alternatives does not, however, provide conclusive details about the long-term disposition of this biologically important area.⁵ The long-term plans for this property are important to the analysis of mitigation measures because the SDEIS/EIR contemplates that some habitat mitigation activities will occur in this area, outside of the ~200-acre Habitat Restoration Area.⁶

We note that the depiction of the 100 acres of El Segundo dunes north of the Habitat Restoration Area as "Airfield/Airport Open Space" diverges from the previous positions articulated by the City of Los Angeles. In the staff report for issuance of a Coastal Development Permit for landscaping along Waterview Street at the northern end of this area, the City in 2001 wrote, "The Project, a narrow, landscaped area along the streets, would provide a buffer between the golf course and residential areas...."⁷ As we noted in our previous comments, the zoning for the parcels in the dunes was set at [Q]OS-1-XL in 1994, which disallows development in the dunes habitat preserve and restricts use of the remainder of the property to "a nature preserve and accessory uses only."⁸ In the Land Use section of the SDEIS/EIR, while the entire 300 acres of the El Segundo dunes are designated as "Open Space," the map refers to the "Los Angeles Airport/El Segundo Dunes Specific Plan" as the descriptor.⁹ This Specific Plan has been superceded by the 1994 zoning update, but this fact is not reflected in the various maps in the SDEIS/EIR. The restriction of the northern 100 acres of the dunes to "nature preserve and accessory uses" should be clarified in the Final EIS/EIR.

2.0 Direct Impacts

2.1 Mitigation Land Evaluation Procedure (formerly "modified Habitat Evaluation Procedure")

The modified Habitat Evaluation Procedure presented in the DEIS/EIR has been renamed the Mitigation Land Evaluation Procedure in the SDEIS/EIR.¹⁰ This methodology was rejected outright by the U.S. Fish and Wildlife Service ("USFWS") and the California Department of Fish and Game ("CDFG") in comments on the DEIS/EIR, but the SDEIS/EIR retains the methodology while simply changing the name, "to eliminate confusion associated with a similarity in the designation to an unrelated methodology developed by the USFWS."¹¹ This change in terminology does not correct the faulty

11. *Id.*

assumptions of the underlying method, and does nothing to correct the deficiencies in this method that were identified by the USFWS, CDFG, and our previous review.

The SDEIS/EIR uses the Mitigation Land Evaluation Procedure to determine impacts to sensitive vegetation types and to quantify impacts to habitats of sensitive species.¹² The name change is a *de facto* confirmation that the “methodology” is not based on an accepted technique, the “Habitat Evaluation Procedures” (“HEP”)¹³ developed by the U.S. Fish and Wildlife Service, but rather was invented for this analysis. While the HEP is an established method with a history of usage,¹⁴ the MLEP is not a recognized method for the evaluation of impacts to sensitive species or vegetation types, or the determination of mitigation ratios for such impacts. Because the SDEIS/EIR does not reprint the methodology it has renamed MLEP, further discussion of the MLEP must refer to the DEIS/EIR.

The MLEP sets habitat evaluation standards based on an “optimal” site with “a multitude of floral and faunal species.”¹⁵ One would expect that each vegetation type would be compared against an optimal site of that same vegetation type, but this is not the case. Rather, the MLEP inexplicably compares all vegetation types against a valley needlegrass grassland/vernal pool complex. One might also expect that the habitat evaluation for each species would incorporate features relevant to that species’ survival. This is not true either, because the habitat evaluation standards bear no relation to species requirements. For example, we compared the habitat evaluation standards in the MLEP to the habitat requirements of loggerhead shrike (*Lanius ludovicianus*) and black-tailed jackrabbit (*Lepus californicus bennettii*) (Table 1),¹⁶ and found no nexus. The MLEP assigns low values of 0.25 for vegetation types that are occupied by these species (non-native grassland/ruderal), even though this vegetation is quite good habitat for both species. Furthermore, because the MLEP compares all vegetation types against one vegetation type, the MLEP results in the false conclusion that habitat values lost by destruction of one vegetation type can be mitigated by enhancing a completely different vegetation type.

This critical failure bears repeating. The single set of standards used to evaluate all vegetation types does not reflect ecological value, either to sensitive species or as vegetation communities. This problem derives from the physical and biological criteria used to evaluate habitat and the so-called “ecosystem functional integrity” components of the analysis. Rather than developing criteria for each vegetation type, the MLEP evaluates all vegetation types against the characteristics found in a “reference site.” The vegetation type chosen for this standard is that of valley needlegrass grassland/vernal pool complex.¹⁷ For some inexplicable reason, all vegetation types are measured against this standard, including southern foredune, southern dune scrub, and disturbed dune scrub/foredune. Dune vegetation does not exhibit many features found in a valley needlegrass grassland/vernal pool complex. Because dune vegetation does not have vernal pools and associated species, these vegetation dune types are assigned lower

16. Because the MLEP is the “modified HEP” with a different name, our analysis is the same as provided in our 2001 comments.

17. DEIS/EIR, p. 4-615.

“habitat” values — 0.35 for both southern dune scrub and disturbed dune scrub/foredune, and 0.45 for southern foredune. This ranking merely illustrates that dune scrub is not good valley needlegrass grassland/vernal pool complex, but it says nothing about whether it is good dune scrub.

Table 1. Relevance of Mitigation Land Evaluation Procedure Standards to Two Sensitive Species

MLEP Standards	Relevance to value of area as black-tailed jackrabbit habitat	Relevance to value of area as loggerhead shrike habitat
TOPOGRAPHY		
Mound-depression microrrelief	None. Species occurs in a variety of topographic conditions.	None
Native soils w/ slope <10%	None	None
Areas w/ period of inundation ≥ 30 days	None. Can serve as vectors for seed dispersal between vernal pools, but not necessary for habitat. ¹⁸	None
Summer desiccation	None	None
FLORA		
>10% vegetative cover	Some. Forage and cover must be present.	Some. Vegetation must support prey populations.
Native grasses >10%	None. Will forage on all manner of grasses, forbs, and shrubs. ¹⁹	None
Vernal pool associated species	None	None
Listed vernal pool associated species	None	None
FAUNA		
Domination of native fauna (reproducing)	None	None
Grassland associated species (reproducing)	None	None
Sensitive vernal pool associated species	None	None
Listed vernal pool associated species	None	None
ECOSYSTEM FUNCTIONAL INTEGRITY		
Contiguity w/ wetland and State-designated sensitive terrestrial habitat	None	None
Designated sensitive terrestrial habitat	None	None
Under regulatory conservation	None	None
Variety of pollinator/dispersal mechanisms present (wind, wildlife)	None. Is itself a dispersal agent.	None
Contiguous native habitat > 40 acres	Potentially important. Size of habitat, whether native or not, is important.	Potentially important. Size of habitat, whether native or not, is important.

Hansen. 1982. Herbaceous vegetation of habitat used by blacktail jackrabbits and Nuttall cottontails in southeastern Idaho. *American Midland Naturalist* 107(1):180–184. Jameson, E.W., Jr., and H.J. Peeters. 1988. *California mammals*. University of California Press, Berkeley.

The portion of habitat value deriving from “ecosystem functional integrity” is another wholesale creation of the DEIS/EIR, and by extension the SDEIS/EIR. The choice of standards is arbitrary, with little to do with the sensitive species and vegetation types under analysis. Whether a site is “under regulatory conservation” does not necessarily have anything to do with the ecological value of its vegetation type for sensitive species. Similarly, “contiguity with state-designated habitat” is not an ecological criterion. “Variety of pollinator/dispersal mechanisms present” is oriented toward vernal pool vegetation, and the choice of “contiguous native habitat >40 acres” is arbitrary.

The MLEP fundamentally obscures the reality that sensitive plants and wildlife utilize vegetation that is not dominated by native species. Loggerhead shrikes forage in ruderal and non-native grasslands as well as in dune scrub. Jackrabbits are thriving in an area with little native plant component. Furthermore, the MLEP asserts that landscaped areas within the airport grounds contain “habitat units,” even though these areas support neither sensitive vegetation communities nor sensitive species. The MLEP is therefore of no use in evaluating the impacts to native wildlife, or in devising mitigation schemes for those impacts. The MLEP is so flawed that it completely fails to establish the nexus for mitigation of impacts.

We are not saying that it would be impossible to develop a scheme to assess vegetation communities that assigns lower area equivalence to degraded vegetation. Indeed, the suggestion by CDFG that non-native grasslands be mitigated at a 0.5:1 ratio is implicit recognition of such an approach. A preliminary effort to develop a “habitat hectares” scheme has been published in the scientific literature, but it is fundamentally different from the MLEP.²⁰ A valid “habitat area” approach should include the following features: 1) incremental values of habitat areas are assigned strictly on biological criteria, 2) these criteria are developed separately for each vegetation type, and 3) the results are not applied as proxies for the habitat requirements of individual wildlife species.²¹ The MLEP violates all three of these conditions. (Technically, this type of approach should not be called a “habitat area” approach, because “habitat” is a specific term that is defined relative to an individual species.²²)

2.2 Alternative D

The SDEIS/EIR discloses that the new, preferred Alternative D would result in direct destruction of 1.53 acres of sensitive habitat for the construction of navigational aids and associated service roads within the El Segundo dunes, both inside and outside the Habitat Restoration Area. This would include removal of 0.8 acres of disturbed foredune, 0.5 acres of disturbed grassland, and 0.2 acres of foredune.²³ The acreage may sound minimal to the casual reader, but the raw acreage does not reveal the true extent of project impacts because it conceals the spatial configuration of the development. The Biotic Communities analysis fails to reveal the geographic arrangement of the proposed construction, and does not consider this critical information in the assessment of impacts. This information about configuration is important because if the navigational aids are scattered, a greater area will be subjected to “edge effects” from adjacency to the new infrastructure and the construction. If they are clustered, then

23. SDEIS/EIR, Table S4.10-4.

impacts will be lessened. Clustering of development is one of the basic tenets of conservation planning. Every site of disturbance within the dunes habitat is an area that is more easily invaded by exotic plants and arthropods. It is therefore troubling that the SDEIS/EIR contains no assessment of the configuration of this development footprint.

Configuration of the navigational aids on the dunes is found only in the Coastal Zone Management and Coastal Barriers section. A figure in that section reveals that the navigational aids will be installed at no fewer than 23 separate locations in two lines extending two thirds of the way across the dunes from east to west.²⁴ In addition, existing navigational aids will be removed from 12 other locations both in and out of the Habitat Restoration Area. Each new navigational aid will be 9 feet square, within a 15-foot service buffer. The total area of the new navigational aids is 0.2 acres, so the remaining 1.4 acres of identified disruption must be from new roads or other construction impacts. Therefore, from the new navigational aids alone, nearly 1,300 feet of new habitat edges will be introduced into the El Segundo dunes. It is furthermore unclear if habitat disruption from removal of existing navigational aids has been evaluated.

The impact analysis for Alternative D uses the flawed MLEP to calculate "habitat units" that will be lost for various sensitive species. These habitat units are essentially meaningless; the actual acres of lost habitat should be the basis for impact assessment. According to the SDEIS/EIR the following sensitive species will experience habitat loss in the following amounts: black-tailed jackrabbit, 23.76 acres; western spadefoot toad (*Spea hammondi*), 8.97 acres; loggerhead shrike, 83.25 acres.

The area of impacts to black-tailed jackrabbit is actually much larger than 23.76 acres. The area currently occupied by this species will be used as a construction staging area, which will eliminate far more habitat than the parking garage.²⁵ In addition, the mitigation measure for this species proposes relocating all of the jackrabbits to the El Segundo dunes. The resulting total loss of habitat is therefore closer to the 118.75 acres described for the other Alternatives.

Loss of habitat for jackrabbits, loggerhead shrikes, and western spadefoot toads constitutes a significant impact because the losses would appreciably diminish the ranges of these rare species. LAX supports the only population of jackrabbits in west Los Angeles and indeed, in most of the Los Angeles basin. LAX also supports one of the last western spadefoot toad populations in the Los Angeles basin. Surveys in 2003 for breeding loggerhead shrikes recorded fewer than six pairs within the Los Angeles basin (Kimball Garrett, Los Angeles County Museum of Natural History, pers. comm.), and the species has disappeared in recent years from regularly surveyed sites at Holy Cross Cemetery, Madroña Marsh, and other Los Angeles locations (Professor Hartmut Walter, UCLA Department of Geography, pers. comm.). All three of these species are on the verge of extirpation within a large cismontane geographic area, making any impacts to the populations at LAX highly significant. Cumulative impacts to these species, from the proposed project and other projects in the area, including the Catellus West Bluffs development, are highly significant.

The impact analysis for Alternative D (and the other Alternatives) does not address the "bomb disposal site" located within the Habitat Restoration Area. Consultants to LAX previously recommended that

24. SDEIS/EIR, Figure S4.14-1.

25. SDEIS/EIR, Figure S4.20-1.

this site be moved as part of the Master Plan process so that the ongoing adverse impacts to sensitive habitats (including scraping of restored areas, and disposal of debris within restored areas) could be avoided.²⁶

The impact analysis does not provide a sufficient discussion of chemicals that would be used for dust suppression. The SDEIS/EIR suggests the use of "nontoxic" soil binders to reduce dust, but the compatibility of these chemicals with habitat restoration and biological communities is unknown or not reported, and so cannot be evaluated.

3.0 Indirect Impacts

The SDEIS/EIR provides additional discussion of the effects of light and noise on biological resources. While presenting marginally more information, the analysis and conclusions on both these topics are lacking in logic and scientific support.

3.1 Artificial Night Lighting and Wildlife

Discussion of the impacts of artificial night lighting on wildlife is hampered by the confusing use of terminology in the SDEIS/EIR. The issue is routinely described as an analysis of "light emissions," and the magnitude of lighting is described in foot-candles ("fc"). The difficulty with this is that foot-candles (or the SI equivalent lux) are measures of illumination within an area, not the emission of light from a source. Light emissions should be described in terms of luminance. Both illumination and luminance are relevant to assessment of the biological impacts of artificial lighting. Luminance is primarily associated with attraction and repulsion of animals, while illumination primarily results in orientation and disorientation.²⁷ Analysis of lighting should therefore clearly distinguish between illumination and luminance in considering impacts to wildlife.

The analysis of lighting impacts from all Alternatives lacks relevant spatial information to reach meaningful conclusions. For example, the baseline conditions within the dunes Habitat Restoration Area are described as ranging from 0.004 fc to 0.26 fc.²⁸ For all build scenarios, the SDEIS/EIR predicts that illumination will increase by 0.34 fc. The spatial distribution of this increase is not described, which makes it difficult to discern how large an area will be subjected to increased lighting from the project.

The SDEIS/EIR tries to reach the conclusion that current lighting levels have no adverse influence on wildlife. This conclusion is not supported by the facts. First, all lighting levels within the dunes were recorded during a night with a clear sky. Light reflected by clouds or fog is at a minimum on clear nights; ambient illumination may increase substantially on overcast or foggy nights.²⁹ The

characterization of the baseline conditions does not therefore adequately represent lighting impacts, given the frequency of these meteorological conditions along the coast.

Second, the biological analysis asserts that only nocturnal and crepuscular species could be affected by artificial night lighting. This conclusion reveals a failure to understand basic ecology and an ignorance of the scientific literature. One of the common effects of artificial night lighting is to extend the activity period of a diurnal species into the nighttime hours. This has been well documented for birds,³⁰ and is so notable in reptiles that animals exhibiting such behavior have been characterized as using the "night light niche."³¹ In another example, seals extended foraging time on salmon by using the lights from a bridge overhead.³² Extended activity times for diurnal species results in disruption of interactions with other species. Species with extended activity periods may 1) subject other species to increased predation, 2) increase competition with nocturnal and crepuscular species, and 3) be subject to additional predation. The outcome of these altered species interactions will be positive, neutral, and negative for different members of the community, be they diurnal, crepuscular, or nocturnal. One experimental investigation reports the outcome of increased foraging time allowed by artificial lighting for butterfly larvae. The higher growth rate associated with longer photoperiod was offset by significantly higher predation on the butterfly larvae from the primary parasitoid species.³³ The SDEIS/EIR errs dramatically in claiming that diurnal species would not be affected by artificial night lighting.

Third, the SDEIS/EIR does not discuss the relevant literature to develop thresholds to determine adverse impacts from lighting. Rather, it draws on the rather illogical statement that because sensitive species are present in the dunes area with existing light levels, the light does not adversely affect these species.³⁴ Presence of a species in a degraded habitat does not mean that the habitat is not degraded. The conclusion of no impact from existing lighting cannot be drawn without knowing the density of sensitive species in the absence of artificial night lighting. Even using the measurements taken on a clear night for the SDEIS/EIR, artificial illumination on the dunes reaches 0.26 fc (2.8 lux), which is an order of magnitude greater than that provided by a full moon (~0.1 lux). The claim that illumination of this magnitude does not affect wildlife is untenable, given the known influences of lunar cycles on wildlife behavior. For example, scorpions stay closer to their burrows during the full moon.³⁵ Other animals,

including snakes,³⁶ small mammals,³⁷ lagomorphs,³⁸ and bats,³⁹ similarly avoid foraging during the full moon to avoid the increased predation risk. With areas of the dunes subjected permanently to illumination brighter than that of a full moon, the conclusion that this baseline condition causes no impacts is not supported by scientific evidence. Even the dimmest illumination found in the baseline conditions at the dunes (0.004 fc = 0.043 lux) is still greater than the light of a quarter moon (0.01 lux), let alone a moonless clear night (i.e., starlight only with no light pollution; 0.001 lux), or a moonless overcast night (i.e., no starlight with no light pollution; 0.0001 lux).

With these natural illumination levels in mind, it becomes evident that impacts from additional light created by the project will be significant to wildlife. All project Alternatives would increase illumination within the Habitat Restoration Area so that illumination would range from 0.344–0.6 fc (3.7–6.5 lux). This illumination is 37 to 65 times brighter than that of a full moon. Given that the wildlife species of the dunes evolved for hundreds of thousands of years with, and are adapted to, a natural light regime with a maximum illumination of the full moon, and some wildlife species may detect and respond to illuminations below 0.01 or even 0.0001 lux,⁴⁰ an increase of 0.34 fc (3.6 lux) constitutes a significant adverse impact.

3.2 Noise and Wildlife

In our 2001 comments on the DEIS/EIR, we requested that the impact of noise on wildlife be analyzed. The SDEIS/EIR presents an analysis, but it is lacking in scope and logic.

The scope of the analysis of noise impacts is limited in the SDEIS/EIR to sensitive species only. While these impacts are important, this scope is unduly narrow, because it ignores impacts to wildlife species not designated as “sensitive” that are found in rare natural communities (also called “sensitive habitats”). Rare natural communities, such as southern foredune, dune scrub, and valley needlegrass grassland, are important for both their flora and fauna. It would defeat the purpose of protecting such sensitive habitats if impacts to the wildlife in those habitats are not analyzed. The noise analysis should therefore be expanded to consider impacts to the wide range of wildlife found in the sensitive habitats at LAX, and not limited to only those individual species designated as sensitive.

The logic of the noise analysis is also flawed. This is exemplified by the conclusion that, “Based on the analysis of existing noise levels at locations occupied by sensitive species, and the presence of sensitive species within these areas, it appears that current noise conditions do not adversely affect sensitive species at LAX.”⁴¹ Again, as is the case with the analysis of artificial night lighting, insufficient information is available in the SDEIS/EIR to draw this conclusion. If the density of sensitive species

41. SDEIS/EIR, p. 4-453.

without elevated noise levels were known, and those densities remained the same with elevated noise, then perhaps a conclusion of no impact could be reached. But the SDEIS/EIR does not report density of occupation by any sensitive species (except El Segundo blue butterfly, *Euphilotes bernardino allyni*) and presents no comparison to suggest that densities would be the same in the absence of the noise associated with the fourth largest airport in the United States. Without these critical parts of a logical argument, the conclusion that existing noise does not affect sensitive species at LAX is unfounded.

Beyond the faulty conclusion that *current* noise levels do not affect sensitive species at LAX, the SDEIS/EIR also asserts that *increased* noise would not affect sensitive species. This conclusion is a result of the inappropriately narrow scope of the analysis and a failure to consider reasonable thresholds for noise effects. A rather exhaustive body of literature is referenced, but glossed over by the SDEIS/EIR, that illustrates the adverse impacts of airport noise on vertebrates, even at levels far below the thresholds in the SDEIS/EIR. Chronic noise, even at low levels, is associated with elevated stress hormone levels, higher blood pressure, faster heart rates, and other physiological effects.⁴² As a result, birds, mammals, and other vertebrates may show anatomical differences (smaller body size, enlarged adrenal glands) from prolonged exposure to noise.

A study of the influence of aircraft overflights on birds is cited in the SDEIS/EIR, noting that "there were no major differences in the nesting productivity of the most abundant species, and the nesting success was high and similar for both the control site and the test site."⁴³ This reference is rather disingenuous, because it neglects to inform the reader that the Alaska study site experienced L_{max} below 70 dB(A) while the L_{max} at LAX ranges 90–140 dB(A) under the various Alternatives. This represents a considerable difference, because decibels are measured on a logarithmic scale.

Road noise, which is several orders of magnitude quieter than aircraft noise, has been documented to exert an adverse impact on breeding birds. Of 45 bird species investigated in woodlands in The Netherlands, 33 showed significantly depressed breeding density in response to increased noise levels near roads. All species in the small passerine families Sylviidae, Fringillidae, and Emberizidae were affected by noise.⁴⁴ Empirical measurement of the threshold value triggering decreased density in woodlands shows that for all bird species combined the threshold value is 42–52 dB(A), with individual species exhibiting thresholds as low as 36 dB(A) and as high as 58 dB(A).⁴⁵ Furthermore, years with overall low population densities showed lower threshold levels. Similar research has been conducted for

grasslands. Overall, this research shows that breeding bird habitat is degraded at noise levels as low as 36 dB(A).⁴⁶

Mammals are likewise vulnerable to impacts from chronic airport noise:

Only a few studies of the physiological effects of noise on rodents have involved wild animals. A field study by Chesser et al. (1975) involved two populations of house mice near the end of a runway at Memphis International Airport. Adult mice also were collected from a rural field 2.0 km from the airport field. Background noise levels at both fields were 80–85 dB. Noise levels of incoming and outgoing aircraft at the airport field averaged 110 dB, with the highest reading reaching 120 dB. Total body weights and adrenal gland weights of mice from the fields were measured. Additional mice were captured from the rural field, placed in the laboratory, and exposed to 1 minute of 105-dB recorded jet aircraft noise every 6 minutes to determine if noise was the causative factor. Control mice were not subjected to noise. After 2 weeks, the adrenals were removed and weighed. Adrenal gland weights of male and female mice from the airport field were significantly greater than those of mice from the rural field. The noise-exposed mice in the laboratory study had significantly greater adrenal gland weights than the control mice. After ruling out stress factors, such as population density, Chesser et al. (1975) concluded that noise was the dominant stressful factor causing the adrenal weight differences between the two feral populations.⁴⁷

While house mice are of no regulatory concern, native small mammals on the El Segundo dunes include harvest mouse, *Reithrodontomys megalotis*, and desert wood rat, *Neotoma lepida*, which are locally significant. But again, the SDEIS/EIR does not analyze these impacts because it concentrates only on sensitive species, and not on the full range of wildlife species in sensitive habitats.

The scientific literature provides ample evidence to conclude that the sensitive habitats at LAX are degraded by noise from airport operations and that increased noise would constitute a significant adverse impact.

4.0 Mitigation Measures

The SDEIS/EIR, because it relies on the MLEP to formulate mitigation measures for impacts to sensitive species and biotic communities, contains deeply flawed mitigation measures.

The SDEIS/EIR reports that all of the proposed project Alternatives will destroy four seasonal ponds occupied by western spadefoot toads on the south airfield. These populations number at least several hundred adults and all sites would be destroyed by the various project Alternatives. The SDEIS/EIR estimates occupied area as 8.97 acres of ephemerally wetted areas and adjacent upland habitats. Spadefoot toads require upland habitats surrounding their aquatic habitat.⁴⁸ It is unclear how upland habitats were measured for the SDEIS/EIR. Critically important in the analysis is that the species is found in four separate areas. Even though the areas are close to each other, the existing configuration of

Foppen, and G. Veenbaas. 1997. Disturbance by traffic of breeding birds: evaluation of the effect and considerations in planning and managing road corridors. *Biodiversity and Conservation* 6(4):567–581.

47. Mancini, K.M., D.N. Gladwin, R. Vilella, and M.G. Cavendish. 1988. Effects of aircraft noise and sonic booms on domestic animals and wildlife: a literature synthesis. U.S. Fish and Wildlife Service National Ecology Research Center, Ft. Collins, Colorado. NERC-88/29. 88 pp.

48. Ruibal, R., L. Trevis, and V. Roig. 1969. The terrestrial ecology of the spadefoot toad *Scaphiopus hammondi*. *Copeia* 572–584.

habitat patches is important to reduce risk to the species from a catastrophic event (e.g., chemical spill). Depending on the separation of the pools, there may still be genetic exchange among the populations in each. These risk dynamics should be considered when evaluating the impact on the species and potential mitigation measures.

Loss of the LAX population of western spadefoot toads would cause a significant restriction of the range of the species. Because of the significance of the LAX population to the range of the species, mitigation areas should be as close as possible to the existing sites. The first choice should be within the 100 acres north of the Habitat Restoration Area where vernal pools were found historically.⁴⁹ This site would not require land acquisition and would be consistent with achieving other mitigation goals within this area. Furthermore, the biological consultants for the LAX Master Plan recommend that this site be restored with vernal pools.⁵⁰ The second priority for creation of habitat and reintroduction of western spadefoot toad is the West Bluffs site. While this site is currently graded for development, the owner is willing to sell the property, which historically supported appropriate vernal pool habitat. The area of the reintroduction site must at least equal the area occupied at LAX. Given the difficulty of restoring habitat and establishing rare species, a 3:1 mitigation ratio for pool surface area would be more appropriate. This surface area must be accompanied by surrounding upland habitat at a ratio of 10 to 15 acres for each acre of pool surface area. Ideally the mitigation pool surface area would be divided among at least three pools to minimize the effects from a possible catastrophic event.

Mitigation for impacts to Riverside fairy shrimp (*Branchinecta sandiegoensis*) should use the same pool system as developed for the western spadefoot toad.

The SDEIS/EIR suggests that the impact of destroying at least 83 acres of habitat for loggerhead shrike can be mitigated by enhancing habitat within the El Segundo dunes. As proposed, this mitigation measure will not be successful. It suggests that the loss of 83 acres of habitat can be offset by enhancing habitat within 300 acres of existing, occupied habitat. The SDEIS/EIR presents no evidence that the 300 acres of the El Segundo dunes could support a greater density of shrikes. Surveys of the El Segundo dunes in 1995 and 1998 showed this area to be occupied by breeding shrikes.⁵¹ An average of six individuals per survey were seen within the Habitat Restoration Area in 1995.⁵² Territory size for loggerhead shrikes on the Channel Islands is large, 34 ha (~84 acres),⁵³ while mainland territories are somewhat smaller, 4.4–16.0 ha (~10.9–39.5 acres).⁵⁴ Assuming the Habitat Restoration Area supports three pairs of breeding shrikes, the territory size would be ~27 ha (~66.7 acres). Experts familiar with shrikes and the El Segundo dunes doubt that the mitigation measure would be successful in increasing shrike density in this occupied habitat (Professor Hartmut Walter, UCLA Department of Geography, pers. comm.).

Only one of the three proposed enhancement activities (removal of roads) could be conducted within the Habitat Restoration Area. The other enhancement activities would be conducted outside the Habitat Restoration Area. If enhancement will occur outside the Habitat Restoration Area, then the mitigation measure must establish that restored areas will be protected permanently as natural habitat. The SDEIS/EIR fails to state that mitigation areas outside of the Habitat Restoration Area will be permanently protected.

Enhancement to improve habitat for loggerhead shrikes might also have adverse consequences on other species. Shrikes are fond of Jerusalem crickets as forage.⁵⁵ The Jerusalem cricket found at the El Segundo dunes is a sensitive endemic species.⁵⁶ This is meant only to illustrate that artificially increasing the density of one species is not necessarily consistent with management for other species or for maximum biological diversity. Similarly, as discussed below, enhancement to support a large population of jackrabbits would conflict with the provision of habitat for El Segundo blue butterflies.

The proposed mitigation for impacts to black-tailed jackrabbits involves relocation from a ruderal grassland to the Habitat Restoration Area, which contains southern dune scrub and foredune scrub vegetation. It is likely that this mitigation measure will not succeed. First, the 200 acres (81 ha) of the Habitat Restoration Area will support a lower density of jackrabbits than the open grassland they now inhabit. Black-tailed jackrabbits are generalist herbivores, and therefore can survive in a range of vegetation types. The density of jackrabbits differs, however, with the composition of the vegetation. Sites that have very high grass cover relative to shrubs and forbs support far greater densities. For example, a steppe habitat with 59% grass, 10% forb, and 31% shrub cover supported 18.4 jackrabbits per ha, and density decreased with increasing shrub cover to 1.4 individuals per ha at 91.0% shrub cover.⁵⁷ Because the Habitat Restoration Area is intended to support scrub habitats, jackrabbits could only persist at a far lower density than they do in their current habitat at the Airport Operations Area, meaning a much larger area would be required to support the population. Furthermore, the SDEIS/EIR does not consider the possible reasons that black-tailed jackrabbits are no longer present on the dunes, even though they were present historically. For some reason the population was extirpated, and unless the forces that caused the extirpation are removed, the mitigation will fail. We see two possible explanations. First, the small population size within the Habitat Restoration Area was vulnerable to random events simply because it was small. If this is true, then the relocation will eventually fail unless the dunes are managed to maintain a larger population size to the detriment of other sensitive species on the dunes, including El Segundo blue butterfly. A second possible explanation for the disappearance of jackrabbits from the dunes can be deduced from the timing of their extirpation. According to surveys in the DEIS/EIR, jackrabbits died out (or were killed) sometime between surveys in 1978 and 1988.⁵⁸ The other major change in the mammal fauna between 1978 and 1988 was the appearance of the non-native red fox as a breeding resident on the dunes. Red fox are recorded predators of black-tailed jackrabbits, so the invasion and success of this predator may have resulted in the elimination of jackrabbits. If this is true, any jackrabbit relocation program must be accompanied by a humane red fox (and feral cat/dog) control program.

58. DEIS/EIR, Technical Report 7. Biological Resources Memoranda for the Record on Floral and Faunal Surveys, p. 493.

Mitigation for Lewis' evening primrose (*Camissonia lewisii*) does not ensure that a replacement population of the species will be created, only that more individuals will be grown on the El Segundo dunes, where the species is already found. In addition to establishing a numerical goal for the number of individuals to be replaced, mitigation should ensure that the area occupied by the species will increase by at least the 2.5 acres that would be lost. Because there is a risk-spreading benefit in the disjunct configuration of the impacted population, the mitigation site should be geographically distinct from currently occupied sites.

Mitigation Measure MM-ET-4 describes actions to mitigate impacts to El Segundo blue butterfly from Alternative D. It contains the following provisions, summarized and quoted from here, that deserve comment based on our previous experience⁵⁹ with such mitigation efforts: 1) avoid flight season for construction, such that construction occurs between October 1st and May 31st, 2) mitigate the number of plants of coast buckwheat at 1:1 ratio, 3) "salvage existing coast buckwheat plants and any larvae on the plant or in the soil below the plant that would be removed," and 4) salvage any El Segundo blue butterfly larvae from plants that are not salvaged.⁶⁰ While it may seem intuitive to avoid construction during the adult flight season, the species may indeed be more vulnerable at other times because individuals are in diapause as pupae in the sand beneath the plants. While flying adults can escape physical disturbance in the environment, pupae cannot move to avoid being crushed. If the Section 7 consultation with USFWS results in a "no jeopardy" determination, the following strategy would reduce impacts to the butterfly. Plants that will be impacted should be carefully removed in the late Spring before adult butterflies eclose by cutting them at the surface of the sand. This minimizes disturbance to pupae in the duff and sand below. Then construction should be delayed until after the ensuing flight season. Butterflies that emerge to find their plants gone will be forced to emigrate to nearby habitat. If desired, the affected areas can be searched for pupae after the flight season to locate any pupae in multiple-year diapause. Relocation of mature coast buckwheat plants is not a cost efficient means of mitigation. Most plants will die, and the butterfly would be better served by restoring more habitat with container plants. Given the timing of the construction phase, the existing measure incorrectly refers to salvage of larvae at a time when only pupae would be found. Finally, mitigation at a 1:1 ratio for plants is insufficient. The mitigation ratio for direct impacts to this rare natural community should be at a 5:1 ratio on an area basis rather than a per plant basis. The impacts to 0.24 acres of occupied El Segundo blue butterfly habitat (which will be scattered across the Habitat Restoration Area) should be mitigated by restoration of 1.25 acres of the vegetation type in similar topoclimatic configuration. Impacts to backdune areas should be mitigated by restoring backdune vegetation, not by planting a remote foredune area as contemplated by the mitigation measure.

5.0 Conclusion

The full DEIS/EIR, including the new Supplement, fails to provide a realistic assessment of the impacts of the proposed project on biological resources, including sensitive species and rare natural communities. The centerpiece of the analysis of direct impacts is a fatally flawed methodology. This methodology confuses the distinction between habitat and vegetation type, and even fails to account for

59. Longcore, T., R. Mattoni, and A. Mattoni. 2003. Final report for Palos Verdes blue butterfly pupal salvage on Palos Verdes and San Pedro housing, San Pedro, California. The Urban Wildlands Group, Los Angeles (Department of the Navy Letter Agreement # N68711-02-LT-C3001). 9 pp.

60. DSEIS/EIR, p. 4-494.

differences between vegetation types. The assessment of indirect impacts relies on illogical assertions (e.g., if a habitat is degraded for a species then further degradation will have no adverse impact), and fails to consider the scientific literature and its application to the impact analysis.

The magnitude of the LAX Master Plan development and its impacts to wildlife habitat for all four Alternatives, combined with the regional setting and cumulative impacts from development in the City of Los Angeles, lead to the conclusion that implementation of the Master Plan will have significant adverse impacts on biological resources. The mitigation measures proposed to offset these impacts are wholly insufficient to reduce these impacts to a less than significant level.

Review of Biological Resources Analysis in LAX Master Plan Draft Environmental Impact Statement/Environmental Impact Report

This review pertains to the Federal Aviation Administration and Los Angeles World Airports Joint Draft Environmental Impact Statement/Environmental Impact Report ("EIS/R"). It addresses Sections 4.10 (Biotic Communities), 4.11 (Endangered and Threatened Species of Flora and Fauna), 4.12 (Wetlands), 4.14 (Coastal Zone), and 4.18 (Light Emissions). The review was prepared by Dr. Travis Longcore and Catherine Rich, who are experts in the ecology and history of the natural communities that would be affected by the proposed airport expansion. Dr. Longcore has co-authored several peer-reviewed scientific articles on the El Segundo Dunes and the Los Angeles Coastal Prairie (including its vernal pools),¹ which both would be adversely affected by the proposed project.

The presentation of information in the EIS/R about biological resources is segmented into several sections. For the purpose of this review, however, all biological resource issues are treated together, because mitigation measures for biological impacts are largely the same.

1.0 Project Description

For the purpose of discussing the impacts to biological resources, the EIS/R does not provide a complete project description. Within the extent of the Master Plan boundaries, it is unclear what the disposition of certain areas of biologically significant property will be. In maps of the various project alternatives, the legend indicates useless designations such as "Airport Related."² There is no way to ascertain with certainty what the use of such land will be under the various alternatives.

1.1 Failure To Analyze Northside/Southside Project

The EIS/R describes the LAX Northside Project as "Collateral Development" that previously has been entitled through the CEQA process.³ Reliance on old CEQA documentation is problematic, and development of this project would seem to require a reopening of the environmental review, especially given the changed conditions since the approval in 1983. However, the real difficulty is that the EIS/R replaces the LAX Northside Project with the Westchester Southside Project in each of the three build alternatives for the Master Plan. These projects are not the same, and even if the CEQA documentation for the Northside Project is deemed adequate, the Southside Project must be fully analyzed under CEQA. The EIS/R does not completely describe or analyze the biological impacts of the Southside Project.

 3. EIS/R, pp. 3-20, 3-29.

The Westchester Southside Project, as depicted in the EIS/R,⁴ would include the conversion of 100 acres of the El Segundo Dunes to a golf course. (Several figures in the EIS/R appendices map this area at the northern portion of the dunes as "golf course/open space" and include "Resort Hotels" within the same color designation. At a minimum the maps indicate some level of development of the dunes as part of the Westchester Southside Project.) The dunes golf course/open space development was not included in the CEQA analysis for the LAX Northside Project, and remains unanalyzed for compliance with any environmental laws (CEQA, NEPA, California Coastal Act). It is inappropriate for the EIS/R to rely on the Westchester Southside Project — which is a site for relocation of displaced businesses⁵ — for mitigation, and not to evaluate the full impacts of the development. While all of the El Segundo Dunes are within the Master Plan area, and the alternatives themselves show no development on the 100 acres at the northern end of the dunes, the result of adopting any of the three project alternatives is to develop 100 acres of dunes in association with "Resort Hotels" and "golf course/open space."⁶ The resource value of this area is discussed later, but the analysis of the Westchester Southside Project should not be piecemealed. Currently, the biological impacts of the Westchester Southside Project do not seem to be analyzed fully, nor are they included in the discussion of cumulative impacts for the project. Even if one accepts the premise of the EIS/R that the project will proceed absent approval of the Master Plan, the Westchester Southside Project is "reasonably foreseeable" — in fact relied upon for mitigation — and all of its impacts must be disclosed and mitigated as part of the Master Plan EIS/R.

The decision not to address the biological impacts of the Westchester Southside Project can be interpreted as a strategic choice to avoid disclosure of the full impacts of the airport expansion project. From a biological standpoint, the Westchester Southside Project, even though it would involve fewer square feet of built space than the LAX Northside Project (2.6 million square feet vs. 4.5 million square feet), it has a larger geographic footprint and greater biological impact. Any of the three build alternatives plus the Westchester Southside Project would be a catastrophe for the biological resources found at LAX.

1.2 Previous Failure To Disclose Impacts of Development on El Segundo Dunes

Los Angeles World Airports ("LAWA") has previously failed to disclose impacts of development on the El Segundo Dunes. In 1999, a newspaper story announced that LAWA was planning to install landscaping on the northern end of the El Segundo Dunes, along Waterview, Rindge, and Napoleon streets. The Urban Wildlands Group, a Los Angeles-based nonprofit whose board includes the authors of this letter, contacted LAWA to inform project managers of the sensitive resources present and request that the project not include invasive plants that would degrade the dunes. LAWA promised, but then failed to provide, the plant list for the project. LAWA proceeded to implement the project, but failed to secure the proper permits from the City of Los Angeles as required under the California Coastal Act.⁷ After installing a new walkway and over 90 mature, non-native palm trees in a sensitive habitat area,⁷

4. EIS/R, Appendix JI. Biological Assessment Technical Report, Figures 8, 11, 14.

5. EIS/R, pp. 3-33, 3-47, 3-56.

6. City of Los Angeles Ordinance 169,767 restricts use of the northern 100 acres of the El Segundo Dunes at LAX to "nature preserve and accessory uses only." This ordinance was passed unanimously by the City Council on April 6, 1994 as part of the General Plan/Zoning Consistency Program. Given this unequivocal direction from the City, it is unclear why the Master Plan is ambiguous about the disposition of this area, unless the intention is to attempt to remove the development conditions from the property and seek another use as part of the Westchester Southside Project.

7. Installation of palm trees is damaging ecologically, and also provides sites for birds to perch, potentially increasing bird strikes with aircraft. Consultants for the airport report that "[t]he El Segundo Dunes provides relatively few attractants

(cont'd)

LAWA was instructed to stop work by the California Coastal Commission, told that it must obtain a permit, and subsequently applied for a permit from the City. The Urban Wildlands Group opposed the permit application for the partially implemented project because it would significantly disrupt habitat values of an environmentally sensitive habitat area ("ESHA"), as defined under the California Coastal Act.⁸ The City analysis of the project also agreed that the site was an ESHA.⁹ The appeal of the permit was denied by the City of Los Angeles Board of Public Works with the stipulation that LAWA resolve the issue in consultation with The Urban Wildlands Group and those residents opposed to the palm trees. This has not yet happened.

LAWA steadfastly maintains that the 100 acres outside of the El Segundo Blue Butterfly Preserve is not part of the El Segundo Dunes and that it will be developed as a golf course.¹⁰ The area, however, is within the jurisdiction of the California Coastal Commission, and no approved Local Coastal Plan has been produced that would allow for a golf course. The EIS/R provides even more information to join previously published sources¹¹ showing that the area is an environmentally sensitive habitat area and therefore protected by Section 30240(a) of the California Coastal Act. For example, the EIS/R itself discloses that El Segundo blue butterflies (*Euphilotes bernardino allyni*) occupy one subsite,¹² sensitive Lewis' evening primrose (*Camissonia lewisii*) occupies seven subsites,¹³ and the area is occupied by sensitive species such as silvery legless lizard (*Anniella pulchra*), San Diego horned lizard (*Phrynosoma coronatum blainvillei*),¹⁴ loggerhead shrike (*Lanius ludovicianus*; breeding),¹⁵ and Dorothy's sand dune weevil (*Trigonoscuta dorothea dorothea*).¹⁶ The golf course or other development on the dunes should either be analyzed as part of the Master Plan EIS/R for conformance with applicable laws, including the California Coastal Act, or be explicitly deleted from the plans for the area. The EIS/R should offer some certainty about what development will take place within the Master Plan boundaries and disclose the impacts of that development.

to birds which may partially account for the significantly lower percentage of strikes occurring over this area than over the approach area. The El Segundo Dunes naturally supports very few trees — the only trees present are non-native trees that have been planted...." (EIS/R, Technical Report 7. Biological Resources Memoranda for the Record on Floral and Faunal Surveys, p. 341). Without complete environmental review, LAWA planted more attractants for birds in the form of palm trees. The EIS/R also reports that the native birds of the dunes are not involved in bird strikes, while species promoted by urban development, such as pigeons and gulls, are involved in the most strikes.

2.0 Current Conditions

The description of current conditions of the biological resources within the Master Plan boundaries is biased toward underestimating the value of the habitats that will be impacted.

2.1 Surveys

A great deal of effort was expended surveying the insects of the El Segundo Dunes, especially within the El Segundo Blue Butterfly Preserve, even though this area is not targeted for direct development. Surveys for areas that would be subject to significant direct impacts were inadequate. It appears that only one type of survey — sweep netting — was conducted east of Pershing Drive in the areas that would be most affected by development. This single method would not detect all of the sensitive species that might occur in the area. For example, the El Segundo Jerusalem cricket (*Stenopelmatus* sp.), a burrowing insect, would not be detected with sweep netting. Pitfall trapping would be required to ascertain its presence, and should be performed in the areas of project impacts east of Pershing Drive. Other survey methods, including black lighting and malaise trapping, were conducted only west of Pershing Drive on the El Segundo Dunes, not in the areas of direct project impacts.

While the extensive surveys conducted on the El Segundo Dunes may be useful for evaluating the impacts of the Westchester Southside Project, which the EIS/R does not do, they offer little information to understand the biological communities supported in the open spaces that would be developed under the three development alternatives. For example, the EIS/R provides no summary of the bird surveys conducted at the ephemeral wetlands and open spaces found in the western area of the airport, and provides only handwritten notes buried in the appendices.¹⁷ A summary would be useful to understand the character of the biotic communities in these areas. Species of local conservation concern such as Costa's hummingbird (*Calypte costae*), western meadowlark (*Sturnella neglecta*), and common yellowthroat (*Geothlypis trichas*) were recorded in these areas, yet no complete description of the communities is provided in the text of the document. The biological consultants for the EIS/R report that the ephemeral wetland area at the west end of the airport "provides resting and foraging habitat for numerous resident and migratory bird species,"¹⁸ but the EIS/R provides no summary of these observations or description of the impact of development on these species.

For the El Segundo Dunes, an extensive list of birds is found, complete with species that are almost certainly not present at all. The "Floral Compendium" and "Faunal Compendium" include "species observed or expected to occur on or in the immediate vicinity of the site."¹⁹ On this list are found species that are highly unlikely to be present on the dunes or even near the dunes. For example, acorn woodpecker (*Melanerpes formicivorus*) is not likely to be found on the El Segundo Dunes now or in recent history. Acorn woodpeckers in Los Angeles would be associated with coast live oaks, which are found nowhere on the El Segundo Dunes or the Los Angeles Coastal Prairie. The rather excessive bird list in the Faunal Compendium is made ever more curious by the statement elsewhere by the biological

consultants for the EIS/R that "the Dunes does not support a large resident bird population."²⁰ It is odd to include these ambitious lists, because the biological analysis does not evaluate the impacts of the three alternatives on the species of wildlife in them.

2.2 "Determined Absent"

The summary table for sensitive species provided in Section 4.10 of the EIS/R is misleading. For many species, the table indicates that they have been "determined absent" from the Master Plan boundaries based on directed surveys. When dealing with small arthropods that are difficult to capture, persist at low numbers, and may have large annual variation in numbers, one cannot conclude that a species is "determined absent." All that can be done is to state that the species was not found during a certain duration and intensity of searching. It is likely that the survey methodology did not possess sufficient statistical power to detect the species.²¹ Presence may be determined conclusively, but absence cannot, especially for cryptic (i.e., small or camouflaged) species. Some degree of certainty about absence could be derived if one had knowledge of the population size, yearly variation in population size of the species, and the trapping efficiency of the survey methods. This information is not available, and therefore no statistically defensible declaration of absence can be made about the sensitive arthropod species.

In other instances, the declaration of absence is contradicted by the reports upon which the section is based. For example, Table 4.10-2 claims that the following species are absent from the Master Plan boundaries: Henne's ecosman moth (*Eucosa hennei*), Rivers' dune moth (*Euxoa riversii*), Ford's sand dune moth (*Psammobotrys fordii*), El Segundo scythrid moth (*Scythris* new sp.), lesser dunes scythrid moth (*Scythris* new sp.), El Segundo goat moth (*Comadia intrusa*), and Santa Monica dunes moth (*Copeblepharon sanctamonicae*). However, in the underlying report, Frank Hovore, the surveyor, writes:

Sensitive moth species (general *Comadia*, *Copeblepharon*, *Euxoa*, *Psammobotrys* [sic], *Scythris*) — A wide variety of moth specimens, including some possibly representing all of these species except *Psammobotrys* [sic], were taken in light traps, but moths in the traps were rendered unidentifiable by the combination of alcohol and churning actions of other species. All of the moth species previously known to occur on the dunes probably persist, because all of the known larval hosts are present. For most moth species, focused light collecting would be necessary to determine presence and distribution, using dry traps or light sheets. Very large numbers of *Psammobotrys* [sic] were collected on the dunes historically (LACM collection), and it is assumed that this species is present, but is highly seasonal and difficult to collect without sustained and focused field efforts.²²

The text presented in Table 4.10-2 of the EIS/R contradicts the surveys that were conducted. Far from being absent, as maintained in Table 4.10-2, a qualified surveyor determined that the methodology was insufficient to determine presence of these moth species, but that the species were indeed probably

present. Mischaracterization such as this undermines the credibility of the description of current conditions presented in the EIS/R.

2.3 Terminology

The EIS/R is inconsistent in its use of terminology describing the 100 acres north of the El Segundo Blue Butterfly Preserve. This area, along with the preserve, is part of the El Segundo Dunes.²³ It has been degraded through residential construction and intrusion of exotic plant species, but it remains of significant biological value and is itself a sensitive habitat (see above, Section 1.2). In various places in the EIS/R, this area is referred to as “dunes and adjacent landforms,” “non-restructured dunes,”²⁴ “100 acres north of Sandpiper Street,”²⁵ and “the 100-acre open space north of the preserve.”²⁶ Implicit in the choice of terminology for this area is perhaps the intention to construct a golf course upon it. The Los Angeles Airport/El Segundo Dunes Specific Plan, adopted in 1992, incorrectly claims that “approximately 100 acres of the Dunes ... do not contain significant habitat resources.”²⁷ The Specific Plan requires the proposed golf course to provide revenue for the upkeep of the dunes habitat preserve,²⁸ thereby lifting that burden from LAWA, which perhaps partially explains LAWA’s enthusiasm for the idea. However, existing zoning for the area — established more recently than the Specific Plan — is as a nature preserve. EIS/R maps should be consistent with the existing “nature preserve” zoning and should consistently acknowledge this area as part of the El Segundo Dunes.

The EIS/R also exhibits some difficulty with terminology to describe the habitat that formerly was found throughout the entire project area inland of the El Segundo Dunes. In a published article, Mattoni and Longcore describe this area as the Los Angeles Coastal Prairie, and document the historic plant diversity and the presence of extensive vernal pools.²⁹ The article has been commended as an exemplar of the practice of historical ecology in *The Historical Ecology Handbook: A Restorationist’s Guide to Reference Ecosystems*.³⁰ For some reason, the EIS/R avoids using the Mattoni and Longcore article where it could be useful. For example, Mattoni and Longcore provide documentation of many sensitive species historically present within the study area from herbarium label texts. This includes a full list of vernal pool species historically found in the area, as well as upland forbs, grasses, and shrubs. Instead, the EIS/R chooses to classify the site as Valley Needlegrass Grassland. The historic evidence does not support the assumption that this area was dominated by perennial grasses; rather it was dominated by forbs. This is an important conclusion of Mattoni and Longcore’s research that the EIS/R neither accepts nor attempts to dispute.

2.4 Disturbed Dune Scrub/Foredune

Concurrent with the changing terminology about the portion of the El Segundo Dunes not found within the habitat preserve is the decision to classify all dune scrub/foredune outside of the preserve area as disturbed dune scrub. While it is true that the dunes area outside the habitat preserve has a heavier exotic species load, and does not support coast buckwheat (*Eriogonum parvifolium*), it nevertheless has more biological value than is implied by the description. For example, this area supports sensitive plants (Lewis' evening primrose, *Camissonia lewisii*), birds (loggerhead shrike, *Lanius ludovicianus*), and arthropods (see above, Section 1.2). Mattoni et al. describe the ex-residential area in their 2000 article:

Removal of the residences in the 1970s was superficial, leaving some foundations, substantial rubble, foreign soil, roads, and other infrastructure. Vegetation regenerated without assistance, producing a cover of predominately iceplant (*Carpobrotus edulis*) and acacia (*Acacia cyclopis*) with patches of a few highly dispersive dune shrub species.³¹

However, not all ex-residential sites supported the same arthropod communities. Some sites within the ex-residential area supported terrestrial arthropod communities (including rare and sensitive species) that were similar to those found on undisturbed foredune and undisturbed backdune sites.³² This variation in the vegetation and associated wildlife across the 100 acres should be reflected in the EIS/R. The wholesale characterization of the area as "disturbed dune scrub/foredune" is misleading in terms of its value to the dune system and proper statutory designation as an ESHA.

2.5 El Segundo Blue Butterfly

Much ado is made over the population size of the El Segundo blue butterfly ("ESB"). However, the methodology used to calculate population size by LAWA is flawed and overestimates population size by at least 400%. While many methods to track trends in butterfly population size exist in the scientific literature,³³ when LAWA hired consultants in 1994 to prepare the EIS/R, they inexplicably used none of the established methods. While consultants continued walking a transect to count butterflies established by Mattoni in 1984, they stopped conducting surveys throughout the entire season. It is absolutely

essential to survey throughout the flight season of the butterfly to obtain an estimate of total population size. Furthermore, rather than using an established method to analyze transect counts, Dr. Andrew Huang, an engineer at LAWA, constructed his own method to estimate population size. This method is flawed, and these flaws were explained by Dr. Travis Longcore to Dr. Huang in an email earlier this year, portions of which bear repeating here. The message describes methods used to estimate population size of the ESB by Longcore and others in a scientific article that was at that time in review and has subsequently been accepted for publication in an international scientific journal, the *Journal of Insect Conservation*.

The first method [of calculating population size] was the Pollard Index, which is quite straightforward and about which there can be no argument. There is not a lot of latitude in summing the average weekly count over the course of the season.

The second method is essentially the same as your numerical approximation. This method is first used, albeit with different data sources, by Watt et al in 1977 (Watt, Ward B., Frances S. Chew, Lee R. G. Snyder, Alice G. Watt, and David E. Rothschild. 1977. Population structures of Pierid butterflies I. Numbers and movements of some montane *Colias* species. *Oecologia* 27:1-22.) Watt et al. estimated "total animals [butterflies] present in the brood" by estimating daily butterfly numbers through MRR and extrapolation, summing them to calculate total animal-days, and multiplying this number by the death rate (determined by MRR). Dividing by the longevity (or residence time) would yield the same result. This is what we did, using Arnold's 1979 residence time estimates (ave 6.1 days). Your model does not divide by average longevity, but rather another figure. This is what I don't understand. What is wrong with the logic (used by Watt et al. as well) that the total brood size is equal to the total number of butterfly-days divided by the average butterfly longevity?

$$\frac{\text{butterfly-days}}{\text{longevity (days)}} = \text{butterflies}$$

Your model does something similar, calculating total butterfly days by integrating under the curve (gaussian or not) and dividing by a figure. The question, and the crux of the differences in our results, is the number that you divide by, which is 1.59. You get your number by parameterizing based on the recapture rates. I think the difficulty with this is that you do not know the age of the butterflies that were initially captured. Your method would work if all of the butterflies captured by Arnold on the first day were freshly eclosed adults. However, they cannot be. Some of them will be one, two, or more days old. Failure to account for this will skew your estimate of longevity downwards, and your total population estimate upwards. Now, I am going to guess that you will say that 1.59 days is not the longevity. But if it is not, what is it? Can you see a flaw in the logic of the Watt et al. method or otherwise reconcile it with your method?

One last thing on this method. Our application of it gave a population estimate for 1984 at LAX of 432, while Arnold's MRR estimate was 664, and the Zonneveld model estimated 910. Application of your method would give an estimate of 1,658. (Note: in case you want to calculate these numbers, with the exception of Arnold's estimate, they include an adjustment for the number of flowerheads) (Arnold, R.A. (1986) Studies of the El Segundo blue butterfly - 1984. Inland Fisheries Administrative Report 86-4.)

The third method that we used was the Zonneveld model. What is interesting is that our estimates of death rate (3.3-5.9 days), which vary from year to year, are similar to those given by Arnold (2.3-7.3 days) from MRR. We followed the model as set out by Zonneveld in the 1991 paper. We did not doubt the magnitude of the results because of the correspondence with the Watt et al method, the Pollard index, and the reasonableness of the longevity estimates.³⁴

34. Longcore, T. 6 March 2001. Email to Dr. A. Huang.

Dr. Huang did not defend his method, stating in a response to Dr. Longcore, "You have raised many outstanding issues. ... I am very busy with a number of projects. I won't be able to respond to your questions for awhile."³⁵ To date, he has not provided a substantive response. The EIS/R should therefore be adjusted to reflect El Segundo blue butterfly population numbers that are calculated using the best available scientific methods. Three methods of evaluating the transect counts are given in the *Journal of Insect Conservation* paper, the proofs of which are appended to this report.³⁶

As is evident from the literature about butterfly population size estimation,³⁷ the block counts promoted in the EIS/R are useful only to determine presence of the butterfly, not to estimate population size. The most perplexing part of the discussion of ESB population size by LAWA, both in reports by its consultants and in the EIS/R, is that none of the relevant scientific literature is referenced. Butterflies are conspicuous organisms, and schemes were developed in the 1970s to track population size, yet these are ignored. Sometimes remaking the wheel can lead to innovation, but in this instance it has led to confusion and the propagation of the myth that there are 40,000–80,000 El Segundo blue butterflies on the LAWA property: For example, LAWA claims that in 1998 there were roughly 12,000 ESB along the transect,³⁸ while proper analysis of the data indicates a population of $3,356 \pm 805$ S.D.³⁹ Similarly extravagant claims for the period 1996–2000⁴⁰ should be revised.

The EIS/R discussion of the ESB population size provides a diversion from the real issues at hand. Recovery of the species and downlisting from endangered to threatened status requires securing all of the El Segundo Dunes, including that area not currently in the habitat preserve.⁴¹ The 200-acre preserve is still vulnerable to disease, adverse weather, fire, and other accidents. Long-term extinction risk for the butterfly can be minimized through increasing habitat area, not simply by relying on existing areas to provide spectacular numbers. Furthermore, concentration on the El Segundo blue butterfly draws attention away from the ten other endemic invertebrates found on the dunes whose continued persistence depends on habitat values beyond those needed to maintain the butterfly.⁴²

LAWA's persistent strategy has been to focus on the butterfly and the 200-acre preserve to the exclusion of all else. For example, in the above-described Waterview Street Landscaping Project, LAWA's main claim in support of the project was that it did not affect the butterfly preserve or the butterfly. None of the appellants had argued that the project directly affected the butterfly, and pointed instead to the other sensitive species and habitats found on the project site. This notwithstanding, there are legitimate impacts to the El Segundo blue butterfly that would result from the alternatives in the EIS/R.

3.0 Assessment of Impacts

While the EIS/R identifies impacts to biological resources, its improper quantification of those impacts results in an underestimation of the actual biological consequences of the build alternatives and ultimately the incorrect conclusion that those impacts can be mitigated to a less than significant level.

3.1 Direct Impacts

The EIS/R uses what it calls a "modified Habitat Evaluation Procedure" to determine impacts on sensitive vegetation types and to quantify impacts to habitats of sensitive species.⁴³ This procedure is supposedly based on "Habitat Evaluation Procedures" ("HEP")⁴⁴ previously developed by the U.S. Fish and Wildlife Service that have some degree of scientific validity and history of usage.⁴⁵ However, the methodology employed in the EIS/R uses the name of this procedure without incorporating any of the essential elements of the analysis. By comparing existing habitat for sensitive species against an abstracted, ideal habitat type, the EIS/R argues that loss of up to 500 acres of habitat for sensitive species can be mitigated by "improving" 100 acres of land already in a nature preserve. This conclusion is not supported by any accepted methodology of impact assessment and seems to have been specifically designed to underestimate the actual impacts to sensitive species at LAX.

HEP was designed for use with target species by the U.S. Fish and Wildlife Service in the 1970s to provide a form of standardization and comparability for environmental analysis. In HEP implementation, the term "habitat" is defined as the biophysical requirements of an individual species (e.g., bald eagle habitat), not as a general term synonymous with vegetation type (e.g., grassland habitat). The U.S. Fish and Wildlife Service states this in the guiding policies for HEP implementation:

HEP is a species-habitat approach to impact assessment; and habitat quality for selected evaluation species is documented with an index, the Habitat Suitability Index (HSI). This value is derived from an evaluation of the ability of key habitat components to supply the life requisites of selected species of fish and wildlife.⁴⁶

The explicit species-based approach of the HEP is apparent in the manual describing the procedure:

HEP is a species-based assessment methodology. It is applicable only for the species evaluated and does not directly relate that species with other ecosystem components. HEP conceptually addresses only the issues of species populations and habitats.⁴⁷

The "modified" HEP in the EIS/R does not establish which species will be used to evaluate the value of the reference sites, nor does it create HSIs for them. Rather, it sets habitat evaluation standards based on an "optimal" site with "a multitude of floral and faunal species."⁴⁸

43. EIS/R, p. 4-615.

44. The EIS/R refers to a "Habitat Evaluation Procedure" in the singular form, while the U.S. Fish and Wildlife Service manual calls the method "Habitat Evaluation Procedures" in the plural form. We abbreviate both as "HEP" and treat the acronym as a singular noun indicating a methodology.

45. For example, see Johnson, T.L., and D.M. Swift. 2000. A test of a habitat evaluation procedure for Rocky Mountain bighorn sheep. *Restoration Ecology* 8(4S):47-56.

46. U.S. Fish and Wildlife Service. 1996. Fish and Wildlife Service manual, 870 FW 1, Habitat Evaluation Procedures. [online at <http://policy.fws.gov/870fw1.html>].

47. U.S. Fish and Wildlife Service. 1980. Habitat as the Basis for Environmental Assessment, 101 ESM.

The “modified” HEP does not provide information about the value of habitats within the subject site for several of the sensitive species found there. For example, it does not consider the habitat requirements of loggerhead shrike (*Lanius ludovicianus*) or black-tailed jackrabbit (*Lepus californicus bennettii*). It assigns values of 0.25 for vegetation types that are occupied by these species (Non-Native Grassland/Ruderal). By definition under a true HEP, occupied sites would score much higher. By “modifying” the HEP to address an abstract ideal habitat, actual habitat values to sensitive species are ignored (see below, Table 1).

In fact, the “modified” HEP resembles actual HEP implementation only superficially, in that values between 0 and 1 are assigned to certain arbitrary standards for vegetation types within the study area. None of the essential features of HEP are present in the modified method; the “modified” HEP therefore does not provide the basis for impact assessment in the project area.⁴⁹

Not only is the “modified” HEP quite different from the actual procedure, the standards used to evaluate habitats do not reflect ecological value. This problem derives from the physical and biologic criteria used to evaluate habitat and the so-called “ecosystem functional integrity” components of the analysis. Rather than using target species and HSIs to characterize vegetation types as required in HEP, the EIS/R evaluates whether each of the vegetation types in the project area meets the characteristics found in a “reference site.” The habitat type chosen for this standard is that of Valley Needlegrass Grassland/Vernal Pool complex⁵⁰ (i.e., Los Angeles Coastal Prairie). For some inexplicable reason, all habitats are measured against this standard, including Southern Fore dune, Southern Dune Scrub, and Disturbed Dune Scrub/Fore dune. Of course these dune habitats do not have features found in a needlegrass grassland/vernal pool complex. Therefore, because of their failure to have vernal pools and associated species, these vegetation classifications are assigned lower habitat values, 0.35 for both Southern Dune Scrub and Disturbed Dune Scrub/Fore dune, and 0.45 for Southern Fore dune. These values are ludicrous, first because habitat values and “Habitat Units” are supposed to be relevant to individual species, and second because one vegetation type is measured by the features of another. *The analysis succeeds only in illustrating that dune habitats are not the same as vernal pool/grassland complexes.*

The portion of habitat value deriving from “ecosystem functional integrity” is another wholesale creation of the EIS/R. These standards are not part of HEP, and the choice of standards is arbitrary, with little to do with the sensitive species and vegetation types under analysis. Whether a site is “under regulatory conservation” does not necessarily have anything to do with the ecological value of its vegetation type to sensitive species. Similarly, “contiguity with state-designated habitat” is not an ecological criterion. “Variety of pollinator/dispersal mechanisms present” is oriented toward vernal pool habitats, and the choice of “contiguous native habitat >40 acres” is arbitrary. Throughout, the analysis avoids recognition that sensitive plants and wildlife utilize habitats that are not dominated by native species. Loggerhead shrikes forage in ruderal and non-native grasslands as well as in dune scrub. Jackrabbits are thriving in an area with little native plant component. A true HEP would calculate the value of the areas being utilized by carefully selected individual species and use those values to quantify impacts. The EIS/R’s “modified” HEP is fatally flawed and must either be revised to follow established procedure, or be abandoned.

50. EIS/R, p. 4-615.

3.1.1 Sensitive Vegetation Types

With the exception of the ambiguous treatment of the 100 acres on the northern portion of the El Segundo Dunes, the EIS/R claims not to be proposing direct impacts to sensitive vegetation types. The vegetation types to be removed by the three build alternatives are 306–404 acres of Non-Native Grassland/Ruderal and 60–96 acres of Disturbed/Bare Ground. Although these are not sensitive vegetation types, they are used extensively by sensitive species. Whereas the impacts of removal are to sensitive species, the EIS/R proposes mitigation of abstract “Habitat Units” using the “modified” HEP. The result of the use of the “modified” HEP is to underestimate the effects on the species that use these habitats. The “modified” HEP does not evaluate the value of non-native grassland and disturbed areas to each of the species involved, but rather compares those habitats against an idealized habitat. This allows the EIS/R to state losses and to mitigate in “Habitat Units” instead of acres. *“Habitat Units” calculated in the HEP do not reflect the value of the habitats to the sensitive species.* The EIS/R considers these “Habitat Units” as fungible entities, and thereby proposes to mitigate effects to one vegetation type by enhancing another habitat type. Also, by ranking vegetation types on the dunes by comparing them with Valley Needlegrass Grassland/Vernal Pool complex, the EIS/R creates an artificial deficit of “Habitat Units” within the dunes area. The EIS/R then proposes to mitigate for the loss of Non-Native Grassland (occupied by sensitive species) by enhancing the habitat within the already-preserved and restored area of the El Segundo Dunes. If one accepts the logic of the EIS/R’s HEP and mitigation scheme, the loss of Non-Native Grassland can be mitigated by making the El Segundo Dunes more like a Valley Needlegrass Grassland/Vernal Pool complex. (The EIS/R actually claims to restore these areas to Southern Dune Scrub, but does not reconcile that the “deficit” in habitat values on the dunes was caused by the “failure” of dune scrub to have vernal pool/grassland characteristics.) So by the twisted logic of the “modified” HEP, the loss of 366–500 acres of vegetation types occupied by sensitive species putatively can be mitigated by “improving” roughly 100 acres already protected as a nature reserve or zoned as such.⁵¹ Because the “modified” HEP does not measure habitat values for the sensitive species involved, the description of impacts in terms of “Habitat Units” will drastically underestimate the impacts to those vegetation types. Again, it must be noted that the procedure used in the EIS/R *has no basis in scientific literature* and resembles the actual HEP in name only.

All alternatives propose the removal of sensitive habitats within the El Segundo Dunes to allow construction of navigational aids. These impacts range from 640–1,344 square feet. While this does constitute a significant impact, it is dwarfed in comparison to the other direct and indirect impacts proposed under the three build alternatives.

The discussion of acreage and “Habitat Units” lost under each alternative is not clear with respect to the Westchester Southside Project. Some impacts from the Westchester Southside Project are included (e.g., loss of mature trees), but the effects of the “Resort Hotels” and golf course/open space development are not discussed. The No Action/No Project Alternative explicitly includes the loss of habitat from the LAX Northside and Continental City projects. As mentioned above, this improperly assumes completion of the LAX Northside Project even though changed conditions should result in reopening of the environmental analysis. Inclusion of these speculative developments as part of the No Project alternative serves only to make the impacts of the Master Plan alternatives appear smaller.

51. While there are certainly adequate opportunities to enhance the habitat on the El Segundo Dunes through road/infrastructure removal and revegetation, the area available is simply inadequate to compensate for the loss of sensitive species habitat under the three build alternatives.

The EIS/R mentions but does not discuss adequately one impact of the Westchester Southside development: the removal of 300 mature trees that are used as "nursery" sites for raptors.⁵² The biological appendix contains no reference to this impact, or the abundance and species of raptors involved.⁵³ Neither is a description immediately apparent in the "Biological Resources Memoranda for the Record on Floral and Faunal Surveys."⁵⁴ The EIS/R should contain a full description of the species of raptors involved, their relative abundance, the location of the trees, and behaviors observed to allow a full evaluation of the impacts.

3.1.2 Sensitive Species

The faulty "modified" HEP results in the underestimation of impacts on sensitive species in the EIS/R. The statement of the impacts to populations are low, which results in improper conclusions about mitigation (see below, Section 4.0).

Lewis' evening primrose (*Camissonia lewisii*). All alternatives acknowledge direct impacts to Lewis' evening primrose. This is expressed in terms of the number of individuals that would be affected. While the number of individuals is important, the area that these individuals occupy is as important to the conservation of the species. However, the map showing the distribution of the species indicates locations only on the El Segundo Dunes west of Pershing Drive. No indication is given of the location of areas occupied east of Pershing Drive, which total 2.5 acres.⁵⁵ Populations separated from one another offer some degree of insurance against catastrophic losses at individual sites. The complete geographic distribution of the species at LAX should be provided in the EIS/R.

Belkin's tabanid dune fly (*Brennania belkini*). The EIS/R does not acknowledge the loss of habitat for the Belkin's tabanid dune fly, which is a sensitive species.⁵⁶ This species was recorded as present in the "north runway expansion area."⁵⁷ The report indicates that the species may disperse into suitable habitat areas. The presence of this dune-associated species and the sensitive Lewis' evening primrose in the north runway expansion area suggests that this area has a substrate suitable for dune obligate species. This may be the result of previous grading, but the value of this site to these and other sensitive species (e.g., potentially El Segundo crab spider, *Ebo* new sp.⁵⁸) should be noted.

San Diego black-tailed jackrabbit (*Lepus californicus bennettii*). The EIS/R acknowledges direct impacts to the habitat of this species, west of the southern runway, east of Pershing Drive. Each of the alternatives would result in the loss of 118.75 acres of occupied area, consisting of the entire population at LAX. The EIS/R maintains that these 118.75 acres equal 14.91 "Habitat Units," or roughly 15 acres of ideal vernal pool/grassland complex. As discussed above, this conversion to "Habitat Units" is misguided and wrong. Only two of the sixteen standards for calculating "Habitat Units" are even remotely related to the value of these areas to black-tailed jackrabbit.

Table 1. Relevance of "Modified" Habitat Evaluation Procedure Standards to Two Sensitive Species

HEP Standards	Relevance to value of area as black-tailed jackrabbit habitat	Relevance to value of area as loggerhead shrike habitat
TOPOGRAPHY		
Mound-depression microrelief	None. Species occurs in a variety of topographic conditions.	None
Native soils w/ slope <10%	None	None
Areas w/ period of inundation ≥ 30 days	None. Can serve as vectors for seed dispersal between vernal pools, but not necessary for habitat. ⁵⁹	None
Summer desiccation	None	None
FLORA		
>10% vegetative cover	Some. Forage and cover must be present.	Some. Vegetation must support prey populations.
Native grasses >10%	None. Will forage on all manner of grasses, forbs, and shrubs. ⁶⁰	None
Vernal pool associated species	None	None
Listed vernal pool associated species	None	None
FAUNA		
Domination of native fauna (reproducing)	None	None
Grassland associated species (reproducing)	None	None
Sensitive vernal pool associated species	None	None
Listed vernal pool associated species	None	None
ECOSYSTEM FUNCTIONAL INTEGRITY		
Contiguity w/ wetland and State-designated sensitive terrestrial habitat	None	None
Designated sensitive terrestrial habitat	None	None
Under regulatory conservation	None	None
Variety of pollinator/dispersal mechanisms present (wind, wildlife)	None. Is itself a dispersal agent.	None
Contiguous native habitat > 40 acres	Potentially important. Size of habitat, whether native or not, is important.	Potentially important. Size of habitat, whether native or not, is important.

The conversion of occupied area to "Habitat Units," based on the standards listed here, is a misapplication of HEP. The extent of habitat loss to the species is on the order of 119 acres. The use of improperly-defined "Habitat Units" to quantify this loss implies that 15 acres of ideal vernal pool/grassland could support as many black-tailed jackrabbits as 119 acres of non-native grassland.

59. Zedler, P.H., and C. Black. 1992. Seed dispersal by a generalized herbivore: rabbits as dispersal vectors in a semiarid California vernal pool landscape. *The American Midland Naturalist* 128(1):1-10. (Jackrabbits play a similar role in the vernal pool landscape.)

60. Johnson, R.D., and J.E. Anderson. 1984. Diets of black-tailed jack rabbits in relation to population density and vegetation. *Journal of Range Management* 37(1):79-83. MacCracken, J.G., and R.M. Hansen. 1982. Herbaceous vegetation of habitat used by blacktail jackrabbits and Nuttall cottontails in southeastern Idaho. *American Midland Naturalist* 107(1):180-184. Jameson, E.W., Jr., and H.J. Peeters. *California mammals*. Berkeley: University of California Press.

This is not possible; 15 acres is substantially smaller than the smallest recorded home range for the species (256 acres).⁶¹

Surveys determining the area occupied by black-tailed jackrabbit may underestimate the area currently occupied. Research indicates that jackrabbits may move from 2 to 10 miles during a day, from shrub cover where the species conceals itself during the day, to foraging habitat in the late afternoon and evening.⁶² The EIS/R does not provide sufficient survey information to establish if the grasslands and disturbed areas to the west of the southern runways provide only foraging habitat, and whether other locations (e.g., El Segundo Dunes) are already occupied at different times of the day. This is also suggested by studies of home range. In a study of big sagebrush and black greasewood, black-tailed jackrabbit ranges were larger (256–768 acres)⁶³ than the presumed occupied area at LAX (119 acres). This raises the question whether the species actually occupies a greater area at LAX, especially during the night and crepuscular periods when no surveys were undertaken.

Loggerhead shrike (*Lanius ludovicianus*). The same difficulties found quantifying habitat of black-tailed jackrabbit are found with description of impacts to loggerhead shrike. According to the EIS/R, the species currently occupies 171.86 acres that would be unusable following implementation of any of the project alternatives. (Such precision in habitat quantification is illusory; the EIS/R extrapolates occupied area by vegetation type, providing an *estimate* of habitat area that may differ from the area actually utilized.) Similarly, the EIS/R claims that this impact equals 22.88 “Habitat Units,” suggesting that roughly 23 acres of optimum habitat could mitigate for the loss of 172 acres of occupied habitat. This is false, and grossly underestimates the impacts to the species. No data are provided that link vegetation type to shrike density, as would be necessary to support this claim. The HEP standards are no more relevant to loggerhead shrike than they are to black-tailed jackrabbit. Unless an actual Habitat Suitability Index is developed for loggerhead shrike, all discussion of direct impacts should refer to the area of occupied habitat destroyed, not to the hypothetical “Habitat Units.” It is furthermore unclear whether the area of the Westchester Southside Project was surveyed, and whether these impacts are included.

Burrowing owl (*Athene cunicularia*). Surveys located burrowing owls within the project boundaries, though found no direct evidence of breeding. The EIS/R claims that the species “was determined not to breed within the Master Plan boundaries.”⁶⁴ This contradicts the previous assessment made by EIS/R consultant Jim Jennings, who concluded that “there is the potential that they may still breed in the project area.”⁶⁵ Because burrowing owl densities fluctuate from year to year, burrowing owls were observed in the project area, and potential burrow sites were found, the conservative approach would be to implement measures to ensure the conservation of the species. This species has recently lost much of its local habitat and if extirpated from the project site will disappear from west Los Angeles as a whole.

-
61. Smith, G.W. 1990. Home range and activity patterns of black-tailed jackrabbits. *Great Basin Naturalist* 50(3):249–256. This study found home ranges of 0.4–1.2 square miles for big sagebrush and black greasewood communities in northern Utah. Many factors may allow higher densities at LAX, such as more forage provided by dense non-native grasses and forbs, but there is no evidence that 15 acres of even the best habitats could compensate for the loss of 119 acres.

 65. EIS/R, Technical Report 7. Biological Resources Memoranda for the Record on Floral and Faunal Surveys, p. 463.

Western spadefoot toad (*Spea hammondi*). The EIS/R reports that the proposed project alternatives will destroy four seasonal ponds occupied by western spadefoot toads on the south airfield.⁶⁶ These populations number at least several hundred adults and all would be destroyed by the various project alternatives. The EIS/R estimates occupied area as 8.97 acres of ephemerally wetted areas and adjacent upland habitats. Spadefoot toads require upland habitats surrounding their aquatic habitat.⁶⁷ It is unclear how this area was determined for the EIS/R. Critically important in the analysis is that the species is found in four separate areas. Even though the areas are close to each other, the existing configuration of habitat patches is important to reduce risk to the species from a catastrophic event (e.g., chemical spill, disease). Depending on the separation of the pools, there may still be genetic exchange among the populations in each. These risk dynamics should be considered when evaluating the impact on the species and potential mitigation measures. Loss of the LAX population of western spadefoot toad would cause a significant restriction of the range of the species.

Riverside fairy shrimp (*Branchinecta sandiegoensis*). LAX represents the only known coastal population of Riverside fairy shrimp in Los Angeles County. Loss of this population, which is spread among nine sites on the western portion of the property, would be a significant impact. The EIS/R asserts that because the sites where fairy shrimp cysts were found do not have characteristic vernal pool plants, no suitable habitat is found for the species. This conclusion is false — fairy shrimp require vernal pool hydrology, not vernal pool plants, for their existence. This condition would exist, were the management practices at LAX to remove standing water in these pools. It is indeed LAWA's own management scheme that prevents Riverside fairy shrimp from completing its life cycle; LAWA, therefore, should incur liability for "take" of the species under the Endangered Species Act. LAWA fails to recognize that once the presence of fairy shrimp cysts was detected in the vernal pools at LAX, the airport should have ceased its activities that inhibited the life cycle of the species. Instead, the proposal is to destroy all of the areas currently occupied.

The description of acreage for this species does not seem to include the size of the cachements necessary to fill the "ephemerally wetted areas." These areas are necessary to formulate appropriate mitigation measures and evaluate impacts.

The EIS/R is insistent that "there are no extant vernal pools within the [Airport Operations Area]."⁶⁸ This statement is meant within the definition of vernal pools as a vegetation type. However, the term "vernal pool" may be used to refer to pools with standing water during the winter and spring, regardless of the presence of certain plant species. As defined by the U.S. Fish and Wildlife Service, "a vernal pool is a natural habitat of the Mediterranean climate region of the Pacific coast covered by shallow water for extended periods during the cool season but completely dry for most of the warm season drought."⁶⁹ The definition of the term is hydrological, not botanical. The EIS/R should therefore explicitly disclose that the statement "no vernal pools" refers to a botanical definition. Given the near complete destruction of vernal pools in Los Angeles County,⁷⁰ even loss of sites with vernal pool

hydrology and any remnant species (plant or invertebrate) represents a significant impact. The EIS/R emphasizes that Riverside fairy shrimp habitat is degraded through the presence of exotic plant species, presumably to suggest how much better mitigation sites will be than current conditions. However, the degradation of the habitat by exotic plant species is irrelevant to the quality of the pool as habitat for Riverside fairy shrimp. Other degradation to the habitat results directly from LAWA's management;⁷¹ this degradation is avoidable.

3.2 Indirect Impacts

As a whole, indirect impacts are not well described in the EIS/R. Those that are described are dismissed with little or no data offered in support, leaving the probability of much greater indirect impacts from the project alternatives than those disclosed.

3.2.1 Light

Night lighting has an effect on bird species composition in an area. A study in Sacramento showed that American crows (*Corvus brachyrhynchos*) roost in areas with high nighttime lighting levels.⁷² It is hypothesized that artificial lighting allows them to reduce predation from owls.⁷³ Crows are native, but they are also aggressive, and artificially increased population levels can be detrimental to other native bird species, including such sensitive species as loggerhead shrike. Artificial night lighting has also been shown to affect the behavior of nocturnal frogs, reducing their visual acuity and ability to consume prey, an impact that may befall those amphibians found within Master Plan boundaries.⁷⁴ Many larval forms of arthropods are positively phototactic (e.g., attracted to light, even artificial light), which poses a threat to the many sensitive insect species found on the El Segundo Dunes.⁷⁵ Artificial lighting results in increased mortality of moths and other nocturnal insects.⁷⁶ Night lighting can also affect kestrels as seen from observation of lesser kestrel (*Falco naumanni*), but also applicable to American kestrel (*Falco sparverius*), found on the El Segundo Dunes.⁷⁷ In fact, artificial night lighting affects singing and foraging time of many bird species.⁷⁸ Increased lighting even affects gastropods, which would include the sensitive Trask's snail (*Helminthoglypta traskii*).⁷⁹

(cont'd)

These effects may seem to be relatively innocuous, except that species that extend their activity periods into nighttime are often exposed to drastically increased predation threats. In a study of butterfly larvae, a higher growth rate associated with longer photoperiod (as would be caused by artificial light) resulted in significantly higher predation on the butterfly larvae from the primary parasitoid species.⁸⁰ Similar tradeoffs will likely occur for the El Segundo blue butterfly with increased lighting on the El Segundo Dunes. While the increased light may increase larval development, the time of activity may also increase predation and parasitism.

The conclusion in the EIS/R that the increased levels of night lighting will have no effect on the El Segundo blue butterfly is completely unsupported by current scientific knowledge of the mechanisms of such effects on ecological systems. The EIS/R concentrates on the adult form of the El Segundo blue butterfly, which only constitutes a minute fraction of the lifecycle of the organism, and ignores published scientific literature documenting the tradeoffs of increased lighting on larval forms of butterflies. Furthermore, the EIS/R includes no discussion of bat species that may forage on the El Segundo Dunes. Many bat species found in Los Angeles County are considered sensitive species, and their foraging patterns are affected by lighting levels. Some faster-flying species congregate at streetlights, while slower-flying species avoid them.⁸¹ The EIS/R should document the bat species foraging within the project site and evaluate the impacts of lighting and other development on them.

The increased nighttime light levels on the El Segundo Dunes constitute a significant adverse impact, and should be avoided. One method to decrease the impacts of nighttime lighting is to use low pressure sodium lamps in place of other lighting types. Yellow light from these sources has less ecological impact. Other possible mitigation measures include using full cut-off lighting fixtures and mandating operational controls.

3.2.2 Noise

The effects of airport noise on the fauna of the project area are not considered at all. Perhaps this results from the noise analysis, which improperly chooses 1996 — prior to the introduction of quieter airplanes — as the baseline for noise impacts, rather than what noise conditions would be in the absence of the proposed project. Through this careful choice of baseline, the EIS/R argues that there would be virtually no change in the noise levels on the El Segundo Dunes. However, this is not the case. Noise would be more constant under increased passenger capacity — more planes would be traveling in and out of the airport. Increased noise levels on the El Segundo Dunes will have significant adverse effects on the wildlife found there, effects that are evident from the available scientific literature.

The use of a weighted average to describe noise levels (CNEL) precludes and obfuscates analysis of actual noise impacts. From the standpoint of wildlife, and indeed human physiological responses, it is relevant to know what maximum noise levels are experienced, and at what duration. While the average noise levels described in the EIS/R offer some indication of which areas are louder than others,

maximum noise levels are necessary to evaluate potential hearing loss, startle reactions in animals, barriers to vocal communication, and other significant impacts to the fauna of the El Segundo Dunes.

The body of research on the effects of noise on vertebrates shows that chronic noise, even at low levels, is associated with elevated stress hormone levels, higher blood pressure, faster heart rates, and other physiological effects.⁸² As a result, birds, mammals and other vertebrates may show anatomical differences (smaller body size, enlarged adrenal glands) from prolonged exposure to noise. Species that use vocalizations to communicate may be excluded altogether from noisy areas. The effects of noise on birds and mammals in particular are relevant to the EIS/R.

Birds. Of 45 bird species investigated in woodlands in The Netherlands, 33 showed significantly depressed breeding density in response to increased noise levels near roads. All species in the small passerine families Sylviidae, Fringillidae, and Emberizidae were affected by noise.⁸³ This research also showed that noise effects followed a threshold model.⁸⁴ This means that up to a certain noise level, no decrease in density is observed. When noise increases beyond that threshold level, bird density decreases dramatically in the area between the location at which that threshold is met and the road. The decreased density over the area with noise greater than the threshold level ranges from 30% to 100% and is known as the "decrease factor."⁸⁵

These two variables, the threshold value and the decrease factor, describe the impact of noise on breeding birds. Empirical measurement of the threshold value in woodlands shows that for all bird species combined the threshold value is 42–52 dB(A), with individual species exhibiting thresholds as low as 36 dB(A) and as high as 58 dB(A).⁸⁶ Furthermore, years with overall low population densities showed lower threshold levels.

Similar research has been conducted for grasslands. Overall, this research shows that breeding bird habitat is degraded at noise levels as low as 36 dB(A). Minimum noise levels on the El Segundo Dunes are 70 dB(A) CNEL,⁸⁷ a quantification that does not even provide maximum noise levels. There is no question therefore that noise from LAX operations affects breeding bird densities on the El Segundo Dunes.

U.S. Fish and Wildlife Service National Ecology Research Center, Ft. Collins, Colorado. NERC-88/29. 88 pp. Such effects are found in humans too; children exposed to chronic noise greater than 60 dB "experienced marginally higher resting systolic blood pressure, greater heart rate reactivity to test, and higher overnight cortisol levels, which are signs of modestly elevated physiological stress" (Environmental News Network. 24 May 2001. Noisy neighborhoods harmful to childrens' health).

87. EIS/R, Figures 4.2-15, 4.2-19, 4.2-23.

Mammals. Chronic noise is a problem for native mammals on the El Segundo Dunes, as it is for humans in surrounding neighborhoods. The description of one study on the effect of airport noise on a small mammal illustrates one example of this problem:

Only a few studies of the physiological effects of noise on rodents have involved wild animals. A field study by Chesser et al. (1975) involved two populations of house mice near the end of a runway at Memphis International Airport. Adult mice also were collected from a rural field 2.0 km from the airport field. Background noise levels at both fields were 80–85 dB. Noise levels of incoming and outgoing aircraft at the airport field averaged 110 dB, with the highest reading reaching 120 dB. Total body weights and adrenal gland weights of mice from the fields were measured. Additional mice were captured from the rural field, placed in the laboratory, and exposed to 1 minute of 105-dB recorded jet aircraft noise every 6 minutes to determine if noise was the causative factor. Control mice were not subjected to noise. After 2 weeks, the adrenals were removed and weighed. Adrenal gland weights of male and female mice from the airport field were significantly greater than those of mice from the rural field. The noise-exposed mice in the laboratory study had significantly greater adrenal gland weights than the control mice. After ruling out stress factors, such as population density, Chesser et al. (1975) concluded that noise was the dominant stressful factor causing the adrenal weight differences between the two feral populations.⁸⁸

While house mice are of no regulatory concern, native mammals on the El Segundo Dunes include some native small mammals (harvest mouse, *Reithrodontomys megalotis*, desert wood rat, *Neotoma lepida*) which are locally significant. Impacts of noise to the habitat quality of the El Segundo Dunes for native mammals should be evaluated.

Reptiles and Amphibians. Spadefoot toads may be induced to emerge from their burrows in response to loud noises (95 dB(A) recordings of motorcycle noise in one experiment).⁸⁹ Fringe-toed lizards are rendered deaf after 9 minutes exposure to 95 dB(A) noise in the same study. Some snakes will show alert behavior in response to airplanes flying overhead.⁹⁰

The EIS/R should evaluate the effects of noise on the biota of the El Segundo Dunes. It is likely that if the noise baseline were set at current conditions rather than before the implementation of quieter planes, this analysis would reveal significant impacts on the ability of the El Segundo Dunes to support populations of some species of birds, mammals, and other vertebrates. Such significant impacts should be identified and mitigated.

3.2.3 Pollution

The discussion in the EIS/R about pollution effects on the El Segundo blue butterfly deserves comment. The EIS/R makes the statement, "Monitoring results indicate that current levels of vanadium are not adversely affecting the El Segundo blue butterfly population at the Habitat Restoration Area since counts for the year 2000 showed a significant increase in the population when compared to 1999."⁹¹ Many factors influence butterfly abundance from year to year; changes from 1999 to 2000 provide no information about the effect of pollution on the butterfly. This statement is indicative of a fundamental misunderstanding of the process of deductive reasoning. The reality is that we have no idea what effect pollution has on the populations of sensitive species on the El Segundo Dunes, including the El Segundo blue butterfly. Population trends cannot be derived from two years of data, and are even difficult with ten years of measurements.⁹²

3.2.4 Landscaping

The EIS/R does not assess the detrimental impacts of landscaping adjacent to the El Segundo Dunes. LAWA has planted invasive exotic species as landscape plants in the past, resulting in a greater load of exotic seed rain on the El Segundo Dunes.⁹³ Exotic landscaping material, and associated irrigation, can cause significant adverse effects on the biological resources of the El Segundo Dunes.

Installation of permanent irrigation in new areas along Pershing Drive would result in an expansion of the invasive exotic arthropod community on the El Segundo Dunes. Water sources promote population increases of non-native Argentine ants (*Linepithema humile*), European earwigs (*Forficula auricularia*), and other exotic species, which displace native insect species, an effect that has recently been documented to extend 200 m into native habitats.⁹⁴ Argentine ants are found on the El Segundo Dunes already, but the explosion in numbers associated with permanent irrigation will wreak havoc on native arthropod communities. This is shown by consistent decreases in native arthropod diversity in response to increased Argentine ant abundance.⁹⁵ Argentine ants would displace native ants surrounding the project site. This extirpation reverberates up the food chain, as some native reptiles (e.g., coast horned

lizard, *Phrynosoma coronatum*, found on the El Segundo Dunes) preferentially feed on native ants and decline in their absence.⁹⁶

The EIS/R should require as a mitigation measure that in areas adjacent to the El Segundo Dunes, all landscaping plants be limited to locally native species, and that irrigation be limited to winter only.

3.3 Cumulative Impacts

The analysis of cumulative impacts is woefully inadequate and is inconsistent with previous conclusions reached by the City of Los Angeles in environmental impact reports. The discussion of cumulative impacts in Sections 4.10 and 4.11 of the EIS/R consists of a description of the Master Plan area and the following statement:

Areas surrounding the study area consist largely of developed areas with little or no habitat value. However, two biologically significant open spaces, the Ballona Wetlands and the Ballona Bluffs, remain extant within the vicinity of the study area.⁹⁷

However, in the Final Environmental Impact Report for the West Bluffs Project — a project to build residences on the last open space on the Ballona Bluffs — the City of Los Angeles found:

The contribution of the proposed project to impacts on plant and animal life from ongoing development in the region is not considered to be significant, due to the disturbed nature and correspondingly low resource value of the project site.⁹⁸

The current EIS/R is inconsistent with the above statement. To the contrary, the current EIS/R states that:

The cumulative impacts on biotic communities from development of the LAX Master Plan Improvements, and other proposed projects in the area, most notably the Playa Vista Master Plan Project and the Catellus residential proposal on the Ballona Bluffs, are considered significant due to the limited amount of extant natural habitat in the vicinity of the study area, particularly wetlands.⁹⁹

The EIS/R then argues that implementation of the LAX Master Plan will not contribute to these cumulative impacts. The City of Los Angeles seems to claim that whichever project is under review does not contribute to cumulative impacts, yet once approved, the City's subsequent environmental review documents acknowledge that projects did contribute to cumulative impacts. The reality is that both the Catellus West Bluffs Project and the LAX Master Plan will contribute to significant cumulative impacts on natural resources.

Upland foraging habitat for grassland songbirds and raptors will be nearly eliminated by the combination of the LAX Master Plan, the West Bluffs Project, Playa Vista Phase I, and the potential

96. Suarez, A.V., J.Q. Richmond, and T.J. Case. 2000. Prey selection in horned lizards following the invasion of Argentine ants in southern California. *Ecological Applications* 10:711-725.

97. EIS/R, pp. 4-663, 4-706.

98. City of Los Angeles. October 1998. EIR No. 91-0675. West Bluffs Project Section IV.D.3.

99. EIS/R, p. 4-664.

Playa Vista Phase II. The Ballona Creek watershed (with the exception of the Baldwin Hills) will no longer support many bird species as a result of the cumulative impacts of these developments. Western meadowlark, white-tailed kite, California horned lark, loggerhead shrike, sharp-shinned hawk, northern harrier, Cooper's hawk, and American kestrel will experience significant declines in suitable habitat as a result of these cumulative impacts. Peregrine falcon will experience significant losses of foraging habitat. Many birds associated with the Ballona Wetlands forage in upland habitats, especially during the winter and spring rains. For example, great blue heron and snowy egret forage in the ephemeral wetlands at LAX and the West Bluffs site. If all of these projects are completed, all remnants of vernal pools in the northern portion of the former Los Angeles Coastal Prairie will be obliterated. Vernal pool hydrology at the West Bluffs site and at LAX would be destroyed, yet the EIS/R claims that no significant cumulative impacts will result from the project.

This is the end of the line for open space in west Los Angeles. The City of Los Angeles must recognize that the current project, plus the others previously approved by the City, have significant, irreversible, cumulative impacts on biological resources.

4.0 Mitigation Measures

The mitigation measures that rely on the "modified Habitat Evaluation Procedure" are insufficient to offset the significant impacts that would result from the build alternatives. The use of "Habitat Units" in mitigation measures MM-BC-2, MM-BC-4, MM-BC-5, MM-BC-6, and MM-BC-7 is fundamentally flawed.

The all-purpose mitigation measure "Conservation of Faunal Resources" (MM-BC-4) is completely inadequate to address impacts to sensitive species from the project alternatives. The conversion to "Habitat Units" is spurious; all mitigation must replace lost habitat with an equal or greater area.

4.1 Lewis' Evening Primrose

Mitigation for Lewis' evening primrose does not ensure that a replacement population of the species will be created, only that more individuals will be grown on the El Segundo Dunes, where the species is already found. In addition to establishing a numerical goal for the number of individuals to be replaced, mitigation should ensure the area occupied by the species will increase by at least the 2.5 acres that would be lost. Because there is a risk-spreading benefit in the disjunct configuration of the impacted population, the mitigation site should be geographically distinct from currently occupied sites.

4.2 Western Spadefoot Toad

Mitigation for the western spadefoot toad ignores the geographic configuration of the impacted population(s). These toads are found in four distinct ephemerally wet areas on the LAX property, all of which would be destroyed by the build alternatives. Division of the population into separate, hydrologically distinct pools with different cachmentments is a benefit to the population. Mitigation for these losses cannot be achieved through creation of 1.24 acres of ideal habitat (the "Habitat Units"), but rather must consist of four separate pools and associated cachmentments of at least 9 acres.

The choice of mitigation location is important as well. The top choice would be on the areas of the former Los Angeles Coastal Prairie west of Pershing Drive. However, the EIS/R claims that allowing a vernal pool in this area would encourage bird life as well, and would therefore pose a hazard to aircraft.

If off-site mitigation is necessary, the first choice should be the West Bluffs property, currently subject to development by the Catellus Corporation. The West Bluffs site has vernal pool hydrology and is the only candidate site within a reasonable distance of LAX. Distant sites such as Madrona Marsh and potentially California State University Dominguez Hills (where spadefoot toads possibly persist in a vernal pool but are subject to imminent extirpation from construction), should be utilized only in addition to a more proximate site. If no proximate sites are secured (e.g., the West Bluffs property is unobtainable), then the conclusion of the EIS/R must be that the impacts to the species cannot be mitigated to a less than significant level. Without the LAX population, or a possible West Bluffs replacement, the range of the species in the region will be significantly diminished, even with more distant offsite mitigation.

4.3 Riverside Fairy Shrimp

A similar analysis applies to the proposed mitigation for the loss of habitat for the Riverside fairy shrimp. The species is currently found in at least nine areas affected by the build alternatives. The proposed mitigation is for "no more" than 1.3 acres of replacement habitat.¹⁰⁰ To the contrary, loss of this occupied habitat should be mitigated by provision of nine pools with associated upland cachement areas to support vernal pool hydrology. While the mitigation measure suggests one location with 0.75 habitat value (i.e. restoration of vernal pool plants and other vernal pool characteristics), it is more important to the fairy shrimp that multiple locations be acquired. Population models for species found in habitat patches (e.g., metapopulations) show that persistence is enhanced not by density at a single site — although patch size is important — but by maximizing the number of occupied patches.¹⁰¹ To trade occupied sites for other biological values such as presence of sensitive plant species decreases the long-term persistence possibilities for the fairy shrimp. Certainly full vernal pool restoration would be a noble conservation goal, but it does not mitigate the impacts to the Riverside fairy shrimp. The potential mitigation sites should be chosen by proximity to LAX. The West Bluffs site could provide one, possibly two pools. Additional pools should be identified to mitigate fully the impacts to the species.

4.4 San Diego Black-tailed Jackrabbit

As discussed above, the proposed mitigation for the San Diego black-tailed jackrabbit is insufficient to offset the losses to the species. The loss of 119 acres of occupied habitat must be offset by the provision of at least 119 acres of additional habitat. The EIS/R provides no evidence to show that the species can be supported at similar densities in the Habitat Restoration Area on the dunes, nor that the "Habitat Units" of restoration on the dunes will make the area more suitable for jackrabbits. Black-tailed jackrabbits require mixed grasses, forbs, and shrubs for food; dune scrub may provide less preferred forage than exotic grassland. The Habitat Restoration Area therefore may support lower densities of the species than currently occupy the 119 acres of exotic grassland. Furthermore, the EIS/R provides no estimate of the size of the population to be impacted, or the diel¹⁰² patterns of movement exhibited by the species, information that is necessary to formulate an effective mitigation measure. Any release program on the El Segundo Dunes must be accompanied by a humane control program for the exotic red fox (*Vulpes vulpes*).

100. EIS/R, p. 4-708.

101. Hanski, I. 2000. *Metapopulation ecology*. London: Oxford University Press.

102. "Diel" refers to a 24-hour period, a full day and night.

4.5 Loggerhead Shrike

The EIS/R proposes to mitigate for loss of occupied loggerhead shrike habitat (172 acres) with restoration on the El Segundo Dunes in the form of 22.88 "Habitat Units." Implicit in this proposal is the assumption that the density of loggerhead shrikes on the El Segundo Dunes can be increased to accommodate those displaced by the loss of 172 acres of occupied habitat. The EIS/R provides no information about densities of loggerhead shrike to support this implicit assumption. To the contrary, because the El Segundo Dunes are already occupied with breeding loggerhead shrikes, and the shrike's use of habitat is not tied to whether the vegetation is native or not (or to the arbitrary habitat standards of the HEP), restoration on the El Segundo Dunes is not likely to appreciably increase the density of shrikes found there. Mitigation for this impact must be found elsewhere, in the form of 172 acres of shrike habitat. Loggerhead shrike are found at the West Bluffs site, but the site is only 44 acres and so could only offer partial mitigation for impacts at LAX. Other additional mitigation sites include properties covered under the Playa Vista master plan, or in the Baldwin Hills. However, if 172 acres of shrike habitat in addition to the El Segundo Dunes cannot be identified and acquired as mitigation, then the significant impact to this species cannot be mitigated to a less than significant level. The impacts are certainly not mitigated by the proposal to provide 23 extra "Habitat Units" in currently occupied habitat.

4.6 Los Angeles Coastal Prairie

Prescriptions for restoration of Valley Needlegrass Grassland described in MM-BC-5, MM-BC-6, and MM-BC-7 are not consistent with evidence of the historic vegetation in the area, which Mattoni and Longcore have described as Los Angeles Coastal Prairie. The prescription is for a needlegrass dominated habitat, with four common subshrubs. First, five plant species are insufficient to restore this habitat type; the actual plant diversity of the habitat was significantly higher. Second, the relative abundance of species is nothing approaching historical conditions. A transect along a historic photograph of the Coastal Prairie (or "meadow" as described by Pierce¹⁰³), shows the following coverage: *Lupinus bicolor* (39%), *Camissonia bistorta* (18%), *Phacelia stellaris* (14%), *Lotus strigosus* (8%), *Festuca megalura* (4%), *Cryptantha intermedia* (1%), and open (16%).¹⁰⁴ A mitigation measure should bear at least some resemblance to the vegetation type that it proposes to emulate. Furthermore, the standard of 10% native cover for successful restoration is outrageous. The claim that this is defensible because 10% is deemed significant for the identification of a native grassland by the California Department of Fish and Game is equally stunning. Ten percent cover represents the most degraded grasslands, not a standard to achieve in restoration. If the success criterion for grassland mitigation were followed, the vegetation created would score very low on the "modified" HEP touted in the EIS/R.

4.7 Restoration Performance Criteria

The performance criteria for the restoration efforts are all exceedingly weak. The only quantifiable standard for revegetation performance is attainment of native cover, the highest of which is 45%. Ecologists have developed many measures of habitat quality that are available to define performance

103. Pierce, W.D. 1938. The fauna and flora of the El Segundo sand dunes: I. General ecology of the dunes. *Bulletin of the Southern California Academy of Sciences* 37(3):93-97.

104. Mattoni, R., and T.R. Longcore. 1997. The Los Angeles Coastal Prairie, a vanished community. *Crossosoma* 26(2):71-102, at 87.

standards for revegetation, including many measures of plant diversity and plant structure.¹⁰⁵ Wetland mitigation must meet stringent standards quantifying wetland functions and values.¹⁰⁶ Terrestrial arthropods have been used to assess the performance of revegetation in re-creating native habitats.¹⁰⁷ The performance criteria for restoration should provide more ecological information than simply percent native cover, especially when so many measures are readily available. Without true ecological assessment of restored areas, the success of the mitigation will be forever unknown.

4.8 Raptor "Nursery Sites"

Insufficient information about the impact to raptors using mature trees is provided to allow assessment of whether the mitigation measure (MM-BC-3) would be effective for replacement of mature trees. The location of this mitigation would be important, and the destruction of nearly all of the open space used for foraging by raptors may render "nursery sites" extraneous, with no raptors to use them.

5.0 California Coastal Act

None of the build alternatives in the Master Plan would be consistent with the California Coastal Act. First, there would be many impacts to the environmentally sensitive habitat area on the El Segundo Dunes through the indirect effects of increased construction, light, landscaping, pollution, and road construction. The mitigation measures proposed are insufficient to mitigate for these significant disruptions of habitat values. Even though the development is designed to occur outside the coastal zone boundary, Section 30240(b) of the Coastal Act provides that:

Development in areas adjacent to environmentally sensitive habitat areas and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade those areas, and shall be compatible with the continuance of those habitat and recreation areas.¹⁰⁸

Second, the EIS/R does not discuss impacts to marine biological resources, which could occur as a result of runoff into and jet fuel dumping over the ocean. Impacts to marine biological resources should be described and appropriate changes implemented before preparation of a final EIS/R.

6.0 Conclusion

The EIS/R treatment of biological resources represents the result of significant effort and expenditure on the part of the preparers. Unfortunately, the resulting analysis is deeply flawed, unscientific, and improperly reaches the conclusion that the mitigation measures would reduce impacts to a less than significant level. To the contrary, implementation of any of the three build alternatives would be catastrophic for the biological resources on the project site and result in a significant local and cumulative impact on sensitive species. If approved and implemented, the Master Plan will permanently degrade the diversity and abundance of native wildlife in west Los Angeles. The last refuges of birds and mammals depending on large open spaces will be erased from the landscape.

Appendix B

Qualifications of Travis Longcore and Catherine Rich

TRAVIS LONGCORE

P.O. Box 24020
Los Angeles, California 90024-0020
Telephone: (310) 247-9719

EDUCATION

- Ph.D., Geography, University of California, Los Angeles 1995–1999
Dissertation Title: *Terrestrial Arthropods as Indicators of Restoration Success in Coastal Sage Scrub*
- M. A., Geography, University of California, Los Angeles 1993–1995
Thesis Title: *Risk, Technology, and Place: Siting a Radioactive Waste Dump in California's Ward Valley*
- Honors B. A., Geography *summa cum laude*, University of Delaware 1989–1993
Thesis Title: *Information Technology and World City Restructuring: The Case of New York City's Financial District*

PROFESSIONAL EXPERIENCE

- Research Assistant Professor, Center for Sustainable Cities, Department of Geography,
University of Southern California 2001–present
- Lecturer, UCLA Department of Geography, UCLA Department of Organismic Biology,
Ecology and Evolution, UCLA Institute of the Environment 2000–present
Lower division: Biogeography, People and the Earth's Ecosystems, Ecology and Conservation of California Oaks. Upper division: World Vegetation, Forest Ecosystems, Ecology, Environmental Impact Analysis.
- Co-founder and Science Director, The Urban Wildlands Group 1996–present
Organization studies and works to protect species, habitats, and ecological processes within urban and urbanizing areas. Projects include restoration and management of habitat supporting endangered butterfly species, education of policymakers on impacts of artificial light and noise on wildlife, research on minimizing ecological effects of fuel modification.
- Principal, Land Protection Partners 1998–present
Consultant to attorneys in land protection actions (primarily California Environmental Quality Act, California Coastal Act, and federal Endangered Species Act). Services include issue identification, preparation of biological analysis with supporting scientific literature review, and communication with resource agency personnel.
- Research Associate, Sustainable Cities Program, University of Southern California 1999–2001
- Summer Instructor, UCLA Graduate School of Education and Information Studies 1997–1999
- Staff Researcher, UCLA Department of Geography 1996–1999
- Teaching Assistant, UCLA Department of Geography 1995–1996
- Geographic Information System Technician, Water Resources Agency, New Castle
County, Delaware 1992–1993

GRANTS, HONORS, AND AWARDS

Professional

- Santa Monica Bay Restoration Commission 2003
Grant of \$131,000 to Los Angeles Conservation Corps and The Urban Wildlands Group to restore coastal dune and bluff vegetation and develop a master plan for restoration of El Segundo dune and bluff habitat.
- Defense Logistics Agency 2003
Contract for \$43,779 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly.
- James C. Zumberge Fund for Innovation, University of Southern California 2003
Grant of \$50,000 for interdisciplinary investigation of phytoremediation with native plants.
- Conservation and Research Foundation 2003
Grant of \$5,000 to The Urban Wildlands Group to support preparation of book, *Ecological Consequences of Artificial Night Lighting*.
- California ReLeaf 2003
Grant of \$7,500 to The Urban Wildlands Group for project, "Urban Forest Assessment and Outreach at UCLA."
- U.S. Department of the Navy 2002
Contract for \$12,000 to The Urban Wildlands Group to salvage Palos Verdes blue butterfly pupae from Navy property to be disposed and developed.
- U.S. Fish and Wildlife Service 2002
Contract for \$10,000 to The Urban Wildlands Group to draft management plan for endangered Kern primrose sphinx moth.
- U.S. Fish and Wildlife Service 2002
Contract for \$24,000 to The Urban Wildlands Group to draft species recovery plan for endangered Calippe silverspot butterfly.
- International Dark-Sky Association Executive Director's Award 2002
- National Fish and Wildlife Foundation 2002
Grant of \$5,000 to The Urban Wildlands Group to support conference *Ecological Consequences of Artificial Night Lighting*.
- Electric Power Research Institute 2002
Grant of \$2,000 to The Urban Wildlands Group to support conference *Ecological Consequences of Artificial Night Lighting*.
- Defense Logistics Agency 2002
Contract for \$42,665 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly.
- U.S. Fish and Wildlife Service Landowner Incentive Program 2001
Grant of \$37,300 to The Urban Wildlands Group to restore habitat for endangered El Segundo

blue butterfly on private property in Torrance, California.

John Randolph Haynes and Dora Haynes Foundation 2000

Co-author of \$398,000 grant to USC Sustainable Cities Program to assess benefits of urban greening in a dense inner-city neighborhood.

Los Angeles Department of Water and Power 2000

USC Sustainable Cities Program awarded \$9,000 contract to assess "Cool Schools" tree planting program.

New Research Design Award for a More Sustainable Los Angeles Region, John Randolph Haynes and Dora Haynes Foundation 2000

Awarded \$5,000 to develop a research design for the use of native plants in phytoremediation.

Graduate

Conference Travel Grant, UCLA Department of Geography 1999

Dissertation Improvement Grant, National Science Foundation (\$8,000) 1998

Distinguished Doctoral Scholar Fellowship, UCLA Alumni Association (\$17,500) 1998

Portable Fellowship, UCLA Graduate Division (\$18,500) 1997

Graduate Research Fellowship, National Science Foundation (\$64,400) 1993

Chancellor's Fellowship, UCLA Graduate Division (declined) 1993

Undergraduate

Alexander J. Taylor Award ("Outstanding Senior Man"), University of Delaware 1993

Geography Faculty Award, University of Delaware 1993

Mid-Atlantic Region Finalist, Rhodes Scholarship 1992

Fellow, Arizona Honors Academy, Northern Arizona University 1992

Marie Donaghay Award for Excellence in Geography, University of Delaware 1992

Phi Beta Kappa 1992

Phi Beta Kappa Clift and DeArmond Award, University of Delaware 1991

George and Margaret Collins Seitz Award, University of Delaware 1991

Eugene duPont Memorial Distinguished Scholar Award, University of Delaware (\$44,500) 1989

PUBLICATIONS AND PRESENTATIONS

In Preparation

1. Rich, Catherine, and Travis Longcore (eds.). *Ecological consequences of artificial night lighting*. Island Press (scheduled 2004).
2. Longcore, Travis. Christina Li, and John P. Wilson. Nature's services in a dense urban neighborhood. *Environmental Management*.

In Review

4. Longcore, Travis and Catherine Rich. Ecological light pollution. *Frontiers in Ecology and Environment*.
3. Longcore, Travis, Catherine Rich, and Dietland Müller-Schwarze. Management by assertion: beavers and vireos at Lake Skinner (Riverside County, California). *Ecological Restoration*.
2. Longcore, Travis, Christina Li, and John P. Wilson. Applicability of CITYgreen urban ecosystem analysis software to a dense urban neighborhood. *Urban Geography*.
1. Longcore, Travis. Ecological effects of fuel management practices around residential development. Sidebar for chapter by Kevin Shafer in text on California fire ecology.

Peer Reviewed Publications

INVITED PRESENTATIONS

- South Coast Wildlands Project Missing Linkages Workshop, August 2002
University of Southern California, Department of Geography, February 2002
Santa Monica Mountains Conservancy, September 2001
California Native Plant Society, South Coast Chapter, August 2001
California State University, Northridge, Olivatt Library, April 2001
University of California Natural Resources Continuing Conference, Wrigley Institute for Environmental Studies, April 2001
Society for Ecological Restoration, California Chapter Annual Conference, October 2000
University of Stockholm, Department of Zoology, September 2000
University of Gothenberg, Department of Applied Environmental Science, September 2000
Lorquin Entomological Society, Los Angeles, California, June 2000
University of California, Los Angeles, Department of Geography, May 2000
Southern California Institute of Architecture, June 1998
Los Angeles Unified School District Target Science, "Butterflies in the City" Workshop Series, South Central Los Angeles Leadership Team, October 1998

PROFESSIONAL SERVICE

- Referee, *Restoration Ecology, Journal of Research on the Lepidoptera, Environmental Management, Transactions in GIS*

Independent Scientific Advisor (Quino checkerspot butterfly), County of San Diego, 2002
Baldwin Hills Park Citizens Advisory Committee, 2002
Conference Co-Chair, The Urban Wildlands Group and UCLA Institute of the Environment, *Ecological Consequences of Artificial Night Lighting*, 2001–2002
Member, Advisory Council, Yosemite Restoration Trust, 1999–present
Member, Recovery Team (Technical Subteam), Quino Checkerspot Butterfly, U.S. Fish and Wildlife Service, 1999–present
Newsletter Layout, Endangered Habitats League, 1998–2002
Member, Conference Steering Committee, UCLA Institute of the Environment, *California's Biodiversity Crisis: The Loss of Nature in an Urbanizing World*, 1998
Managing Editor, Journal of Research on the Lepidoptera, 1997–1999
Member, Recovery Team, El Segundo Blue Butterfly, U.S. Fish and Wildlife Service, 1997–1998
Member, Environmental Review Board, County of Los Angeles (appointed by Los Angeles County Board of Supervisors), 1997–present
Editor, *Western Tanager*, newsletter of the Los Angeles Audubon Society, 1997
Vice President, Los Angeles Audubon Society, 1995–1997
Coordinator, Los Angeles Audubon Society Birdathon, 1996 (recognized by National Audubon Society, "Most Money Raised by a Rookie," September-October issue of *Audubon* magazine)
Graduate Student Association Representative, UCLA Academic Senate Council on Planning and Budget, 1996–1999
Member, Graduate Affairs Committee, UCLA Department of Geography, 1995–1997
Member, Instructional Technology Committee, UCLA Department of Geography, 1993–1995

PROFESSIONAL AFFILIATIONS

Member, Ecological Society of America
Member, Association of American Geographers
Member, Society for Ecological Restoration
Member, Southern California Botanists
Member, California Botanical Society

Education

UCLA Department of Geography, M.A. June 1997. Emphasis in biogeography, urban wildlife, environmental philosophy. Thesis: *Poliophilophilia? Toward an Understanding of the Role of Human Emotion in Nature Preservation*. Teaching Assistant: Biogeography, Physical Geography, People and the Earth's Ecosystems.

UCLA School of Law, J.D. June 1981. Member, State Bar of California. Co-founder and Associate Editor, *UCLA Journal of Environmental Law and Policy*. Co-founder and officer (faculty liaison), UCLA Environmental Law Society.

University of California, Berkeley, A.B. March 1978 (with Distinction). Pre-medical course, psychology major. Member, Board of Directors, U.C. Berkeley CalPIRG (1976-1977). Co-founder, U.C. Berkeley CalPIRG (1976).

Professional Experience

Co-founder and Executive Officer, The Urban Wildlands Group (1996-present). Organization studies and works to protect species, habitats, and ecological processes within urban and urbanizing areas. Projects include restoration and management of habitat supporting endangered butterfly species, public education about effects of noise and artificial night lighting on wildlife, promotion of humane approaches to wildlife management, research on minimizing ecological effects of fuel modification.

Principal, Land Protection Partners (1998-present). Consultant to attorneys in land protection actions (primarily California Environmental Quality Act, California Coastal Act, federal Endangered Species Act). Services include issue identification, preparation of biological analysis with supporting scientific literature review, communication with resource agency personnel.

Contract Attorney, Law Offices of Jonathan Kirsch (1999-present). Trademark and publishing law.

Copy Editor, *Journal of Research on the Lepidoptera* (1997-1999).

Legal/Policy Consultant (1989-1992). Projects included assisting in the preparation of lawsuit (*Nordlinger v. Lynch*) challenging property tax assessment scheme mandated by Proposition 13 (for Center for Law in the Public Interest).

Deputy, Los Angeles City Councilman Marvin Braude (1987-1988). Formulated and developed environmental policies and programs. Represented councilman before city boards,

commissions, and committees, and at community meetings. Coordinated councilman's reelection campaign for seat on AQMD Board.

Community Representative (1985–1986). Directed successful effort to prevent developer from demolishing five contiguous apartment buildings in an unredeveloped Westwood neighborhood. Persuaded Los Angeles City Council to enact a local building moratorium, then successfully represented local community before Planning and Environment Committee of the City Council in a hardship exemption hearing requested by developer. Prepared architectural and historical documentation for Historic Preservation Overlay Zone application.

Staff Attorney, California Commission on Campaign Financing (1984–1985). Contributed to two-volume report on legislative campaign financing (*The New Gold Rush: Financing California's Legislative Campaigns*).

Full-time staff member, Gary Hart presidential campaign (1984). Field desk contact for Northern California; Los Angeles regional co-coordinator. Appointed to Credentials Committee of the 1984 Democratic National Convention.

Attorney, Paul, Hastings, Janofsky & Walker (1983). General civil litigation.

Editor/Assistant, Professor Charles M. Firestone (1982–1983). Edited Firestone and Johnson's *Cases and materials on communications law and policy*, assisted in preparations for conference, UCLA Communications Law Program/International Bar Association Symposium on International Satellite Television.

Research Assistant, Professor Richard Abel (Summer 1980). Compiled information on workplace exposure to toxic substances.

Intern, Hollywood Revitalization Committee (funded by National Trust for Historic Preservation) (Summer 1979). Evaluated feasibility of establishing a façade easement program for Hollywood's historic buildings.

Research Assistant, Professor Laura Nader (funded by National Highway Traffic Safety Administration) (Spring 1978). Research on social costs of automobile accidents.

Research Assistant, Professor Laura Nader (Summer 1977). Participated in study funded by Energy Research & Development Administration evaluating feasibility of alternative energy systems in California. Interviewed officials involved with the implementation of Energy Conservation Standards for New Residential Buildings.

Grants and Awards

Santa Monica Bay Restoration Commission. Grant of \$131,000 to Los Angeles Conservation Corps and The Urban Wildlands Group to restore coastal dune and bluff vegetation and develop a master plan for restoration of El Segundo dune and bluff habitat (2003).

Defense Logistics Agency. Contract for \$43,779 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly (2003).

Conservation and Research Foundation. Grant of \$5,000 to The Urban Wildlands Group to support preparation of book, *Ecological Consequences of Artificial Night Lighting* (2003).

California ReLeaf. Grant of \$7,500 to The Urban Wildlands Group for project, "Urban Forest Assessment and Outreach at UCLA" (2003).

U.S. Department of the Navy. Contract for \$12,000 to The Urban Wildlands Group to salvage Palos Verdes blue butterfly pupae from Navy property to be disposed and developed (2002).

U.S. Fish and Wildlife Service. Contract for \$24,000 to The Urban Wildlands Group to develop Recovery Plan for endangered Callippe silverspot butterfly in San Francisco area, California (2002).

U.S. Fish and Wildlife Service. Contract for \$10,000 to The Urban Wildlands Group to develop Action Plan for endangered Kern primrose sphinx moth on BLM land in the Carrizo Plain National Monument, California (2002).

National Fish and Wildlife Foundation. Grant of \$5,000 to The Urban Wildlands Group to support conference, *Ecological Consequences of Artificial Night Lighting* (2002).

Electric Power Research Institute. Grant of \$2,000 to The Urban Wildlands Group to support conference, *Ecological Consequences of Artificial Night Lighting* (2002).

Defense Logistics Agency. Contract for \$42,665 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly (2002).

U.S. Fish and Wildlife Service Landowner Incentive Program. Grant of \$37,300 to The Urban Wildlands Group to restore habitat for endangered El Segundo blue butterfly on private property in Torrance, California (2001).

International Dark-Sky Association Executive Director's Award, "In recognition of her enthusiastic efforts in the pursuit of the promotion of Dark Skies" (2002).

International Dark-Sky Association Executive Director's Award, "For outstanding service in protecting our nighttime environment" (2001).

Selected Activities and Memberships

Conference Co-Chair, The Urban Wildlands Group/UCLA Institute of the Environment, *Ecological Consequences of Artificial Night Lighting* (2002)

Advisor, California Wildlife Foundation (2002–present)

Member, Advisory Council, California Oak Foundation (1999–present)

Member, Conference Steering Committee, UCLA Institute of the Environment, *California's Biodiversity Crisis: The Loss of Nature in an Urbanizing World* (1998)

President, Los Angeles Audubon Society (1996–1997)

Conservation Co-Chair, Los Angeles Audubon Society (1995–1996)

Second Vice President, Los Angeles Audubon Society (1994–1995)

Member, Advisory Committee, Los Angeles County 1996 Proposition A. Successfully lobbied for inclusion of, and wrote, statement in Proposition A's preamble pertaining to the importance of maintaining biological diversity within the County, and successfully lobbied for creation of a competitive grant category for habitat acquisition and/or restoration.

Member, Society for Conservation Biology

Member, Cooper Ornithological Society

Chief Administrative Officer

November 6, 2003

Mr. Jim Ritchie
City of Los Angeles
Los Angeles World Airports
Master Plan Office
P.O. Box 92216
Los Angeles, CA 90009-2216

**RE: Comments on the LAX Master Plan 2003 Supplemental
Environmental Impact Statement / Environmental Impact Report**

Dear Mr. Ritchie:

The City of Culver City has adopted the attached City Council Resolution 2003-R086 that formally transmits our comments on the LAX Master Plan Draft Supplemental EIS/EIR.

Overall, we believe the Draft Supplemental EIS/EIR fails to adequately address potential significant impacts to Culver City caused by the proposed project. The Draft Supplemental EIS/EIR and associated documents primarily focus on an analysis of impacts and proposed mitigation measures for the area immediately adjacent to the airport.

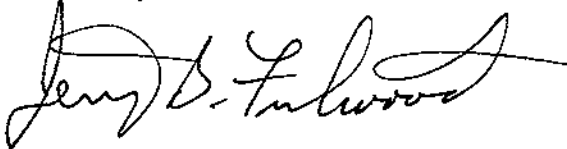

Due to the failure of the Draft Supplemental EIS/EIR to adequately address impacts and propose mitigation measures for Culver City, we believe that the Los Angeles World Airports (LAWA) should find the Draft Supplemental EIS/EIR inadequate for certification and require that it be revised and re-circulated to respond to the deficiencies we have identified in Resolution 2003-R086 and the extensive technical comments that is attached thereto as Exhibit A.

Mr. Jim Ritchie
Page 2 of 2
November 6, 2003

Culver City's comments on the 2003 Supplemental EIS/EIR are in addition to the comments previously provided to LAWA on the 2001 Draft EIS/EIR. A copy of the 2001 Draft EIS/EIR comments is attached. Both sets of Resolutions adopted by the City Council constitute the City's comments on the entire LAX Master Plan and EIS/EIR.

We look forward to your response to the comments and concerns of the City of Culver City.

Sincerely,

Jerry Fulwood
Chief Administrative Officer

David Kessler, Federal Aviation Administration

SAL00020

1 capacity of its existing facilities and promotes development of additional capacity at the
2 many other commercial airports in Southern California to serve the expanding air
3 commerce market place. As established in City Council Resolution No. 98-R087, the
4 City's official position regarding the proposed expansion is one of opposition to the LAX
5 capacity expansion beyond that which can be accommodated by existing LAX facilities,
6 and support for developing the capacity of other commercial airports within Southern
7 California; and,

8
9 WHEREAS, LAWA and the FAA prepared a joint Draft EIS/EIR to address
10 the potential environmental impacts caused by the proposed LAX expansion, which was
11 released for public review and comment on January 18, 2001; and,

12 WHEREAS, the Draft EIS/EIR analyzes four project alternatives: 1) No
13 Action /No Project; 2) Alternative A, Additional runway to the north airfield, 3) Alternative
14 B, an additional runway to the south airfield, and 4) Alternative C, no additional runways
15 but reconfiguration of existing runways including either lengthening, widening, and
16 relocating; and,

17
18 WHEREAS, on June 25, 2001, the Culver City City Council adopted
19 Resolution No. 2001-R068 determining that the 2001 Draft EIS/EIR is substantially
20 inadequate for certification by the Lead Agencies and that there was insufficient analysis
21 of the environmental impacts of the proposed project to Culver City. Despite our close
22 proximity to the airport, the 2001 Draft EIS/EIR does not adequately address potential
23 significant impacts to Culver City caused by the LAX Master Plan, including the proposed
24 LAX Expressway, an elevated roadway along the I-405. Also, a fully regional solution to
25 the growth and demand in air passenger and air cargo capacity is not adequately
26 considered in the 2001 Draft EIS/EIR. The City of Culver City's comments on the 2001
27

1 Draft EIS/EIR, including the City Council Resolution No. 2001-R068 were forwarded to
2 LAWA on July 18, 2001; and,

3 WHEREAS, a City Staff Team, consisting of various City Departments as
4 well as a noise consultant and a traffic consultant hired by the City of Culver City, was
5 established to evaluate and comment on the adequacy of the Draft EIS/EIR in addressing
6 potential impacts to Culver City; and,

7
8 WHEREAS, the City Council of the City of Culver City, accepted public
9 comments and considered the Draft Supplemental EIS/EIR at public meetings on October
10 27, 2003.

11 NOW, THEREFORE, the City Council of the City of Culver City, California,
12 DOES HEREBY RESOLVE as follows:

13 In addition to the comments made through Resolution No. 2001-R068, the
14 following key findings are hereby made by the City Council of the City of Culver City.
15 These findings are described more fully and augmented in greater detail in "Exhibit A",
16 which is attached to this Resolution.

17
18 1. The Draft Supplemental EIS/EIR inadequately and inaccurately
19 addresses the substantial adverse environmental impacts potentially affecting the City of
20 Culver City. Below is a summary of impacts not discussed or analyzed in the Draft
21 Supplemental EIS/EIR.

22 a. Traffic: The Draft Supplemental EIS/EIR is completely
23 inadequate in evaluating traffic impacts in the City of Culver City. Only one
24 intersection in Culver City was analyzed. The analysis should have included
25 other intersections within the radius of influence of the Airport Expansion, to
26 determine whether significant environmental impacts may be caused within
27

1 Culver City and whether those impacts can be mitigated to a to a level of
2 insignificance. Assessment of additional intersections should have been
3 included, all of which currently are operating at unacceptable levels of
4 service.

5 As traffic delays impact the street network system, mass transit
6 (Culver CityBus – Line 6) and public safety services are equally impacted.
7 The Draft Supplemental EIS/EIR does not adequately address potential
8 fiscal impacts of increased Home Land Security. Further, there is potential
9 spillover congestion onto the I-10 freeway at the I-405 interchange. Not only
10 is there a lack of acceptable analysis, the failure to address these issues
11 results in a failure to address potential mitigation measures which might
12 have the effect of reducing the levels of adverse impacts.

13
14 b. Aircraft Overflight Noise: There are potential aircraft overflight
15 noise impacts from two new arrival paths and a new departure path. There
16 are on average approximately 2,100 existing daily flights according to the
17 1996 environmental baseline. A major problem with the Draft Supplemental
18 EIS/EIR regarding aircraft noise is the lack of key data and detailed analysis
19 of the overflight noise impact to Culver City and other communities in close
20 proximity. The degree of impact cannot be determined because noise levels
21 and flight frequency information for aircraft overflights is not provided in the
22 Draft Supplemental EIS/EIR.

23
24 c. Air Pollution: The Draft Supplemental EIS/EIR completely fails
25 to evaluate localized air pollution impacts on Culver City. No mitigation
26 measures are proposed for Culver City from increased air and mobile
27

1 sources from auto traffic, aircraft operations, construction, and in particular
2 from freight and cargo operations. Without this critical analysis, the Draft
3 Supplemental EIS/EIR fails to comply with the minimum requirements of the
4 California Environmental Quality Act (CEQA) and the National Environmental
5 Policy Act (NEPA).

6 d. Cumulative Impacts: The Draft Supplemental EIS/EIR fails to
7 adequately analyze the cumulative impacts of other projects, which will be
8 under construction during the same time period as the proposed expansion
9 of LAX such as I-405 HOV project, Playa Vista, Baldwin Hills Regional Park
10 Plan project, MTA Exposition Line project, and the West Los Angeles
11 College Facilities Master Plan project. For example, the cumulative impacts
12 of the LAX expansion along with the Playa Vista project, including their
13 cumulative construction impacts, would result in significant adverse impacts
14 to the I-405, Sepulveda Boulevard, and other arterials, resulting in adverse
15 impacts to local circulation and air emissions.

16 e. NOP/NOI Comment Letter: In response to the NOP/NOI to
17 prepare the Draft EIS/EIR issued in June 1997, Culver City requested in a
18 letter dated July 31, 1997, that major issues and concerns related to traffic,
19 air quality, overflight operations, regional context, and other subject areas
20 impacting Culver City be analyzed in the preparation of the Draft EIS/EIR.
21 None or minimal analysis of these issues are contained in the 2001 Draft
22 EIS/EIR or in the 2003 Draft Supplemental EIS/EIR. Further, Culver City's
23 NOP/NOI comment letter is not contained in Draft Supplemental EIS/EIR or
24
25
26
27
28

1 Appendix A of the 2001 Draft EIS/EIR, where copies of written comments
2 from affected agencies are contained.

3 2. The magnitude of omissions in the Draft Supplemental EIS/EIR is so
4 extensive that attached hereto as "Exhibit A" of this Resolution, are significant additional
5 comments which detail the failure of the lead agencies to adequately address the
6 complete array of adverse environmental impacts this project is anticipated to have on
7 Culver City.
8

9 Pursuant to the foregoing recitation and findings, the City Council of the City
10 of Culver City, California, hereby:

11 1. Determines that the Draft Supplemental EIS/EIR is substantially
12 inadequate and inaccurate for certification by the Lead Agencies and that a complete and
13 proper level of environmental data and analysis must be incorporated into the Draft
14 Supplemental EIS/EIR to address the identified deficiencies.
15

16 2. Establishes that this Resolution, including attached Exhibit "A,"
17 constitutes the City of Culver City's comments on the July 2003 Draft Supplemental
18 EIS/EIR that was prepared for the proposed LAX Master Plan Addendum.

City of Culver City Resolution No. 2003 – R0
Supplemental Draft EIS/EIR for the LAX Master Plan Addendum
October 27, 2003

SURFACE TRANSPORTATION

Intersection and Street Segment Traffic Impact Analysis

1. The impacts of LAX expansion traffic within Culver City were not given sufficient analysis. The most thorough method of analyzing the traffic flow quality and impacts on a street network is the evaluation of the operations at the critical intersections. They are the locations that act as valves for the flows on the intersecting streets. The flow along the street segments between the important intersections does not yield a true picture, because the interruptions to flow at the critical intersections are not properly accounted for in that type of analysis.
 - a) Only one intersection in Culver City was included in the impact analysis – Sepulveda Boulevard/Centinela Avenue, at the southern edge of the City [Figure 4.3.2-1, following page 4-243].
 - b) In response to the Notice of Preparation of the EIR several years ago, Culver City requested analysis at approximately 40 important intersections within the City, and those intersections were included in discussions of the study method and scope with the City of Los Angeles Department of Transportation and with the LAX consultants. The requests in the response to the Notice of Preparation were not acknowledged. Except for the one intersection mentioned above, the requested intersections were not included in the January 2001 Draft EIS/EIR or the July 2003 Draft Supplemental EIS/EIR. The intersections are listed below:

1. Braddock Drive	@ Overland Avenue
2. Braddock Drive	@ Sepulveda Boulevard
3. Bristol Parkway	@ Centinela Avenue
4. Bristol Parkway	@ Slauson Avenue
5. Buckingham Parkway	@ Slauson Avenue
6. Centinela Avenue	@ Green Valley Circle
7. Centinela Avenue	@ Washington Boulevard
8. Centinela Avenue	@ Washington Place
9. Culver Boulevard	@ Main Street/Washington Boulevard
10. Culver Boulevard	@ Overland Avenue
11. Culver Boulevard	@ Sawtelle Boulevard
12. Culver Boulevard	@ Sepulveda Boulevard

13. Duquesne Avenue	@ Jefferson Boulevard
14. Glencoe Avenue	@ Washington Boulevard
15. Green Valley Circle	@ Sepulveda Boulevard
16. Hannum Avenue	@ Playa Street
17. Hannum Avenue	@ Slauson Avenue
18. I-405 NB Ramps s/o Venice Boulevard	@ Sepulveda Boulevard
19. I-405 SB Ramp n/o Culver Boulevard	@ Sawtelle Boulevard
20. Inglewood Boulevard	@ Washington Boulevard
21. Jefferson Boulevard	@ Overland Avenue
22. Jefferson Boulevard	@ Sepulveda Blvd (N)
23. Jefferson Boulevard	@ Slauson Avenue
24. La Cienega Boulevard	@ Washington Boulevard
25. Marina Freeway	@ Slauson Avenue
26. Matteson Ave/I-405 SB Ramps	@ Sawtelle Boulevard
27. Motor Avenue	@ Washington Boulevard
28. Overland Avenue	@ Washington Boulevard
29. Playa Street/Jefferson Blvd.	@ Sepulveda Boulevard
30. Redwood Avenue	@ Washington Boulevard
31. Sawtelle Boulevard	@ Sepulveda Boulevard
32. Sawtelle Boulevard	@ Venice Boulevard
33. Sawtelle Boulevard	@ Washington Boulevard
34. Sawtelle Boulevard	@ Washington Place
35. Sepulveda Boulevard	@ Slauson Avenue
36. Sepulveda Boulevard	@ Washington Boulevard
37. Sepulveda Boulevard	@ Venice Boulevard
38. Sepulveda Boulevard	@ Washington Place
39. Walgrove Avenue	@ Washington Boulevard

- c) Only six street segments in Culver City were included in the analysis -- 1) Sawtelle Boulevard, south of Venice Boulevard; 2) Sepulveda Boulevard, south of Venice Boulevard; 3) Overland Avenue, south of Venice Boulevard; 4) Sepulveda Boulevard, south of Slauson Avenue; 5) Centinela Avenue, west of Sepulveda Boulevard; and 6) Washington Boulevard, east of Lincoln Boulevard [Figure 4.3.2-1].
- d) Other streets that are components of routes to/from the airport, such as Jefferson Boulevard (west of Sepulveda Boulevard and east of Overland Avenue), Culver Boulevard, and Centinela Avenue (toward the east), are not included, although they are likely to carry meaningful volumes of airport traffic.

- e) Of the streets that are included, some of the segments are not the most critical in evaluating impacts of airport traffic. For example, Overland Avenue, south of Jefferson Boulevard would have far higher impacts of airport traffic than the segment of Overland Avenue (south of Venice Boulevard) that was chosen for analysis. The same could be said about Sawtelle Boulevard, south of Culver Boulevard, and about Washington Boulevard, east and west of Sepulveda Boulevard.
 - f) There is only one study segment along the entire length of La Cienega Boulevard, although that is currently one of the most attractive routes to/from LAX. That attraction will certainly increase when the GTC is located adjacent to La Cienega Boulevard as part of Alternative D, but the impacts have been overlooked.
2. In the January 2001 Draft EIR/EIS in Table II-7.4 on page II-7.13, the "existing" (1996) Level of Service (LOS) operations in the afternoon peak hour were at:
- LOS A or B along Sepulveda Boulevard, south of Venice Boulevard.
 - LOS A and B along Overland Avenue, south of Venice Boulevard.
 - LOS A along La Cienega Boulevard, south of Slauson Avenue.
 - LOS A and B along Washington Boulevard, east of Lincoln Boulevard.
 - LOS B and C along Sepulveda Boulevard, south of Slauson Avenue.

Those calculated levels do not conform to actual experience on the streets. The actual, observable operations are at lower levels, even though traffic signal enhancing equipment (ATSAC) has been installed. The application of street segment analysis has not sufficiently taken into account the interruptions to flow that occur at the critical intersections along the segments.

3. Many of the findings of current and future Levels of Service on street segments [Table S4.3.2-4, pages 4-258 through 4-261] are not credible and should be re-evaluated in light of current experience.
- a) La Cienega Boulevard, south of Slauson Avenue is shown at LOS A or B during all peak hours to the year 2015, although the road is observably congested during peak hours and many non-peak hours now. New traffic counts should be taken and new analyses should be made to bring the study up-to date.
 - b) Washington Boulevard, east of Lincoln Boulevard, is shown at LOS A during all peak hours to 2015, although that high level of operations has not been the experience since the opening of the Costco store in that street segment. Apparently, the calculations, which are based on pre-Costco counts, did not take the new retail traffic into account, despite Costco being

highlighted in the report text as a related project. New traffic counts should be taken and new analyses should be made to bring the study up-to date.

Again, those findings demonstrate the weakness of analysis using street segments instead of intersections. The interruptions of flow at the critical intersections are not fully accounted for in the segment methodology.

4. On page 4-254 is the statement, "Analysis shows that these two important mitigation components [new freeway-to-airport interchanges on I-405 and I-105] would be effective in encouraging airport traffic to stay on the freeway system, and avoid off-loading onto the surface streets." No such analysis is presented, nor could one be produced without taking into account the already significant and increasing congestion on the San Diego Freeway, during both peak and non-peak periods.

The reason drivers seek alternative routes to/from LAX, instead of using the San Diego Freeway, is not the lack of a direct connection between the freeway and the airport. It is because the freeway, itself, north of the airport through Culver City and northward through West Los Angeles, is congested during much of the day, both on weekdays and on weekends. Sepulveda Boulevard and other north-south streets are attractive alternative routes for distances far north of Centinela Avenue. When Playa Vista is developed, the freeway congestion will increase and extend into more hours of the day, as well as further north.

Freeway Impacts

5. The proposed Lennox Interchange will not add to the capacity of the freeway nor improve its operations compared with current conditions. The interchange will not reduce freeway congestion north of the airport through West Los Angeles and into the San Fernando Valley. It may actually add to the congestion by giving airport-oriented drivers the false expectation of a convenient, fast route between the freeway and the airport. The interchange should not be considered to be a mitigation measure for traffic flows on the north/south surface streets, parallel to the freeway that would serve traffic to/from the airport. Most drivers who currently use the surface streets will continue to do so to avoid freeway traffic congestion, and many new drivers will be attracted to the surface streets because of significantly increased freeway congestion.
6. The analysis of the impacts of airport expansion traffic on the freeways is cursory and difficult to ascertain. The results of the impact analyses are not covered or difficult to locate in the report text.

7. Page ES-28: In the discussion regarding congestion, it states that the general area bounded by Marina Freeway, the San Diego Freeway, Rosecrans Avenue, and Vista Del Mar, the hours spent traveling on freeways would be reduced by about 10 percent. This cannot be so, considering that the San Diego Freeway is currently operating at very low levels of service throughout the day and that the LAX master plan is not adding capacity to any of the freeways.
8. People who regularly travel on the San Diego Freeway north of the Marina Freeway through Culver City and West Los Angeles often move at less than 30 miles per hour in mid-afternoon and even slower speeds during peak periods. The average speeds in Table S4.3.2-2 on page 4-252 are not achieved now. The document needs to evaluate and better explain how the addition of LAX traffic will improve the speeds over current conditions.

Congestion Management Plan (CMP) Analysis

9. Although the CMP facilities that were studied are listed on page 4-262, the results of the analyses regarding the individual facilities are hidden and not readily accessible in Attachment G of the Technical Report. That is where the reader has to go to find the impacts of LAX traffic on any of the freeways. Many readers will not have that document and will not be able to find the information in the main text document of the Draft Supplemental EIS/EIR. Please provide an executive summary of Attachment G in the main text of the Draft Supplemental EIS/EIR.
10. CMP Analysis. The intersection of Venice Boulevard and Overland Avenue is designated as a CMP Route Monitoring Location. In the Off-Airport report on page 4-290, Table S4.3.2-14, it indicates that this location will be impacted for Alternative D. The Project's Fair Share Contribution to this location is designated to be 17.7%. Overland Avenue was widened in 2001, both north and south of Venice Boulevard. It is incomprehensible as to how an intersection on the northerly City limit of Culver City is impacted when no intersections with equal or worse level of service between this location and the intersection of Centinela Avenue and Sepulveda Boulevard (at the southerly City limit) are impacted.

Traffic Mitigation Measures

11. There are no guarantees for the funding or implementation of any of the mitigation measures that are presented. On page 4-273, as the introductory sentence to the "Mitigation Measures" section, is the statement, "The following mitigation measures are applicable only to the extent that the use of airport revenues to fund such measures is permissible under federal law and policies." The airport administrators and representatives should obtain

conceptual federal agency approval for funding of the recommended measures before they are presented as feasible. If any of the recommended measures cannot be implemented, the findings of the study will be invalid, and the proposed project should not proceed until feasible and fundable measures can be substituted.

12. At the Sepulveda Boulevard/Centinela Avenue intersection, the only study intersection in Culver City, the recommended mitigation measure is the addition of a right-turn lane on westbound Centinela Avenue. That will require roadway widening into the Caltrans right-of-way. That should be acknowledged in the report, because it will require Caltrans approval, acquisition of substantial right-of-way, construction of a retaining wall, and extensive traffic signal modifications.

13. On pages 4-278 and 4-283, mitigation measures are presented for the roadway links that will be significantly impacted. For the links within Culver City, the only measures recommended are "Fair-share contributions to regional transit service will mitigate the impacts of this link." The following information and analysis is lacking in the document and will need to be provided:

- a) Analyze how the proposed regional transit service measures will be sufficiently effective in mitigating the specific impacts on any of the links.
- b) Explain how and by whom the "fair-share contributions" will be determined. Include the City of Culver City as part the review and approval process.
- c) Identify which agencies will participate and receive funds. Explain how the funds will be spent. Will the funds be for capital improvements only, or will operating costs (particularly, for transit) be included?
- d) Explain and discuss how the compliance of the transit agency and the effectiveness of the transit measures will be monitored to assure that the impacts will be mitigated.

14. In Table S4.3.2-14, on page 4-290, regarding Venice Boulevard, ATSAC signal equipment has been installed at each intersection for many years (before January 1994). Therefore, that cannot be included as a mitigation measure for LAX traffic impacts. An alternative measure should be provided (the signals in that section are operated by the City of Los Angeles, not City of Culver City).

15. Page 4-275: It is unclear how the Year 2008 impacts at the intersection of Centinela and Jefferson Boulevard will be mitigated by the I-405/Lennox interchange.

16. Page 4-276. The mitigation measure at the Sepulveda and Centinela intersection calls for removal of the median island to accommodate a right turn lane. The width of the street may not provide enough space for this.

Construction Traffic Impacts

17. The construction of the LAX modifications will coincide with the construction of the Route I-405 HOV project and Playa Vista, approximately two miles north of the airport [page 4-273]. Both construction contractors will use Sepulveda Boulevard and the San Diego Freeway for major haul/delivery routes and for employee commuter routes. Coordination between the constructions of the two large projects is not likely to be effective, because construction companies schedule operations for their own efficiency without regard to the real impacts on the general public. As stated in the report, "... the cumulative impacts from construction activities on the off-airport surface transportation system would still be significant and temporary." The construction periods during which the two projects (airport modification and Playa Vista) will overlap will be a minimum of five years. That is a long period to be labeled "temporary".
18. According to Table S4.3.2-9 on page 4-270, there will be no truck deliveries or earthmoving trucks from 7 to 11 a.m. That is not a reasonable expectation, based on observable patterns of construction activities.
19. Based on Table S4.3.2-9, the truck movements between 12 a.m. and 7 a.m. would total 6% of the total daily movements. An estimated 73% of the truck movements would occur between 11 a.m. and 3 p.m. But, ST-12 on page 4-248 states that "Truck deliveries will be concentrated during night hours ..." The peak hour for airport traffic will be 11 a.m. to 12 noon, and 18% of the truck movements – an average of 8 entering trucks plus 8 leaving trucks per minute – will occur during that hour. They will interfere with the peak passenger traffic flows.
20. Scheduling truck deliveries to not occur during four peak hours of the day [ST-12, page 4-248] does not adequately address the peak-period truck traffic problem. Many truck drivers will travel from remote supply depots to the airport vicinity during the peak periods in order to enter the airport boundaries during the allowable periods. When leaving, they will exit before the starts of the peak periods, but they will still be traveling on the freeway/street network to the remote locations during the peak periods. Additionally, the freeways and streets serving the airport area are congested during periods far longer than four peak hours per day. Additional and better mitigation measures are needed to adequately address traffic impacts from construction activities.

21. Remote parking areas for construction employees located up to 50 miles away from LAX are recommended [ST-13, page 4-248]. Aside from the improbability of those remote areas being attractive to and extensively used by employees, there is no analysis of the impacts of the added traffic at those remote locations, nor is there analysis of the impacts of the shuttle traffic between those locations and the airport.
22. Although the peak hours on the traffic system may be 8 to 9 a.m. and 5 to 6 p.m., the adjacent hours are also periods of high traffic volumes and congestion. For example, the 4 to 5 p.m. hour will be a high commuter traffic hour for both LAX construction workers and employees at other developments outside the airport throughout the region. That hour cannot be ignored. Analyses of construction traffic impacts during that hour are necessary.

On-Airport Surface Transportation

23. Page 4-217. The analysis takes summer as the peak periods to be evaluated through out the document when construction is purported to be at its peak. There is no indication that the high construction period would not slip into the end-of-the year holiday period. The holiday period between Thanksgiving and New Years is recognized as placing a maximum demand on LAX resources. There is a reasonable expectation that construction will continue through this heightened period of travel. Consideration should be given to this scenario. In addition, the schools are typically not in session during summer months providing a benefit to ambient traffic surrounding the LAX. Ambient traffic surrounding the LAX is nominally worse during the holiday periods at the end of the calendar year.
24. Airport Parking. There were 847,394 vehicles accommodated in airport parking facilities in August 2000 (Page 4-222). Figure S4.3.1.2 indicates that at present the CTA parking facilities are almost 100% occupied.
- The project (Page 4-225) causes demand to regularly exceed capacity on all airport parking facilities. This is true for employee parking and car rental lots as well. The possibility of increased vehicular circulation by motorists seeking parking needs to be evaluated and analyzed in the Draft Supplemental EIS/EIR.
25. The executive summary states that the new configuration of LAX would provide about 35,000 parking spaces, but does not mention the number of current parking spaces.
26. Construction Operations (Page 4-225). During this period the baseline/ambient traffic conditions on the off-airport roadway network will be

aggravated to the level of breakdown. The resultant spillover will resonate through the flow of traffic on surface streets and adjacent Freeway operations. There is no mention in the Draft Supplemental EIS/EIR how or if this impact would be mitigated or reduced.

27. Transit Operations (Page 4-227). All MTA buses will use the Green Line LRT Station as a transit facility. Will other municipal buses be given the same opportunity?
28. RAC vehicles (Table S4.3.1-4). The on-airport rental car facilities can accommodate 9,000 ready/return spaces. Are the vehicles considered in Table S4.3.1-4 and if so, please indicate under which category?
29. On page ES-27, it states, "The primary landside feature of Alternative D would be the relocation of all passenger ground access facilities from the existing Central Terminal Area to the east side of the airport, near I-405." Moving the main access facilities away from LAX proper is simply going to relocate the traffic concentrations to the local streets. The mitigation measures to address this issue have not been adequately provided.
30. Page ES-27: All internal airport ground access facilities should operate at levels of service A or B, at the very least, since all public traffic will no longer exist here.
31. On page 3-25, it states, "...the Mayor of Los Angeles, noting the need to fully examine a regional approach to satisfy air transportation demand..." Since this is a regional approach, as stated, the traffic influence and demand is also regional. Yet, the traffic study is confined to the LAX area.

Transportation – Transit Operations

32. 4.3 Surface Transportation. While the Supplement to the Draft Environmental Impact Report does provide mitigation measures at several intersections through which Culver CityBus operates service, these mitigations measures alone are not enough to greatly improve the quality of or increase the use of public transit. If transit is expected to reduce the number of vehicles passing through intersections at peak times, it must offer its users the advantage of timesavings. The Culver City Transportation Department suggests the implementation of the Transit Priority System (TPS) at all intersections along its line 6 as a mitigation measure to LAX expansion. Over 1,200 daily trips are made on Culver CityBus' line 6 to and from the LAX Transit Center. Providing these and future passengers with greater timesavings will undoubtedly encourage more people to ride transit to and from LAX. By installing TPS along line 6, LAX would reinforce the message that transit is a preferred mode of travel to and from the airport. TPS is compatible with the

Adaptive Traffic Control System, which is already programmed as a mitigation measure at several line 6 intersections.

33. As a means of accommodating more vehicles at impacted intersections, the Draft Supplemental EIS/EIR recommends that existing lanes be re-stripped. The Culver City Transportation Department would strongly stress that lanes be wide enough to comfortably handle transit buses (at least 10') and at the same time, be equipped for bus pullovers at designated stops.
34. The Draft Supplemental EIS/EIR repeatedly makes reference to the provision of "...fair-share contributions towards the MTA's proposed Metro Rapid Program or other enhancements to benefit transit traveling to and from LAX." The Transportation Department would like to see the specifics of such enhancements discussed in further detail, particularly a reference as to whether or not LAX will provide fair-share funding to both the Metro Rapid Program and local line 6 transit.
35. On page 4-283, the Year 2015 Alternative D Mitigation Plan refers to the Overland Avenue link south of Venice Boulevard as a location for "Fair-share contributions to regional transit." Does this refer to Culver CityBus' local line 3?
36. Section 4.3.1 On-Airport Surface Transportation. It is unclear in the document what date was used to analyze transit systems. Culver CityBus Line 6 serving this corridor had grown over 20% in ridership since 1993 to over 2 million passengers annually. The Draft Supplemental EIS/EIR should specify and use current municipal / regional transit data in the study to best reflect the true impact of transit service in and around the airport.
37. Section 4.3.1.6.2 Construction Impacts. It is unclear in the document whether traffic will be diverted traffic from Sepulveda Boulevard during construction. With the assumption of LOS F on Sepulveda Boulevard, this would greatly affect the service of Culver CityBus Line 6 serving the Metro Green Station at Aviation and Imperial via Sepulveda Blvd.
38. Page 4-237, Consistency with other Adopted Plans. Alternative D do not mention or include information contained in the plans of Culver City (General Plan or Short Range Transit Plan) or information contained in the MTA Long Range Plan.

AIR QUALITY

1. Although Alternative D would cause less negative regional air quality impacts, the Supplement to the Draft EIR still fails to evaluate localized air

pollution impacts on Culver City. No mitigation measures are proposed whatsoever.

2. With the goal of encouraging transit use, one of the recommended mitigation measure components mentioned on page 4-392 is to, "Construct on-site or off-site bus turnouts, passenger benches, or shelters; include public outreach." Because a large percentage of passengers and employees driving to LAX must pass through Culver City, the City of Culver City would recommend any mitigation measure that reduces the number of trips to and from LAX via Culver City roads. Although making public transit more accessible to patrons via capital improvements is laudable, the possibility of an employer funded fare subsidy program for use on Culver City buses could potentially decrease the number of vehicle trips through our city significantly. Coupled with improved rapid express buses and proposed increased service frequencies, such fare incentives could dramatically reduce commuting trips along heavily impacted Culver City roads.
3. **Page 4-387, 4.6.7 Cumulative Impacts.** The Draft Supplemental EIS/EIR must take into consideration other planned developments such as I-405 HOV project and Playa Vista. During the initial construction year (2004), Playa Vista Phase II will likely be under construction. This would increase truck traffic as well as emissions relating to construction duties.
4. **Section 4.6, Air Quality.** The plan provides mitigations only for the immediate area around LAX and not for the surrounding areas which could have impacts from increased congestion and air quality from increased air and mobile sources. We can only assume from the magnitude of this project that both air pollution and traffic congestion will increase. Whether the proposed mitigation measures will ease both (air pollution & congestion) is hard to say since the mitigation measures need to be approved by other entities (i.e. shuttle services, airlines, LAX employees, hotels, etc.).

NOISE

Overflight Noise

1. Reviewing the "Current Standard and projected Assumed Flight Tracks" for Alternatives D of the Draft Supplemental EIS/EIR indicates a change in flight tracks over Culver City. Currently, there are two departure flight tracks (airplanes headed east) and no arrival flight tracks passing over Culver City. These two departure tracks are utilized when aircraft take-off in an easterly direction from LAX. Although take-offs to the east are infrequent, the current aircraft over-flight noise level impact and flight frequency within the City of Culver City from the two departure flight paths is not addressed or provided in the documents.

2. For Alternative D, Draft Supplemental EIS/EIR proposes two arrival and one-departure flight tracks passing over portions of Culver City. There is no data in the Draft SEIS/SEIR indicating projected aircraft over-flight noise levels or flight frequency within Culver City from these flight tracks. Existing and proposed aircraft over-flight noise data is needed to evaluate the magnitude of the noise impact of the flight track route changes over Culver City.
3. Based on the 1996 baseline, there are on average approximately 2,100 existing daily flights. This results in approximately 180 additional daily flights for the No Action/No Project and Alternative D options. For Alternatives A and B, there would be an increase of approximately 600 daily additional flights. For Alternative C, there would be an increase of approximately 200 additional daily flights. The Draft Supplemental EIS/EIR should include a more up to date baseline figures (i.e. 2000) for existing flight operations.
4. The documents indicate that aircraft taking off in a westerly direction for an eventual destination in the east will follow what is referred to, as Loop 1 Departure Procedure, which may potentially impact Culver City. All aircraft flying the Loop 1 Departure Procedure routes climb immediately to 5,000 feet west of the airport over the Pacific Ocean and cross the shoreline. The aircrafts will then make a sharp loop resulting in an eastbound route directly above LAX. The aircraft will then follow an easterly departure route crossing directly over Culver City. This procedure is expected to be put in place during the next decade, regardless of the disposition of the LAX Master Plan Alternatives. The degree of negative impact to Culver City is uncertain at this time, as over flight noise levels or frequency of flights within Culver City were not addressed in the Draft Supplemental EIS/EIR. Therefore inadequate information was given to effectively evaluate the noise impacts of the Loop 1 Departure route over Culver City. A complete analysis is needed to quantify the potential for over flight noise impacts on Culver City.
5. The Draft SEIS/SEIR noise sections needs to expand its discussion on the effect of aircraft noise on the quality of life and health, including the effects of sleep disturbance and education, on persons within the areas impacted primarily by CNEL 65 levels. There are no CNEL 65 areas within Culver City but the discussions of sleep disturbances from aircraft over flights of Culver City should be considered as a potential impact on the health and well being of some Culver City residents.
6. The critical point concerning noise and Culver City is that the 65 CNEL noise measurement customarily used in assessing noise from airports does not fully capture the noise exposure likely to be experienced by the population. It represents a weighted average, and therefore discounts single noise events, that can be much higher in sound level. This is of significant concern relative

to aircraft overflights over Culver City where short term, high level noise events add little to average sound levels but can impact a large population with intrusive noise impacts. The Draft Supplemental EIS/EIR fails to adequately address and analyze this issue in the City of Culver City.

PUBLIC SAFETY

Police

1. The primary concern of the police department with the LAX Expansion Project alternatives, including the new Alternative D, is traffic congestion. Traffic congestion significantly impacts the response time of police vehicles to emergency calls, which impact the quality of life in Culver City. The only two routes for response to the Fox Hills area from the east portion of Culver City are La Cienega Boulevard and Sepulveda Boulevard. Both of those streets are currently heavily congested during peak traffic hours and impact the response time of emergency vehicles to or from these areas.

The Draft Supplemental EIS/EIR describes traffic conditions, during peak hours of certain road segments. The segment of Sepulveda Boulevard between Venice Boulevard and Centinela Boulevard is described in the report as follows: "Low volumes; primarily free-flow operations. Density is low, and vehicles can freely maneuver within the traffic stream. Drivers can maintain their desired speeds with little or no delay." That report is not accurate. In fact, the actual traffic conditions during peak hours fit the description of the Impact Report's worst conditions, as follows. "Forced-flow operations with high approach delays at critical signalized intersections. Speeds are reduced substantially, and stoppages may occur for short or long periods of time because of downstream congestion.

All of Culver City's major roads lead to the LAX. Alternative D will cause increased traffic congestion and delays on all of Culver City's north/south through streets. The proposed Alternative D does not address our previous concerns. That is, traffic congestion will increase during all hours, not only at peak times. There will be increased congestion not only on our major streets but also increased vehicular traffic within our residential, park, and school properties throughout the City as a result of the proposed alternative.

As a result of the LAX improvements, there will be added congestion. This will degrade police emergency response times as well as increase demand for law enforcement services and staffing.

Fire

1. As far as comments on Alternatives A, B and C and the No Action/No Project Alternative, previous Fire Department comments on the January 2001 Draft EIS/EIR are still valid. A copy of those comments is forwarded along with these comments.
2. Alternative D is scaled down and therefore has less of an impact to Culver City as compared to the other three alternative plans. However, traffic impacts associated with Alternative D would affect the Culver City Fire Department. More congestion will slow response times of Fire Department vehicles on City streets. The impacts to Culver City's emergency response times are not addressed in the Draft Supplemental EIS/EIR.

OTHER

1. 4.4 Social Impacts: Business assistance services from LAWA, as a result of relocation, should include coordination with Culver City. The Bullet point (fifth from the bottom) should read: "LAWA will coordinate with the County of Los Angeles and the cities of Inglewood, Hawthorne, El Segundo, AND CULVER CITY to locate properties within their jurisdictions suitable for businesses displaced by the acquisition program (4.4.2.5 Master Plan Commitments, RBR-1, Residential, and Business Relocation Program, Page 4-306).
2. In response to the NOP/NOI to prepare the Draft EIS/EIR issued in June 1997, Culver City requested in a letter dated July 31, 1997, that major issues and concerns related to traffic, air quality, overflight operations, regional context, and other subject areas impacting Culver City be analyzed in the preparation of the Draft EIS/EIR. None or minimal analysis of the issues the City requested to be analyzed are contained in the January 2001 Draft EIS/EIR or the 2003 Draft Supplemental EIS/EIR. Further, Culver City's NOP/NOI comment letter is not contained in Appendix A of the 2001 Draft EIS/EIR, where copies of written comments from affected agencies are contained.

Los Angeles, CA 90009-2216

[Certified with Return Receipt]

RE: Comments on the LAX Master Plan Environmental Impact Statement / Environmental Impact Report

Dear Mr. Ritchie:

The City of Culver City has reviewed the LAX Master Plan Draft Environmental Impact Statement/Environmental Impact Report (Draft EIS/EIR) and submits this letter containing our comments. We are deeply concerned about the negative and unmitigated impacts the proposed LAX expansion will have on Culver City. Accordingly, the City of Culver City has adopted the attached City Council Resolution No. 2001-R068 that formally transmits our comment on the Draft EIS/EIR.

Overall, we believe the Draft EIS/EIR fails to adequately address potential significant impacts to Culver City caused by the proposed expansion of LAX including the proposed LAX Expressway along the I-405 Freeway. The Draft EIS/EIR and associated documents primarily focus on an analysis of impacts and proposed mitigation measures for the area immediately adjacent to the airport.

Due to the failure of the Draft EIS/EIR to adequately address impacts and propose mitigation measures for Culver City, despite our close proximity, we believe that the Los Angeles World Airports should find the Draft EIS/EIR inadequate for certification and require that it be revised and re-circulated to respond to the deficiencies we have identified in Resolution No. 2001-R068 and the extensive technical comments that is attached thereto as Exhibit A.

The City of Culver City will use all means necessary to insure that the environmental documents are adequate in their analysis of, and proposed mitigation of, potential impacts on our city. We will work to insure that our city is fully protected from any inappropriate impacts of the project itself.

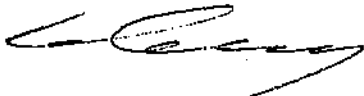

SAL00020

Mr. Jim Ritchie

July 18, 2001

As part of this letter, a copy of Culver City City Council Resolution No. 98-R087, referenced in Resolution No. 2001-R068, calling for a regional airport for Southern California is attached. Further, we are also forwarding a copy of a letter dated June 11, 2001, from the Hillside Memorial Park and Mortuary located in Culver City containing their comments on the LAX Master Plan Draft EIS/EIR.

We look forward to your response to the comments and concerns of the City of Culver City.

Sincerely,

Edward M. Wolkowitz
Mayor, City of Culver City

RESOLUTION NO. 2001-R068

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF CULVER CITY, CALIFORNIA, RECOMMENDING THAT THE LEAD AGENCIES FIND THE DRAFT ENVIRONMENTAL IMPACT STATEMENT/ENVIRONMENTAL IMPACT REPORT FOR THE PROPOSED LAX MASTER PLAN INADEQUATE FOR CERTIFICATION BECAUSE IT FAILS TO COMPLY WITH THE REQUIREMENTS OF THE CALIFORNIA ENVIRONMENTAL QUALITY ACT AND THE NATIONAL ENVIRONMENTAL POLICY ACT.

WHEREAS, the City of Los Angeles Department of Airports has developed a draft Master Plan for Los Angeles International Airport (LAX) which incorporates capacity enhancements to enable the expansion of passenger activity from a current 60 million passengers per year up to an expected 98 million passengers per year and its cargo activity from its current 1.7 million tons per year to an expected 4.2 million tons per year through the year 2015; and,

WHEREAS, LAX is located in close proximity, approximately two miles from the boundaries of the City of Culver City, and the impacts of its operation are of critical interest to the citizens of Culver City; and,

WHEREAS, on July 31, 1997, Culver City provided written comments to the City of Los Angeles Department of Airports and the Federal Aviation Administration (FAA) on the June 11, 1997, Notice of Preparation/Notice of Intent of a Draft Environmental Impact Statement/Environmental Impact Report (Draft EIS/EIR), which in addition to other comments, requested that issues related to traffic, air quality, overflight operations, and regional context be analyzed in the environmental review document; and,

WHEREAS, on September 14, 1998, the City Council of the City of Culver City approved and adopted Resolution No. 98-R087, calling for the development of a Regional

1 Airport Plan for Southern California that constrains LAX to operate within the capacity of its
2 existing facilities and promotes development of additional capacity at the many other
3 commercial airports in Southern California to serve the expanding air commerce market
4 place. As established in City Council Resolution No. 98-R087, the City's official position
5 regarding the proposed expansion is one of opposition to the LAX capacity expansion
6 beyond that which can be accommodated by existing LAX facilities, and support for
7 developing the capacity of other commercial airports within Southern California; and,

8
9 WHEREAS, the Los Angeles World Airports (LAWA) and the FAA prepared a
10 joint Draft EIS/EIR to address the potential environmental impacts caused by the proposed
11 LAX expansion, which was released for public review and comment on January 18, 2001;
12 and,

13 WHEREAS, the Draft EIS/EIR analyzes four project alternatives: 1) No
14 Action/No Project; 2) Alternative A, Additional runway to the north airfield, 3) Alternative B,
15 an additional runway to the south airfield, and 4) Alternative C, no additional runways but
16 reconfiguration of existing runways including either lengthening, widening, and relocating;
17 and,

18
19 WHEREAS, a City Staff Team, consisting of various City Departments as well
20 as a noise consultant and a traffic consultant hired by the City of Culver City, was
21 established to evaluate and comment on the adequacy of the Draft EIS/EIR in addressing
22 potential impacts to Culver City; and,

23
24 WHEREAS, the City Council of the City of Culver City, accepted public
25 comments and considered the Draft EIS/EIR at public meetings on May 29, 2001, and
26 June 25, 2001.

1 NOW, THEREFORE, the City Council of the City of Culver City, California,
2 DOES HEREBY RESOLVE as follows:

3 SECTION 1. The following key findings are hereby made by the City Council
4 of the City of Culver City. These findings are described more fully and augmented in
5 greater detail in "Exhibit A", which is attached to this Resolution.

6 1. The Draft EIS/EIR inadequately and inaccurately addresses the
7 substantial adverse environmental impacts potentially affecting the City of
8 Culver City. The Draft EIS/EIR is inadequate and inaccurate as an
9 informational document based on but not limited to the following issues:

10 a. Aircraft Overflight Noise: There are potential aircraft
11 overflight noise impacts from two new arrival paths and a new
12 departure path. A major problem with the Draft EIS/EIR regarding
13 aircraft noise is the lack of key data and detailed analysis of the
14 overflight noise impact to Culver City and other communities in close
15 proximity. The degree of impact cannot be determined because noise
16 levels and flight frequency information for aircraft overflights is not
17 provided in the Draft EIS/EIR.

18 b. Traffic: The Draft EIS/EIR is totally inadequate in
19 evaluating traffic impacts in the City of Culver City. Only one
20 intersection in Culver City was analyzed. The analysis should have
21 included other intersections within the radius of influence of the Airport
22 Expansion, to determine at which point in Culver City, impacts can be
23 mitigated to a to a level of insignificance, if possible. Assessment of
24
25
26
27

1 additional significant intersections should have been included, all of
2 which currently are operating at unacceptable levels of service. Not
3 only is there a lack of acceptable analysis, the failure to address these
4 issues results in a failure to address potential mitigation measures
5 which might have the effect of reducing the levels of adverse impacts.

6 c. Air Pollution: The Draft EIS/EIR totally fails to evaluate
7 localized air pollution impacts on Culver City. No mitigation measures
8 are proposed for Culver City from increased air and mobile sources
9 from auto traffic, aircraft operations, construction, and in particular from
10 freight and cargo operations. Without this critical analysis, the Draft
11 EIS/EIR fails to comply with the minimum requirements of the California
12 Environmental Quality Act (CEQA) and the National Environmental
13 Policy Act (NEPA).
14

15 d. LAX Expressway Traffic: It is anticipated that there will be
16 more congestion on Culver City arterial streets and creation of
17 "congestion nodes" on the I-405 resulting from anticipated traffic friction,
18 as well as weaving impacts on the I-405 immediately north of SR-90
19 freeway as a result of the proposed Expressway. However, an
20 assessment of these impacts is completely absent from the Draft
21 EIS/EIR.
22

23 e. LAX Expressway Traffic Noise: There are potential
24 adverse impacts due to increased noise from vehicular traffic within
25 residential, park, and school properties located near Coolidge Avenue
26
27

1 and Culver Park Place. These noise-sensitive sites are located
2 abutting or adjacent to the alignment of the proposed Expressway.
3 However, no noise analysis, no noise measurements, and no mitigation
4 measures or sound barriers are proposed for these noise-sensitive
5 uses in Culver City.

6 f. LAX Expressway Construction Activities: Construction of
7 the Expressway is anticipated in Phase II of the Master Plan. The
8 document fails to analyze any cumulative construction impact on Culver
9 City from both the I-405 widening project and the proposed LAX
10 Expressway. The duration of the construction will be 10 years, from
11 2005 to 2015. Despite the long duration of the construction period,
12 there is inadequate analysis and no construction mitigation measures
13 proposed for the affected areas in Culver City.

14 g. LAX Expressway Land Use: Based on evaluation of the
15 proposed LAX Expressway, there are potential land use impacts to
16 residential, business, school, and park uses. The Draft EIS/EIR fails to
17 demonstrate that the proposed Expressway will be compatible with
18 certain sensitive receptor uses due to the lack of analysis and noise
19 mitigations proposed for areas in Culver City. Also, it is apparent from
20 Figure 3.1-7 of Appendix K, that some areas in Culver City will require
21 property acquisition with Expressway Alternative No. 3, particularly on
22 the east side of the I-405 Freeway, north of the SR-90/I405 freeway
23 interchange. However, the Draft EIS/EIR fails to provide adequate
24
25
26
27

1 information, analysis, and mitigation measures regarding this matter.
2 Furthermore, there is also potential visual/shade and shadow/aesthetics
3 impacts from the placement of the elevated Expressway and column
4 supports in Culver City but no analysis or mitigation measures are
5 provided in the document.

6 h. Cumulative Impacts: The Draft EIS/EIR fails to
7 adequately analyze the cumulative impacts of other projects, which will
8 be under construction during the same time period as the proposed
9 expansion of LAX such as Playa Vista. For example, the cumulative
10 impacts of the LAX expansion along with the Playa Vista project,
11 including their cumulative construction impacts, would result in
12 significant adverse impacts to the I-405, Sepulveda Boulevard, and
13 other arterials, resulting in adverse impacts to local circulation and air
14 emissions.
15

16 i. Regional Context: The Draft EIS/EIR presumes that a
17 vast majority of the region's growth in air passenger and air cargo
18 demand will be directed to LAX. A number of commercially viable
19 airports in the Southern California area currently exist and are
20 underutilized relative to their capacity. A fully regional solution to this
21 air passenger and air cargo capacity has not been adequately
22 addressed in the Draft EIS/EIR.
23

24 j. NOP/NOI Comment Letter: In response to the NOP/NOI
25 to prepare the Draft EIS/EIR issued in June 1997, Culver City
26

1 requested in a letter dated July 31, 1997, that major issues and
2 concerns related to traffic, air quality, overflight operations, regional
3 context, and other subject areas impacting Culver City be analyzed in
4 the preparation of the Draft EIS/EIR. None or minimal analysis of the
5 issues the City requested to be analyzed are contained in the Draft
6 EIS/EIR. Further, Culver City's NOP/NOI comment letter is not
7 contained in Appendix A of the Draft EIS/EIR, where copies of written
8 comments from affected agencies are contained.
9

10 2. The magnitude of omissions in the Draft EIS/EIR is so extensive
11 that attached hereto as "Exhibit A" of this Resolution, are significant additional
12 comments which detail the failure of the lead agencies to adequately address
13 the complete array of adverse environmental impacts this project is anticipated
14 to have on Culver City.
15

16 SECTION 2. Pursuant to the foregoing recitation and findings, the City
17 Council of the City of Culver City, California, hereby:

18 1. Determines that the Draft EIS/EIR is substantially inadequate
19 and inaccurate for certification by the Lead Agencies and that a complete and
20 proper level of environmental data and analysis must be incorporated into the
21 Draft EIS/EIR to address the identified deficiencies.
22

23 2. Establishes that this Resolution, including attached Exhibit "A,"
24 constitutes the City of Culver City's formal position and comments on the Draft
25 EIS/EIR that was prepared for the proposed LAX Master Plan.

EXHIBIT A
 CITY OF CULVER CITY RESOLUTION NO. 2001-R068
 Culver City Comments on the L A X Master Plan Draft EIS/EIR
 June 25, 2001

SURFACE TRANSPORTATION

Intersection and Street Segment Traffic Impact Analysis

1. The impacts of LAX expansion traffic within Culver City were not given sufficient analysis. The most thorough method of analyzing the traffic flow quality and impacts on a street network is the evaluation of the operations at the critical intersections. They are the locations that act as valves for the flows on the intersecting streets. The flow along the street segments between the important intersections does not yield a true picture, because the interruptions to flow at the critical intersections are not properly accounted for in that type of analysis. Only one intersection in Culver City was included in the Draft EIS/EIR impact analysis – Sepulveda Boulevard / Centinela Avenue, at the southern edge of the City [Figure 2-1, following page 2-4]. We feel additional and critical Culver City intersections listed in the table below should be analyzed in the Draft EIS/EIR.

1. Braddock Drive	@ Overland Avenue
2. Braddock Drive	@ Sepulveda Boulevard
3. Bristol Parkway	@ Centinela Avenue
4. Bristol Parkway	@ Slauson Avenue
5. Buckingham Parkway	@ Slauson Avenue
6. Centinela Avenue	@ Green Valley Circle
7. Centinela Avenue	@ Washington Boulevard
8. Centinela Avenue	@ Washington Place
9. Culver Boulevard	@ Main Street/Washington Boulevard
10. Culver Boulevard	@ Overland Avenue
11. Culver Boulevard	@ Sawtelle Boulevard
12. Culver Boulevard	@ Sepulveda Boulevard
13. Duquesne Avenue	@ Jefferson Boulevard
14. Glencoe Avenue	@ Washington Boulevard
15. Green Valley Circle	@ Sepulveda Boulevard
16. Hannum Avenue	@ Playa Street
17. Hannum Avenue	@ Slauson Avenue
18. I-405 NB Ramps s/o Venice Boulevard	@ Sepulveda Boulevard
19. I-405 SB Ramp n/o Culver Boulevard	@ Sawtelle Boulevard
20. Inglewood Boulevard	@ Washington Boulevard
21. Jefferson Boulevard	@ Overland Avenue

22. Jefferson Boulevard	@ Sepulveda Boulevard (N)
23. Jefferson Boulevard	@ Slauson Avenue
24. La Cienega Boulevard	@ Washington Boulevard
25. Marina Freeway	@ Slauson Avenue
26. Matteson Avenue/I-405 SB Ramps	@ Sawtelle Boulevard
27. Motor Avenue	@ Washington Boulevard
28. Overland Avenue	@ Washington Boulevard
29. Playa Street/Jefferson Boulevard	@ Sepulveda Boulevard
30. Redwood Avenue	@ Washington Boulevard
31. Sawtelle Boulevard	@ Sepulveda Boulevard
32. Sawtelle Boulevard	@ Venice Boulevard
33. Sawtelle Boulevard	@ Washington Boulevard
34. Sawtelle Boulevard	@ Washington Place
35. Sepulveda Boulevard	@ Slauson Avenue
36. Sepulveda Boulevard	@ Washington Boulevard
37. Sepulveda Boulevard	@ Venice Boulevard
38. Sepulveda Boulevard	@ Washington Place
39. Walgrove Avenue	@ Washington Boulevard

2. Only six street segments in Culver City were included in the analysis – 1) Sawtelle Boulevard, south of Venice Boulevard; 2) Sepulveda Boulevard, south of Venice Boulevard; 3) Overland Avenue, south of Venice Boulevard; 4) Sepulveda Boulevard, south of Sawtelle Boulevard; 5) Centinela Avenue, west of Sepulveda Boulevard; and 6) Washington Boulevard, east of Lincoln Boulevard. [Figure 2-1].
 - a. Other streets that are components of routes to/from the airport, such as Jefferson Boulevard (west of Sepulveda Boulevard and east of Overland Avenue), Culver Boulevard, and Centinela Avenue (toward the east), are not included, although they are likely to carry meaningful volumes of airport traffic. These streets should also be studied.
 - b. Of the streets that are included, some of the segments are not the most critical in evaluating impacts of airport traffic. For example, Overland Avenue, south of Jefferson Boulevard would have far higher impacts of airport traffic than the segment of Overland Avenue that was chosen for analysis. The same could be said about Sawtelle Boulevard, south of Culver Boulevard, and about Washington Boulevard, east and west of Sepulveda Boulevard.
 - c. There is only one study segment along the entire length of La Cienega Boulevard, although that is one of the most attractive routes to/from LAX carrying 15% of LAX traffic, as shown in Draft EIS/EIR Table II-7.13.
 - d. According to Table II-7.4 on page II-7.13, the “existing” (1996) operations in the afternoon peak hour were at:

- Level of Service (LOS) A or B along Sepulveda Blvd., south of Venice Boulevard.
- LOS A and B along Overland Avenue, south of Venice Boulevard.
- LOS A along La Cienega Boulevard, south of Slauson Avenue.
- LOS A and B along Washington Boulevard, east of Lincoln Boulevard.
- LOS B and C along Sepulveda Boulevard, south of Slauson Avenue.

Those calculated levels do not conform to actual experience on the streets. The actual, observable operations are at lower levels, even though traffic signal enhancing equipment (ATSAC) has been installed. The street segment analysis has not taken account sufficiently of the interruptions to flow that occur at the critical intersections along the segments.

e. Many of the findings of current and future Levels of Service on street segments [Table II-7.4, page II-7.13; Attachment C, unnumbered pages] are not credible and should be re-evaluated in light of current experience.

- La Cienega Boulevard, south of Slauson Avenue is shown at LOS A or B during all peak hours to the year 2015, although the road is observably congested during peak hours and many non-peak hours now.
- Washington Boulevard, east of Lincoln Boulevard, is shown at LOS A during all peak hours to 2015, although that high level of operations has not been the experience since the opening of the Costco store in that street segment. Apparently, the calculations, which are based on pre-Costco counts, did not take the new retail traffic into account, despite Costco being highlighted in the report text as a related project.
- Sepulveda Boulevard, south of Slauson Avenue is shown at Loss's A and C in the afternoon peak hour of 2015 with the Alternative C traffic included. The street is already operating at LOS's below those levels, and the additional traffic with no mitigation will not improve operations.

Again, those findings demonstrate the weakness of analysis using street segments instead of intersections. The interruptions of flow at the critical intersections are not fully accounted for in the segment methodology.

3. The "No Action/No Project" (NA/NP) alternative includes large volumes of traffic that would have been generated by LAX Northside and Continental City [page 4-293], assuming these developments were going to be built. However, they have not been built and are not part of the background or base conditions against which the proposed expansion traffic should be measured. Therefore, no credit should be allowed for those non-existent trips. As shown on page 3-10, the Draft EIS/EIR trip generation estimates for Alternative C of the LAX expansion were 22% to 26% lower than the NA/NP trip generation estimates. With such assumptions of base

conditions, the LAX expansion is being treated as if it were a traffic mitigation project, rather than a traffic generating development.

4. According to the Draft EIS/EIR, LAX Alternative C will result in a significant impact at the Sepulveda Boulevard/Centinela Avenue intersection in the year 2015. Two distinct and conflicting mitigation measures are proposed in different parts of the document.
 - a. In Table 4.3.2-28 on page 4-350, pavement widening, etc. is recommended to provide a third left-turn lane for northbound Sepulveda Boulevard. That measure would not be available, because it has already been assigned to the Playa Vista Phase II development.
 - b. In Attachment F [pages are unnumbered], ATSAC traffic signal enhancement equipment is recommended. That equipment is already in place and has been for several years. Therefore, it cannot be considered as a mitigation measure for Alternative C traffic.

Since both of the conflicting mitigation measures that are recommended in different parts of the Draft EIS/EIR are invalid, the impacts at the Sepulveda Boulevard/Centinela Avenue intersection must be considered unmitigated.

5. There is no recommendation or offering of mitigation measures for the Alternative C traffic impacts on the street segments, although such measures are presented for the street segments that would be impacted by Alternatives A and B.
 - a. In 2005, Alternative C traffic will have significant impacts at Sepulveda Boulevard, south of Venice Boulevard, and on Overland Avenue, south of Venice Boulevard (with final mitigation). [Attachment C, pages are unnumbered]
 - b. In 2015, Alternative C traffic will have significant impacts at three segments: 1) Sepulveda Boulevard, south of Venice Boulevard; 2) Overland Avenue, south of Venice Boulevard; and 3) Sepulveda Boulevard, south of Slauson Avenue. Even with the "final mitigation" in place, the second and third segments would have significant impacts residual [Attachment C, pages are unnumbered]. These impacts need to be addressed.
6. For Alternative A, street segment mitigation measures include ATSAC traffic signal enhancement at the Sepulveda Boulevard/Slauson Avenue intersection and at the Sepulveda Boulevard/Centinela Avenue intersection [Table 4.3.2-20, page 4-325]. The ATSAC equipment at those two locations, and at all other intersections along Sepulveda Boulevard, has been in place for several years. Therefore, the mitigation measures are invalid, and the impacts would remain un-mitigated.
7. One of the stated accomplishments of the "congestion relief package" would be to increase the average arterial speed by 3% [Page ES-24]. That would be trivial and

of no real value to individual drivers. For example, at 30 miles per hour, a 3% increase would lead to an average of 30.9 miles per hour, which would not be noticeable to individual drivers.

8. **Supplemental Environmental Evaluation for LAX Expressway and State Route 1 Improvements, Paragraph 2.2.3 on Page 8.** This section describes Pershing Drive as a six-lane arterial. While that statement is true immediately adjacent to the airport, the section of Pershing Drive that connects to Culver Boulevard is a narrow two-lane winding road that will feed the six-lane arterial. This has been left out of the report or ignored. It will be Culver Boulevard and probably Manchester that drivers will use to access the proposed terminals adjacent to Pershing Drive. Culver Boulevard itself is a two-lane road from the 90 Marina Freeway to the Jefferson intersection, and that two-lane road creates congestion in the morning all the way through Playa del Rey and along Vista del Mar all the way back up to Imperial Boulevard. The Playa Vista Traffic Mitigation will address some of this congestion, but Playa Vista is not mitigating anticipated traffic that will be generated by the LAX exchange. This situation needs to be addressed in the Draft EIS/EIR.
9. **4.4.4 Overview, "Community Disruption", also 5.1 Technical Report 3b, page 43, last bullet, 1st paragraph.** Closing Pershing Drive to through traffic places additional morning and evening rush-hour traffic onto Vista Del Mar. The LAX Master Plan shows no connection from eastbound Imperial to Pershing Drive northbound, or a connection from Pershing Drive southbound to the Ring Road (it diverts the traffic over the dunes at Sandpiper) onto Vista Del Mar. How does someone driving from Vista Del Mar turn onto the Ring Road to use the new West Terminal? How does someone driving south on Pershing Drive gain access to the Ring Road to use the new West Terminal? What happens to all the am/pm commuter traffic using Pershing Drive between Imperial and Manchester?
10. **Overview Sections 4.14 & 4.4.4 "Community Disruption", page 4-20.** There is no mention of increased traffic volume on Vista del Mar under the Coastal Zone Management and Coastal Barriers. Section 4.4.4 says "...but adjacent Vista del Mar would provide suitable north/south alternative access." This information needs to be provided in the document.
11. **Overview, Section 4.21 "Design, art...", page 4-47, Key Conclusions, Views and Vistas.** The document says that aesthetic quality along Vista de Mar would not be affected and that the popular ocean and airport views from Sandpiper St. within the dunes area would also be retained. If the traffic southbound on Pershing Drive is not allowed to travel to Imperial and is diverted over Sandpiper to Vista del Mar, Sandpiper will become a well-used and dangerous street. It should be noted that it would be dangerous for vehicles to slow down or stop on Sandpiper to catch the view.

LAX Expressway

12. The reason drivers seek alternative routes to/from LAX, instead of using the San Diego Freeway, is not the lack of a direct connection between the freeway and the airport. It is because the freeway, itself, north of the airport and through Culver City and West Los Angeles, is congested during much of the day, both on weekdays and on weekends. Sepulveda Boulevard and other north-south streets are attractive alternative routes for distances far north of Centinela Avenue. When Playa Vista is developed, the freeway congestion will increase and extend into more hours of the day, as well as further north.
13. The LAX Expressway will not add to the capacity of the freeway. The expressway will essentially be a long off and on-ramp between the airport and the San Diego Freeway. The expressway will not reduce freeway congestion north of the expressway. It may actually add to the congestion by giving airport-oriented drivers the false expectation of a convenient, fast route between the freeway and the airport. The expressway should not be considered a mitigation measure for traffic flows on the surface streets that would serve traffic to/from the airport. Most drivers who currently use the surface streets will continue to do so to avoid freeway traffic congestion, and many new drivers will be attracted to the surface streets because of significantly increased freeway congestion.
14. The first San Diego Freeway ramps north of the juncture of the LAX Expressway and the freeway will be in Culver City. Drivers leaving the airport heading north on the expressway and encountering congestion as they enter the northbound freeway will want to leave the freeway at the first convenient off-ramps, that is, within Culver City. The problem of airport traffic using surface arterial and local streets will have been moved north from Los Angeles into Culver City; the problem will not be eliminated. This issue needs to be addressed in the Draft EIS/EIR.
15. Impacts to Culver City's major intersections should be analyzed under the assumption that the LAX Expressway may not go forward. The analysis should then correlate how the proposed Expressway will mitigate the identified impacts to a level of insignificance.

Freeway Impacts

16. There has been no consideration or analysis of the traffic friction and weaving impacts that will result from the addition of the expressway ramps to the already poorly operating freeway-to-freeway interchange of the San Diego and Marina Freeways. When future Playa Vista traffic is added by way of the San Diego Freeway's Jefferson Boulevard ramps, which are part of that entire interchange, the impacts will be significant.
17. The analysis of the impacts of airport expansion traffic on the freeways is cursory and difficult to ascertain. Although Figure II-7.3 shows study links along two of the

freeways, the results of the impact analyses are not covered in the report text. The results must be found in tables in Attachment C, as follows:

- a. On the San Diego Freeway, the impacts of LAX expansion traffic will be significant both north or south of the airport, even "with final mitigation" in place.
- b. On the Glenn Anderson Freeway (I-105), the impacts east of the airport will be significant.

In neither case are mitigation measures for those impacts presented.

18. There is no analysis of the impacts of LAX expansion traffic on the Santa Monica Freeway (I-10). Although the I-10 is somewhat north of the airport, it serves airport traffic from throughout the region to the northeast and northwest. Analysis of the impacts on the I-10 Freeway should be included in the Draft EIS/EIR.

Construction Traffic Impacts

19. The analysis of construction related impacts is perfunctory, particularly when it is expected that the airport expansion construction will be spread over at least 14 years. The following points need to be addressed:
 - a. Although "The general construction concept is to have many of the transportation improvements completed within the first five years after construction begins ..." [page 4-318], the important LAX Expressway and the northeastern portion of the ring road from the San Diego Freeway to Sepulveda Boulevard would not be available to traffic until well after the first five years [Table 4.3.2-18, page 4-318].
 - b. The Draft EIS/EIR admits to a flow of 2.8 trucks per minute for 10 hours per day in a six-day work schedule or 1.2 trips per minute for 20 hours per day in a seven-day work schedule [Page 4-319]. That is a large number of trucks to be imposed on the current traffic flows on the streets and freeways, particularly when Playa Vista truck trips are also added. The mitigation recommended is to divide the truck trips among four locations at the construction site. But, that does not address the impacts of the trucks on the streets and freeways that are even a short distance away from the construction site. Those impacts are ignored.
 - c. Scheduling truck deliveries to not occur during four peak hours of the day [page 7-3] does not address the truck traffic problem. Many truck drivers will travel from remote supply depots to the airport vicinity during the peak periods in order to enter the airport boundaries during the allowable periods. When leaving, they will exit before the starts of the peak periods, but they will still be traveling on the freeway/street network to the remote locations during the peak periods. Additionally, the freeways and streets serving the airport area are congested during periods far longer than four peak hours per day.

- d. The construction employees will work in three shifts. The workers for the second shift will arrive before the first shift ends [Page 4-319]. Therefore, there would have to be employee parking for, perhaps, 8,000 workers during the period each day when the two shifts overlap. Will that magnitude of employee parking be feasible?
- e. Remote parking areas are recommended for construction employees in Palmdale, Van Nuys, and Ontario [Page 4-319]. Aside from the improbability of those remote areas being attractive to and extensively used by employees, there is no analysis of the impacts of the added traffic at those remote locations, nor is there analysis of the impacts of the shuttle traffic between those locations and the airport.
- f. There is no analysis of the impacts of the construction worker traffic on the entire street/freeway network. Those traffic flows, which will extend through most of the 14-year construction period, will be substantial six or seven days each week.
- g. There is no definition of the work shift schedules upon which to evaluate the potential overlap with the network peak periods, which currently extend for much longer durations than the typical 7 to 9 a.m. and 4 to 6 p.m. Therefore, the impacts of employee traffic cannot be evaluated with any assurance of accuracy or high probability.
- h. The assurances that "Construction traffic during all other times can be managed ..." [page 4-320] and "Traffic patterns around the airport for the general public would be largely maintained ..." [Page 4-320] are weak substitutes for actual measures that should be described and analyzed.
- i. "However, even with these commitments in place, the project would still cause sufficient construction-related traffic to cause noticeable disruption of normal traffic flows near the airport." [Page 4-320]. That will last over most of the construction period of 14 years, and will result in delays to air passengers, cargo deliveries, and the general public bound for other destinations within the sub-region or just passing through.
- j. The construction of the LAX expansion will coincide with the construction of Playa Vista, approximately two miles north of the airport [4-320]. Both construction contractors will use Sepulveda Boulevard and the San Diego Freeway for major haul routes. The LAX Draft EIS/EIR mitigation measure is to expand the "... traffic coordination office ..." to minimize the impacts of construction traffic [4-320]. That is likely to be an ineffective measure, as construction companies schedule operations for their own convenience and efficiency without regard to the real impacts on the general public.
- k. The Draft EIS/EIR authors admit "... significant and temporarily unavoidable ..." impacts [page 4-320]. The construction periods during which the two projects

(airport expansion and Playa Vista) will overlap will be a minimum of 10 years. That is a long period to be labeled "temporarily".

- I. Depending upon scheduling, the impact of closing all or part of Sepulveda Boulevard could be a major disruption to traffic flow in Culver City especially if Playa Vista and LAX Northside are being constructed simultaneously.

Airport Expansion Phasing

20. The anticipated phasing schedule for the airport expansion should be more realistic, because the analyses of expansion traffic are for certain specific study years, and if the study years are not realistic, the analyses are not correct. The Draft EIS/EIR analysis is divided into two airport expansion development phases [Page 2-12]. The traffic impact study and report should be revised extensively to coincide with realistic study years.
 - a. Phase I would be 5 to 6 years long and would end in 2005, according to the document. That is now impossible. The EIS/EIR will not be approved before late 2001, and Phase I of the actual construction could not begin before 2002. Therefore, Phase I would end in 2007 or 2008, not 2005.
 - b. Phase II, which would end 10 years after the completion of Phase I, according to the document, would extend to 2017 or 2018, not 2015, as stated throughout the Draft EIS/EIR.

Related Projects Analysis

21. The accuracy of the related projects analysis is questionable when the following mistakes about several of the highlighted entries [page 2-16] are considered:
 - a. Sony Pictures Studio – "2 miles north of LAX" [It is 5 miles north of LAX.]
 - b. Costco Center – "City of Los Angeles" [It is in Culver City.]
 - c. Marina del Rey – "City of Los Angeles" [It is in unincorporated County area.]

If the report authors made mistakes with significant information regarding large and well-known projects near their study site, about which there is substantial public information, what is the potential for accuracy of the remainder of the list that includes many smaller projects and many more remote projects?

Transit Systems

22. Page 4-241, Transit Systems. The date used for this analysis is based on 1993 data. This data is old and thus inaccurate. Culver CityBus Line 6 serving this corridor had grown over 20% in ridership since 1993 to over 2 million passengers annually. We recommend that the LAX study use current municipal / regional transit

data in the study to best reflect the true impact of transit service in and around the airport.

23. Page 4-254, 4.3.1.6.2 Alternate A- Added Runway North: Relocation and expansion of the LAX Transit Center. The City would like to be involved in the decision making process for its proposed relocation of the transit center.
24. Page 4-274 Environmental Action Plan (Proposed) Last Paragraph. This paragraph and globally throughout the document, should propose the use of signal transponders for all Municipal and Regional transit services in and around the airport. LADOT is currently using its Intelligent Transportation System (ITS) infrastructure and the ATCS system for the Rapid Bus along Wilshire and Ventura Boulevards. This technology used with transponders on transit buses serving the airport area could improve mobility.
25. Tables 4.3.2-8, 4.3.2-9, 4.3.2-12, 4.3.2-13 and 4.3.2-15. These tables reflect the circulation / LOS impact at major intersections in and around the LAWA project. As the tables note, a LOS of "F" is predicted along Sepulveda Blvd. and surrounding Culver City arterials and streets. In fact, the vehicle to capacity ratio (V/C) is significantly higher than the 1.00 used to define intersections as LOS "F". In some cases the V/C exceeds 1.5 on arterials in proximity to Culver City and along Culver CityBus routes.
26. Page 4-320 Section 4.3.2.9 Mitigation Measures. All Alternatives (A, B and C) should propose to install transponders for all transit operations serving the airport area. This should be coordinated with the proposal to mitigate impacts on mobility and LOS at surrounding intersections as identified in Tier 1 and 2 with the installation of LADOT's ATCS or priority control system.
- Additionally, if a negative impact is determined at an intersection creating a LOS of .85 or greater as a result of the implementation of either Alternative A, B, or C a mitigation should be required to improve that intersection to an acceptable LOS; or its previous LOS.
27. Page 4-236, Environmental Action Plan and Page 4-252, Phase I Construction Commitments (2000 – 2005): ST-4 Limited Short Term Lane Closures. Master Plan Commitment ST-4 states that the lane closures at key Century Blvd. / Sepulveda Blvd. intersections would be limited to 12 hours and would be scheduled for less congested non-summer and non-holiday periods. This expected closure would severely hurt the on-time performance of Culver CityBus Line 6. We recommend work to commence during non-peak traffic periods as well, such as nights and weekends. This impact was addressed in the Draft EIS/EIR.
28. Page 4-269, 4.3.1.7.2 Alternatives A, B, and C: Phase I (Year 2004). The Culver City Transportation Department has concern with the proposal's mention to divert traffic off Sepulveda Blvd. onto Century Blvd. during the construction of the

Sepulveda tunnel. With the assumption of LOS F, this would greatly affect the service of Culver CityBus Line 6 serving the Metro Green Line Station at Aviation and Imperial via Sepulveda Blvd.

29. **Page 4-270, 4.3.1.9.3 Alternative C- No Additional Runway.** The Culver City Transportation Department has concern that no mitigation measures are identified for the construction impacts on inbound upper level ramp to the CTA from south Sepulveda Blvd. This will have a significant impact of bus services and general mobility along Sepulveda Blvd.
30. **Page 4-320, Section 4.3.2.8 Cumulative Impacts.** As noted in this section, other projects might be under development concurrently, such as Playa Vista. If both projects use the same truck routes, such as the I-405, Sepulveda Blvd. or other arterials a significant adverse impact to local circulation will result. If at all possible the LAWA Traffic Coordination Office should plan for truck trips during non-peak periods or at night.
31. **Page 4-263, Consistency with other Adopted Plans.** Alternatives A, B, and C do not mention or include information contained in the plans of Culver City (General Plan or Short Range Transit Plan) or information contained in the MTA Long Range Plan.
- AIR QUALITY**
32. **Page 4-496, Table 4.6-9.** The table represents unmitigated off-airport emission inventories. Should we assume the significant increase in PM 10 is a result of increased cargo operations and additional trips over the base?
33. **Page 4-509, Overall Significance of Alternative C.** Under Alternative C, conformity requirements are met. However, there is concern with the amount of emissions brought to the eastside of the airport under this Alternative. Under Alternative C mobile source emissions from cargo carriers, additional passenger trips, and increased flights cannot be mitigated.
33. **Page 4-511, 4.6.7 Cumulative Impacts.** This expansion of LAX should take into consideration other planned developments such as Playa Vista. During the initial construction year (2004), Playa Vista Phase II will likely be under construction. This would increase truck traffic as well as emissions relating to construction duties.
34. **Section 4.6, Draft EIS/EIR.** The plan provides mitigations only for the immediate area around LAX and not for the surrounding areas which could have impacts from increased congestion and air quality from increased air and mobile sources. We can only assume from the magnitude of this project that both air pollution and traffic congestion will increase. Whether the proposed mitigation measures will ease both (air pollution & congestion) is hard to say since the mitigation measures need to be

approved by other entities (i.e. shuttle services, airlines, LAX employees, hotels, etc.).

NOISE

Overflight Noise

35. Reviewing the "Current Standard and projected Assumed Flight Tracks" for No Action and Alternatives A, B and C, Appendix D of the Draft EIS/EIR indicates a change in flight tracks over Culver City. Currently, there are two departure flight tracks (airplanes headed east) and no arrival flight tracks passing over Culver City. The current aircraft over-flight noise level impact and flight frequency within Culver City from the two departure flights paths is not addressed in the Draft EIS/EIR documents.
36. For each build alternatives, the Draft EIS/EIR proposes two arrival and one departure flight tracks passing over portions of Culver City. There is no data in the Draft EIS/EIR indicating projected aircraft over-flight noise levels or flight frequency within Culver City from these flight tracks. Existing and proposed aircraft over-flight noise data is needed to evaluate the noise impact of the flight track route changes over Culver City.
37. The documents indicate that aircraft taking off in a westerly direction for an eventual destination in the east will follow what is referred to, as Loop 1 Departure Procedure, which may potentially impact Culver City. All aircraft flying the Loop 1 Departure Procedure routes climb immediately to 5,000 feet west of the airport over the Pacific Ocean and cross the shoreline. The aircrafts will then make a sharp loop resulting in an eastbound route directly above LAX. The aircraft will then follow an easterly departure route crossing directly over Culver City. This procedure is expected to be put in place during the next decade, regardless of the disposition of the LAX Master Plan Alternatives. The degree of negative impact to Culver City is uncertain at this time, as over flight noise levels or frequency of flights within Culver City were not addressed in the Draft EIS/EIR. Therefore inadequate information was given to effectively evaluate the noise impacts of the Loop 1 Departure route over Culver City. A complete analysis is needed to quantify the potential for overflight noise impacts on Culver City.
38. The Draft EIS/EIR noise sections needs to expand its discussion on the effect of aircraft noise on the quality of life and health, including the effects of sleep disturbance and education, on persons within the areas impacted primarily by CNEL 65 levels. There are no CNEL 65 areas within Culver City but the discussions of sleep disturbances from aircraft over flights of Culver City should be considered as a potential impact on the health and well being of some Culver City residents.

39. The critical point concerning noise and Culver City is that the 65 CNEL noise measurement customarily used in assessing noise from airports does not fully capture the noise exposure likely to be experienced by the population. It represents a weighted average, and therefore discounts single noise events, that can be much higher in sound level. This is of significant concern relative to aircraft overflights over Culver City where short term, high level noise events add little to average sound levels but can impact a large population with intrusive noise impacts. The Draft EIS/EIR fails to adequately address this issue.

Lax Expressway Traffic Noise

40. LAX Expressway Alternative No. 3 has the potential to increase the traffic noise impact on a larger and more noise sensitive area within Culver City than LAX Expressway Alternative No. 2. The Draft EIS/EIR reports the traffic noise from Alternative No. 3 will potentially impact numerous properties within Culver City from Port Road at the I-405 freeway south to Green Valley Circle. Sensitive areas anticipated to have an increase in traffic noise impact with this Alternative are residential or school properties located adjacent to the freeway, north of Segrell Way.
41. The Draft EIS/EIR report indicates a potential residential zone impact on the west side of Coolidge Avenue between Diller Avenue and Port Road. After reviewing the reports and completing an inspection of the neighborhood, there are additional residential parcels on Culver Park Place/Culver Park Drive between Segrell Way and Diller, which could be impacted by an increase in traffic noise. It is also believed that the El Marino School and Park will be affected by an increase in traffic noise with the completion of the Alternative 3 Expressway Viaduct. These additional "affected" areas should be analyzed and included in Figures 3.1-1 to 3.1-10 of Appendix K.
42. The LAX Expressway Noise Abatement section states that the implementation of the Alternative 3 project could increase traffic noise by a small increment at several residences located along Coolidge Avenue and that a screening analysis was conducted. The report also states that the existing and future-without-project traffic noise level is likely to approach or exceed the FHWA Noise Abatement Criteria (NAC) due to the major highway facilities and interchange/on ramps in the vicinity of these residential uses. The report suggests that any noise abatement in the form of sound walls in this area would be deferred and evaluated as part of the Caltrans project development process for sound walls.
- It is understood that this statement means that although LAWA predicts an increase in traffic noise from the Expressway Alternative No. 3 to residential properties, noise mitigation in the form of sound walls would not be included in the Expressway design, but included in the Caltrans sound wall project development list. Any noise mitigation measures such as the construction sound walls should be independent of

Caltrans sound wall project development process and included as a separate mitigation measure in the Draft EIS/EIR and Appendix K documents.

Lax Expressway Construction Noise

43. Construction noise and vibration impacts are likely when a construction site is located within 300 feet of residences or schools. Based on the preliminary construction plan indicated in the Appendix K of the Draft EIS/EIR, there is the potential for short-term impact from construction noise within Culver City. Also, it indicates that construction crews, on occasion, will be scheduled to work during the evening hours utilizing high-powered lights for illumination.

A complete and thorough analysis of construction impacts and required mitigation measures associated with the LAX Expressway is needed in Appendix K. During the preliminary engineering, a detailed analysis of construction noise impacts and mitigation measures must be developed and provided to the City of Culver City for inclusion in the construction contract documents. The mitigations should include, but not be limited to, the following:

- Requiring the contractor to construct temporary construction sound walls.
- Placing restrictions on construction during nighttime hours.
- Limiting the use of particularly noisy activities such as impact pile driving and jack hammering.
- Requiring the construction to be performed in compliance with specific equipment and property line noise limits.

Approaches to ensure that construction is performed in compliance with specified requirements include:

- Construction noise monitoring by the construction management firm.
- Requiring contractors to retain acoustical engineers to perform noise control plans.
- Limiting specific noisy construction activities, particularly during early morning and nighttime hours.
- Requiring contractor to have temporary noise barriers stockpiled.
- Performance of all construction in a manner to minimize noise.
- Use of equipment with high performance mufflers.
- Minimization of the need for the use of back-up alarms.
- Selections of haul routes and schedules to minimize impact to residential neighborhoods.
- Positioning of staging areas away from noise sensitive areas.

LAND USE

44. **Draft EIS/EIR, Section 4.2, Page 4-76 to 4-234.** The land use study area discussed in the Draft EIS/EIR is limited to those communities immediately surrounding LAX (i.e. Cities of LA, Inglewood, El Segundo, and Hawthorne). The City of Culver City is not included in the land use study area. Therefore, the evaluation and land use mitigation measures regarding land use impacts is limited to the Cities listed above. The land use study area and discussion should however, be expanded to include communities such as Culver City, which although is not directly adjacent to the LAX boundary, are close enough where potential significant noise, traffic, air quality and more impacts from the proposed LAX Master Plan could occur. There is inadequate information in the Draft EIS/EIR to effectively determine whether individual or combined impacts associated with the Master Plan alternatives could render land uses in Culver City incompatible.
45. **Draft EIS/EIR, Section 4.0, Figure 4-1, Page 4-3.** The Expressway is shown in this figure to be part of the "Master Plan Boundaries". However, the Expressway is only drawn up to the area near the Howard Hughes Parkway on and off ramps. As Appendix K states, the LAWA preferred Expressway extends all the way up to areas north of the SR-90/I-405 Interchange. Include and expand this Master Plan Boundary figure to show the entire length of the proposed Expressway roadway, in particular the neighborhoods of Culver City.
46. **Appendix K, 4.1 Land Use, Page 19-24 and Appendix K, 5.1 Land Use, Pages 64-68.** Adequate analysis of land use impacts is lacking and required mitigation measures for the proposed LAX Expressway on Culver City is not addressed in Appendix K. LAX's primary mitigation measure is the Expressway. The Expressway could cause significant impacts to Culver City and therefore the analysis of the Expressway on Culver City is essential and critical. Figure 3.1-1 and 3.1-7, highlights only some of the potentially affected parcels which may require partial or full acquisition for right-of-way purposes. For instance, the affected parcel labeled as "P" for Public Facility Parcels on the east side of the I-405 Freeway between Bristol Parkway and Green Valley Circle is NOT entirely a flood control channel. Portions of this highlighted area are private property. The figures need to be revised and include all affected land uses in Culver City.
- a. There should be specific mention and analysis of land use impacts to the single-family homes on Coolidge Avenue, Culver Park Place, and Culver Park Drive, as well as the El Marino School and the El Marino Park. Also, there is no mention of potential property acquisition at this location, despite the closeness of this proposed roadway.
 - b. Under both the Single Viaduct and Split Viaduct Alignment for the LAX Expressway, additional areas in Culver City along the I-405 could be subject to land use impacts. Impacts to Culver City will start slightly north of the SR-90 interchange down to the City limits at Green Valley Circle, with elevated

crossovers at Centinela, Sepulveda, Bristol Parkway, and Jefferson Boulevards. Due to the need for placing column structures, there could also be significant impact to the industrial properties along Bankfield Avenue as well as to some industrial/commercial properties that are on Jefferson Boulevard. There could also be column placements in the parking lots that are in the vicinity of Bristol Parkway and Centinela Avenue. Supports for the elevated structure will, most likely, be located in the CHP parking lot, in the area of Bankfield Avenue-Selmarine Drive, and the west side of Slauson Avenue north of Jefferson Boulevard.

There are multiple environmental impacts to Culver City that must be addressed along the east side of the I-405 right-of-way in the vicinity of Bristol Parkway and Green Valley Circle. There are commercial, light manufacturing, and office uses along the east edge of the I-405 that would be subject to land use impacts from the LAX Expressway. Hotels located within the City of Culver City such as the Radisson, the Sheraton Four Points, and the Ramada Plaza Hotel located on Centinela and Sepulveda Boulevard could also be impacted. An application for a new car dealership (Airport Marina Ford) has been submitted to the City of Culver City for initial review. This new facility is proposed to be located on private property and partially in the current LA County Flood Control easement area as well as some portion of the existing Centinela Avenue right of way. This proposed development would be in conflict with the proposed alignment of both the build alternatives of the LAX Expressway.

47. **Appendix K, 4.1 Land Use, Page 19-24 and Appendix K, 5.1 Land Use, Pages 64-68.** In Appendix K, there is a limited amount of discussion and analysis of adopted Culver City land use, circulation, and noise policies.
48. **Appendix K, Section 5.5.1.2, Page 65, 1st paragraph, Alternative 2 (Split Viaduct).** Under Lax Expressway Alternative 2, the report states *"Although this alternative would likely require the acquisition of additional Right-of-Way along both the east and west side of the 405 FWY would not be considered a high priority roadway improvement under Culver City's General Plan Circulation Element. Irrespective of the emphasis the city places on the priority of the LAX Expressway project Alternative 2, no specific conflict with Culver City's Circulation Element have been identified."* This statement is confusing, misleading, and needs to be clarified. It should be noted that the City's Circulation Element was updated in 1996. At this time, any off airport roadway improvements such as the LAX Expressway was not analyzed or included in our Circulation Element. Therefore, to state there is no specific conflict with the Circulation is not correct.
49. **Appendix K, Page 66, Section 5.1.1.3, Second Paragraph, Last Sentence.** Correct and revise the last sentence to include the language in bold brackets. "However the reduction to noise levels to 66 dBA would not be consistent with the City Inglewood and **[City of Culver City]** General Plan Noise Element." Also, nowhere in the document does it discuss or explain or provide mitigations as to how

noise generated from the proposed Expressway will be reduced to 66 dBA or lower in those areas in Culver City.

50. **Appendix K, Figure 4.1-6 on page 4-65.** Any figure(s) illustrating the location/map of the proposed LAX expressway should include and highlight those communities or uses that would be impacted by the ENTIRE length of the proposed expressway.
51. **Appendix K, Page 23, Section 4.1.2.1.** – Correct language on this page to state that the City of Culver City, not "community of Fox Hills" bounds the northeast portion of the LAX Expressway.
52. **Preliminary Section 4F of the Supplemental Environmental Evaluation for LAX Expressway and State Route 1 Improvements.** On Page 6, *Table B*, it lists Fox Hills Park as a part of the City of Fox Hills. This should be corrected to show that Fox Hills Park is in the City of Culver City. Again, on Page 6, *Table B*, El Marino Park should be added to the list, as should El Marino School.
53. **Draft EIS/EIR Page 3-44, Master Plan Chapter V Page V-3.111, Appendix K page 2.** The referenced documents contain no or minimal discussions on the proposed Expressway under Alternative B (Additional runway to the South). Under Master Plan Alternative B, will the Expressway also extend up to the Howard Hughes Parkway ramps or to the SR-90/405 interchange? Where is the terminus of the Expressway under Alternative B?
- Parks and Schools**
54. **Volume 3, Section 4.26.3 Parks and Recreation Section in Paragraph 4.26.3.3 Affected Environmental/Environmental Baseline.** Culver City is not included in the list of analysis. An expressway on the east side of the 405 would be adjacent to the El Marino Elementary School, and would be adjacent to El Marino Park. This is of concern for environmental and noise related issues and needs to be further analyzed in the EIR as to what impacts the expressway would create and how it would affect both the school and the park.
55. **Section 4.27, Schools.** The analysis of this section includes distant schools in San Pedro and Banning, but does not mention Culver City at all. How can a major report such as this can ignore a city close to LAX while including schools in San Pedro, Carson, etc.? There is no consideration of El Marino School, which is literally within 100 feet of the existing freeway and the proposed Expressway would be built very close to the school. This issue needs to be addressed as a part of the Draft EIS/EIR.
56. **Preliminary Section 4F of the Supplemental Environmental Evaluation for LAX Expressway and State Route 1 Improvements.** The *Figure A* diagram of the Expressway on the east side of the freeway shows that there will be impacts to El

Marino School and the adjacent El Marino Park; yet it is not mentioned elsewhere in the report.

Since the impacts to El Marino School and El Marino Park are not addressed and in fact are ignored in the document, there is no way to comment on the adequacy of the impact analysis without seeing this specific analysis that should have been done as part of the Draft EIS/EIR document. The document needs to provide an analysis to be able to comment on.

4.4 Social Impacts

57. **Section 4.4.2 Relocation of Residences or Businesses.** Under the build alternatives, the LAX expressway would impact residences and businesses in Culver City (i.e. Marina Ford, etc.). How will these impacts be mitigated? What would be the tax impacts for these uses if relocated, acquired, etc.?
58. **Section 4.4.4 Community Disruption and Alteration of Surface Transportation Patterns, Page 4-20.** It should be acknowledged under "The Transportation System Improvements Under Build Alternatives" section, that certain northern portions of the LAX Expressway are proposed to extend out of the I-405 and MTA right of way onto non-ROW land in Culver City boundaries.
59. **Section 4.18 Light Emissions, Page 4-824.** There is no mention or analysis in the Draft EIS/EIR or Appendix K of potential light spill (light that shines beyond the area intended for illumination, can be a source of annoyance particularly for residences where light spill might disturb sleep or privacy) from the proposed LAX Expressway onto adjoining properties in the City of Culver City (i.e. residential properties on Coolidge Avenue and near Culver Park Place). Also, there are no mitigation measures required for potential light emission impacts from the LAX Expressway in the City of Culver City.

4.20 Construction Impacts

60. Significant negative impacts to Culver City are anticipated with the construction of the LAX Master Plan and in particular the LAX Expressway. There will be construction impacts within Culver City related to noise, land use, surface transportation, air quality, schools, aesthetics, lighting, public safety, and other environmental subject areas. However, the Draft EIS/EIR and associated appendices and technical reports neither address nor mention these impacts onto Culver City. From review of the documents, the evaluation and discussion of construction related impacts and mitigation is geared toward the immediate area surrounding the LAX boundary (i.e. Westchester, El Segundo, Inglewood, etc.). Therefore, it is uncertain whether the mitigation measures and master plan commitments related to construction of LAX apply to affected areas in Culver City. Clarify and specify in the Draft EIS/EIR and associated documents any construction impacts and mitigation measures applicable to affected areas in Culver City.

61. **Construction Schedule, page 4-859, 4-860.** Include a discussion under Alternative A and Alternative B, explaining under which phase the LAX Expressway will be constructed.
62. **Appendix K.** There is minimal and inadequate discussion of construction impacts and mitigation measures of the LAX Expressway.

4.21 Design, Art and Architecture

63. **Page 4-921, Lax Expressway.** This section should discuss visual/aesthetic impacts to land uses in Culver City. The Single Viaduct alignment (Alternative 3) for the LAX Expressway would parallel the I-405 right-of-way from approximately Arbor Vitae Street to areas slightly north of the SR-90. Figure 3.1-7 in Appendix K only highlights some and not all the affected areas in Culver City. In the area particularly northeast of the I-405/1-90 freeway interchange, the LAX Expressway would be visible from sensitive receptors such as single-family homes on Coolidge Avenue, Culver Park Place, Culver Park Drive, as well as the El Marino School and El Marino Park. At present, there is a densely landscaped area, which provide a visual buffer between the I-405 freeway and the homes on Coolidge Avenue. The proposed LAX Expressway would be closer than the existing freeway, if not on top of some of the homes and yards, and will eliminate the landscape buffer. Notwithstanding potential property acquisition at this location, the closeness of this proposed roadway will impact views from the residential area as well as the El Marino School and Park. Therefore significant aesthetic and view impacts from the LAX Expressway are expected.

Additional areas in Culver City along the I-405 would be subject to visual impacts under both the Single Viaduct and Split Viaduct Alignment for the LAX Expressway. The light manufacturing, commercial, office, research and development uses would be subject to visual impacts and shade and shadow effects from the LAX Expressway. Hotels located within the City of Culver City such as the Radisson, Four Points Sheraton Hotel, and the Ramada Plaza Hotel on Centinela and Sepulveda Boulevard would also view the proposed LAX Expressway.

Impacts to Culver City will start from slightly north of the SR-90 and I-405 freeway interchange down to the City limits at Green Valley Circle, with elevated crossovers at Centinela, Sepulveda, Bristol Parkway, and Jefferson Boulevards. Due to the need for placing column structures, there could also be significant impact to the industrial properties along Bankfield Avenue as well as to some industrial/commercial properties that are on Jefferson Boulevard. There would also be visual impacts, including shade and shadow effects and column placements in the parking lots that are in the vicinity of Bristol Parkway and Centinela Avenue. Supports for the elevated structure will, most likely, be located in the CHP parking lot, in the area of Bankfield Avenue-Selmarine Drive, and the west side of Slauson Avenue north of Jefferson Boulevard.

These impacts to Culver City are not mentioned in the Draft EIS/EIR or in Appendix K. Conduct a view analysis within Culver City areas, provide adequate mitigation measures, and include discussion within the Draft EIS/EIR of the visual/aesthetic/shade and shadow impacts to these sensitive receptors as well as other commercial and other types of uses in Culver City impacted by the LAX Expressway.

64. **Page 4-898, Environmental Action Plan and Page, 4-926 MM-DA-1 & MM-DA-2.** The two proposed mitigation measures (MM-DA-1 & MM-DA-2) designed to address aesthetic and visual impacts from the construction of the LAX Expressway should include areas and roadways in Culver City such as Coolidge Avenue, Culver Park Drive, Culver Park Place, Slauson Avenue, Selmarine Avenue, Bankfield Avenue, Jefferson Boulevard, Bristol Parkway, Green Valley Circle, and Centinela Parkway. Ensure in the language of the proposed mitigation measures that any construction fencing, pedestrian canopies, and view analysis be provided for these roadways listed above as they will be directly and significantly impacted by the proposed LAX Expressway.
65. **Appendix K, Page 60 and 110, Visual.** The visual analysis section does not analyze or evaluate view impacts or shade and shadow effects of the LAX Expressway to those areas in Culver City northeast of the I-405/I-90 freeways.
66. **Appendix K, Figure 4.17-1, Photo Locations.** Figure 4.17-1, stops short of depicting the entire northern length of the Expressway adjacent to Culver City. As such, the photo analysis conducted did not analyze those areas north of the freeway interchange in Culver City. Modify this figure to show additional photo locations and show the proposed Expressway extending slightly north the I-405/I-90 interchange, consistent with Figure 3.1-7, Segment A.

4.24 Human Health and Safety (CEQA)

67. **4.24.2.6, Environmental Consequences, Page 4-1046.** Provide an explanation or time frame in the phasing out of older, noisier aircraft. How long will this take?

PUBLIC SAFETY

Police:

68. The primary concern of the Police Department with the LAX Expansion Project proposals is traffic congestion. Traffic Congestion impacts the response time of Police vehicles to emergency calls, which impacts the quality of life in Culver City. The only two routes for response to the Fox Hills area from the East Portion of Culver City are La Cienega Avenue and Sepulveda Boulevard. Both of those streets

are congested during peak traffic hours and impact the response time of emergency vehicles to or from the above-described areas.

69. **Executive Summary IV-8.28 and IV-8.31.** The document describes traffic conditions, during peak hours of certain road segments. The segment of Sepulveda between Venice and Centinela is described in the report as follows. "Low volumes; primarily free-flow operations. Density is low, and vehicles can freely maneuver within the traffic stream. Drivers can maintain their desired speeds with little or no delay." That Report is not accurate. In fact, the actual traffic conditions during peak hours fit the description of the Impact Report's worst conditions, as follows. "Forced-flow operations with high approach delays at critical signalized intersections. Speeds are reduced substantially, and stoppages may occur for short or long periods of time because of downstream congestion."

70. All of our major roads lead to LAX. The LAX Expressway is proposed to accommodate traffic flow in and out of LAX. It directly feeds outbound LAX traffic to the San Diego Freeway, connecting N/B traffic to the 405 Freeway between the Jefferson Blvd and Culver Blvd ramps. There are no proposals for modifying that portion of the freeway for the added volume. The overflow traffic will exit into Culver City from the next two northbound ramps (Culver and Venice). That volume of traffic will add to the already congested Sepulveda Blvd, Washington Blvd, Washington Place, Culver Blvd and Venice Boulevards during peak traffic hours. It will also cause increased traffic congestion and delays on all of Culver City's North/South through streets. As the LAX grows, added traffic congestion will result in slower response times to emergency police calls.

Fire:

71. Both LAX Expressway proposals have southbound lanes beginning north of SR 90 freeway and continuing south to Arbor Vitae Street. There are no on- or off-ramps to provide emergency access along the way. Arriving at the emergency scene may prove difficult as traffic backs up with no way to divert vehicles. Culver City will be responsible for providing coverage on the southbound expressway unless farther distanced Los Angeles City Fire Department units are expected to handle all calls. The draft EIS/EIR needs to adequately address how emergency vehicles (fire trucks) can access/respond in a timely manner along the entire length of the proposed Expressway under non-peak and peak travel times.

72. The Report does not address additional traffic congestion on Sepulveda Boulevard through Culver City or the merging Expressway onto northbound San Diego Freeway. Any new traffic will have a significant impact on the Culver City Fire Department's response into the Fox Hills neighborhood, Centinela Avenue, I-405 Freeway north, etc. from the current location of Culver City Fire Station 3 located at 11304 Segrell Way.

73. Overviews 4.24.3 Safety, page 4-58, under LNG/CNG Facility, last paragraph, last sentence. Under all three Alternatives, the existing LNG Facility would be relocated to a site in the southeast portion of the airport near the East Imperial Cargo Complex. CNG storage would be constructed in conjunction with the LNG facility. The hazard radius for the LNG/CNG Facility would remain at a maximum of approximately 1,300 feet. As the location shown is in close proximity to the I-105 Freeway, the document does not mention the freeway as a possible exposure.

ENERGY

74. 4.17 Energy Supply and Natural Resources. The projections are all based on 1997, 1998 figures, before deregulation set in. What are the environmental impacts on electricity and natural gas usage based on current generation and transport capacity projections?

75. 4.17.1.8 Mitigation Measures. There is repeated reference to a Master Plan Commitment E-1, Energy Conservation and Efficiency Plan that would be implemented by LAWA which therefore eliminates the need for any mitigation measures. Has any portion of the plan been implemented to date, and if so what has the effectiveness been in energy reduction? Is it feasible to indicate that LAWA is capable of reducing energy consumption?

REGIONAL CONTEXT

76. The Draft EIS/EIR presumes that a vast majority of the region's growth in air passenger and air cargo demand will be directed to LAX. A number of commercially viable airports in the Southern California area currently exist and are underutilized relative to their capacity. A fully regional solution to this air passenger and air cargo capacity has not been adequately addressed in the Draft EIS/EIR.

77. 1.13.3 Future Demand for Air Passenger and Cargo Transportation. What is the impact the Alameda Corridor and the East Alameda Corridor projects on shifting the transport of cargo to other airports from manufacturing centers?

78. 1.2.4 Forecast Distribution of Demand. Where is the scenario that LAX is constrained to its current MAP and the demand has to be distributed to other airports? Only discussion is that air traffic will decrease overall, not about distribution.

79. 1.3 Meeting the Demand for Transportation. The length of the driving time to various cities is unrealistic. Assumes less than 50 mph speed on open freeways.

80. 1.4 The Need to Expand LAX. Statements do not indicate the benefit to the region with a freeze on LAX expansion – reduced traffic, pollution, noise, etc.

81.2.6 **Non-LAX Development.** Costco Center is located in Culver City not City of Los Angeles.

OTHER

82. In response to the NOP/NOI to prepare the Draft EIS/EIR issued in June 1997, Culver City requested in a letter dated July 31, 1997, that major issues and concerns related to traffic, air quality, overflight operations, regional context, and other subject areas impacting Culver City be analyzed in the preparation of the Draft EIS/EIR. None or minimal analysis of the issues the City requested to be analyzed are contained in the Draft EIS/EIR. Further, Culver City's NOP/NOI comment letter is not contained in Appendix A of the Draft EIS/EIR, where copies of written comments from affected agencies are contained.

November 7, 2003

Metropolitan
Transportation
Authority

One Gateway Plaza
Los Angeles, CA
90012-2952

Mr. Jim Ritchie
Los Angeles World Airports
City of Los Angeles
LAX Master Plan Office
P.O. Box 92216
Los Angeles, CA 90009-2216

Dear Mr. Ritchie:

Thank you for the opportunity to comment on the Supplement to the Draft Environmental Impact Statement / Environmental Impact Report on the LAX Master Plan. This letter conveys the Los Angeles County Metropolitan Transportation Authority's (MTA) comments concerning issues that are germane to our agency's statutory responsibilities.

The following issues should be addressed in the Final EIS / EIR, including transportation project programming and funding, the Metro Green Line extension, intermodal service interface and planning, facility capacity and utilization, and planning methodology.

- 1. Transportation Project Programming and Funding.** The Master Plan relies on numerous transportation mitigation projects that lack sufficient detail to determine their feasibility. Los Angeles World Airports (LAWA) should clarify which transportation projects have committed funds programmed, the source of those funds, and which projects lack full funding and/or have not completed the environmental review process.
- 2. Metro Green Line Extension.** There is no discussion in Alternative D regarding any future extension of the Metro Green Line. The Master Plan should address a possible Green Line station located at the new Ground Transportation Center (GTC), so that airport-bound Green Line passengers coming from the north would not have to overshoot the GTC by alighting at the current Aviation Green Line station. In addition, LAWA should ensure that construction of the automated people mover (APM) would not preclude the potential extension of the Green Line. It should be noted that the proposed alignment for the APM crosses the MTA-owned Harbor Subdivision right-of-way. This is an active rail line presently operated by BNSF, which has perpetual operating rights.
- 3. Intermodal Service Interface and Planning.** MTA would like to coordinate more closely with LAWA on the expansion of the Fly-Away program. In

SAL00021

0311807220

particular, Metro Rapid service interface issues and MTA's proposed hub-and-spoke bus restructuring should be explored. Specific locations for new Fly-Away routes should be identified.

4. **Transit Facility Capacity and Utilization.** Alternative D states that the new GTC would handle 60% of airport-access passenger trips, while the new Intermodal Transportation Center (ITC) would handle 30% of airport-access passenger trips. Assuming that airport-access passenger trips using public transportation are now less than 5%, the Final EIR / EIS should justify this assumption about future ridership and explain how public transit agencies will meet this huge increase in new passenger demand.
5. **Metro Rail Demand.** Alternative D calls for Green Line added capacity of 30% and Blue Line added capacity of 50% by the year 2015. LAWA should clarify whether this assumes improvements beyond the Blue Line's current three-car train operation. In addition, the Final EIR /EIS should explain how the additional Green Line capacity will occur.
6. **LAX Transit Center.** LAWA proposes to eliminate the existing LAX transit center near Lot C and incorporate it into the new ITC. LAWA should coordinate with MTA on this, since this will affect MTA's operations, routing, deadheading, and operational costs.

The MTA looks forward to reviewing the Final EIS / EIR. If you have any questions regarding this response, please call Stephen Fox at (213) 922-2238.

Re: Supplement to the Draft Environmental Impact Statement/Environmental Impact Report
for the Los Angeles International Airport Proposed Master Plan Improvements project

Dear Sirs:

Attached please find the Los Angeles Unified School District's (District) comments on the above referenced project. The focus of the our comments relate to the inadequacy of the air toxic analysis and subsequent risk assessment prepared for the proposed project.

The District also acknowledges the concerns raised by the Inglewood Unified School District (IUSD) relating to increased noise on educational facilities in proximity of its schools. The District believes that concerns raised by the IUSD are relevant to its schools located within proximity of the airport facility.

It is the District's charge to protect the health and safety of its students and staff, and the integrity of the learning environment. As such, the District requests that the document be revised to effectively address the impact of toxic air contaminants and noise on our local schools.

The District appreciates your consideration of our comments. Should you have any questions, please contact me at (213) 241-3921 or Bill Piazza of my staff at (213) 743-5086.

Sincerely,

Patrick A. Schanen, Deputy Director
Office of Environmental Health and Safety

c: A. Bellomo

SUBJECT: Supplement to the Draft EIS/EIR-Los Angeles International Airport Proposed Master Plan Improvements: Assessment of Air Quality Impacts.

In response to your request to assess the adequacy of the air quality element for the above referenced project, the following is provided.

Upon review of available documentation provided in the supplement to the Draft EIS/EIR, staff identified a critical flaw in the dispersion model methodology utilized to characterize the generation of toxic air pollutants from aircraft operations. This technical flaw, in conjunction with the applicant's failure to characterize the generation of toxic air pollutants associated with on-road mobile source activity, underestimates the potential human health impacts from exposure to toxic air contaminants related to the implementation of the proposed project. Additionally, the Draft EIS/EIR does not provide the necessary technical documentation/information to permit a thorough review as required under CEQA guidance.

The following discussion documents staff's assertion that the assessment of toxic air pollutants is without merit and relevant documentation to permit a review of the applicant's dispersion modeling analysis was not "readily available for public examination."

The dispersion modeling methodology is flawed and fails to appropriately assess the generation of toxic emissions from aircraft operations.

To assess carcinogenic and noncarcinogenic exposures, the applicant utilized a predictive model or mathematical simulation to estimate the dispersion of toxic air emissions and quantify their relative concentrations throughout the local community. Although staff believes that dispersion modeling is the appropriate analytical approach to assess pollutants generated from an airport landing facility, the choice of model and associated input values will dictate the viability of the simulation.

For this assessment, the applicant employed the Industrial Source Complex Short Term (ISCST3) dispersion model. ISCST3 is a United States Environmental Protection Agency (U.S. EPA) "guideline" model used to predict pollutant concentrations from an array of emission sources (i.e., point, area and volume). However, to characterize each source,

SAL00022

discrete input values must be entered by the user. For example, to account for the heat generated from jet aircraft exhaust, the applicant attempted to approximate the initial plume rise of various aircraft engines based upon a heat balance approach to produce a theoretical buoyancy flux and corresponding vertical exit velocity of the exhaust gas. The resultant exit velocity along with various source parameters (i.e., release height, exhaust temperature, stack diameter) were programmed into the model's point source algorithm to characterize "on-ground" (i.e., taxi/idle and takeoff) and "in-air" (i.e., approach and climbout) aircraft emissions. The identified release parameters utilized to assess the impact of aircraft emissions is provided in the original Draft EIS/EIR, Technical Report 4.

To assess the adequacy of the applicant's approach, staff identified the initial height of the exhaust plume for the on-ground aircraft/engine size categories (i.e., small, medium and large) corresponding to the lowest identified equivalent vertical exit velocity. This procedure was also recommended by the applicant who reports in their Technical Report, that utilizing the data "in Table VIII, plume rise can be calculated using the standard plume rise formulas presented in ISCST3 User's Guide." Results of staff's review indicate that for all aircraft/engine size categories, calculated plume heights from a horizontal source are excessive and physically impossible. Table 1 outlines the predicted plume heights for the above referenced aircraft/engine size categories. Supporting calculation worksheets are presented in Attachment A.

Table 1
Calculated Initial Plume Heights
(units expressed in meters)

Stability Class	Small Jet Taxi/Idle	Medium Jet Taxi/Idle	Large Jet Taxi/Idle	Small Jet Takeoff	Medium Jet Takeoff	Large Jet Takeoff
A-D	23.720	85.146	125.104	71.740	347.493	517.774
E	36.065	63.824	75.591	59.181	132.263	164.706
F	30.274	53.312	63.079	49.459	110.116	137.043

As noted above, the initial plume heights extend from 23.72 meters (77.8 feet) for small jet aircraft operating in the taxi/idle mode to 517.774 meters (1698.7 feet) for larger aircraft during takeoff roll. Clearly, these values are without merit. To exemplify staff's concern, the U.S. Department of Transportation, Federal Aviation Administration (FAA) released a letter report in October 2002 entitled "*Preliminary Report: The use of LIDAR to characterize aircraft initial plume characteristics.*" Although the LIDAR study reports "significant" plume rise occurs, until an "additional follow-on analysis" is conducted, a single value of 12 meters (39.4 feet) be utilized for large commercial and commuter aircraft.

As such, this recommendation was incorporated into FAA's EDMS model version 4.1. As reported in the September 30, 2002 EDMS Reference Manual Supplement entitled *Model Changes between EDMS 4.05 and EDMS 4.1*, it was reported:

Previously, the release height and the initial vertical dispersion coefficient were based on best available information and good engineering judgment. Based on results of an aircraft plume behavior study performed using LIght Detection And Ranging (LIDAR) aircraft plume behavior can be more accurately characterized through revised model defaults for release height and the initial vertical dispersion coefficient.

The model change bulletin continues by stating that:

Previously, the release height was airframe dependent and set to the average engine centerline height. In EDMS 4.1, the release height has been set to 12 meters for all aircraft types. This is meant to compensate for plume rise in buoyant jet and turboprop exhaust, since the LIDAR study concluded that significant plume rise occurs and was not being accounted for.

Noting the relevance of utilizing an appropriate plume height to assess pollutant dispersion from aircraft operations, the applicant's initial height approximations are excessive and inconsistent with FAA guidance.

To exemplify, staff prepared a comparative analysis of modeled concentrations based upon the applicant's point source parameters with those currently recommended by the FAA. Due to the applicant's failure to provide relevant model input data (see discussion regarding technical documentation below) to reprogram the model utilizing the revised plume height for each source location, the analysis compared the relative difference in downwind concentrations for each on-ground aircraft/engine size category. To account for the revised plume height, the source release height was set to 12 meters and the exit velocity was limited to a nominal value of 0.001 meters per second to limit momentum flux. Additionally, the exhaust temperature was set to 0 to negate the effects of thermal buoyancy. This value will cause the ISCST3 model to set the exit temperature equal to the ambient temperature for each hour in the meteorological data set. For each source, a unitized emission rate was used to characterize the hydrocarbon exhaust stream.

A polar grid receptor network consisting of 36 direction radials was programmed to identify receptors at 500, 750, 1000, 1250 and 1500 meters. Hourly surface weather data from the South Coast Air Quality Management District's Lennox monitoring station was incorporated into the modeling exercise to represent local weather conditions and prevailing winds.

Tables 2 and 3 present the results of the comparative analysis. As noted below, the relative percentage increase from the original model configuration is considerable for all aircraft/engine size categories.

Table 2
Maximum Period Values
 (units expressed in micrograms per cubic meter)

Source Description	Concentration Initial Plume Height	Concentration Revised Plume Height	Percent Increase
Small Jet Taxi/Idle	5.38	9.10	69.3
Medium Jet Taxi/Idle	1.92	9.09	373.7
Large Jet Taxi/Idle	1.13	9.09	701.7
Small Jet Takeoff	2.33	9.10	291.3
Medium Jet Takeoff	0.24	9.09	3709.3
Large Jet Takeoff	0.11	9.09	7876.4

Table 3
Maximum One Hour Values
 (units expressed in micrograms per cubic meter)

Source Description	Concentration Initial Plume Height	Concentration Revised Plume Height	Percent Increase
Small Jet Taxi/Idle	75.42	183.37	143.1
Medium Jet Taxi/Idle	21.89	183.20	737.0
Large Jet Taxi/Idle	15.17	183.06	1107.1
Small Jet Takeoff	26.19	183.37	600.2
Medium Jet Takeoff	3.70	183.20	4845.6
Large Jet Takeoff	1.90	183.06	9526.6

As such, staff contends that the applicant's dispersion analysis characterizing the generation of toxic air pollutants is flawed and clearly underestimates the impact of aircraft emissions on the local community. A copy of the dispersion model input and output files is presented in Attachment B.

The assessment fails to address the generation of toxic air emissions from on-road mobile sources.

Notwithstanding the questionable adequacy of the applicant's assessment of aircraft

emissions, they also fail to recognize and subsequently assess the generation of toxic air pollutants from vehicular traffic associated with the proposed project.

There is a body of documentation acknowledging that vehicular sources generate toxic air pollutants. In fact, in a 1994 environmental fact sheet entitled *Air Toxics from Motor Vehicles*, the U.S. EPA estimated that “mobile (car, truck, and bus) sources of air toxics account for as much as half of all cancers attributed to outdoor sources of air toxics.” In the recent South Coast Air Quality Management District (SCAQMD) *Multiple Air Toxics Exposure Study* (MATES II), it was reported that:

The contribution to risk is dominated by mobile sources (e.g., cars, trucks, trains, ships, aircraft, etc.). About 70% of all risk is attributed to diesel particulate emissions; about 20% to other toxics associated with mobile sources (including benzene, butadiene, and formaldehyde); about 10% of all risk is attributed to stationary sources (which include industries and other certain businesses such as dry cleaners and print shops.)

The California legislature (SB 352, Escutia 2003) has also recognized the potential impact associated with exposure to mobile source emissions by establishing a statutory “standard of care” for assessing the impact of toxic pollutants on students and school-based staff located near roadways.

Clearly, vehicular sources associated with the proposed project may contribute significantly to the impacts of toxic emissions throughout the local community. The applicant has the obligation to provide a comprehensive evaluation of all sources of toxic emissions associated with the proposed project. There is no basis to omit this source category from consideration.

For your reference, staff has attached the above referenced U.S. EPA fact sheet and recommends that the applicant contact representatives from the U.S. EPA’s Office of Air Quality Planning and Standards, the California Air Resources Board, as well as the SCAQMD for guidance in preparing an appropriate assessment.

The Draft EIS/EIR fails to provide the necessary technical documentation to permit a complete examination of the applicant’s dispersion model analysis.

Section 15147 of Title 14 of the California Code of Regulations provides guidance regarding the technical detail contained within an EIR. As reported in the guidelines:

The information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

Although staff appreciates the applicant's attempt to disclose its "highly" technical documentation in the various appendices to the Draft EIS/EIR, an essential portion of their analysis was not available for public examination. To effectively evaluate the results of a model analysis, one must examine the actual input and output files to confirm its consistency with a prescribed methodology or identify discrepancies contrary to that methodology.

It also allows the reviewer to reprogram the model with revised input values to produce a comparative analysis which may serve as the basis to challenge its adequacy. Although staff was able to identify a serious flaw in the applicant's modeling analysis, it was limited to a review of written documentation without benefit of evaluating the actual model data. Staff believes that access to this information may have led to the identification of additional inadequacies in the applicant's analysis.

To underscore the relevance of staff's contention, the SCAQMD CEQA Air Quality Handbook references the assessment methodology utilized under the Air Toxic "Hot Spots" Information and Assessment Act (AB 2588, Connelly 1987) to address air toxic exposures within the context of a CEQA analysis. The guidance document entitled *Air Toxic Hot Spots Program Risk Assessment Guidelines Part IV: Technical Support Document Exposure Assessment and Stochastic Analysis* (OEHHA, 2000) provides detailed discussion on various aspects of air dispersion modeling including requirements for report submittal. Specifically, the guidance reports air dispersion modeling results shall include but not be limited to 1) model printouts (numbered) including annual concentrations and maximum hourly concentrations and 2) electronic media (disk) with input/output files for the air dispersion program (e.g., the ISCST3 input file containing the regulatory options and emission parameters, receptor locations, meteorology, etc.).

Although inclusion of this data is customary, the applicant did not provide nor make publicly available this information to permit a full evaluation of the impacts of toxic air emissions on the local community.

Staff trusts that the preceding analysis demonstrates the inadequacy of the applicant's air toxic assessment and provides relevant documentation to challenge its adequacy. Please advise as to the disposition of this memorandum and subsequent response by the applicant. I can be reached at (213) 241-3926 should you have any questions or need additional information.

bp:

CONC URBAN FLAT NOSTD NOCALM NOCMPL

*** MODEL SETUP OPTIONS SUMMARY ***

**Simple Terrain Model is Selected

**Model is Setup For Calculation of Average CONCentration Values.

-- SCAVENGING/DEPOSITION LOGIC --

**Model Uses NO DRY DEPLETION. DDPLETE = F
**Model Uses NO WET DEPLETION. WDPLETE = F
**NO WET SCAVENGING Data Provided.
**NO GAS DRY DEPOSITION Data Provided.
**Model Does NOT Use GRIDDED TERRAIN Data for Depletion Calculations

**Model Uses URBAN Dispersion.

**Model Uses User-Specified Options:

1. Final Plume Rise.
2. Not Use Stack-tip Downwash.
3. Buoyancy-induced Dispersion.
4. Not Use Calms Processing Routine.
5. Not Use Missing Data Processing Routine.
6. Default Wind Profile Exponents.
7. Default Vertical Potential Temperature Gradients.

**Model Assumes Receptors on FLAT Terrain.

**Model Assumes No FLAGPOLE Receptor Heights.

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 12 Source(s); 12 Source Group(s); and 180 Receptor(s)

**The Model Assumes A Pollutant Type of: OTHER

**Model Set To Continue RUNNING After the Setup Testing.

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**Misc. Inputs: Anem. Hgt. (m) = 10.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 1.3 MB of RAM.

**Input Runstream File: LAX1.DTA

**Output Print File: LAX1.LST

**MODELOPTs:

Environmental Fact Sheet

Air Toxics from Motor Vehicles

What are Air Toxics?

Air toxics are air pollutants that cause adverse health effects. The U.S. Environmental Protection Agency (EPA) has focused most of its air toxics efforts to date on carcinogens, which are compounds that cause cancer. Non-cancer health effects such as reproductive and neurological problems are also of concern to EPA.

How dangerous are air toxics?

It's hard to say. Some air toxics have been proven to cause cancer in humans. However, most air toxics are identified through laboratory experiments in which animals receive very high doses of the compound being studied. People almost never breathe such high doses. But lower exposures may still pose risks. One fact is clear: vehicles are such an integral part of our society that virtually everyone is exposed to their emissions.

Air Toxics from Vehicles and Their Fuels

Motor vehicles emit several pollutants that EPA classifies as known or probable human carcinogens. Benzene, for instance, is a known human carcinogen, while formaldehyde, acetaldehyde, 1,3-butadiene and diesel particulate matter are probable human carcinogens. Studies are underway to determine whether other toxic substances are present in mobile source emissions. For example, EPA and industry are investigating

whether oxygen-containing fuel additives such as methyl tertiary butyl ether (MTBE) cause any adverse health effects. EPA is also working with the vehicle and fuel industries to test motor vehicle emissions for the presence of dioxin.

EPA estimates that mobile (car, truck, and bus) sources of air toxics account for as much as half of all cancers attributed to outdoor sources of air toxics. This estimate is not based on actual cancer cases, but on models that predict the maximum number of cancers that could be expected from current levels of exposure to mobile source emissions.

The models consider available health studies, air quality data, and other information about the types of vehicles and fuels currently in use. Non-road mobile sources (such as tractors and snowmobiles) emit air toxics as well.

How are Air Toxics from Motor Vehicles Formed?

Some toxic compounds are present in gasoline and are emitted to the air when gasoline evaporates or passes through the engine as unburned fuel. Benzene, for example, is a component of gasoline. Cars emit small quantities of benzene in unburned fuel, or as vapor when gasoline evaporates.

A significant amount of automotive benzene comes from the incomplete combustion of compounds in gasoline such as toluene and xylene that are chemically very similar to benzene. Like benzene itself, these compounds occur naturally in petroleum and become more concentrated when petroleum is refined to produce high octane gasoline.

Formaldehyde, acetaldehyde, diesel particulate matter, and 1,3-butadiene are not present in fuel but are by-products of incomplete combustion. Formaldehyde and acetaldehyde are also formed through a secondary process when other mobile source pollutants undergo chemical reactions in the atmosphere.

Reducing Air Toxics from Motor Vehicles

The emissions that come out of a vehicle depend greatly on the fuel that goes into it. Consequently, programs to control air toxics pollution have centered around changing fuel composition as well as around improving vehicle technology or performance. One of the first, and most successful

programs has been the removal of lead from gasoline. The lead phaseout began in the mid-1970s. It will be complete January 1, 1996 when lead is banned from gasoline. The removal of lead from gasoline has essentially eliminated mobile source emissions of this highly toxic substance.

More recent fuel and emission control system changes include:

- Limits on gasoline volatility - Volatility is a measure of how easily a liquid evaporates. As described earlier, some toxics such as benzene are present in gasoline and get into the air when gasoline evaporates. Limits on gasoline volatility have been imposed over the last several years to control evaporative emissions of both hydrocarbon and toxic compounds (most air toxics are hydrocarbons so programs designed to reduce hydrocarbon emissions also reduce air toxics).
- Reformulated gasoline - The 1990 Clean Air Act requires reformulated gasoline to be introduced in the nation's most polluted cities beginning in 1995.
- From 1995-1999, these gasolines must provide a minimum 15% reduction in air toxics emissions over typical 1990 gasolines. This increases to a 20% minimum reduction beginning in the year 2000. The air toxics reductions will be achieved mainly by reducing gasoline volatility and by reducing the benzene content of the gasoline.
- Limits on diesel sulfur - Regulations limiting the amount of sulfur in diesel fuel took effect in 1993. Today's lower-sulfur diesel fuels are important in reducing emissions of particulate matter and other air toxics from diesel-fueled buses and trucks.
- More stringent standards and test procedures - To date, there are no specific standards for air toxics emissions from motor vehicles. However, the 1990 Clean Air Act does set specific emission standards for hydrocarbons and for diesel particulate matter. Air toxics are present in both of these pollutant categories. As vehicle manufacturers develop technologies to comply with the hydrocarbon and/or particulate standards (e.g., more efficient catalytic converters), air toxics are reduced as well.

Requirements under the Act for testing carbon monoxide emissions at cold temperatures will also have an indirect but important effect in reducing air toxics emissions in the critical first moments of vehicle operation.

- Control of emissions in actual customer use - From a pollution perspective, what matters most is not new vehicle emission standards but actual emissions from vehicles on the road. The Clean Air Act establishes several programs to make sure vehicle emission controls are functioning properly in actual use. These include requirements for periodic emission inspections and for computerized diagnostic systems that alert drivers and mechanics to malfunctioning emission controls.

In summary, the many vehicle and fuel changes in the last 25 years have greatly reduced air toxics emissions from highway vehicles. New cars today are capable of emitting 90% less air toxics on a per-mile basis than the uncontrolled models of 1970; new trucks and buses are designed to emit less than half the air toxics of their 1970 counterparts.

Overall air toxics emissions will continue to decrease through the 1990s as older vehicles leave the fleet and as new regulatory programs take effect. However, the number of vehicles on the road and the number of miles they travel is continuing to grow. Without additional controls, growth in vehicle travel will offset progress in reducing air toxics by early in the next century.

What More Can Be Done?

The 1990 Clean Air Act requires EPA to specifically regulate air toxics from motor vehicles in the form of standards for fuels, or vehicles, or both.

Additional hydrocarbon and particulate matter controls such as tightening tailpipe standards even further will reduce air toxics emissions somewhat. California for example, sets tighter hydrocarbon limits for vehicles sold in that state than the federal requirements for vehicles sold elsewhere. Other states can choose to adopt the California standards, which provide some air toxics benefits. Expansion of existing regulatory programs (such as more widespread use of reformulated gasoline or wider requirements for emission inspections) could also help reduce air toxics. Specific vehicle emission standards for one or more toxic compounds are also an option.

Changes in gasoline and diesel fuel composition (such as reducing sulfur, benzene or other aromatic chemical compounds) can also reduce air toxics emissions.

A switch to alternative, non-petroleum fuels that are cleaner than today's gasoline and diesel fuels offers another strategy for reducing air toxics. Choices include alcohols, natural gas, propane, and electricity. These fuels are inherently cleaner than conventional gasoline and diesel because they do not contain toxics such as benzene. In addition, they are made of simpler chemical compounds which yield lower levels of complex combustion by-products such as 1,3-butadiene.

**Re: City of El Segundo LAX Master Plan Advisory Commission
Comments Regarding the Draft Supplemental EIS/EIR for the LAX
Master Plan Enhanced Safety and Security Plan**

Dear Mr. Ritchie and Mr. Kessler:

In 1999, the City of El Segundo created the LAX Master Plan Advisory Commission, a citizen advisory panel charged with the task of reviewing and commenting on the EIS/EIR process related to the development of the LAX Master Plan. In September 2001, LAXMAC issued a detailed letter commenting on the Draft EIS/EIR issued in January of the same year. In response to the "Supplement to the Draft Environmental Impact Statement/Environmental Impact Report Los Angeles International Airport Master Plan" released by Los Angeles World Airports (LAWA) in August 2003, LAXMAC offers this comment letter.

LAXMAC is intended as a citizen body that will consider and relate the day-to-day concerns of the residents of the City of El Segundo with respect to the ongoing EIS/EIR process. Accordingly, the comments and opinions stated in this letter are generally non-technical in nature. An additional and more formal comment letter stating the City of El Segundo's technical and legal concerns with the Draft Supplement to the EIS/EIR will be sent under separate cover.

350 Main Street, El Segundo, California 90245-3895
Phone (310) 524-2302 FAX (310) 322-7137

SAL00023

The following is an overview of the concerns identified by LAXMAC during its review of the Supplement:

Proposal to move southern most runway (25L) fifty-feet south will reduce quality of life of El Segundo Residents

Perhaps the most troubling proposal outlined in the Supplement for El Segundo residents is the relocation of the southernmost runway (25L) fifty-feet closer to the northern border of the City of El Segundo. Currently, the western terminus of that runway lies approximately 700 feet from residences in the City. The noise and disruption experienced by those residents is well documented. The proposed relocation of the runway will result in at least 55 additional residents being pushed into the 75 CNEL noise contour. The only mitigation proposed by LAWA to deal with the additional noise appears limited to additional residential sound insulation funding. The members of LAXMAC have determined that proposed mitigation to be a wholly inadequate response to the additional noise issues created by the runway location. Traditionally, the City of El Segundo has not accepted residential sound insulation funds from LAX because of the aviation easement requirement imposed by LAWA as a condition of residents' accepting the money. At a minimum, LAXMAC urges strongly that LAWA reconsider the policy of requiring residents to execute an aviation easement prior to receiving residential sound insulation funding provided by LAX.

In addition, the members of LAXMAC do not fully accept the "safety" justification for relocating the runway. The Supplement indicates that the runway is being relocated to provide additional separation between 25L and 25R for the purpose in constructing additional taxiway space between the two runways. The taxiway space is said to be required because of a series of runway incursions occurring at LAX. While the members of LAXMAC accept that runway incursions may have occurred on the airfield, the commission believes that they are few in number and minor in nature. LAWA has failed to document that any of the incursions are "Class A" near-miss incidents. Accordingly, LAXMAC is on record as disagreeing with the justification stated in the Supplement for relocating runway 25L further south.

Additionally, many El Segundo residents are concerned about the additional noise emanating from cargo carriers as a result of the runway relocation. LAXMAC has determined that a large number of cargo flight operations are conducted during the evening hours, and that a significant percentage of aircraft used for that purpose are pre-Stage III planes that meet the FAA guidelines due the installation of "hush kits." The committee believes the combination of a relocated runway, noisy aircraft and nighttime operations will impact deleteriously

the quality of life in El Segundo. To address those issues, it is imperative to consider such mitigations as restrictions on evening cargo operations and more stringent implementation of Stage III aircraft noise standards.

The members of LAXMAC questioned also why the Supplement did not include an examination of the end around taxiway concept. It may be possible to meet the taxiway requirements of the airfield in the scenario painted by Alternative D by constructing end around taxiways at the western terminus of runways 25L and 25R. In such a configuration, it would likely not be necessary to provide additional separation between the runways, thus eliminating the need to relocate 25L south. The members of LAXMAC have urged the completion of a full noise study, including single event noise issues and end around taxiways. It is a concern of the members of LAXMAC that the noise created by heavy aircraft accelerating to make the grade heading south to north might create even more noise issues for the residents who make their homes near the western terminus of the runways. As mentioned previously, many live within 700 feet of the runway and there is little margin for error with respect to noise created on the airfield. Nonetheless, it is certain that the end around taxiway concept is worth additional study.

1996 Baseline Year not adequate for an EIS/EIR issued in 2003

In its comments forwarded in 2001, the members of LAXMAC expressed serious concerns that the 1996 baseline year established as the benchmark was not adequate for mitigations in an EIS/EIR document published five years later. Those concerns still hold – and in fact become more exacerbated with the passage of time. In addition, the problem seems to be complicated by inconsistencies within the Technical Supplements included within the Supplement. Specifically, in some instances, the baseline year appears to have been updated to the year 2000.

Spot checking throughout the document seems to indicate that the update in baseline year was made in those instances when it benefited LAWA in presenting a plan to properly mitigate known impacts. One example of such is the inclusion of year 2000 noise data in some of the appendices. That is noteworthy because aircraft following the implementation of Stage III noise mitigation measures are generally quieter than they were in 1996. While the members of LAXMAC have not undertaken a thorough examination of the Supplement to determine if such changes in baseline year analysis was made throughout, the Commission does have concerns that changes were made in some cases to conveniently ease the burden of proposed mitigations.

For the record, the members of LAXMAC believe that the baseline year for data analysis in all instances should be more recent than 1996 – irrespective of the impact on the EIS/EIR process.

Supplement does not consider that all proposed measures will not be funded

The members of LAXMAC share the concerns expressed by the County of Los Angeles that the Supplement should indicate that planned mitigations may not be feasible, and that the LAX Master Plan should be approved with overriding considerations if planned transportation projects do not come to fruition. The Supplemental discusses the construction of an off ramp at the 405 Freeway and Lennox Boulevard, improvements adjacent to the Marina Freeway and numerous local traffic signal coordination and intersection improvements. Given this current period of economic malaise, especially at the State level, it is counterintuitive to assume funding will remain available for many of those projects. LAXMAC believes this to be especially true locally with respect to several planned transportation projects. The Supplemental should be clearer in identifying available revenue sources and must included a plan should such the anticipated funding not come to pass. The commission opposes going forward with the construction of Alternative D with sufficient assurances of mitigation not based on what may be illusory future funding.

Alternative D likely to create unanticipated traffic issues

The Supplement states that that an essential component of the plan's congestion relief package is the relocation of almost all passenger-related vehicle traffic to the east of the central terminal via the new ground transportation center, the intermodal transportation center and consolidated rental car facility. The rationale behind the plan is that the new facilities will be located near the I-405 and I-105 freeways, thus encouraging related airport traffic to stay on those major freeways "rather than offload onto adjacent arterial streets." In addition to the potential that several of the improvements necessary to implement the plan (most notably an off ramp at 405/Lennox and a flyover from 405 to 105 east) may not be constructed, it is simply not logical to conclude that traffic headed toward LAX will stay on the freeways.

Consider the following: LAX is currently operating at approximately 60 MAP. The capacity of the airport under Alternative D is asserted by LAWA to be 78.9 MAP. The commute on the I-405 south and the I-105 west near LAX is currently congested during peak travel hours and, of course, holiday travel periods. The City of El Segundo has learned from experience that drivers during those periods

simply exit the freeway during times of congestion and access Sepulveda Boulevard, Aviation Boulevard, Imperial Highway, and other streets seeking access to the airport. Accordingly, it stands to reason that an approximate 30% increase in passenger volume handled at the airport, will lead to increased traffic on the two adjacent freeways and adjacent major arterials. It stands to reason as well, that moving the major vehicle transportation centers closer to the freeways will serve to add to the congestion on those freeways during peak travel hours, thus rendering specious the claim in the Draft Supplement that drivers will be inclined to remain on the freeway for longer periods of time. Ironically, the Supplement itself seems to provide additional evidence supporting that contention by stating that the ground transportation center would have “direct access to Century Boulevard, La Cienega Boulevard, and Imperial Highway.”

The members of LAXMAC seek not to quibble with the technical analysis here, although the City of El Segundo's technical consultant will provide specific critiques of the modeling. Rather, the Commission seeks more tangible and fully funded mitigation measures aimed at reducing traffic in the intersections of the major arterials adjacent to the airport. Those issues will be documented more thoroughly in separate comment letter on behalf of the City of El Segundo.

Supplement does not address impacts created by construction of the project

The Alternative D proposal is an extraordinarily large project, and phasing of the construction will lessen only a portion of the inevitable impacts of the construction itself. It is clear that many of those issues would be addressed on a day-to-day basis when and if construction of the project commences. However, the members of LAXMAC believe that such issues as the re-routing of traffic and the noise of construction equipment on and adjacent to the work site have been addressed inadequately as a part of the EIS/EIR process. Those types of impacts can be anticipated, and thus planned appropriately.

Supplement does not support a truly regional airport plan

Finally, the members of LAXMAC have determined that the Supplement does not seek to seriously promote a regional airport plan despite language to the contrary in the Executive Summary. The Commission believes that the Supplement and LAWA should discuss seriously a scenario in which cargo operations are shifted to outlying facilities in Ontario and Palmdale. LAWA operates airports in those two cities and purports to seek an increase in the capacity and use of those facilities. Yet, curiously, there is no mention in the Supplement of efforts to induce airlines to utilize those facilities in lieu of LAX.

Frankly, it is almost inconceivable that such inducements are not discussed as potential mitigation measures addressing the impacts anticipated following the construction of the Alternative D proposal.

LAXMAC views that omission as evidence of the lack of creative thinking that went into the document. During the past five years, work has been completed on such projects as the Alameda Corridor and it is troubling to note that little effort has been made to incorporate those assets in the Master Planning process. For example, the Commission received information on a plan to build an air cargo facility at the Los Angeles Harbor, wherein goods could be shipped directly from the harbor via the Alameda Corridor. Granted, it is an unconventional proposal that would face significant obstacles prior to implementation. However, it represents the type of "out-of-the-box" thinking that seems so lacking in the Supplement.

RE: Supplement to the Draft Environmental Impact Report / Environmental Impact Statement for the LAX Master Plan

Dear Mr. Ritchie:

Thank you for the opportunity to review the Supplement to the Draft Environmental Impact Report / Environmental Impact Statement ("Supplement") for the Los Angeles International Airport ("LAX") Master Plan Improvements ("Master Plan"). The Supplement includes environmental analysis of Master Plan Alternative D, the Enhanced Safety and Security Plan, which is designed to constrain passenger and cargo capacity at LAX and enhance safety and security.

The City of Santa Monica's August 1, 2001 comment letter regarding the original Draft Environmental Impact Report / Environmental Impact Statement ("Original Report") is enclosed. Our previous letter detailed the Original Report's failure to fully analyze the environmental impacts of the Master Plan and to provide acceptable mitigation for impacts on Santa Monica. The Supplement continues to ignore environmental impacts and appropriate mitigation measures related to surface transportation, general aviation, and induced socio-economic impacts. As these concerns are detailed in our previous letter, we will not repeat them here. However, we would like to emphasize some of the analytical failures of the Supplement.

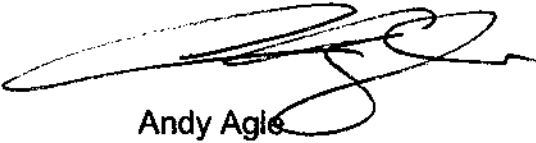

First, the Supplement fails to analyze the surface transportation impacts of Alternative D. As was the case with the Original Report, the Supplement ignores transportation impacts upon any of Santa Monica's intersections, in spite of our early identification of intersections to be analyzed. The Original Report and the Supplement must analyze these intersections and identify appropriate mitigation measures.

As is the case under Alternatives A, B, C, Alternative D proposes a reduction in total acreage committed to General Aviation from the current 14 acres to

approximately 6 acres. As detailed in our previous letter, the continued displacement of General Aviation operations from LAX will have significant environmental consequences for Santa Monica Airport and the City of Santa Monica. The Original Document and the Supplement must evaluate these impacts, especially in the areas of noise, surface transportation, airspace safety and air quality, and propose appropriate mitigation measures. In addition, business concerns about the effectiveness of the security measures proposed under Alternative D could increase the number of business travelers who choose private jet travel, resulting in even greater use of Santa Monica Airport and associated environmental impacts.

Thank you again for the opportunity to review the Supplement. We look forward to your response to our comments.

Sincerely,

A handwritten signature in black ink, appearing to read "Andy Agle", with a large, sweeping flourish extending to the left.

RE: LAX Master Plan and Environmental Impact Report / Environmental
Impact Statement

Dear Mr. Ritchie and Mr. Kessler:

Thank you for the opportunity to review the Draft Environmental Impact Report / Environmental Impact Statement ("DEIR") for the Los Angeles International Airport Master Plan Improvements ("Master Plan"). The Master Plan presents significant environmental consequences for Santa Monica and the entire region.

On July 10, 2001, the Santa Monica City Council adopted a formal position in opposition to the LAX Master Plan due to the significant and unavoidable environmental impacts associated therewith. The DEIR does not fully analyze the environmental consequences of the Master Plan, nor does it provide acceptable mitigation for impacts on Santa Monica. The Master Plan does not provide for guaranteed infrastructure, facilities, and airside acreage to fully support transient business aircraft and fixed-base business operations, which should include a minimum of three fixed-base operations for business jets and an exclusive runway for small to mid-size jets; nor does it provide for appropriate phasing of surface transportation enhancements relative to air transportation enhancements; nor does it include the relocation and expansion of the LAX Transit Center as a Master Plan commitment at a location that will promote the use of transit.

The Westside Cities have sent a joint comment letter regarding the inadequacy of the Master Plan environmental documents. The following provides additional information regarding critical Master Plan and DEIR issues for the City of Santa Monica.

GENERAL ISSUES

Overall, the DEIR provides insufficient analysis of the environmental impacts of the proposed project. On July 25, 1997, the City of Santa Monica submitted comments regarding the Notice of Preparation of the DEIR ("NOP letter"). Several critical issues that we requested be analyzed in the DEIR have not been analyzed, in spite of obvious environmental impacts on Santa Monica. In order to fully understand the environmental impacts of the Master Plan, it is imperative that these issues are adequately analyzed.

SURFACE TRANSPORTATION

Environmental Impacts and Analysis

Figure 4.3.2-4 of the DEIR identifies street segments that will experience more airport traffic with implementation of the LAWA staff-recommended Alternative C. Several street segments in Santa Monica are identified to receive more airport traffic. However, the DEIR fails to analyze any traffic intersections in Santa Monica, in spite of our NOP letter's identification of 22 intersections in Santa Monica for analysis. The DEIR is clearly flawed in this analysis of the surface transportation impacts of the Master Plan.

The DEIR analysis relies upon several Master Plan transportation improvements, including the LAX Expressway, people mover, and Green Line transit extension, to help mitigate the Master Plan surface transportation impacts. However, the creation of new on-site airport facilities, including new terminal facilities, is proposed to occur during Phase 1 of the Master Plan, while the aforementioned transportation improvements occur after Phase 1. This phasing creates a multi-year period where surface transportation impacts will be severely exacerbated prior to implementation of improvements that help mitigate those impacts.

Appropriate Mitigation Measures

The DEIR must fully evaluate the surface transportation impacts associated with the Master Plan, and provide mitigation measure to minimize those impacts. For any Santa Monica intersections that are negatively impacted, mitigation measures that are acceptable to the City of Santa Monica must be proposed.

Any Master Plan improvements that help mitigate the surface transportation impacts of increased passengers and cargo must be implemented prior to development of new terminal facilities.

The DEIR forecasts a 50 percent increase in transit usage as a result of implementation of Phase I, which includes an improved location for the transit center and additional fly-away locations. In order to ensure the maximization of transit possibilities, the siting and development of a new transit center must be identified and approved by bus services providers, including the Santa Monica Big Blue Bus.

GENERAL AVIATION

Environmental Impacts and Analysis

A critical concern for Santa Monica is the impact of any Master Plan changes on the general aviation (GA) facilities and operations at LAX. Reduction of LAX facilities and/or displacement of operations, particularly business jet operations, create a substantial impact on other airports in the basin. This is already a problem that has created significant and unmitigated impacts on Santa Monica because of the congestion and lack of adequate business jet facilities at LAX.

Santa Monica Airport (SMO) has been subjected to increases in transient business jets using our air field due to inadequate air side and landside facilities at LAX. Additionally these aircraft using Santa Monica Airport are also increasingly of a size that appear inappropriate in scale and character for both the airport facility and the surrounding West Los Angeles and Santa Monica community ----- which is tightly situated in densely populated residential areas. This represents a very substantial concern and problem which requires any developments at LAX to not only stop the displacement of business jet aircraft but to, in fact, return this previously displaced traffic to its proper setting.

As the proposed LAX Master Plan repeatedly states, LAX is the "gateway" facility for the region and the hub of economic activity. The re-positioning of LAX as the center of business jet aircraft activity will allow better integration of connections and coordination of business travel and meeting. LAX is the most appropriate setting for business jet aircraft accessing the Southern California area, particularly the westside of the region.

Business jet aircraft are more appropriately served at LAX as it can provide for a higher margin of safety with longer runway surfaces and safety areas, more high speed turn outs and taxiways, dedicated airspace, continuous tower support and a full complement of emergency facilities and services. The re-focusing of

business jet aircraft activity to LAX will provide opportunities for better integration with commercial air operations, rental cars, customs and better maintenance and support services for such aircraft.

The DEIR states that under all the development alternatives, including the LAWA staff-recommended Alternative C, the total acreage committed to GA will be reduced from 14 acres to between 5 and 6 acres. A stunning 62% reduction can only further displace GA operations. Sharing any space with air carrier maintenance activity would likely diminish or overwhelm less financially lucrative GA jet service. The continued displacement of GA operations from LAX has had, and will continue to have, significant environmental consequences for the Santa Monica Airport and the City of Santa Monica. The DEIR must evaluate these environmental impacts, especially in the areas of noise, surface transportation, airspace safety and air quality.

GA has always been a vital part of LAX history and should remain so, particularly the business jet aircraft, which are becoming a significant part of the GA fleet. In all of the alternatives presented in the draft LAX Master Plan, the plan indicates an expansion in GA facilities by increasing total square footage from 144,000 square feet to 244,000 square feet with the addition of a new 100,000 square foot hangar facility at Sepulveda and Century. However this is not analyzed in the DEIR, nor reconciled with the intended reduction of acreage for GA use.

Appropriate Mitigation Measures

The DEIR must fully evaluate the environmental impacts associated with decreased GA facilities, and provide mitigation measure to minimize those impacts. In order to provide adequate opportunities for the basing of business aircraft, as well as to adequately handle transient business, larger areas of unimpaired space are needed for vehicle parking and servicing. We recommend that no reduction in GA-committed acreage be made. LAWA should provide a covenant or land restriction to the permanence of dedicated acreage, expanded facilities and perpetual operating Fixed Base Operations (FBOs) for business jets. LAX should provide for three FBOs, which would truly allow a full range of services and healthy competition.

The proposed airside improvements with additional taxiways and aircraft movement areas are of significant importance to improving GA-business jet services. An existing and rapidly growing problem at LAX is the airfield congestion and related delays resulting in uncertain scheduling. The proposed extensive aircraft taxiway and other movement area improvements could provide readier access to and from runways for GA-business jet aircraft. The improved separation of runways could increase the number of aircraft that can takeoff and land in tandem, allowing for better interposition of GA business jet aircraft ---- if

the additional capacity isn't consumed by "sharing" facilities with air carrier or cargo uses.

The dedication of one runway, exclusive of air carrier service, for small to mid-size jets (small to mid-size in terms of LAX but unquestionably too large for adjacent GA airports) has great potential to not only stem the rate of displacement of GA jet aircraft, but also to be an affirmative support for the operations of GA jet aircraft and to provide a positive basis for the return of those previously displaced to SMO. In order for the business community to make appropriate decisions and investments, such as basing jet aircraft operations, the plan needs to formally dedicate a runway to use by GA jet aircraft in perpetuity, otherwise air carrier and cargo demand will overwhelm the less financially lucrative business jet users.

The provision of a dedicated runway for business aircraft would also enhance operations and safety in the region surrounding LAX. Instrument departures from Santa Monica must be integrated with LAX departures as their pathways intersect. This requires intense coordination between the two air traffic control towers and the region and often results in aircraft having to sit idling for extended periods of time at Santa Monica waiting clearance at LAX. These aircraft should all be operating under the control and guidance of a single tower, which has the essential benefit of direct visual contact and a single voice. In addition, the establishment of a primary business operations center at LAX will also allow for the development of more efficient air space planning and procedures for both departures and arrivals. A dedicated GA runway must also have full operational support services such as a dedicated instrument landing system, approach lights and air traffic control tower.

Total airside acreage committed to general aviation support facilities must expand beyond the current 14 acres in order to fully support general aviation, including business jet operations, with a full compliment of both based aircraft and transit parking spaces, executive terminal facilities, vehicle parking and pick-up/drop facilities and transport to rental vehicle sites and local hotels.

The Master Plan must provide for, at minimum, three full-service fixed-base operators specifically for general aviation. The Master Plan must include expanded and enhanced general aviation capacity, services, and facilities, particularly for jet aircraft. An increase in facility space to at least 244,000 square feet should be accomplished as soon as possible. Enhanced, fully incorporated and dedicated ground transportation improvements, particularly access roadways and services, to and from general aviation facilities, including general aviation / business user exclusive access roadways and entries, should be incorporated in the Master Plan. Parking improvement plans must include enhanced vehicular

Mr. Jim Ritchie
Page 6 of 6
August 1, 2001

parking, as well as dedicated drop off/pick up accommodations at all general aviation facilities.

The development of an operational and business plan is essential for the maintenance and enhancement of general aviation, particularly with regard to GA jet aircraft operations at LAX, including appropriate long-range feasibility and trend studies. A business plan and aggressive marketing program is necessary to attract and recapture general aviation jet aircraft activity at the earliest possible date.

INDUCED SOCIO-ECONOMIC IMPACTS

Environmental Impacts and Analysis

The DEIR finds that the Master Plan alternatives will induce between 13,000 and 30,000 new households in the region, including between 2,600 and 4,800 new households in a 10-mile radius. A significant proportion of these new households are expected to be in need of affordable housing. The DEIR concludes that this is a small amount in comparison to expected total growth in the region. However, given the high cost of housing in the region, and particularly in the Westside areas near LAX, providing affordable housing for these new households will be a critical local and regional impact.

Appropriate Mitigation Measures

The DEIR must identify measures to ensure the creation of affordable housing for new household growth that will be induced by the Master Plan.

Thank you again for the opportunity to review these draft documents. We look forward to your response to our comments.

Sincerely,

Michael Feinstein
Mayor

RE: Draft Supplemental EIS/EIR for the LAX Master Plan

Dear Mr. Ritchie and Mr. Kessler:

The future of LAX and its impact upon traffic congestion, noise and air pollution, and human safety in the air and on the ground are of great interest to the City Council and residents of Rancho Palos Verdes. The City Council submitted a comment letter dated September 20, 2001 regarding the LAX Master Plan Draft EIS/EIR.

On November 5, 2003 the City Council of Rancho Palos Verdes reviewed key components of the Draft Supplemental Environmental Impact Report for the LAX Master Plan, Alternative "D". On behalf of the City Council and residents of Rancho Palos Verdes, I respectfully submit the following new concerns for consideration in the final EIS/EIR:

1. 1996 Baseline Data Inadequate for EIS/EIR
The draft EIS/EIR document predominately utilizes 1996 data as the benchmark for mitigation considerations and comparisons between Alternatives. However, in some instances the baseline year has been updated to year 2000. We feel the EIS/EIR should establish a consistent baseline year throughout the document and that year should be the most current available.

2. Supplemental EIR Non-Compliance with CEQA
While the City applauds Mayor James Hahn's initiative to develop Alternative "D", in response to the September 11th terrorist attacks, the City believes the proposed plans under Alternative "D" are significantly different from the other LAX Master Plan Alternatives "A", "B", and "C" and therefore incomparable in purpose and vision. The City concurs with the South Bay Cities Council of Governments that a new revised draft EIS/EIR should have

been prepared to review Alternative "D" and it's comprehensive impacts instead of addressing Alternative "D" in a Supplement to the 2001 Draft EIS/EIR.

3. Capping Growth at 78 Million Annual Passengers

The goal of limiting passenger capacity through design control measures seems implausible given that the runway designs of Alternative "D" are similar to Alternative "C". While both Alternatives lengthen both north runways and the separation distance in between, Alternative "D" actually extends one runway (RW 6L/24R) nearly 1,000 feet more than Alternative "C". We believe the capacity of the Alternative "D" runways is underestimated at 78.9 million annual passengers and more comparable to Alternative "C" projection of 89.6 million passengers. In addition, the proposed runway improvements of Alternative "D", unlike Alternative "C", accommodates the new Super Jumbo A380 aircraft with about 600 seats, which will increase the number of passengers per aircraft operation. Considering the capacity growth potential of these runway improvements, the City is unclear how forecasts in 2015 (121.06 passengers per air carrier operation) can be lower than the actual number of passengers per air carrier operation in year 2002 (123.18 passengers).

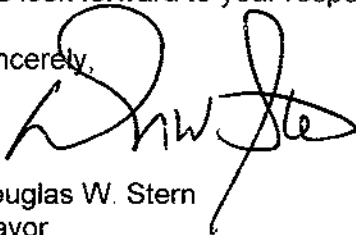

4. Security Measures

The enhanced security measures and improvements advocated by Alternative "D" seem counterintuitive. The emphasis of centralizing major components, such as passenger check-in and parking structures, may potentially create unfavorable conditions for a single point of possible disruption, i.e. the proposed People Mover circulation system. The RAND Corporation conducted an independent study of the proposed security measures and determined that security would not increase from current LAX safety levels. The City requests LAWA and the FAA to take into consideration the RAND Corporation Study findings.

As a member of the LAX Community Noise Roundtable, the City supports the attached comment letter, which more fully addresses the omissions and deficiencies of the Supplement to the Draft EIR. Lastly, the City Council of Rancho Palos Verdes believes a regional solution for addressing increased passenger and air cargo demand is essential for Southern California and again requests LAWA and the FAA to consider a regional airport system as a viable alternative in the discussion of the LAX Master Plan.

We look forward to your response to our comments.

Sincerely,

Douglas W. Stern

**Re. LAX MASTER PLAN SUPPLEMENT TO THE DRAFT ENVIRONMENTAL IMPACT
STATEMENT / ENVIRONMENTAL IMPACT REPORT
(CLEARINGHOUSE NO. 199 706 1047)**

Dear Mr. Ritchie:

The City of Los Angeles Department of Transportation (LADOT) has reviewed the Supplement to the Draft Environmental Impact Statement / Environmental Impact Report (DEIS/DEIR) for the LAX Master Plan project. LADOT has worked closely with Los Angeles World Airport (LAWA) staff and their consultants to develop an acceptable off-site traffic impact analysis for the preferred project alternative (Alternative D) and to prepare a transportation mitigation program designed to address the anticipated traffic impacts of the proposed modernization of the Los Angeles International Airport. Also, LADOT will continue to work with LAWA staff, their consultants and Caltrans in the development of any necessary Project Study Reports for the proposed freeway system improvements.

Since this is a supplement to a Program DEIS/DEIR, several detailed design matters will be evaluated and finalized at a later date. It is during the development of the engineering plans that the feasibility of several of the key infrastructure improvement proposals can be determined. For these reasons, LADOT and the Department of Public Works should be consulted in the preparation and evaluation of the final designs of the key transportation elements of the preferred LAX Master Plan alternative, including the proposed:

- Automated People Mover System
- Internal Airport Roadway System
- I-405 Freeway / Lennox Boulevard Interchange
- Inter-Modal Transportation Center
- Ground Transportation Center
- Commercial Vehicle Holding Area
- Consolidated Rental Car Facility

LADOT offers the following comments on the LAX Master Plan DEIR/DEIS:

GENERAL COMMENTS

1. MITIGATION PHASING PLAN

To ensure that the full build-out of the LAX Master Plan project does not take place until all of the required transportation improvements are implemented, a mitigation implementation plan showing when transportation improvements will be guaranteed and constructed commensurate to the level of development has been developed (Table S4.3.2-13 on page 4-284 of the Main Document) was prepared in consultation with LADOT. Any changes to the phasing plan shall require approval by LADOT.

2. PROJECT DESIGN / QUEUING ANALYSIS

LADOT should be consulted early in the advanced planning and design process of the key infrastructure features of Alternative D. It is recommended that queuing analyses, subject to review and approval by LADOT, be conducted before the final designs of the new internal airport roadways that provide access to/from the Intermodal Transportation Center, the Ground Transportation Center, the consolidated Rental-Car facility, and the Commercial Vehicle Holding Area. The queuing analyses will assist in determining the need for future traffic signals, intersection turn lanes, acceleration and deceleration lanes, and necessary transition lengths. The private airport roadways shall be designed in a manner to provide adequate merge/weave distances, lane storage capacities and turn radii to avoid queuing and spill-over problems onto the public roadway system.

The automated people mover (APM) system should be designed and constructed to minimize disruption and vehicle delay on the public roadway and transit system. The APM system should be elevated above street level and there should be no at-grade crossing of public roadways.

The parking and driveway plans for the consolidated Rental-Car (RAC) facility should be designed to comply with LADOT standards and to minimize any possible conflicts between users of the RAC facility and users of the abutting street system. The site plans for the RAC facility are subject to review and approval by both LADOT and the Bureau of Engineering.

3. RELATED PROJECTS - PLAYA VISTA

The Notice of Preparation for the second phase of the Playa Vista project was released in November 2002. The proposed land use for this project is now significantly reduced from an earlier project description. The traffic forecasts for the LAX Master Plan traffic impact analysis assume the earlier, larger Playa Vista Phase 2 land use definition. In doing so, the LAX Master Plan traffic analysis may significantly and conservatively overstate the projected traffic volumes along the I-405 Freeway, Jefferson Boulevard, Lincoln Boulevard, Centinela

Avenue, and Sepulveda Boulevard. It is recommended that an additional traffic model assignment be prepared to reassess the anticipated LAX Master Plan project impacts along these key corridors and at the Alternative D study intersections. This would require that the future environmental baseline and Alternative D scenarios be re-analyzed to include the correct project definition for Playa Vista Phase 2.

4. **LINCOLN CORRIDOR TASK FORCE**

The Lincoln Corridor Task Force (LCTF) was formed to join several agencies in an effort to address the increasing congestion along a five-mile stretch of Lincoln Boulevard between Manchester Avenue and the Santa Monica (I-10) Freeway and to determine the long-term transportation needs of the corridor. The LCTF includes representatives from Caltrans, the County of Los Angeles, the Cities of Los Angeles, Culver City and Santa Monica, the Los Angeles County Metropolitan Transportation Authority, the Southern California Association of Governments, and the California Coastal Commission. Ultimately, the LCTF's goal would be, with consensus from the participating agencies and input from the public, to develop a mutually agreeable transportation improvement plan for Lincoln Boulevard which may include an array of capacity enhancing measures, transit enhancement strategies, and improved corridor aesthetics.

If and when the agencies of the LCTF are successful in adopting a mutually agreeable set of transportation improvements for the Lincoln Boulevard corridor, the proposed LAX Master Plan improvements along the corridor should be reexamined to explore the option of constructing some or all of the LCTF improvements in lieu of the LAX Master Plan improvements if it is determined by LAWA and LADOT that (1) the LCTF improvements are regionally superior, and (2) they fully or partially mitigate the project-related traffic impacts of the LAX Master Plan project. By contributing to the implementation of the improvement plan developed by the LCTF, the LAX Master Plan can address the project-related impacts along Lincoln Boulevard by fully or partially reducing traffic impacts with the improvements developed by the LCTF.

5. **AVIATION BOULEVARD RIGHT OF WAY**

The proposed reconfiguration of the airport should preserve the right-of-way for the existing BNSF rail structure along the west side of Aviation Boulevard. To allow for future connectivity of transit rail lines, preserving this right-of-way would maintain the opportunity for MTA or other agency to connect rapid transit corridors to the north.

6. **TAXICAB GENERAL PRIORITIES FOR THE COMMERCIAL VEHICLE HOLDING AREA**

LADOT staff should be consulted early in the design process of the Commercial Vehicle Holding Area (CVHA). Key elements that should be considered when planning and designing the CVHA are:

- The taxicab holding lot should have a capacity of at least 125 vehicles.
- To operate effectively and efficiently, the taxicab holding lot and dispatching booth must be in close proximity to the taxi stands serving LAX.
- Taxi stands must be in close proximity to baggage claim area exits.
- Currently, there are fewer than 60 vehicle spaces for taxicabs in the CTA. We recommend no fewer than 75 spaces - either in the CTA or, if required to use the Ground Transportation Center, in close proximity to passenger exit areas.
- There must be adequate (i.e., easily discernable and strategically placed) signage inside and outside the terminal building(s) directing passengers to taxicabs.
- There should not be any co-mingling (i.e., there must be separation) of private vehicles and taxicabs.
- There should be separation of vehicles of the different types of commercial ground transportation operators. Buses, limousines, vans, hotel/motel and rental car courtesy vehicles and taxicabs must each have their own separate locations for picking up passengers - which they can enter and exit without conflicting with each other. Note: buses, limousines and vans can coexist peacefully, as they do now, in a general holding lot area.
- There should be a phone line(s) from the taxi stands to the taxicab holding lot facility for potential off-peak passenger service.

In addition, special consideration should be made to allow City-franchised taxicabs limited access to the Central Terminal Area (CTA). With extensive driver background checks and a state of the art screening system for each taxicab entering the CTA, the overall project goal of safety and security can be achieved. Allowing secure City of Los Angeles taxicabs to serve the CTA may further reduce traffic demands at the Ground Transportation Center (GTC) and at the Intermodal Transportation Center (ITC).

7. **PROJECT TRIP GENERATION - THRESHOLD**

The amount of airport traffic generated during peak commuter hours, not airport Million Annual Passengers (MAP), is the indicator used by LADOT to determine significant traffic impacts and surface street congestion levels. If Alternative D is approved, LADOT recommends that LAWA staff, in consultation with LADOT, develop "trip monitoring and management" strategies to: (1) further reduce the airport-bound vehicle trips; and/or (2) provide additional transportation improvements when established peak hour trip generation threshold levels are exceeded. These strategies can include additional Fly-Away Shuttle locations, Intelligent Transportation Systems improvements, intersection improvements, and/or Transportation Demand Management (TDM) strategies promoting ride-sharing for airport

employees. To efficiently and accurately monitor the threshold levels, pavement embedded detector loops or equivalent should be installed to electronically record vehicle entry/exit rates at key entry/exit points to airport facilities including, but not limited to, the Ground Transportation Center (GTC), Intermodal Transportation Center (ITC), Rental Car Facility, etc.

8. INTELLIGENT TRANSPORTATION SYSTEMS

To enhance the transportation infrastructure improvements associated with the proposed project, Intelligent Transportation Systems (ITS) should play a key role in the overall modernization of the airport. ITS strategies (including computerized signal and surveillance systems, changeable message signs, and highway advisory radio) can provide improved incident management and route guidance for airport-bound motorists. Also, an effective ITS program can help to appropriately direct airport-bound traffic on the principal roadways designed to carry heavy volumes of traffic and off of the local residential streets.

COMMENTS ON CHAPTER 4 (MAIN DOCUMENT)

9. ALTERNATIVE D LEVELS OF SERVICE

Some of the intersection level-of-service (LOS) results summarized in Table S4.3.2-4 (page 4-254 to 4-258) do not match with the results that were approved by LADOT prior to the release of this report. LAWA staff and traffic consultants should work with LADOT to remedy these discrepancies.

10. CONGESTION MANAGEMENT PROGRAM

Starting on page 4-261, in the Congestion Management Program (CMP) Analysis, the report identifies the CMP arterials and the CMP Freeway Monitoring Locations. However, the CMP Arterial Monitoring Stations are not listed. These intersections should be identified in the CMP Analysis and should be analyzed consistent with the CMP guidelines for transportation impact analysis. This comment also applies to the Technical Report 2b and is repeated below.

11. TRANSIT ENHANCEMENTS

In Tables S4.3.2-11 and S4.3.2-12 (pages 4-275 to 4-284), it is indicated that several of the significant traffic impacts resulting from Alternative D can be mitigated through a fair-share contribution to MTA's Metro Rapid Bus Program or to other regionally significant transit enhancements. Many of these significant traffic impacts are expected along Lincoln and Sepulveda Boulevards, which are two corridors included in MTA's 5-year plan for deployment of the Metro Rapid Bus Program. Expansion of the existing transit system, through additional buses and improved signal operations providing priority treatment for buses, can serve as an effective vehicle trip-reduction measure. However, it is unclear if the proposed transit enhancements would augment existing bus routes operated by other providers, by new service

offered by the airport, or by a combination of the two. LAWA should work with MTA, LADOT and with the other local-area bus service providers to investigate these options.

A key aspect of the proposed Alternative D project is the expansion of the LAX Fly-Away program. New remote locations are being evaluated in Downtown Los Angeles, Norwalk, and in the Cities of Long Beach and Inglewood. Also, a second Fly-Away terminal is being considered in the San Fernando Valley area. Since Alternative D would restrict CTA access to all vehicles other than the Fly-Away buses, there is a clear incentive for airport-bound travelers to travel to LAX via the Fly-Away buses. Therefore, should the proposed fair-share transit enhancements described above not be implemented, expansion of the Fly-Away program, beyond the proposed remote terminals described above, can serve as a reasonable substitute mitigation measure to provide an attractive alternative for airport-bound passengers through limited-stop service using buses equipped with luggage racks that travel along the Lincoln and Sepulveda corridors.

It should be noted that the future transit mode-split assumptions in the development of the year 2015 Alternative D traffic forecasts are conservative. With the door-to-door convenience afforded to the passengers of the Fly-Away buses, the true trip-reduction benefit of the program may be higher than assumed in the traffic impact analysis.

12. MITIGATION PROPOSAL FOR FACILITY #45

In Table S4.3.2-11, on page 4-276, the mitigation proposal for the intersection of the I-105 Freeway ramp/Continental City and Imperial Highway (facility #45) includes the upgrade of the traffic signal to operate under LADOT's Adaptive Traffic Control System (ATCS). However, the implementation of ATCS at this location is already programmed by LADOT and is, therefore, not an available mitigation measure. The proposal of ATCS should be removed from the mitigation description.

13. 2015 ALTERNATIVE D MITIGATION PLAN

In Section 4.3.2.10.2, on page 4-295, it is indicated that three of the study intersections are expected to remain unmitigated after implementation of the proposed transportation mitigation program. However, upon review of the traffic impact analysis in the report, six intersections would still remain significantly impacted. While mitigations are proposed for these six locations, the project impacts, although reduced, still exceed LADOT's significant impact threshold. The volume-to-capacity ratios are appropriately disclosed in the report; however, it appears that the results were incorrectly summarized in this section. This comment also applies to the Technical Report 2b and is repeated below. The six intersections that would remain significantly impacted are:

- Airport Boulevard & Century Boulevard
- Centinela Avenue & Sepulveda Boulevard
- I-105 Freeway/Continental City Drive & Imperial Highway
- Lincoln Boulevard & Jefferson Boulevard

- La Cienega Boulevard & Imperial Highway
- La Cienega Boulevard & Century Boulevard

COMMENTS ON TECHNICAL REPORT 2b

14. MITIGATION MEASURES FOR ALTERNATIVE D

In Section 5.2, on page 36, it is indicated that three of the study intersections are expected to remain unmitigated after implementation of the proposed transportation mitigation program. However, upon review of the traffic impact analysis in Attachment E of Technical Report 2b, six intersections would remain significantly impacted. While mitigations are proposed for these six locations, the project impacts, although reduced, still exceed LADOT's significant impact threshold. The volume-to-capacity (V/C) ratios for the intersections are correctly reflected in the individual intersection V/C worksheets in the report; however, it appears that the results were incorrectly summarized in this section. These intersections are listed in comment #13 above.

15. CHAPTER 6 - CONGESTION MANAGEMENT PROGRAM

Starting on page 45, in the Congestion Management Program (CMP) Analysis, the report identifies the CMP arterials and the CMP Freeway Monitoring Locations. However, the CMP Arterial Monitoring Station are not listed. These intersections should be identified in the CMP Analysis and should be analyzed consistent with the CMP guidelines for transportation impact analysis.

16. ATTACHMENT C - LOS SUMMARIES FOR ALTERNATIVE D

It should be noted that the intersection volume-to-capacity (V/C) ratios summarized in Attachment C do not match the V/C ratios listed in the report. By year 2015, all of the study intersections within the City of Los Angeles will operate under the Adaptive Traffic Control System (ATCS). The V/C ratios listed in Attachment C do not reflect the 0.03 credit (V/C reduction) afforded by the ATCS traffic signal operating system.

17. ATTACHMENT E - PROPOSED TRANSPORTATION IMPROVEMENTS

In the report, it is indicated that the project would result in a significant traffic impact at the intersection of Sepulveda Boulevard and Centinela Avenue (facility #22). An intersection improvement has been proposed to mitigate the impact. However, the report does not disclose that while the mitigation does reduce the project impact, it does not reduce it to a level of insignificance. To fully mitigate the impact at this intersection, LADOT recommends that, in addition to the proposed intersection improvement, a fair-share contribution to MTA's Metro Rapid Bus Program or other transit enhancement be provided by LAWA. Since there are several impacted intersections along the Sepulveda Corridor that are already proposed to be

mitigated through expansion of the existing transit system providing service to this roadway, the residual impact at the intersection of Sepulveda Boulevard and Centinela Avenue can be fully mitigated. Doing so will reduce the number of intersections that remain significantly impacted after implementation of the mitigation program from six to five.

The V/C results shown in the table for the intersection of the I-105 Freeway ramp/Continental City and Imperial Highway (facility #45) are not consistent with the results that were reviewed and approved by LADOT before release of the DEIR supplement, nor are the results consistent with the V/C ratios that are presented in the individual level-of-service worksheets in Attachment I of Technical Report 2b. The intersection improvement proposed for this intersection does not fully mitigate the project's traffic impact. Also, since the implementation of ATCS is already programmed by LADOT at this intersection, it is not an available mitigation measure. The proposal of ATCS should be removed from the mitigation description. Therefore, to account for the incorrect V/C ratios reported and the unavailability of ATCS as a mitigation, the report should disclose that the intersection of the I-105 Freeway ramp/Continental City and Imperial Highway would remain significantly impacted even after implementation of the mitigation program.

CONCLUSION

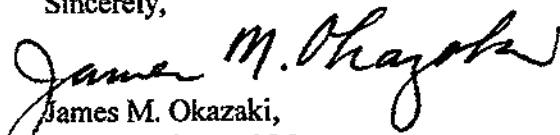

We look forward to working with LAWA in the further development of a comprehensive ground access plan to the Los Angeles International Airport, and in the advance planning process for Alternative D. During this process, we recommend that LAWA, in consultation with LADOT and Caltrans, address the results of the Congestion Management Program analysis by investigating regional solutions to freeway mainline congestion. In the event that freeway mainline improvements above and beyond what have already been explored or programmed (like the I-405 High-Occupancy-Vehicle Lane project) cannot be identified, it may be necessary to explore improvements to key regionally-significant roadways to provide airport-bound motorists with additional and enhanced arterial route choices. One example may be grade-separating key intersections along the La Cienega corridor, which may help to relieve the delays that are expected to increase along the I-10-to-I-405 route to the airport.

Also, during the advance planning of Alternative D, LADOT requests that LAWA investigate the possibility of also allowing taxicabs into the Central Terminal Area (CTA) to pick-up arriving passengers only. This can serve to reduce the number of vehicles at the Ground Transportation Center (GTC) and the Intermodal Transportation Center (ITC), which would further reduce traffic congestion and improve the overall operation of these terminals. Taxicabs, as the only form of commercial ground transportation at the airport that is franchised and thoroughly regulated by the City, deserves

special consideration, along with the Fly-Away buses operated by LAWA, to be allowed access to the CTA. Authorized Taxicab Management, the current taxicab dispatching and supervising company at LAX is ready and willing to work with LADOT and LAWA to establish a state of the art screening system for every driver and vehicle dispatched into the CTA to insure that the security goals of Alternative D are not compromised.

If you have any questions, please call Jay Kim or Tomas Carranza of our West Los Angeles Development Review Office at (213) 485-1062.

Sincerely,

James M. Okazaki,
Assistant General Manager

Alan L. Murphy
Airport Director

November 5, 2003

Mr. Jim Ritchie
City of Los Angeles
Los Angeles World Airports
LAX Master Plan Office
P. O. Box 92216
Los Angeles, CA 90009-2216

**Subject: Comments on July 2003 LAX Master Plan Supplement to the Draft
EIS/EIR**

Dear Mr. Ritchie:

Based upon our review of the above-referenced document, we provide the following comments on behalf of John Wayne Airport.

Document reference location:

- Document: Appendices A, B, C, D, E, F, G and H
- Section: S-B. Existing Baseline Comparison Issues – 1996 to 2000
- Sub-section: 2.2 Regional Trends
- Page: 3
- Table: S1 bottom half which lists "Aircraft Operations and Market Share" for SNA (John Wayne Airport)

Comment:

- The 1996 SNA Aircraft Operations count of "468,811" is incorrect. The correct count is "452,955." This revised 1996 count results in a change to the SNA percentage for "AAG" (Average Annual Compound Growth Rate) from the incorrect value of "-4.6%" to the correct value of "-3.8%." And, this correct 1996 operations count also results in a change to the SNA percentage for "1996 Market Share" from "19.7%" to "19.1%."

Thank you for the opportunity to comment on this important environmental document. If you have any questions or need any additional information, please contact my staff representative John Leyerle at (949) 252-5239.

Sincerely,

for
Alan L. Murphy
Airport Director

Re: Draft Supplemental EIS/EIR for the LAX Master Plan

Dear Mr. Ritchie and Mr. Kessler:

The City Council of the City of Rolling Hills Estates, located on the Palos Verdes Peninsula just south of Los Angeles International Airport (LAX), is pleased to be given the opportunity to provide comment on the Draft Supplemental EIS/EIR for the LAX Master Plan.

While the City of Rolling Hills Estates may not be directly impacted by LAX, in terms of direct impacts that are associated with ground-related adjacencies, the City *is* often impacted from air traffic overhead, including but not limited to aircraft noise, air pollution, and potential safety concerns with smaller aircraft from Torrance airport.

The City Council of Rolling Hills Estates has taken a position to state that any improvements to LAX must carefully consider flight patterns over the Palos Verdes Peninsula, such that aircraft must not "cross" over the Peninsula, particularly at relatively low altitudes, as is presently often the case.

The City Council has also taken a position to support the comments and questions submitted to you by both the County of Los Angeles (report prepared by A.C. Lazzaretto and Associates, dated October 2003) and by the South Bay Cities Council of Governments (SBCCOG). Further, the City of Rolling Hills Estates is in support of the comments and questions submitted to you by adjacent Peninsula Cities and other south bay cities.

Lastly, the City Council agrees with others who have stated that the document is inadequate to understand the full scope of impacts to ground access surrounding the airport, to the communities adjacent to the airport and in the flight path and to demonstrating enhanced safety and security. Additionally, we join with those who favor a binding agreement to cap the airport's growth at 78 MAP.

Mr. Ritchie and Mr. Kessler
Page two

We understand that LAX needs to be modernized. We do not oppose these efforts. However, we want to be assured that the safeguards delineated in the plan are realistic and achievable.

We look forward to your response to our comments.

Sincerely,

Barbara Rauch
Mayor

Comments: my deed says that my property is in the flight path. Every day I experience the sound of loud noises and pray that a plane doesn't fall on my house. At times, I have to ask the person over the phone to hold on until the plane flies by. I see a lot of plane flying digital and not straight. I feel that this Master Plan (LAX) should be evaluated in terms of the noise level. It appears that this will increase the number of flights. It is unfair for you to expect us to adopt this plan and not consider working with the community to reduce noise by sound proofing homes that are in the flight path. Appealing to the community in terms of how this would be a benefit. I request that my property be placed on this list among others in my neighborhood for sound proofing. What are you giving back to the community, noise and constant traffic?

Dear Mr. Kessler:

Airport Commission president John Agoglia doesn't know how someone can look at the report on LAX's nation-leading number of near-misses and say that we don't need to upgrade the airport. I ask how someone can look at the report and say we should bring more planes into an airport that is already far beyond its safe capacity. Everyone wants a safer LAX. We can start by putting a cap on the number of flights. Palmdale and inland empire facilities can take up the slack.

Similarly we are told that the airport master plan, while greatly increasing the number of flights, will help relieve traffic around LAX. If you believe that, I've got a bridge I'd like to sell you.

Sincerely,

Russell Stone

Dear Mr. Kessler

I own apartment buildings near Arbor Vitae and Airport Boulevards and support plan 1 the "No Action/No Project Alternative". I am very opposed to "Alternative D". I feel this will not enhance public safety, and will have the opposite effect. I believe concentrating all passengers in one central screening area subjects them to a large-scale terrorist attack. The Rand study recently confirms this.

The estimated costs of 9 billion dollars for Alternative D is way too expensive and will result in higher fees for the airlines, taxpayers and air travelers. Lower cost alternative must be explored first, before taking this extreme measure.

Implementation of Alternative D will have a significant impact to the environment. Traffic congestion will increase. Currently, many of our tenants walk to work from their apartments. Demolishing our apartment building and others in the area will eliminate affordable housing for airport workers and create more commuter traffic from tenants forced to drive into LAX.

Please submit this letter for the record during the public hearings.

Sincerely,

Ansho Uchima

Dear Mr. Kessler,

I am writing in support of Alternative D for LAX. Specifically, I am in favor of the cap on passenger activity level to 78.9 MAP in 2015 comparable to current levels. This would force a regionalization of transportation that needs to happen. Further, alternative D would link the airport to current public transportation specifically the Green Line.

Please register my support for Alternative D in your decision making.

Sincerely,

Lawrence Lurvey

Re: Request for Extension of Time to Comment on the Supplement to the Draft EIS/EIR for the LAX Master Plan

Dear Mr. Ritchie and Mr. Kessler:

On behalf of the Natural Resources Defense Council ("NRDC") and its members, we are writing to request an extension of ninety days for the public to comment on the Supplement to the Draft Environmental Impact Statement/Environmental Impact Report ("EIS/EIR") for the Draft Los Angeles International Airport Master Plan.

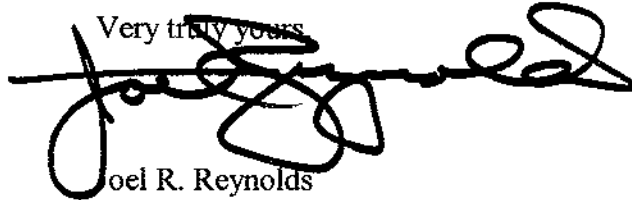

Expansion of Los Angeles International Airport continues to be a matter of significant public concern. Because we believe that the short comment period of 45 days is insufficient to allow meaningful public comment, we request that Los Angeles World Airports extend the public comment period and reschedule the public hearings accordingly. This request is necessitated both by the importance of this matter and the fact that the end of summer is a difficult time for many members of the public to participate in hearings and submit comments. Currently, all of the public hearings are scheduled between August 11 and August 23, a period when many affected community members may be away on vacation or otherwise preoccupied with family matters. An extension of the comment period deadline is necessary to improve the public's opportunity to provide comment on this important matter.

David B. Kessler
Jim Ritchie
July 16, 2003
Page 2

In addition, although we anticipate preparing additional comments based on our review of the Supplement, we are attaching to this letter for your consideration the comments that we previously submitted in 2001 regarding the Draft Los Angeles International Airport Master Plan and Draft EIS/EIR.

Thank you for your consideration of this request.

Very truly yours,

A handwritten signature in black ink, appearing to read "Joel R. Reynolds", written over the typed name below.

Re: Comments on the Draft Los Angeles International Airport Master Plan and Draft Environmental Impact Statement/Environmental Impact Report

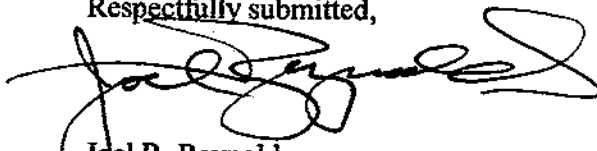

Dear Mr. Ritchie and Mr. Kessler:

On behalf of the Natural Resources Defense Council ("NRDC") and its over 500,000 members, we submit these comments on the documents cited above.

In light of significantly changed circumstances since the draft EIS/EIR was circulated for public comment, we believe that the document should be withdrawn and a new EIS/EIR prepared. In the alternative, we request that a supplemental environmental impact report/statement addressing the implications of the September 11 attacks for the planned expansion of LAX be prepared before any decision on the project is made. Without any doubt, this extraordinary event constitutes significant new information that may fundamentally alter the plan as proposed and, indeed, may ultimately dictate a changed result. The implications of the attack for air travel and security issues are fundamental, as is the importance of meaningful public input on a project as significant as the proposed LAX expansion. Under these circumstances, additional environmental review and public comment is unquestionably required.

Without waiving these requests, we submit as an Attachment brief comments on the air quality and health assessment portions of the draft EIS/EIR as previously circulated for public comment.

Respectfully submitted,

Joel R. Reynolds
Senior Attorney

ATTACHMENT

The Air Quality and Human Health Risk Assessment portions of the LAX EIS/EIR raise a number of concerns:

LAWA Should Not Take Credit for Mitigation Measures It Cannot Ensure

LAWA cannot include or take credit for measures over which it has no control or enforcement, such as a requirement of all construction deliveries to be made with clean fuel vehicles. The modification of airplane operating procedures, which would contribute some of the largest emissions reductions, requires FAA approval. Other proposed measures, such as Intelligent Transportation Systems and traffic management programs require cooperation from MTA and Caltrans. LAWA's commitment to and control over the list of mitigation measures needs to be clarified. Finally, the Technical Report 4, Attachment X, which contains details about air quality mitigation measures, should be redone in a legible electronic rather than scanned form.

The No Action/No Build Scenario Does Not Necessarily Mean Greater Public Risk

We disagree that the No Action/No build scenario would generate greater air quality risks to the public. Most of the air quality improving measures included in the mitigation and Environmental Action plans could be implemented under this scenario without any changes to current runways. Therefore, the EIS/EIR statements, such as "All of the Master Plan build alternatives would be better, producing lower overall emissions, than the No Action/No Project alternative,"¹ are misleading and false. The appropriate comparison would be with a project that included air quality improvement measures but did not add any changes to the current runways.

The Human Health Risk Assessment goes one step further and states that the No Action/No Project Alternative "would cause maximally exposed individual cancer risks and non-cancer hazards to increase in all areas near LAX in both horizon years."² This statement could only be true if the mitigation measures were only applied to the three build alternatives. Again, most of those mitigation efforts could also be implemented without any new runway construction or expansion. In fact, health risks from the No Action/No Project Alternative may be significantly over stated, if the recent Fleet and Commercial Airport Ground Access rules were not incorporated into the emission inventory projections.³

1997 Air Quality Standards Should Be Included in the Analysis:

¹ On-Airport Emissions Key Conclusions, page 4-460, LAX EIS/EIR

² 14a Human Health Risk Assessment Technical Report (HHRA), page 2, LAX EIS/EIR

³ http://www.aqmd.gov/news1/Fleet_Rule_Home.htm and <http://www.aqmd.gov/rules/rulesreg.html>

The air quality analysis in the EIS/EIR should include the ozone and fine particulate standards passed by the US EPA in 1997. The standards were unanimously upheld by the Supreme Court in February of this year. Regardless of the previous uncertain legal status of these standards, LAWA should have included analysis under the more protective standards, as a conservative precaution. Now that these standards are slated for implementation, they must be used in the EIS/EIR.

Though the EIS/EIR included California Ambient Air Quality Standards (CAAQS), which are slightly more stringent than older national standards, the new national standards are even more protective of human health. Additionally, LAWA should be more sensitive to these concerns given the current "Extreme" nonattainment status of the Los Angeles area with respect to ozone and "Serious" status with respect to particulates.⁴

The "Preferred Alternative" Would Violate Standards for Particulate Matter

In the General Approach and Methodology section, it is stated that the current method to account for PM_{2.5} is to use PM₁₀ as a surrogate.⁵ If this is so, then both the construction and operational unmitigated emissions from all alternatives would exceed the new PM_{2.5} standards by significant amounts ranging up to 550% for Alternative A during the peak of construction.⁶ With the menu of mitigation efforts in place, all alternatives are still predicted to violate the new particulate standards. The preferred alternative is predicted to be at more than twice the standard during construction and full operation.⁷ Nowhere in the EIS/EIR are these issues addressed.

Proposed Mitigation for Particulate Matter and Ozone is Utterly Insufficient

Despite the large problems with particulate emissions without mitigation, the mitigation efforts included in the plan reduce particulates the least of all the criteria pollutants, a nominal 5 to 7 percent compared to the up to one third reductions in carbon monoxide (CO). Estimates of particulate reductions are conspicuously missing from Table 4.6-16, which lists the reductions of NO_x, VOC, and CO from mitigation measures. According to Table 4.6-6, stationary sources at LAX contribute significantly to total particulate emissions, accounting for 54 of the 159 tons per year of baseline (1996) emissions, however no mitigation measures are offered to address this large source category. LAWA should focus more attention on mitigation measures that lower particulates.

⁴ "PM10" or PM with average diameter less than or equal to 10 microns.

⁵ PM_{2.5} are particulates with diameters less than or equal to 2.5 microns; page 4-462, LAX EIS/EIR

⁶ Based on Table 4.6-13, LAX EIS/EIR; Calculation: (98 ug/m³ - 15 ug/m³)/15ug/m³, Annual Arithmetic Mean (AAM)

⁷ Based on Table 4.6-20, LAX EIS/EIR; 39 ug/m³ and 34 ug/m³ versus 15ug/m³, AAM

The EIS/EIR also fails to address the impacts of any alternatives on ozone, a major air quality problem in Los Angeles, in terms of meeting state and federal standards.

Conformity Budgets Should Be Included:

The emission levels predicted in the EIS/EIR from the preferred alternative are stated to trigger conformity requirements. However, the conformity analysis including these figures will not be available to the public for some time. Without this analysis, it is impossible to assess the feasibility of any alternatives. LAWA should, at a minimum, include in the EIS/EIR the conformity emissions budget listed in the California State Implementation Plan (SIP), and compare the overall emissions projected in the LAX Master Plan to this budget.

Questionable Emission Estimates for Toxic Air Pollutants:

Although the consultants used a wide variety of referenced sources to construct emission profiles for all of the sources at LAX, the “surveys” that were used to obtain operational factors for all of the equipment were not referenced. It is unclear why a phase I set of emissions estimates was constructed for all sources and then later revised as phase II, only changing emission estimates for aircraft.

The report states that the Phase II emission estimates were “refined based on inspections at LAX and interviews with LAX tenants identified by LAWA.” It is not clear how these inspections and interviews could cause emission estimates for some of the most toxic chemicals, such as 1,3-butadiene, acetaldehyde, acrolein, arsenic, benzene, cadmium, formaldehyde, lead and styrene to be adjusted downward, while other less toxic chemicals such as hexane, copper, nickel and zinc were increased. Lead, for example, was adjusted from an estimated 1,253 kilograms emitted per year from aircraft to 29 kg per year, with no footnoted explanation of anticipated jet fuel changes or any other such possibility. It is implausible that operational parameters could drastically decrease emission estimates for certain chemicals while increasing others.

Emissions of Lead from Airport Activity Must Be Better Addressed:

In the state of California, airports are the largest source of lead, accounting for 149 of the estimated 175 to 182 tons emitted per year.⁸ Lead was listed by the state as a Toxic Air Contaminant (TAC) in 1997, and the Office of Environmental Health Hazard Assessment (OEHHA) recently selected lead as one of five TACs that may cause infants and children to

⁸ Proposed Identification of Inorganic Lead as a Toxic Air Contaminant, California Air Resources Board, March 1997.

be especially susceptible to illness.⁹ OEHHA is currently reviewing lead standards to determine whether they are protective of children's health. The agency has already concluded that even airborne lead levels at one third of the current state standard could result in 10 percent of children having lead blood levels above official levels of concern set by the Center for Disease Control and Prevention.¹⁰

Considering these developments, the exclusion of lead from the air quality and human health risk assessment (HHRA) portions of the EIS/EIR is inappropriate. The EIS/EIR states that emissions of lead are "relatively low and would not contribute to a violation of the Pb NAAQS or CAAQS."¹¹ However, it is known that harmful effects of lead can occur from exposures below the ambient air quality standard. Since the lead standard was put in place over 20 years ago, it has become clear that lead is a potential human carcinogen and a strong neuro- and developmental toxicant at low levels.¹²

The screening report attached to the HHRA actually named lead as a "significant community health concern... released in significant quantities (2,941 kg/yr) from LAX."¹³ It also stated that lead would be "retained as a TAP of potential concern," and the Air Quality report directs the reader to the HHRA for further analysis of lead. However, there it is stated that lead is predicted to be below the ambient standards and therefore eliminated from the analysis.¹⁴ Because lead does not have a Reference Exposure Level (REL), as with other chemicals for which "toxicity criteria are not available," a quantitative toxicity screen was not conducted.¹⁵ In fact, The California Air Resources Board has not yet set a REL for lead because they could not identify a threshold value below which exposure to lead is safe.¹⁶

The final risk analysis completely excludes noncancer effects of lead as well as cancer risks from lead despite the availability of cancer potency factors.¹⁷ The EIS/EIR for LAX is unacceptable without further analysis of such a major threat to public health.

Health Risks are Underestimated:

⁹ Under the Children's Environmental Health Protection Act (Senate Bill 25, Escutia; chaptered 1999) and (Health and Safety Code Sections 39669.5(a)); the five TACs were reviewed and endorsed by the Scientific Review Panel.

¹⁵ HHRA, Appendix B, Page 18, LAX EIS/EIR

¹⁶ Consolidated Table of OEHHA/ARB Approved Risk Assessment Health Values, July 2001.

¹⁷ Consolidated Table of OEHHA/ARB Approved Risk Assessment Health Values, July 2001.

The Executive Summary of Human Health Risk Assessment states that “methods are used that are more likely to overestimate than underestimate possible health risks” and “risk estimates represent upper-bound predictions of exposure, and therefore health risk, that may be associated with living near, and breathing emissions from, LAX during and after implementation of the Master Plan.” The risk assessment, however, upon closer examination, actually underestimates risk in many instances.

The assessment states “cancer risks were estimated for people who grow up and spend most of their adult life near the airport.”¹⁸ Consequently, the analysis was based on exposure durations of 30 years for adults and six years for children. This is counter to common risk assessment guidance recommending exposure durations of 70 years for lifetime cancer risk.¹⁹ The resulting assessment, based on these low exposure duration values, underestimates exposure by over one half.

Inhalation Rates used in the analysis were also at the low end of the spectrum. The US EPA Exposure Factors Handbook²⁰ recommends an average inhalation rate of 1.07 m³/hr, more than 70 percent higher than the 15 m³/day rate used in this assessment. The assessment also selected the highest average adult body weight, 70 kilograms (kg), which leads to further underestimates in weight-adjusted exposure. Guidance indicates that lifespan exposure analysis (0 to 70 years) should use an average body weight of 62-63 kg, depending on the source.²¹ Additionally, if this assessment represents the most sensitive populations, it should use body weight factors for adult females, which range from 62-68 kg, according to EPA’s Exposure Factor Handbook.

Health Risk Assessment Based on Alternative C May Underestimate Risks from Other Alternatives

The risk was also underestimated for the build alternatives under 2005 post-mitigation conditions, because it was based on Alternative C, which the assessment states is “essentially identical” to alternatives A and B.²² Alternative C, however, would include the least construction activity of the three alternatives and therefore would represent the lowest risk of any alternative. Pre-mitigation analysis for 2005 did not state which alternative the modeling was based on; it was simply noted that all three build alternatives were “predicted

¹⁸ HHRA, page 19, LAX EIS/EIR

¹⁹ Office of Environmental Health Hazard Assessment, Exposure Assessment and Stochastic Analysis Technical Document, Chapter 11: Exposure Duration, December, 1996; California EPA, Practices, Needs and Methodologies for Human Exposure Assessment at Cal/EPA, Table 4-4, February, 2001; US EPA Exposure Factors Handbook, ORD, August, 1997.

²⁰ Chapter 5, Table 7

²¹ The CalTOX Model uses a body weight of 62 kg for child/adult combined analysis; OEHHA’s Exposure Assessment and Stochastic Analysis uses 63 kg for age 0-70 analysis, according to Practices, Needs and Methodologies for Human Exposure Assessment at Cal/EPA, Table 4-4, February, 2001

²² HHRA, Page 54, LAX EIS/EIR

to be similar.”²³ Alternative B seems to produce the highest modeled concentrations of TAPs in 2015 for both pre- and post-mitigation conditions. Therefore, it would seem to be the logical choice as a conservative estimate for all three alternatives.

Particulate Emissions from Aircraft Must Be Included

Particulate emission estimates from aircraft should have been considered in the HHRA. It is merely mentioned that their exclusion leads to “uncertainty in the risk estimates presented”;²⁴ it should have been clearly acknowledged that it led to a significant underestimation of risk. The Air Quality analysis stated that “The major sources of PM₁₀ emissions are aircraft engines (32 percent)...” while the HHRA states that aircraft are expected to emit “relatively little” PM.²⁵ This later statement is a contradiction and serves to minimize the impacts of the build alternatives which would include more aircraft activity.

Finally, the last section of the HHRA concedes that “incremental cancer risks after mitigation could be underestimated by about 60 percent.” This is inconsistent with previous statements that this assessment represents the upper-bound of risk. Assumptions regarding mitigation measures should have been the most conservative, eliminating the uncertainty of underestimation of risk on such a large scale. Uncertainty regarding risk from diesel particulates, which account for a majority of the cancer risk, was not directly addressed. In fact, assumptions were buried in footnotes to two tables.²⁶

RE: Comments on LAX Master Plan EIS/EIR

1. Planning horizon and job loss

The Executive Summary of the Supplement to Draft EIS/EIR, Impact Comparison ES-11, indicates that LAX-Related Jobs for Entire LA Region in 2015 will be 350,557 for Alternative D versus 448,083 for Alternatives A and B. This is a loss of 97,526 jobs.

2015 is a short planning horizon for a major long-lived infrastructure project such as an airport. Furthermore 2015 is not used consistently. For example, the DEIS/EIR Section 1.3 Meeting the Demand for Transportation in the Region discusses freeway congestion in 2020. Section 1.1.3.3 Future Demand also looks at 2020.

Section 1.3.4 Telecommunications and Video Conferencing discusses those technologies' impact on air travel in 2030.

The Southern California Association of Governments employs a 2030 time line for evaluating aviation demand in the region.

- Calculate the disparity in jobs under the several Master Plan alternatives for 2020 and 2030.

SPC00018

- For each of the years 2015, 2020, and 2030 identify the loss of jobs under Alternative D versus A or B by city, county, and ethnic group.
- Incorporate this loss of jobs by ethnic group in the DEIS/EIR discussion of environmental justice.
- Justify adopting the Alternative D with the greatest number of lost jobs.

2. Planning horizon and economic loss.

The Executive Summary of the Supplement to Draft EIS/EIR, Impact Comparison ES-10, shows LAX-Related Economic Activity for Entire LA Region in 2015 will be \$63.7 billion under Alternative D versus \$83.7 billion for Alternatives A and B. This is a loss of \$20 billion of economic activity.

2015 is a short planning horizon for a major long-lived infrastructure project such as an airport. Furthermore 2015 is not used consistently. For example, the DEIS/EIR Section 1.3 Meeting the Demand for Transportation in the Region discusses freeway congestion in 2020. Section 1.1.3.3 Future Demand also looks at 2020.

Section 1.3.4 Telecommunications and Video Conferencing discusses those technologies' impact on air travel in 2030.

The Southern California Association of Governments employs a 2030 time line for evaluating aviation demand in the region.

- Calculate the disparity in economic activity under the Master Plan alternatives for 2020 and 2030.
- For each of the years 2015, 2020, and 2030 identify the loss of economic activity under Alternative D versus A or B by city and county.
- Justify adopting Alternative D with the greatest loss of economic benefit.

3. Failure to provide sufficient regional airport capacity.

An April 11, 2003 memorandum from Los Angeles Deputy Mayor Troy Edwards and Airport Commission President Ted Stein to U.S. Department of Transportation Secretary Norman Mineta states that failure to provide sufficient aviation capacity will have a detrimental effect on the economy of the region and the State of California.

- Justify reducing the number of gates at LAX in Alternative D and restricting the airport's capacity for providing passenger and cargo service in terms of Edwards and Stein's analysis. Quantify the detrimental effect of Alternative D versus Alternatives A and B on the economy of the region and the State of California.

- Calculate the loss of jobs and economic benefit associated with the Alternative D reduction in the number of airport gates at LAX.
- Justify the selection of Alternative D over A or B, both of which provide for more of the capacity which the referenced memo says is needed.
- Identify any studies that show that the region can meet its aviation capacity needs in 2030 by utilizing existing airports (LAX, LGB, BUR, SNA, PSP, ONT, PMD, and SBD) under the capacity constraints of Alternative D. For this purpose, consider only existing or currently authorized regional airports with Airport System Master Plans and with approved passenger service.
- According to the minutes of the January 16, 2003 meeting of the Southern California Association of Governments Aviation Task Force, Mr. Jim Ritchie, Director of Long-Range Planning of LAWA stated that the runway capacity of LAX will be 89 million annual passengers under Alternative D. Explain why the airport is to be limited to 78 MAP under Alternative D if a potential shortage of airport capacity is predicted.
- Calculate the loss of jobs and economic benefit associated with the Alternative D failure to utilize the 89 MAP capacity of the runways.

4. Reliance on inclusion of MCAS El Toro.

The DEIS/EIR assumes the use of the former MCAS El Toro to meet the region's aviation needs. See for example, Table 1-13 LA Region Airport System Scenarios for 2015. The voters of Orange County, the County of Orange Board of Supervisors, and the Department of Navy have stated that El Toro will be reused for non-aviation purposes and will not be a commercial airport. The Southern California Association of Governments has signed an agreement with the federal government to discontinue planning for an airport at El Toro and is in the process of removing that former military base from its 2004 Regional Transportation Plan.

The Supplement fails to update the DEIS/EIR Regional Context, Section 1.2.2.4 MCAS El Toro, and related maps, tables and narrative sections to eliminate use of El Toro.

- Revise the Supplement to reflect the removal of El Toro airport from consideration.
- Recalculate all job and economic data in the Supplement to the DEIS/EIR to reflect the fact that El Toro will not be a commercial airport.
- Using data from the Southern California Association of Governments modeling for the Regional Transportation Plan, show the effect of using LAX Master Plan Alternative D versus Alternatives A or B on regional aviation capacity.

5. Failure to use latest planning data.

The DEIS/EIR and Supplement utilize outdated planning data. For example, 1996 passenger data is used when Los Angeles World Airports conducted extensive passenger surveys at LAX and Ontario airports in 2001. Over 20,000 passenger surveys were collected in order to determine the domestic and foreign destinations of passengers and the California counties of origin for passengers using those airports.

- Revise the DEIS/EIR and Supplement to use LAWA's 2001 data on passengers in lieu of 1996 and other outdated data.

6. Failure to incorporate technological advances that will increase airport capacity.

No increase in capacity has been included for improvements in airfield capacity arising from technological factors such as improved weather forecasting and new air traffic control procedures. For example the FAA Airports Capacity Benchmarks Report - 2001 states:

"Technology and procedural improvements are expected to improve the Los Angeles capacity benchmark by 11% (165-167 flights per hour) over the next 10 years, while the adverse weather capacity benchmark will increase by 4% (132-133 flights per hour)."

- Calculate the capacity of the airport under the physical conditions of Alternative D but without artificial constraints on the number of passengers served. Consider technological factors such as the above and the likely trend in aircraft seating.

7. Failure to consider the trend to quieter and less polluting aircraft.

Alternative D seeks to limit the number of passengers to 78 Million per Year. With newer aircraft this cap will result in a decrease in the amount of noise and air pollution over time.

- Calculate the noise and air pollution impact of Alternative D in 2015, 2020 and 2030 versus baseline conditions.

Very truly,

Leonard Kranser

To Whom It May Concern,

I recently received a postcard stating that I should have already received an LAX Master Plan Notification of Availability. I am writing to inform you that I don't recall having received any such thing.

Please resend the information and/or respond by e-mail detailing what the NOA is and how it effects me. Thank you.

Sincerely,

Cynthia R. Stevens

COMMENTS FROM AN OLD TIMER

Mr. David B. Kessler, AICP
U.S. Department of Transportation
Federal Aviation Administration
LAX Master Plan Office
P.O.Box 92007
Los Angeles, CA 90009-2007

In reviewing LAX (D) and LAX (E) I find them full of holes and VERY EXPENSIVE.

1. Leave the terminals and existing access as is. This allows people to drop off and pick up the elderly and handy capped right at their terminals. This scatter of terminals is safer than the proposed concentration.
2. Moving runways and putting a taxiway between them has not improved wing tip clearance versus 45 degree holding between existing runways. Nobody shows which way the airplanes would be going in those center taxiways. This very unsafe.
3. The time and cost moving a runway will effect a shortage of operational runways for a long time and with the existing air traffic will cause a real problem.
4. The location of the new tower solved the visibility problem that occurred on the north runway and taxiway that one time. NO PROBLEMS SINCE.
5. With the financial shortage in Federal, State and City, leave as is except to improve the security in the existing terminals.
6. I went to the library to review the airport plan D and was shocked by the extent of the environmental study. About 6 feet of books full of GOBBLED- GOOK. When there wasn't an acceptable plan to evaluate. What a waste of taxpayer funds.
7. Cargo truck traffic mixed with passenger traffic could be solved by utilizing Ontario airport where the truck traffic can come and go in all directions and not restricted to approach only in one direction.

I am here to support the Mayor's Alternative D of the LAX Master Plan. I am currently the President of Korean American Chamber of Los Angeles.

The development of the alternative is a significant accomplishment for the City of Los Angeles.

I do not need to emphasize the importance of LAX to Greater Los Angeles, and to our Korean American Community. This air port has been the gate way to Pacific Rim, which has greatly and positively impacted Los Angeles business Community.

It is very critical to continue to attract foreigners, mainly but not limited to Pacific Rim, by having a much more efficient, safe and secure airport.

RE: LAX Master Plan Proposal

Although, Mayor Hahn's recent proposed LAX Master Plan Alternative was intended to focus on "safety and security" issues, it has become apparent that there are very serious flaws in this proposal. A recent Rand Corp. study has indicated that congregating all commercial passengers in one location increases the risk and harm to a greater number of people by a terrorist attack. In addition, the added inconvenience of additional time required to be screened and transported to the airline terminals encourages business and wealthy travelers to engage private business jets, charters, and fractional share aircraft for transportation. These general aviation options are not regulated as strictly as commercial aircraft nor are the aircraft or their passengers screened for security purposes at LAX or any general aviation airport in the area.

Los Angeles World Airports (LAWA) must address the lack of security at the general aviation passenger access to LAX at the Imperial entrance. In addition, more space should be given to general aviation uses in order to avoid "spillover" GA traffic into Santa Monica Airport.

LAWA and the City of Los Angeles should also do what they can to encourage airlines to promote the use of regionally diverse airports such as Ontario, John Wayne, and Burbank. I do not believe that LAX needs to be larger and that increasing the capacity of the airport will only adversely affect our roadways and air quality. Development of airport capacity should follow regional housing development, i.e., in the Inland Empire and eastern portions of the county.

I do not like the concept of everyone going to the Manchester Square facility. RAND says it is unsafe. I also think it would add considerably to the time required to get from home/hotel to your airline gate. It would also require several changes of travel modes which (1) is a disincentive, and (2) is hard with children, baggage, or disabilities. It seems like the potential for lost luggage, missed connections, etc. would be increased. I suggest that a direct rail/LRT connection be made to the airline terminals so that if you use the train you get right into the terminal (an incentive!). If you drive to the airport, you need to do a remote check in at a Manchester Sq. facility. But some parking needs to be available near the terminals. And some check in facilities will still be available in the terminals (for connecting flights if nothing else) and problem solving for missed flights, etc. will be easier and congestion will be less if there are various facilities to choose from.

Finally, I encourage the separation of the runways/taxiways as required for safety reasons but I disagree that we should be building the airport only for super sized planes. A balance of sizes would seem to be more appropriate and more generally useful in the long run. I think we want this design of the airport to be good well past 2015, which is coming right up – and may be past by the time construction is done. Let's plan for 2050!

Sincerely,

Annette Mercer

Comments: To whom this may concern,
I ask that my house get soundproofed due to the loud noises from the airplanes. I am 81yrs old and the noise is so loud that I am not able to relax at times. I cannot hear when I watch television not can hear when I am on the phone. But most importantly is I lose a lot of sleep. I can't rest during the day as my doctor ask because the planes make my house tremble and are so very loud. when I do fall asleep the noise awakes me and it scares me. I try to go to bed at 7:30pm but I can't fall asleep as I should until several hours later, basically once the planes calm down and are not coming over my house anymore at night. Again I am an elderly woman and I am in desperate need of this work being done to my home. In concern of my age ~~and health~~ so that I may rest as I should. I would kindly appreciate it if my comments would be taken into deep consideration.

Thankyou kindly,
Martha Whitaker

RE: DSEIR/DSEIS for LAX Proposed Master Plan Improvements

I write on behalf of the Coalition Against the Pipeline and Michele Grumet in opposition to the project.

1. The DSEIR/DSEIS, ("EIR") fails to define a true no project alternative. The document does not discuss the existing status quo. Manchester Square is still inhabited by many apartment dwellers as well as some occupants of single family dwellings. Most structures in Manchester Square are viable and occupied. The EIR treats the no project alternative as though under that alternative, residential structures in Manchester Square have been demolished, but this is not the case. The City claims that such demolition is necessary as a noise mitigation measure and will occur in any event. But there is no substantial evidence to support a finding that insulation would not address the problem. Indeed, residents who have requested insulation were told that they were not eligible for insulation because their area had been targeted for acquisition. This means that the use of Manchester Square has been decided upon by the City even before the environmental review process is complete. In other words, the EIR is a sham post-hoc rationalization for a preconceived policy decision. This violates the very core of CEQA and NEPA.

CEQA and NEPA require that the agencies analyze the existing status quo and compare the various proposed alternatives with the existing situation, which is characterized by the existence of Manchester Square as a viable residential community the occupants of which are eligible for insulation as offered to other communities not targeted for acquisition.

2. CEQA and NEPA require the agencies to analyze a reasonable range of feasible alternatives.

(a) Alternative E has been proposed by some area residents but has been improperly dismissed by the agencies without meaningful analysis.

(b) Moreover, the agencies failed to consider use of people movers from the existing parking lots to speed the arrival and departure process as an alternative to the acquisition of Manchester Square.

(c) Nor have the agencies considered building multi-story parking structures in the presently available off-site lots, including lot C.

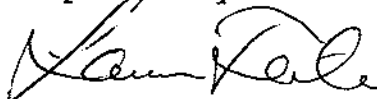

The EIR's alternatives analysis is colored by prejudgment and is illegal.

3. Adoption of a Statement of Overriding Considerations is illegal unless all feasible alternatives and mitigation measures have been considered and properly rejected. This has not been done for reasons described above.

4. The EIR fails to comply with the Government Code's requirement of assuring correlation and consistency between growth and transportation infrastructure. This project will have substantial growth-inducing impacts outside the project area. No mechanism has been considered for limiting such growth so that it does not outstrip the area's ability to expand its transportation infrastructure to keep pace with such growth. The EIR does not consider the adequacy of existing infrastructure outside the project area.

5. The agencies have failed to consider the impact of airport expansion in promoting an increase in airport noise outside areas already impacted by heavy take-off and landing traffic.

Respectfully Submitted,

Lawrence Teeter, Esq.

REVIEW OF LAX MASTER PLAN

Office Use Only

This review finds deficiencies in three important areas: passenger convenience, safety and security, and costs.

Passenger Convenience

The purpose of airports is to serve the using passengers and the airlines. This plan fails to address passenger convenience, and, instead, imposes great inconvenience.

The FAA now recognizes passenger convenience as an important airport design factor and defines it in terms of time to move the passenger from the parking lot of the departure airport to the parking lot of the arrival airport - not simply airline gate to airline gate as previously defined. The LAX Master Plan will greatly increase the parking lot to parking lot time required over that of the current LAX configuration.

The proposed Ground Transportation Center (GTC) is nearly a mile removed from the terminal area. It is connected via a train (people mover) that passengers must ride between the ticket counter and the terminal. The passengers must carry any carry-on baggage and packages by hand or with a cart on the train. This will be a great inconvenience to any mobility-challenged passengers. The current LAX configuration imposes no such inconvenience.

The proposed new Intermodal Transportation Center (ITC) is even more inconvenient. For a Green Line rail passenger to get from the ITC to the new west terminals requires taking a moving sidewalk, then the train (people mover) that

Attach additional sheets if necessary.

Official comments must be received by 5:00pm, Pacific Daylight Time, MONDAY, AUGUST 25, 2003

stops at the Rental Car Facility, then to the new Central Terminal Area, then to the underground people mover to the new west terminals. This is inconvenience at its worst. And what of the non-passenger(s) accompanying the passenger that has to immediately retrace this route?

This master plan clearly needs to be replanned with a criterion to minimize parking lot to parking lot time for the using passengers.

Safety & Security

Aircraft collisions during taxi, takeoff and landing can result in more casualties than any terrorist attack. Avoiding such collisions must be first priority. The proposed reconfiguration of the runways is aimed at this goal. NASA Future Flight Center simulations of aircraft operations with the new position of runways 25L and 24L and a new center taxiway indicate that the proposed reconfiguration is better than the current LAX configuration. I do not believe studies have been so complete as to conclude that the proposed reconfiguration of runways is the best. I believe that the proposal to move the runway 25L only 50 feet to the south is short sighted. Moving it farther south would provide greater aircraft separation, less wake turbulence interference between runways, and provide growth potential to handle larger aircraft on the southern runways (25) as will the northern runways (24).

The location of the new Rental Car Facility very near the end of the newly positioned runway 24L is unsafe. This is a runway configured to handle the new super-jumbo size aircraft (Airbus A380). An aircraft landing short of the runway or not successfully taking off when the runways are operating in an easterly departure pattern will risk impacting with the proposed Rental Car Facility.

The master plan puts high importance on security as it should, but the importance is way over balanced with all other important factors. It apparently assumes that security will always be dependent on today's technology and procedures. As security technologies and procedures mature, a future-thinking plan will provide an airport that can benefit from them.

The master plan has several factors that appear to reduce security. Centralizing passenger check-in at the proposed Ground Transportation Center provides a single location that if incapacitated will shut down the entire airport operations. The current multi-terminal, decentralized check-in configuration does not have this weakness. Incapacitation could come from earthquake, fire, electrical outage, and other factors as well as from terrorist activity.

The train (people mover) is also a potential single point failure that can shut down airport operations. A small bomb, bomb scare, mechanical failure, or even protestors on the tracks could bring the airport operations to a halt.

Any airport plan with centralized features will have inherent vulnerabilities to potential full shutdowns from these features. Such major vulnerabilities are not existent in decentralized designs.

The proposed greatly expanded physical size of the airport presents a much greater area that must be secured.

A RAND Corporation study of the security afforded by the proposed LAX Master Plan found that the proposed changes would not increase security compared to the current LAX configuration.

Cost

The proposed cost at \$9 billion is high and many sources indicate that the real cost is even higher. Reports indicate that the following costs have not yet been included:

- Buying houses and moving 6,000 people out of a Westchester neighborhood
- Financing costs, interest and insurance on revenue bonds
- Tax revenue loss after buying up 77 acres of commercial property
- Purchasing property and the rights to build 2 freeway interchanges
- Cost of the FlyAway lots and service included in the plan
- Environmental mitigation that could require up to one quarter of the budget

The high cost should provide some major benefits. The only claimed major benefit is security - and issues of the foregoing discussion compromise that promise. There is no proposed benefit in airport capacity expansion. The proposed airport is designed to handle 78 million passengers per year, the same as the current LAX configuration. Certainly, the passenger convenience is diminished. The parking lot to parking lot time is lengthened.

The plan totally ignores the great economic value in getting passengers to/from homes and offices quickly. The economic costs of inefficient passenger service can outweigh the benefits of costly and ineffective security measures. Because the City of Los Angeles is not bearing these high costs, airport users will ultimately pay them through fees and higher ticket costs. It does not appear that sufficient benefit to the passenger will be returned for the cost.

Summary

The foregoing points indicate that the LAX Master Plan is not well conceived. Media reports state that the airlines don't favor it. The communities near the airport do not favor it. Certainly the user passengers can not favor it due to the high costs it will impose on them, the lengthened parking lot to parking lot time, the greater inconvenience, and the dubious added security.

Los Angeles County Supervisor Don Knabe has called the LAX Master Plan unacceptable. Congresswoman Jane Harmon also does not support the plan. These and other officials who have done studies of the proposed plan find it unacceptable.

A lower cost alternate is preferred. This alternative should be based on the runway reconfiguration for added safety and on utilizing most of the existing terminal infrastructure with added modifications for enhanced security. It is believed that such an alternative could add security, little, if any, passenger inconvenience, be more acceptable to local communities, have less environmental impacts, and be accomplished with half the costs or less.

Conclusion

The proposed LAX Master Plan is unacceptable.

The proposed LAX reconfiguration will add great inconvenience and cost to the using passengers.

The added security is dubious. The proposal includes vulnerabilities from centralized facilities not existent in the current LAX configuration.

The anticipated costs are not justified by the potential benefits.

Other lower cost, more effective alternatives are believed to exist.

RE: Mayor Hahn's LAX Master Plan Proposal

Although, Mayor Hahn's recent proposed LAX Master Plan Alternative was intended to focus on "safety and security" issues, it has become apparent that there are very serious flaws in this proposal.

A recent Rand Corp. study has indicated that congregating all commercial passengers in one location increases the risk and harm to a greater number of people by a terrorist attack.

The added inconvenience of additional time required to be screened and transported to the airline terminals encourages business and wealthy travelers to engage private business jets, charters, and fractional share aircraft for transportation. These general aviation options are not regulated as strictly as commercial aircraft nor are the aircraft or their passengers screened for security purposes at LAX or any general aviation airport in the area.

I urge Los Angeles World Airports (LAWA) to thoughtfully consider the risks of this proposal and to address the lack of security at the general aviation passenger access to LAX at the Imperial entrance. In addition, encourage the FAA to increase security standards nationwide for access to all general aviation areas and other airports with general aviation traffic.

Additional Comments: Please make all passengers, both
commercial and general aviation passengers
go through all the proper screening
procedures at the off-site screening
location.

General aviation passengers usually are ^{the} wealthy
elite - that shouldn't preclude them
from following the same security
procedures as commercial airline
passengers!

Thank you,

Erin King

Statement of
Congresswoman Maxine Waters
August 20, 2003

Public hearing held by Los Angeles World Airports and the Federal Aviation Administration

Joslyn Community Center Auditorium
1601 Valley Drive
Manhattan Beach, CA

Thank you for the opportunity to speak and submit a statement regarding the Draft Environmental Impact Statement/Environmental Impact Report for Alternative D Enhanced Safety and Security.

As the Member of Congress for the 35th Congressional District, I represent over 638,000 constituents who live in the cities and communities of Inglewood, Westchester, Playa del Rey, Gardena, Hawthorne, Lawndale and portions of South Los Angeles. Since the release of the prior Master Plan in January 2001 and the release of the new Supplement to the Master Plan Alternative D, the views and concerns of my constituents have not changed.

Thousands of residents are still heavily impacted by airplane noise on a constant basis. Thousands of residents are still impacted by pollutants and toxins from aircraft emissions that fly overhead. Thousands of residents have suffered the consequences of increased traffic congestion in their neighborhoods. Thousands of residents are still suffering from hearing loss, sleep deprivation, hypertension, respiratory ailments, anxiety and stress. Residents should not have to live under such conditions.

With the release of Alternative D, new issues of concern have arisen. I have talked to many residents and elected officials regarding Alternative D. The primary focus of the plan is enhanced safety and security imposed as a result of the possible threat of terrorism in the aftermath of the September 11th attacks.

SPC00040

Although I am highly in favor of ensuring all passengers and employees at LAX and other airports are as safe as possible, there are evident flaws in Alternative D. Specifically, my objections to the proposed plan hinge on the following:

1) The new alternative increases the passenger cap from 78 million annual passengers (MAP) to 78.9 MAP as illustrated in the Table ES-1 of the Executive Summary, Supplement to the Draft EIS/EIR Volume 1. This is a clear deviation and violation of the Mayor's promise and pledge to constrain passenger capacity within LAX to the existing facilities which he signed on March 26, 2001.

On July 16, 2002, I introduced The Careful Airport Planning (CAP) for Southern California Act (H.R. 5144). This legislation would cap LAX traffic at 78 million passengers a year and prevent LAX from expanding beyond its current capacity. The County Board of Supervisors and the Los Angeles City Council has supported this legislation which is currently pending.

2) Alternative D sounds more like expansion than safety and security given the fact part of the plan is to utilize the Manchester Square area as a Ground Transportation Center (GTC). If LAWA is relocating residents out of the Manchester Square area and clearing the land of over 568 properties to build this new Center, I would definitely call that expansion. This site has been opposed by the community, elected officials and there is no substantive proof that it will make the airport more secure.

3) Based on a recent analysis completed earlier this year by the RAND Corporation, to simply reconfigure the airport does not mean the airport is safer than before. It would actually make the airport less safe in certain instances. The RAND analysis states that "The greatest risks are in high density areas such as lines for ticketing, baggage claim and the security check points. These risks are not likely to be reduced by Alternative D, which simply moves these targets of opportunity to the Ground Transportation Center (Manchester Square) and the people mover."

4) During these tough economic times, it is not prudent to increase passenger facilities charges and to use any surplus funds on untested ideas. We must take a lesson from the State of California and not allow ourselves to create a deficit in the billions of dollars on plans and ideas of uncertainty.

There are major airlines who are also opposing Alternative D due to the current decline in air travel and the increased costs that would be incurred such as landing fees, to pay for much of the project.

Alternative D is simply a ploy and continuation of former Mayor Richard Riordan's plan to expand the airport under the name of safety and security. In addition, Alternative D provides Los Angeles World Airport (LAWA) Commission President Ted Stein and Mayor Hahn an opportunity to assist their fat cat developer friends in securing large city contracts in return for re-election campaign contributions.

I am opposed to Alternative D. I believe that now is the time to seriously look at developing a more regional approach to air travel so that airports such as Ontario International and Palmdale Regional can begin to accept their fair share of air traffic.

I am asking all constituents of the 35th Congressional District and the South Bay communities to oppose Alternative D.

Congresswoman Waters: Security and Public Safety Must Come First at LAX

Lawmaker Introduces Legislation to Prohibit Construction of a Remote Check-in Facility at Manchester Square Unless It Provides Increased Security, Public Safety

Washington, D.C.—Immediately prior to adjournment of Congress for the August recess, Rep. Maxine Waters (D-CA) introduced H.R. 2985, a bill to prohibit construction of a new Ground Transportation Center (GTC), a remote passenger check-in facility at Los Angeles International Airport (LAX), unless it has been determined that such a facility would improve the safety and security of the public.

“The safety and security of LAX is an issue of tremendous importance to me and the people I represent,” said Congresswoman Waters. “I am deeply concerned that the proposed GTC at Manchester Square will actually make the airport less secure than it is now.”

Supporters of Los Angeles Mayor James Hahn’s \$9.6 billion LAX modernization plan claim the proposed GTC will improve airport security and make LAX less vulnerable to terrorist attacks. However, a recent study by the RAND Corporation concluded that reconfiguring LAX will do nothing to improve public safety; it will only relocate the target of an attack to the remote check-in facility.

“According to the Rand Study, passengers and airport personnel would be more vulnerable to terrorist attacks because of the concentration of passengers at the GTC,” Waters explained. “Moreover, the study found that by consolidating passengers and vehicles at a check-in center a mile from the airport, the mayor’s plan could greatly increase the number of casualties that result from firearms or small bombs concealed in luggage if such attacks were to occur.”

Waters' bill would prohibit the construction of the GTC unless there is a determination that such a remote check-in facility will, in fact, improve public safety and security. The bill would require a review of the proposed facility by the Department of Homeland Security prior to its construction. If the Secretary of Homeland Security determines that the facility will not protect the safety and security of air passengers and the general public more effectively than the existing facilities at LAX, the Federal Aviation Administration (FAA) would not be allowed to approve its construction.

"LAX is the third largest airport in the United States and a potential target for terrorists," said the Congresswoman. "I will not support an LAX modernization project that compromises public safety and security."

On July 23, 2003, Congresswoman Waters sent letters to the Chairman and Ranking Member of the House Appropriations Committee to request that the Transportation-Treasury Appropriations Act for Fiscal Year 2004 include a provision to condition the construction of the proposed remote passenger check-in facility on a security determination. On the same day, she sent letters to the Chairman and Ranking Member of the House Transportation Committee to request that the conference report for H.R. 2115, the FAA Reauthorization Act, include a comparable provision.

"Security must come first," Waters said. "I will continue to use every available opportunity provided by the legislative process to ensure that this controversial LAX expansion project does not compromise the safety and security of LAX and the surrounding community."

Firms With LAX Ties Aid Hahn *Some critics see a conflict of interest in fund-raisers set up by possible contractors.*

By Patrick McGreevy
Times Staff Writer

Two weeks after Mayor James K. Hahn proposed spending \$9 billion to modernize Los Angeles International Airport, contractors likely to benefit from the massive public works project are lining up to raise money for his reelection campaign.

Airport contractors have scheduled Hahn fund-raisers for Monday, Tuesday and Wednesday, with admission set at \$1,000 per person.

Critics of the LAX renovation and advocates of new ethics rules at City Hall said they were troubled that airport contractors would help Hahn raise money so soon after the release of his plan.

"It is no surprise that the mayor is developing an opportunity to dole out \$9 billion worth of favors to people who are contributing to his campaign," said Denny Schneider, an officer of the Westchester-Playa del Rey Neighborhood Council. "It's a pay-to-play system at this point. I feel very frustrated and betrayed."

Rep. Maxine Waters (D-Los Angeles), who opposes the project, also said she believes there is a link between the plan and Hahn's political ambitions.

"As far as I am concerned, this is about contracts and the exercise of power by the mayor to create more opportunity for his contributors," Waters said.

Bill Carrick, a political advisor to Hahn, denied any connection between the modernization plan and the fund-raisers.

"There isn't any link," Carrick said. "The fund-raising operation has been planning these events for a while, long before the mayor's plan was announced."

Other observers said that Hahn's plan for LAX faces an uphill battle for approval, so the mayor may not be able to deliver the large public works contracts, even if he wants to. The proposal, including reconfiguration of the central terminal area and construction of a new passenger check-in facility a mile east of the airport,

SPC00040

would need approval from the city Airport Commission, the City Council and the Federal Aviation Administration after a 45-day public comment period.

"If the mayor's plan is D.O.A., then the quid in quid pro quo goes away," said a political consultant, Larry Levine, who is not affiliated with the Hahn campaign.

Contractors said they had scheduled the fund-raisers well before Hahn released details of his airport plan July 9, and they maintained that they support the mayor for reelection because of his broader vision for improving Los Angeles.

Many contractors see the airport overhaul as a significant part of that vision, however.

In an invitation to Monday's reception at its One Bunker Hill headquarters, the engineering firm HNTB said Hahn's reelection is important "so the city can continue developing its focus upon" issues that include "modernization, safety and security enhancements for LAX."

HNTB already has contracts worth \$8.1 million with the city airport department, known as Los Angeles World Airports, including one to help expand Ontario International Airport and another to improve airfields that would be affected by the LAX modernization plan.

The company also was a subcontractor to Bechtel-JGM for a security study on the LAX perimeter and was a subcontractor on a study of passenger ground-transportation service.

HNTB officials did not return calls for comment.

On Tuesday, public relations firm Fleishman-Hillard will host a luncheon for Hahn at the exclusive City Club in downtown Los Angeles.

The firm has an \$800,000 contract with the city airport agency to help with marketing Ontario International Airport.

"I can tell you unequivocally, my raising money for the mayor has absolutely nothing to do with Fleishman-Hillard's relationship" with the airport agency, said Doug Dowie, the firm's general manager. He said the company had no plans to bid for additional airport work created by the modernization plan.

Hahn's Wednesday fund-raiser is a reception at Union Station hosted by the heads of airport contracting firms, including Psomas and Associates, Daniel Mann Johnson and Mendenhall and G & C Equipment Corp.

One of the hosts, Tim Psomas, is chairman of the board of an engineering firm that has received work worth more than \$2 million through January 2004 as a subcontractor on the LAX master plan.

Another co-host of the event is Gerald Seelman, a corporate vice president with Daniel Mann Johnson and Mendenhall, an engineering company that has a \$5.2-million city contract to design the new Flyaway Bus Terminal at Van Nuys Airport, where passengers will board buses for LAX.

Another co-host for Wednesday's reception is Gene Hale, the president of G & C Equipment Corp., which provides rental equipment to the city airport agency.

Hale said he supports Hahn for many reasons, and he also hopes to get a piece of the LAX work.

"I will submit my bid just like everybody else to the prime contractors," he said.

Hale also is chairman of the Greater Los Angeles African American Chamber of Commerce, which two weeks ago became one of the first business groups to endorse Hahn's modernization plan.

"We think the revised plan would be economically viable for the city and will create a lot of jobs," Hale said.

Supporters who have been asked by Hahn's campaign to help raise money say they have been told by mayoral advisors that the goal is to raise enough money to dissuade potential challengers to the incumbent.

"Clearly we want to send a message to anyone thinking of running that the reelect Jim Hahn campaign will be well-funded," Carrick said.

"That's how you keep people out. You scare them with money," added political consultant Joe Cerrell, who has submitted a bid for an LAX community relations contract and said he would raise money for Hahn "if asked."

Hahn recently reported that he had reached the \$200,000 threshold in fund-raising, even though no one has filed papers to challenge him yet and the election will not be until March 2005.

"He is going to be fully prepared to run a vigorous and competitive campaign," Carrick said.

RE: Mayor Hahn's LAX Master Plan Proposal

Mayor Hahn's recent proposed LAX Master Plan Alternative is supposed to address "Safety and Security" issues, however I am extremely concerned about the exception of general aviation airport users who would continue to be allowed unscreened access to the runway from the Imperial Highway entrance.

I am always worried about the private planes that fly over my house -- that neither the plane, the pilot nor the passengers have been screened for anything by anyone.

The Los Angeles World Airports is urged to consider the risks of this proposal and address the lack of security at the general aviation passenger access at the Imperial entrance.

In addition, encourage the FAA to increase security standards nationwide not only for access to all general aviation areas but also for screening of the pilot, plane and passengers for security purposes at all airports, like ours, with general aviation traffic.

Sincerely,

Betty Tomeio

Los Angeles, CA 90009-2007

Dear Mr. Kessler,

I am writing you in reference to the Regional Airport in Palmdale. The communities of the high desert now have over a quarter of a million inhabitants. The city of Santa Clarita has even more. Both areas are growing at an astonishing rate. In the future it is where all northern Los Angeles growth will come.

For residents of either community to get to LAX over the constant congestion is almost unbearable. In fact, it is easier to get to either Long Beach or Ontario from Palmdale than to go to LAX for a morning flight. Of course there is Burbank if you are flying the west coast corridor. Those flights however are often full with no plans for expansion there.

With the City of Los Angeles wanting to expand and upgrade LAX, they should consider or be mandated to sell the Palmdale property to a consortium of interested communities so we can develop our own airport.

Palmdale and Lancaster are at an extreme disadvantage to be able to entice white-collar businesses to our area without local air service. New air service need not connect through LAX. Flights going east could connect in Las Vegas or Phoenix.

Our company, Lance Camper Mfg., goes through the time-wasting experience of having to bring people up to our factory through LAX for business meeting and training. Between the up and back trips we waste almost a day and add to the congestion. We are planning our regular dealer meeting with 230 people. It would be best of we had it locally with a visitation to our factory. That is hardly an option because of the lengthy drive.

Those council members who are opposed to either opening up Palmdale Regional Airport or selling it need to make the trip from Palmdale to LAX to catch an 8:00 am flight. You need to leave at 4:30 am and hope there are no accidents along the way. It is easier to leave in the evening and overnight at an airport hotel.

It's hard to understand why any authority would want to make LAX more congested than it already is. If the Palmdale Regional Air Park could provide air service for the high desert and the Santa Clarita area it would be another step toward getting a high-speed train and a stop in Palmdale. Even now, rail service to Palmdale is excellent. From the Palmdale stop to the airport is a three-minute cab ride.

Let's override the political issue and start considering the people who are affected by not having our own air service.

Thank you for considering our message.

Sincerely,

A handwritten signature in black ink that reads "Norman Jacobson". The signature is fluid and cursive, written over the printed name and title.

Comments to Los Angeles master plan

July, 2003

SPC00053

Release of LAX Master Plan on the 9th of July 03

- **The LAX master plan has been officially released on the 9th of July by LA Mayor Hahn:**
 - ▶ **Address passenger security and airport safety.**
 - ▶ **Keep LAX as major international gateway.**
 - ▶ **Limited growth assumed (78 million versus 56 today) with alternative D.**
 - ▶ **Traffic growth at other local airports questionable (ONT, BUR and LGB capability to get 20 million additional pax).**
 - ▶ **International traffic to more than double.**
 - ▶ **Minimize environmental impact.**
 - ▶ **\$9.6 billion to be spent from 2004 to 2015.**
 - ▶ **Would create 49000 construction jobs**
 - ▶ **Carriers will pay a significant part of the bill.**
 - ▶ **Airside and terminals will be heavily modified.**
 - ▶ **New satellite to be built.**
 - ▶ **Most of CTA will be transformed with no vehicle access and with a secured train system.**
 - ▶ **Construction timescale and priorities to be clarified.**
 - ▶ **Star alliance approves the plan. ATA and domestic carriers are against.**
 - ▶ **Public comments within 45 days (3rd week of August).**

Airbus proposal for LAX plan

- This proposal is based on Airbus knowledge of the LAX situation and of the A380 performance.
- Proposal aim to improve airside safety (runway incursions) while providing A380 capability (international traffic growth without movement and noise increase) and to minimize costs.
- Proposal aim to link short/medium plan with long term master plan
- Proposal to be agreed/validated by the carriers.
- Joint agreed proposal to be discussed with LAWA and possibly presented to the LAWA board of commissioners, the carriers and to the LA council

Proposal for LAX runways

- Assume primary departure runways for group VI aircraft operations: 6R/24L (150x10285ft) and 7L/25R (150ftx12090ft).
- Assume primary arrival runways for group VI aircraft operations: 6L/24R (150x8925ft) and 8R/25L runways (200x11095ft).
 - ▶ Rem: A380 can takeoff at MTOW (QFA) on 10000ft and on 9000ft for other carriers. Landings ranging from 7000 to 8000ft.
- Adapt shoulders/lights where needed.
 - ▶ Rem: 25L as primary group VI departure until taxiway C is upgraded for group VI aircraft operations.
- Do not move any runway to the South.
- Shift runways 24R (1500ft) and 25L (3000ft) to the West. It would reduce noise exposure, improve the runway incursion issue and allow an increase of the South cargo area (with runway 25L limited to 10000ft).
- Ban general aviation and helicopters traffic (types primary involved in fatal accidents).
- Limit commuter traffic to 19 seaters and above.

Proposal for LAX taxiways

- Assume taxiways A, C West and E West as main parallel group VI taxiways. Minimum separations ranging from 450ft (E), 500ft (A) to 648ft (C).
- Create:
 - ▶ 2 interim taxiways for aircraft up to group III (separations from 350ft to 372ft), between the two pairs of runways.
 - ▶ 1 new taxiway for group IV to VI at 500ft (or more if possible) North of runway 24R.
- Adapt taxiways D/E East area to allow 24L departures or 6L arrivals.
- Restrict taxiway B to group III and relocate Taxiway C East 238ft North of B, for group IV to VI operations, with 146ft clearance to a new Service road adjacent to apron area.
- Assume AA and S as main North/South group VI taxiways.
- Replace taxiway Q by a new taxiway T designed for group VI operations.
- Increase TWY to object (service road) distances on main group VI taxiways to 146ft (or 160ft wherever possible).
- Strengthen existing parts as required (Sepulveda tunnels).

Proposal for apron and terminals (2006/2008)

- Upgrade TBIT and T2 for 2006:
 - ▶ 3 A380 TBIT stands as baseline (investigate terminal mods and dual pax bridge feasibility. 3rd pax bridge whenever possible.
 - ▶ 1 stand at T2 as a basis. 2nd stand after another A380 carrier decides to use T2. NWA to be in the loop.
 - ▶ Loss of gates to be compensated by additional gates at AAL maintenance area (2 A380 or 4 group III aircraft). This area to be the first phase of the new satellite.
- Investigate:
 - ▶ 1 T4 stand with access from taxiway C and evaluate impact of a Twy C clearance increase to 146ft. DAL in the loop.
 - ▶ Additional stands at T6/T7 with relocated taxiway C. UAL in the loop.
- Adapt West pad with 3 A380 stands (2 pax bridges) . Improve bussing service (7 bus lanes with priority on premium pax) and minimum facilities (toilets...)
- Reduce service roads widths to increase either Twy separations or useable apron.

Proposal for LAX apron and terminals (2009+)

- Upgrade TBIT West
 - ▶ Mix of A380, A346 and 773 new stands (8 to 9). Create West new international satellite with adequate mix of stands (20 to 25).
- Suppress all existing terminal gates at ends (North and South) to create a new buffer zone (push back area) and to restore adequacy of existing terminal facilities (mostly undersized).
- Prepare adequate remote and cargo stands at East and South East areas (increased areas).
- Assume 24 A380 passenger flights a day with 12 contact stands by 2012. Assume mix of 777 and A330/340 for other gates. Total number of International gates to double.

August 20, 2003

Dear Mr. Ritchie:

Our family feels the LAX Master Plan is just another way for LAX to expand. The communities around the airport have suffered with noise, pollution, and traffic for years. Now is the time to build regional international airports here in Southern California.

Thank you.

Sincerely,

J. A. Hyra

Subject: Palmdale Regional Airport

To Whom It May Concern:

I would like to comment on the greater Los Angeles Airport plan as described recently in various news accounts.

Having recently relocated from Northern California, I find it troublesome at best that the Palmdale Region Airport sits without scheduled airline service yet is able to accommodate the heaviest and largest commercial aircraft in the world. Being one of the 300,000+ residents in the Antelope Valley, I am forced to commute to Ontario, Burbank, or LAX to catch a flight, helping to further clog the already overloaded and busy highway 14 freeway.

I would like to encourage the decision makers at large, yourself included, to reinstate airline service to Palmdale and relieve the citizens and environment of unnecessary traffic, hassle, and inconvenience.

Sincerely,

Kris Wiggs

To whom it may concern

I am a resident of 5401 W. 93rd Street Apt. #2 Los Angeles, CA. 90045.

The building is owned by the Cadman Group.

I have notice that several buildings on my block are empty including the building next door which has 60 days to move.

I would like to know if the above address will be effected by the LAX expansion and if so when. I received the enclosed letter in the mail, but

I have never received a master Plan (NOA) either have the other tenants.

The reason I am notifying you is because I have been a resident at the above address for 3 years pays \$895 monthly for rent and I just received a notification from the owner 60 days or quit over some hear say and I am not fighting the owner because Consumer Affairs says they are legally right without giving me a written reason on why I have to leave.

REC

I would like to know if I am entitled to any wages by the LAX due to the fact that I had occupied the residency for 3 years paying full rent. If you believe I am entitled to any relocating wages or if you believe my building is on the market before 10/07/03 please let me know in writing, phone or e-mail I will greatly appreciate it. If I am contacting the wrong department please forward to the correct department or mail me the correct information.

Sincerely

Public Comments Regarding LAX Master Plan Alternative D

August 19, 2003

Robert L. Rodine
The Polaris Group
Sherman Oaks, California
818-789-7319
polarisrlr@juno.com

I most heartily endorse the adoption of a program to modernize LAX.

LAX Medium Growth demand embodied in the SCAG Regional Transportation Plan, driven by fundamental regional demographics at 2020, is 94.2 Million Annual Passengers ("MAP"), and 4.2 Million Tons of Cargo Annually. This is 59.8 % of the forecasted regional load of 157.4 MAP.

Under Alternative D, emphasized to be part of a Regional Plan, the loads planned for LAX are 78.9 MAP and 3.1 Million Annual Tons of Cargo. This reduction in the LAX portion of the regional volumes is 15.3 MAP and 1.1 Million Annual Tons of Cargo. If this reduction in volume is retained within the region through diversion to other regional airports there would be no net negative impact. If, however, it is not, the negative impact is the loss of approximately \$33 BB of turnover annually and some 222,000 jobs inclusive of the effects of induced economies (exclusive of construction related expenditures.) If we are to avoid the above losses, it seems that specific arrangements for diversion would necessarily be in place before leaping off on a \$9 BB public works project, however, the EIR seems to be mute on this aspect of the plan. What, if any specific arrangements have been formalized to insure that the proposed diversion of traffic doesn't result in any negative economic impact for the region? Absent a prearranged plan with specific agreements to accommodate the displaced LAX passengers within the region, I am abjectly opposed such a plan based on the supposition of such a large phantom backup element.

I am also vitally concerned about security a LAX for both passengers and employees. Using a very simple blast radius analysis, it is clear that the proposed CTA has a much higher concentration of passengers on an hourly basis than does the current dispersed terminal arrangement. Quantified, the current terminal arrangement results in a blast exposure factor of approximately 1,509 passengers per hour, while the proposed passenger arrival facility will result in and exposure factor of 7,425 passengers per hour. I think that increase in risk renders the proposed plan unacceptable as defined.

Thank you very much.

Document: Draft Master Plan Addendum Supplement to the Draft EIS/EIR

Subsection (If applicable):
Number: _____ Title: Soundproofing, Noise Impact

Comments:

I'm requesting again for a noise monitoring. The airplanes fly over lower days & night they suppose to fly starting at 5:00 am, but they don't. At bad weather they take off from West to East Coast. They fly so low the house vibrate the house. They interfere with the television & satellite. I have to wait until one pass before we can see the picture again. We can hear when they slow the plane. When the windows are open we cannot hear the telephone or television. I have a heart condition, asthma and allergies. Between the soot & dust, I'm having a hard time.

Thank You,
Royce H. Jacquet

Mayor Mike Gordon
City of El Segundo
Comments on the
LAX Master Plan Draft EIS/EIR Supplement
August 20, 2003

- **Good Evening. I am Mayor Mike Gordon, representing the City of El Segundo.**
- **Given the length and complexity of the Master Plan and environmental documents, our full comments on technical issues will not be ready for some time, therefore the City's comments tonight are preliminary.**
- **The City of El Segundo continues to oppose LAX Master Plan Alternatives A, B, and C for the many reasons the City expressed orally and in writing during the public review and comment period for the initial Draft EIS/EIR in 2002.**
- **While we feel the stated objectives of the new plan supports a regional aviation approach — an issue that Mayor Hahn and I continue to work side by side on—the City of El Segundo has not yet taken an official position on Alternative D, nor have I.**
- **Specifically, the City supports a regional approach alternative that makes proper use of Inland Empire airports.**
- **The City supports an alternative with fewer environmental impacts. We would like to see the adverse impacts of the airport minimized and mitigated to the greatest extent feasible.**
- **The City of El Segundo supports enhanced safety and security at LAX.**
- **And the City supports an alternative that by design will accommodate passenger and cargo levels no greater than the physical capacity of the airport as it exists today, approximately 78 million annual passengers.**
- **Limiting LAX's capacity to its current capacity has always been our number one goal. We believe limiting LAX's capacity will allow other**

airports in the region to develop and handle a fair share of future regional aviation demand.

- . This approach will result in fewer environmental impacts,**
- . and will improve safety and security at the airport.**
- . However, the City is greatly concerned about the impacts of proposed southside airfield changes that move the southernmost runway 50 feet closer to El Segundo.**
- . LAWA has stated that it believes these changes are necessary to improve runway safety.**
- . However, we are currently studying the impacts of the reconfiguration, and other options for the southern runway complex.**
- . In particular, we urge a full public consideration of end-around taxiways as an alternative that could provide greater safety sooner, at lower cost and with fewer new burdens on local communities.**
- . Safety at LAX must be a priority for all of us.**
- . The City is prepared to support measures necessary to enhance safety, even if those measures increase our burden, but only if we are assured, through an independent expert, that other alternatives are not equally effective.**
- . In conclusion, we are grateful for Mayor Hahn's responsive leadership and his pledge to constrain growth at LAX and foster a regional approach to meeting future aviation demand.**
- . It is our hope that the ultimate outcome of this Master Plan process will be a regional airport approach that ensures that LAX does not exceed its current capacity.**
- . Thank you.**

A Preliminary Review of Issues Associated with the LAX Master Plan Supplement to the Draft EIS/EIR

*Prepared for the Los Angeles County Board of Supervisors
by A.C. Lazzaretto and Associates
August 2003*

INTRODUCTION

The Federal Aviation Administration (FAA) and Los Angeles World Airports (LAWA) made available for public comment in early 2001 a Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR) addressing three build alternatives, a no-build alternative, and the existing setting for the Los Angeles International Airport (LAX) Master Plan. In response to considerable public comment and the terrorist attacks that occurred on September 11, 2001, a fourth alternative -- Alternative D, the Enhanced Safety and Security Plan -- has been added to the LAX Master Plan. A Supplement to the Draft EIS/EIR was made available for public comment in July of 2003 to update information presented in the Draft EIS/EIR and to integrate Alternative D into the environmental review process.

Alternative D includes a number of airfield facility modifications. Although LAX would continue to operate with 4 runways, 2 of the existing runways would be moved, two would be lengthened, and all would be further separated from one another. The existing parking structures would be relocated and replaced by new centralized passenger terminals. The existing Terminals 1 through 7 would be reconfigured, including a new north/south linear concourse at the Tom Bradley International Terminal, flanked on the west by a new satellite concourse. A new ground transportation center and intermodal transportation center to be built east of Aviation Blvd. would serve as the primary access for all passenger drop-off and pick-up and vehicle parking. Some cargo facilities would be modified, although overall square footage would be equivalent to the No Action/No Project Alternative.

A brief preliminary review has been conducted to assess changes between the original Draft EIS/EIR and the 2003 Supplement to the Draft EIS/EIR for the LAX Master Plan, as well as consistency and accuracy of information within the documents. The initial review points to several issues requiring further comment and discussion.

One of these issues was central to County comments on the earlier LAX Master Plan review, and remains an area of potential concern for the current document: although LAWA indicates that its goal is to limit growth, improvements proposed as part of Alternative D would in reality serve to reinforce LAX as the preeminent airport of the southern California region, and may undermine attempts to strengthen the role of outlying airports. In addition to this thematic concern, there are a number of additional points that merit further consideration. The preliminary findings are outlined briefly in the discussion below.

DISCUSSION

1. The Proposed Master Plan Alternative D May Not Constrain Growth at LAX

The stated goal of Alternative D is to limit growth at LAX to 78 Million Annual Passengers (MAP) and induce growth at other regional airports. The primary means to accomplish this is to limit aircraft gates to 153 which is the same number of gates that exist in the No Project Alternative (NPA). However, the NPA includes 48 remote gates that are simply aircraft parking spaces on concrete. Alternative D provides 153 fully

County comments - LAX [Attach I]

functional and high capacity gates and does not remove the concrete which will remain available for aircraft parking. The true number of gates is therefore over 200. Furthermore, the design of the new gates is a linear configuration as opposed to the existing cul-de-sac configuration. The linear configuration is more flexible and has more capacity. Also, space in the western portion of the airport will remain available for future consideration of a new west terminal, as proposed in Alternatives A, B and C. Therefore, the gate limitation is not an effective constraint on passenger levels.

Alternative D includes other improvements that would support growth beyond the 78 MAP level. In particular, the new remote terminal in the Manchester Square area provides 6.5 million square feet of terminal space -- more than 50% greater than the 4 million square feet proposed in the 98 MAP Alternatives A, B and C. Further, many of the proposed improvements to the north airfield are designed to accommodate the new generation of larger aircraft.

Orientation of new LAX facilities to the new larger aircraft could have long-term, pervasive effects. Because the new larger aircraft require many smaller connecting flights to fill its 600 seats, these improvements will strengthen the "confluence of connections" that reinforce LAX as the preeminent airport of the southern California region, and at the same time reduce the incentive for airlines to utilize other regional facilities. A true constraint on the growth of LAX would be to make it inhospitable towards the new larger aircraft, coupled with improvements to serve new larger aircraft at another regional airport, and transit links to join the two facilities.

2. Airport Security May Not be Fully Achieved by Alternative D

Preliminary review suggests that the Supplement to the Draft EIS/EIR may fall short of an adequate review of airport security issues. Although the Executive Summary to the Addendum refers the reader to Appendix I 'for a detailed assessment of the security and safety features of Alternative D,' Appendix I offers a heavily conceptual and theoretical document that falls significantly short on detail. Anomalies include contradictory content and a lack of clarity expected of a public information document.

3. Environmental Justice May Not be Well Served by Alternative D

Presidential Executive Order 12898, issued in February 1994, requires all federal agencies to analyze environmental justice impacts when proposing public projects. The analysis is intended to determine whether minority and low-income communities are unfairly burdened by project impacts, with the goal of using mitigation measures to create a level playing field. In 1999, Senate Bill 115 was passed making environmental justice a requirement of CEQA as well.

Despite the importance of this subject, the original Draft EIS/EIR was found to lack even the most elementary NEPA requirements for environmental justice. Preliminary review suggests that the Supplement to the Draft EIS/EIR has corrected some but not all of the earlier deficiencies. In particular, the Supplement to the Draft EIS/EIR again limits the area of analysis (reviewing only those census tracts surrounding LAX), improperly omits assessment of many effects due to the preparers' inability to quantify or analyze the impacts, and defers a determination of significance pending completion of the mitigation program.

The assessment does not appear to consider the trade-offs between environmental protection and environmental justice pertaining to the placement and length of LAX runways: runway extension to the west would have significant adverse impacts on biological resources (particularly the El Segundo Blue Butterfly), but would serve

County comments - LAX [Attach I]

environmental justice through a significant lessening of noise, air quality and traffic impacts on Lennox, Inglewood and other disadvantaged communities around LAX. Nor does the assessment apply rigorous standards in assessing the proportionality of impacts and mitigation measures between the wealthier northside area and communities east of LAX including Lennox and Inglewood. These relevant issues require further review as part of the Supplement to the Draft EIS/EIR.

4. The Baseline Year of 1996 is Not Adequate for a 2003 Impact Assessment

It appears that the Supplement to the Draft EIS/EIR continues to use 1996 data to establish baseline conditions for a number of topical issues. This outdated reference point was considered inadequate for the original EIS/EIR, and remains unsuitable for use in the current Supplement to the Draft EIS/EIR.

5. The No Project Alternative does not offer a Consistent Yardstick for Measuring Project Impacts

The original EIS/EIR provided an incomplete discussion of the No Project Alternative by incorporating improvements that were then only in the "planning stages" and overstating the service levels and capacity of the existing facilities. This approach made it difficult to draw meaningful comparisons with project alternatives. Preliminary review indicates that the Supplement to the Draft EIS/EIR may also provide an incomplete picture of impacts associated with the No Project Alternative. In particular, the Supplement to the Draft EIS/EIR appears to substantially overstate passenger and cargo handling capacity under the no-build scenario, while understating both for the build scenarios.

Additionally, the No Project Alternative has not represented passenger capacity in a consistent manner. In the original 1997 Notice of Preparation, the No Project Alternative was linked to a range of 68-72 MAP whereas the 2001 and 2003 EIS/EIR documents increased this estimate to 71.2-78.7 MAP. Based on communications provided by LAWA at the Environmental Justice Workshop held in Inglewood, the increase between 1997 and 2001 reflected actual increases in passenger demand during that period. However, there was no equivalent adjustment for the period from 2001-2003, when passenger demand has fallen by almost one-third.

The Supplement to the Draft EIS/EIR states that the No Project Alternative is provided as a benchmark for comparison of the four build alternatives. However, use of a higher baseline passenger number minimizes the extent of the difference between existing and future conditions at LAX, which in turn affects comparative impact assessments throughout the EIS/EIR. Use of a *worst-case scenario*, in which the baseline was based on a low estimate of existing passenger demand, would have better served the goals of CEQA and NEPA, and given a more realistic picture of the changes between current and future conditions at LAX. The County believes that LAWA should revisit key impact findings in light of actual 2003 passenger demand, instead of the estimates developed for 2001.

6. Traffic, Noise and Air Quality Impacts have been Shifted Eastward

The revised Master Plan represents a major shift of improvements away from neighboring areas north and south of LAX and toward communities to the east. The unincorporated community of Lennox and the City of Inglewood now appear to bear the brunt of added traffic, while Manchester will be the primary location for passenger processing. This shift heightens the need for close scrutiny of the proposed mitigation plan and the analysis of Environmental Justice.

County comments - LAX [Attach I]

7. **Major Changes in the Project Call for Preparation of a Comprehensive Revised Draft EIS/EIR**

CEQA Guidelines require that a Subsequent EIR for a project must be completed if the Lead Agency determines that changes in a project will require major revisions to a previous EIR; a Supplement to an EIR may be prepared if changes in the project are not considered major (§15162(a)). Both Subsequent and Supplemental EIRs are subject to the same notice and public review requirements as the original EIR, but Subsequent EIRs must make available all the information in the environmental evaluation, whereas Supplemental EIRs only need circulate new or revised information. Discussion provided in the CEQA Guidelines indicates that both types of review are intended for use in connection with *previously certified or approved* environmental documents.

In the present case, there is no previously certified or approved document. Furthermore, preliminary review of the Supplement to the Draft EIS/EIR indicates that changes to the proposed project are major. Thus, even an adaptation of the Guidelines (i.e., to encompass a document that has not been previously certified or approved) would indicate the project should have been addressed through preparation of a comprehensive revised Draft EIS/EIR, in which the full record of information was consolidated in an effort to facilitate public review.

Public review and lead agency decision-making would also have been better served by providing copies of the comment letters submitted during public review of the original EIS/EIR. Instead, the Supplement to the Draft EIS/EIR makes no effort to present or even summarize the earlier comment letters. This approach creates a process that is confusing and cumbersome for reviewing agencies and organizations, and thwarts an opportunity to advance public participation.

8. **Growth-Inducing Impacts May Be Significantly Greater than Stated**

The Supplement to the Draft EIS/EIR bases its analysis of growth inducement on projected cargo and passenger activity. It concludes that by 2015, Alternative D would yield a direct economic output of \$63.7 billion and 350,500 jobs, plus an indirect economic output of \$93.8 billion and 629,000 jobs through a multiplier effect of 1.5. The EIS/EIR assumes that all of the jobs would be within the 5-County SCAG region, 78% of the jobs would be within a 20-mile radius, and 40% within a 10-mile radius of LAX. Finally, it concludes that Alternative D would be similar in terms of job formation to the No Action/No Project Alternative, differing by an increase of about 1%. With respect to collateral development, the EIS/EIR finds Alternative D impacts equivalent to the No Project Alternative for LAX Northside¹, Westchester Southside and Belford, and less than the No Project Alternative for Continental City and Manchester South.

In taking this approach, the document ignores the cumulative synergistic effects that would result if LAX Northside is constructed in tandem with the LAX improvements. The increase in cargo will create corresponding increases in off-airport services and place extraordinary pressures on commercial and residential land uses in the immediate neighborhood. The Growth-Inducing Impact Analysis does not appear to address these more localized impacts at all, even though the past history of LAX shows them to be potentially significant.

¹ LAX Northside is approximately 330-acres of land located on the north side of LAX (bisected by Westchester Parkway) and owned by LAWA. Tentative Map #34836, approved for this site during the mid-1980s, would allow development of about 4.5 million square feet of office, hotel, restaurant, retail, research and airport-related land uses.

Mr. Jim Ritchie
City of Los Angeles
Los Angeles World Airports
LAX Master Plan Office
P.O. Box 92216
Los Angeles, CA 90009-2216

Dear Msrs. Kessler and Ritchie:

Under the proposed Alternative D of the Los Angeles International Airport Master Plan, the airport will undergo substantial changes which will impact a variety of sectors, including the communities, the airline industry, and the region. The plan is referred to as the "Safety and Security Plan" which reduces substantially the expansion in capacity and site footprint as proposed in Alternatives A, B and C.

While Alternative D has improved based on requests from the communities and from other constituents, it nonetheless raises some important questions. I have reviewed the Supplemental Draft Environmental Impact Report for the Master Plan and have determined that there are some specific issues that need to be further analyzed and addressed.

Transportation Issues:

Mitigation measures are unfunded, uncertain, & underevaluated: Alternative D

shifts the majority of the traffic impacts from the current central terminal area to the area now known as Manchester Square. While there are some traffic mitigations included in the Supplemental EIS/EIR, one of the main features of this proposal requires building an off-ramp from the I - 405 freeway at Lennox Blvd. directly into the new Ground Transportation Center (GTC). The vast majority of these mitigations are directly tied to the availability of airport-related funds and to the availability of funding from other agencies, like the Metro Transit Authority and the State of California. There is also a reliance upon "future" expansion of various programs outside of the airport's jurisdiction like the MTA's Rapid Bus service. There seems to be no analysis of the traffic impacts of Alternative D should these mitigations not materialize nor are there any alternatives presented.

Furthermore, there has been no analysis done of the impacts of the new freeway offramp from the I-405 freeway at Lennox Blvd. on the I-405 freeway, both North and South Bound. Currently, access to the airport via the I-405 is accessible via at least 3 freeway exits, both North and South bound. Alternative D concentrates the freeway access to one point from the I-405 freeway into the GTC. The draft document comparison states that under Alternative D, freeway speeds would be "faster than the No Action/No Project" alternative based on what appears to be an analysis of current traffic patterns. However, given that the proposal in Alternative D creates an entirely different traffic pattern, it is hard to imagine how the comparison is a valid one. Furthermore, there seems to be little hard evidence provided to back up the claims of faster freeway speeds and reduced traffic.

Cargo impacts could be further mitigated: DOT and LAWA have previously analyzed the extension of Avian Blvd. directly into the airport to provide a dedicated cargo road. This option has been fully designed and is likely ready to be implemented. This option would have a positive effect on current airport operations and traffic patterns.

Public transportation connectivity: The plan calls for the Green Line light rail to be connected to the Intermodal Transportation Center (ITC) located at the former Continental City site by way of a moving sidewalk or other device. Furthermore there is an existing EIR for expansion of the Green Line northward past LAX and into Westchester. Green Line project remains in the jurisdiction of the Los Angeles Metropolitan Transportation Authority (MTA), and the MTA owns the existing heavy rail right-of-way that proceeds northward along Aviation Blvd. into Westchester. Nonetheless, the plan should more explicitly call for the preservation and enhancement of the existing right-of-way for a future expansion of the Green Line. This is most sensitive in the area along Aviation adjacent to Runway 25/7, where it is subject to competing interests: light rail, heavy rail, automated people mover, street widening and FAA flight signaling infrastructure.

Security Issues:

Alternative D is billed as the "Safety and Security" plan for LAX. The premise upon which the security proposals have been designed is to protect the "primary function" of the airport, which, presumably, is the take-off and landing of aircraft. Therefore, the separation of passengers and vehicles from the Central Terminal Area was a primary design component of Alt D to prevent against bomb or other dangerous activity which would stop air traffic at LAX. While the specifics of the technologies required to implement the security provisions have not been detailed in the Supplement, additional information presented in the accompanying SAIC report relies upon a series of assumptions which lead to the ultimate conclusion that Alternative D is safer than the no project alternative and safer than all of the other alternatives previously presented.

As in other areas of the Supplemental EIS/EIR, Alternative D leads to more questions than answers, particularly in the realm of security. First, the premise of protecting the "primary function" of the airport is one that deserves greater consideration. Alternative D, while claiming to diffuse passengers through separate entry points at the Ground Transportation Center (GTC), the Consolidated Rental Car Facility (RAC) and the CTA, actually makes those locations easier targets for terrorists or others wishing to maximize the loss of life in any one incident. This leads to the question of whether enough will be done to protect airport patrons versus airport operations? In addition, one well-placed explosive device on the automated people mover could just as easily debilitate airport operations and create additional risk to area hotels and businesses located on Century Blvd. just below the people mover. There are any number of scenarios that could be imagined that seem to be ignored by the security proposals contained within the current document.

Further, it is worth noting that the current environmental documents do not fully elaborate upon the technology and construction specifics of the proposed security enhancements. LAWA's own security consultants have acknowledged that their analysis is based on technology that does not yet exist. The electronic scanning of automobiles and trucks upon entrance to parking facilities, face recognition technology, and fast baggage screening at the point of entry at the CTA are components of the security plan that are required to make Alternative D work. If any one of these component parts is not yet developed, is too costly once developed to implement or is not commercially available at the time of construction then the plan does not work and security risks are imminently greater.

SAIC consultants have also stated that while costs for implementation of the security plan are unknown at this time, ultimately the airport would achieve savings through the reduction in security personnel required since technology would replace them. However, the Supplemental EIS/EIR states clearly that there would be "no cost savings for law enforcement personnel" in fact, estimates that security personnel would increase by 162 for airport police and that 12 additional LAPD officers will be required. Is the baseline for this analysis security staffing at LAX pre- or post-9/11? Given that

the technologies do not yet exist, how do we even know what will be required to staff and maintain them?

Furthermore, LAWA's original intent was to create a security review after the approval of the EIR. However, the publication of the RAND study was an incentive to accelerate that review and incorporate the SAIC study into the plan release. If the security review was to come after the EIR approval by City Council, that suggests that any terminal structure can be made to be reasonably secure regardless of what was on the land use document. Otherwise, the security review by SAIC would have been incorporated at a very early date. Finally, should this be the case, it begs the fundamental question of why the plan calls for such aggressive construction and development of areas like the GTC to be located at Manchester Square, a mile away from the existing terminals.

There is also no discussion of how phasing of construction will affect the overall security elements. Since the CTA, people mover, and baggage transport facility are among the last components of the plan, how will the airport be protected, assuming the premise adopted by Alternative D, in the interim?

These discrepancies and the lack of detail for the actual implementation of the necessary security technologies are of grave concern. Other risk scenarios must be evaluated in this process.

Concerns over Growth Potential:

The Supplemental EIS/EIR acknowledges that under Alternative D, every single terminal function area will be substantially increased - in many cases doubled. This leaves the only restriction on growth the number of aircraft that can be accommodated by the physical gate structures. Regardless of the number of gates that will be constructed, there still exists the ability to expand gate capacity with portable gates, as are in use today in the western portion of the facility.

Given that ability, what will true capacity be at LAX following the implementation of Alternative D? Furthermore, what, if any, environmental or other review is required to move a portable gate onto the western tarmac? Finally, what constraints, if any, which exist for future elected officials in Los Angeles who may see fit to enact a true capacity expansion at LAX to 98 MAP or higher, even at the expense of a truly regional air transportation system?

Manchester Square:

Because of the uniqueness and prominence of the proposed GTC at Manchester Square, its discussion deserves special attention. Ground traffic impacts remain a question for the GTC. The community has been assured to a certain point at forums such as the LAX Working Group that traffic impacts would be minimized through the Westchester community because access points to the GTC are limited to the 405/105

freeways, Lennox Blvd. and other points south.

If, however, access to the GTC is largely expected from the 405/105 freeways, then those freeways which already experience overcapacity from non-airport uses will incur additional traffic impact. This suggests that some airport-bound vehicles will approach from north via other routes, like Sepulveda, Lincoln, Centinela, La Tijera, and La Cienega, much as they do today, even though the explicit design of the GTC is to make this access inconvenient for travelers.

The site footprint of the GTC as outlined in the land use plan raises further questions. If passengers are just moving through the GTC with no concessions or amenities, does it need to be of the large size as suggested on the plan's maps? What uses are called for in a facility the size of the GTC other than security devices? Alternative D is unclear on this. And if efficient passenger throughput can be achieved in a smaller facility, can it occupy either a smaller footprint in Manchester Square, or can it be located elsewhere? All of these issues raise the question of whether the GTC as located at Manchester Square will provide truly adequate security mitigation consistent with the costs associated with this aspect of the project.

OTHER ISSUES:

The draft documentation provided on Alternative D raises some significant additional concerns. One issue that appears to be under-addressed are the potential environmental impacts of the construction of the underground baggage transport facility. Some areas of the plan refer to the baggage facility as a part of the current proposal while others identify it as a potential future development. It seems that regardless of whether it is in or out of the current proposal, it should be evaluated as a part of the Master Plan. Placing a baggage transport system underground will have significant impacts - both during and after construction. How far below grade would this system need to be? What are existing physical limitations - both man made and natural that would affect the feasibility of this system? If the system is never implemented, how and where do the TSA requirements of 100% baggage screening get addressed? Currently there is little to no discussion of the myriad of issues including construction impacts, geological impacts, impacts of the water table, impacts on public utilities, relocation of public and other utility lines, and excavation requirements just to name a few.

Environmental Justice:

The Supplemental EIS/EIR, while identifying that the majority of affected communities are minority, clearly states that there are no Master Plan commitments related to environmental justice. It merely states that there will be continued input through the ongoing Environmental Justice Program. This is not sufficient given the serious impacts this project will have on the surrounding communities.

Cost:

The \$9 billion cost of Alternative D is no doubt a substantial fiscal impact on several sectors. While it is difficult to compare the LAX Master Plan with those of other U.S. airport remodeling plans and their local realities, the cost differences with those projects are nonetheless striking:

Atlanta:	\$5.4 billion
New York JFK:	\$1.2 billion
Chicago O'Hare:	\$6 billion
San Francisco:	\$2.4 billion

If the LAX Master Plan calls for limited or no capacity expansion plus safety and security improvements, then a cost of \$9 billion is inconsistent with the basic goals of the "Safety and Security Plan". Surely these laudable goals could be accomplished at a lower cost. Could not basic security and safety measures be implemented at LAX for \$2 billion, while reducing gates to limit capacity, increasing airfield safety, improving connectivity to public transportation and making LAX the crown jewel of a truly regional air transportation system?

The airline industry will be a substantial source of funding for this project. Assessments to the airlines will come in the form of passenger facility charges (PFCs) and sources. Currently, airlines at LAX enjoy low cost-per-enplanement (the cost of putting one passenger onto an airplane) as compared to other airports, due in part to the fact that LAWA has less debt service that it is currently passing on to the carriers. Cost-per-enplanement will nonetheless quadruple or quintuple at LAX as these assessments are incurred.

After the events of September 11, 2001 and due in part to the general economic downturn and subsequent reduction in business and pleasure travel, the airline industry is facing devastating economic impacts. As an industry that inherently has very high operating costs and capital investment requirements, the airlines are highly sensitive to fluctuations in their revenues.

Some airlines are currently in bankruptcy proceedings while others hover perilously close. Furthermore, some of the airlines currently operating at LAX, who represent a significant portion of the U.S. domestic and international travel markets, have expressed concern that they cannot incur these costs over the project's horizon and continue to provide service at LAX as their customers demand. While there has been some communication between the airlines and the planners, the airlines still feel that their concerns over project cost are unheard.

Other Alternatives Should be Examined:

Of all the project iterations to date, one concept that has never been given enough

thought is improving and enhancing the airport within the current physical layout. Creating transportation improvements like adding ATCS systems to more intersections, improving connectivity with public transportation, making security upgrades that will need to be done in the interim anyway, making runway modifications such as the South runway proposal, and terminal changes within the current physical layout can all be accomplished quickly and will have a real impact. These changes, combined with a consolidated transportation access location and a rental car facility could ultimately lead to a safer, more efficient airport that works better in the context of the surrounding community, truly caps growth, and costs significantly less than the soaring costs for Alternative D.

The RAND analysis of security identifies significant infrastructure improvements that can be done now, with existing technology, that will have a direct impact on the safety of airport patrons and airport operations. There are other proposals, such as the previously mentioned extension of Avion Blvd. as a dedicated cargo road and consolidated rental car facility that will significantly improve transportation access to LAX. The rental car facility alone will decrease over 1 million shuttle trips currently occurring because there are multiple rental car locations in and around the airport today.

By ignoring other options and issuing comparisons based on a "do nothing" alternative, we do a disservice to everyone. There is no question that "doing nothing" is not an option. This Master Plan should be one that achieves something real, at a reasonable price and not one that seems to raise more questions than it answers.

I urge your further consideration of these issues as you work to complete a true Master Plan for the future of LAX.

Sincerely,

Cindy Miscikowski
Councilmember, 11th District

**LAWA MASTER PLAN EIS/EIR
PUBLIC MEETING – FURAMA HOTEL - 23 AUGUST 2003
COMMENTS BY YVONNE BRATHWAITE BURKE CHAIR, LOS ANGELES
COUNTY BOARD OF SUPERVISORS**

Good morning! On behalf of the Los Angeles County Board of Supervisors, thank you for the opportunity to offer preliminary comments on the SUPPLEMENT TO THE DRAFT EIS/EIR for LAWA's Proposed LAX Master Plan. In reviewing the extensive materials presented in the original EIS/EIR of 2001 and the supplement of 2003, we recognize the enormity and importance of the challenge faced by LAWA, we acknowledge the extensive effort that has been made, and we thank LAWA for responding to public demand in extending the review period into November. HOWEVER, THESE CONSIDERATIONS DO NOT DIMINISH THE VERY REAL CONCERNS OF THE LOS ANGELES COUNTY BOARD OF SUPERVISORS CONCERNING THE PROPOSED MASTER PLAN and the INADEQUACIES OF THE SUPPLEMENT TO THE DRAFT EIS/EIR. I would like to touch briefly on a couple of the key issues at this time.

TRAFFIC, NOISE AND AIR QUALITY IMPACTS HAVE BEEN SHIFTED EASTWARD

The revised Master Plan as presented in new Alternative D reshuffles airport improvements away from neighboring areas north and south of LAX, and toward communities to the east. As a result, the unincorporated community of Lennox and the City of Inglewood now appear to bear the brunt of added traffic. The community adjacent to Manchester will now face a host of impacts related to the new passenger processing facility. Compared with the previously considered Alternative C, this proposal places even a heavier impact burden on communities to the north and east. I have serious concerns about the disproportionate impact of Alternative D on these communities, all of which are in my district. The City of Inglewood and the unincorporated community of Lennox will continue to be the most impacted by the operation of LAX.

Although Alternative D is presented as the alternative that will “constrain” passenger growth to 78.9 million annual passengers based upon the number of available gates, even the eye of a lay person can see that Alternative D provides LAWA with a footprint larger than the prior alternatives. This footprint, along with the new air terminal layout, provides the opportunity of future expansion of LAX with resulting increases in already intolerable air quality, noise, traffic and safety impacts on the communities of Inglewood and Lennox.

The residents of these communities already suffer inordinately from the current operation of LAX. *I personally believe it's high time we address whether LAX, an airport surrounded on three sides by urban development, shouldn't be scaled back rather than improved, enhanced and enlarged, unless the present impact from noise is mitigated.* The Los Angeles County Board of Supervisors has been on record for some time in support of a strong regional airport system which focuses on outlying airports such as Ontario or Palmdale, airports which are not surrounded by development . We expressed this position in our comments on the Draft EIS/EIR in 2001. Although Mayor Hahn has voiced his support for a regional airport system, Alternative D continues to reinforce **LAX as the preeminent airport for the Southern California region. Consequently, the concept of strengthening the role of outlying airports in order to avoid adversely impacting the lives of tens of thousands, if not millions, of people, is seriously undermined.**

ENVIRONMENTAL JUSTICE MAY NOT BE WELL SERVED BY THE EIS/EIR EVALUATION

The requirement to consider Environmental Justice has been in place for almost 10 years now, originally signed into law by President Clinton in 1994. And yet, the original Draft EIS/EIR prepared by LAWA in 2001 -- 7 years after Executive Order 12898 -- lacked even the most elementary analyses of this topic. Our preliminary review indicates that LAWA has not yet achieved a fair and complete assessment of the critically important issue of Environmental Justice.

In my earlier remarks concerning noise, air quality and traffic, I noted that Alternative D appears to shift the burden of airport improvements away from the wealthier communities on the north and south, and toward the more economically disadvantaged communities east and northeast of LAX. I believe that this Supplement to the Draft EIS/EIR will not be adequate until it provides an honest assessment of the trade-offs between environmental protection and environmental justice. In designing runway extensions and facilities to the east, this plan appears to protect biological resources -- particularly the El Segundo Blue Butterfly -- at the expense of residents -- children and families -- in the communities of Lennox, Inglewood and Manchester. Can such a trade-off be justified? I see no assessment that provides the evidence. This EIS/EIR is the right time to take a hard look at the human costs that will be incurred in order to protect a limited habitat area on the coast. We ask that the analysis be performed *now*, as part of the Environmental Justice assessment, before the opportunity is lost.

Thank you for your consideration of these comments.

TESTIMONY

Good morning, I'm Don Knabe, Los Angeles County
Supervisor for the Fourth District which represents LAX.

Thank you for the opportunity to speak this morning about
the future of Los Angeles International Airport and our
regional air transportation needs.

I appreciate Supervisor Burke's comments and support her
concerns about environmental justice issues, etc.

I'd like to begin by saying I agree with Mayor Hahn that
something must be done to make LAX more secure and
more efficient in handling passengers while balancing the

concerns of the local community and the need to create additional jobs.

Alternative D indicates that it is designed to accommodate a passenger activity level of 78.9 million annual passengers by reducing the number of existing gates and by foregoing the creation of the new terminal facilities and runway extensions that had previously been considered.

I support the mayor's stated goal of providing for more manageable limits on the passenger volumes at LAX given the well-documented impacts that the airport has had on the surrounding communities and the surrounding infrastructure.

The County of Los Angeles is in the process of reviewing the LAX Master Plan materials to get a better understanding of

just how the mayor intends to assure the region that the 78.9 MAP capacity will not be exceeded once Alternative D is implemented.

In May of this year our County Counsel provided us with their opinion that the City and Los Angeles World Airports could legally place deed restrictions on the LAX property restricting the future development of the airport in order to benefit nearby properties owned by other nearby public entities or private parties.

I believe limiting development is a way to keep a passenger cap in place. I have submitted a motion for consideration by the Board of Supervisors to call on the City of Los Angeles to deed restrict the land until 2020 to ensure that LAX does not exceed 78 MAP

I encourage Mayor Hahn and LAWA to follow through on efforts to limit LAX growth to a manageable level to the greatest extent possible through a commitment to place deed restrictions on certain portions of the LAX property until 2020 to prevent those portions from being used to expand facilities to serve passenger volumes beyond the intended 78.9 MAP level.

Specifically, it would be appropriate for LAWA and the City to commit that the portion of LAX generally located on the west side of the airport easterly of Pershing Drive between the north and south pairs of runways and westerly of the proposed Redeveloped Central Terminal Area (Area 1); and the portion generally located on the northeast corner quadrant of the LAX property and currently used for parking

lot and rental car purposes depicted as the site of the proposed Consolidated Rental Car Facility (Area 2) would be deed restricted through 2020.

The deed restrictions should provide that those two areas will not be developed with airport passenger terminal, airport runways, or other improvements intended to increase airport passenger capacities beyond Mayor Hahn's stated 78.9 MAP activity target levels.

Such a firm commitment may be crucial in obtaining the support of Mayor Hahn's Alternative D from at least some of the significant interested agencies and groups who will so directly be affected by the development at LAX.

While I've have spoken this morning about limiting growth, I do want to say that the security aspect of this plan is a major concern of mine. While the County is reviewing the security aspects of this plan and will comment on it in a written report as part of your official record, I still have strong security concerns with the Manchester Square passenger check in facility. I want to make sure that we ^{give} ~~consider~~ the same safety concerns to the passengers as we do the infrastructure of the airport.

Again, thank you for the opportunity to speak with you today and I hope that we can move forward in a productive way at achieving our common goals for the redevelopment of LAX; Limiting growth and protecting people through viable safety enhancements.

- * Good morning. I am Councilman Kelly McDowell, representing the City of El Segundo.
- * Given the length and complexity of the Master Plan and its environmental documents, our full comments on technical issues will not be ready for some time. Therefore my City's comments today are preliminary.
- * El Segundo continues to oppose Alternatives A, B, and C for the many reasons we expressed orally and in writing during the public review and comment period for the initial Draft EIS/EIR in 2002.
- * El Segundo has not endorsed Alternative D--but we feel its stated objectives are consistent with a regional aviation approach.
- * Specifically, the City of El Segundo supports a regional approach alternative that makes proper use of Inland Empire airports.
- * We support an alternative with fewer environmental impacts. And we would like to see the adverse impacts of the airport minimized and mitigated to the greatest extent feasible.
- * El Segundo supports enhanced safety and security at LAX.
- * And my City supports an alternative that by design will accommodate passenger and cargo levels no greater than the physical capacity of the airport as it exists today.

* Limiting LAX to its current capacity has always been our number one goal--and we believe that limiting LAX's capacity will:

** allow other airports in the region to develop and handle a fair share of future regional aviation demand;

** result in fewer environmental impacts; and

** improve safety and security at the airport.

* But my City is greatly concerned about the impacts of proposed southside airfield changes that would move the southernmost runway 50 feet closer to El Segundo.

* LAWA has stated that it believes these changes are necessary to improve runway safety.

* However, we are currently studying the impacts of the proposed reconfiguration, and the options for the southern runway complex.

* In particular, we urge full public consideration of end-around taxiways as an alternative that could provide greater safety at lower cost and with fewer added burdens on nearby communities.

- * Safety at LAX must be a priority for all of us.
- * El Segundo is prepared to support measures necessary to enhance safety--even if those measures increase our burden--but only if we are assured, by an independent expert, that other alternatives would not be equally effective.
- * In conclusion, we are grateful for Mayor Hahn's responsive leadership and his continuing pledge to constrain growth at LAX and foster a regional approach to meet future aviation demand.
- * It is our hope that the ultimate outcome of this Master Plan process will be a truly regional airport approach that ensures that LAX does not exceed its current capacity.
- * Thank you.

23 AUGUST 2003 LAWA MEETING
Furama Hotel, 8601 Lincoln Boulevard; 310.670.811; 9:00-1:00
TOPICS : Supplement, Baseline, Cumulative

- S. Bauer, here in assn. w/ AC Lazz, to Speak on Behalf of Co of L.A.

- In allotted 3 minutes, I will touch briefly on just a few key points:
 - - Use of Supplement to the Draft EIS/EIR
 - Baseline Data Assessment
 - Security Analysis for Alternative D

USE OF A SUPPLEMENT TO THE DRAFT EIS/EIR

CEQA Gdlns state that a *SUPPLMNT to an EIR may be prepared IF CHANGES IN A PROJ ARE NOT SIG.* Where **MAJOR REVISIONS** have occurred ... *the proper type of document is a SUBSEQNT EIR* that presents ALL info ... instead of only the CHANGD info. **BOTH types of review are intended for use in conjctn w/ prevsly certified docs.**

In present case, THERE IS NO PREVIOUSLY CERTIFIED or approved document. And FURTHERMORE, *the changes to this project are MAJOR – an entirely NEW ALT* has been introduced as the preferred project!

Thus EVEN AN ADAPTATION of CEQA -- to encompass a document that HASN'T BEEN CERTIFIED – would indicate the project should have been addressed through preparation of a comprehensive revised Draft EIS/EIR.

- **In this context, WHY DID LAWA NOT PREPARE A COMPHENSV REV. DR EIS/EIR THAT PRESENTED a FULL SET OF INFO for REVIEW w/ THE NEW ALT D?** } out

We have a 2ND SERIOUS CONCERN w/ this process: **In 2001**, Co. of L.A. devoted considerable **time, FUNDS & effort** to review & submit comments on *extnsive documntn* released by LAWA at that time. **I am CERTAIN a similar effort was spent by MANY OTHERS HERE TODAY.**

There is **NO QUESTION** that a *resp to the earlier comments* would have served to ADVANCE PUBLIC DISCOURSE, strengthen the opportunity for **ENV. PROTECTN**, and facilitate ^{an} UNDERSTANDING OF THE LEAD AGENCY'S THINKING on a wide range of KEY ISSUES...

current review + present insight into

→ **WHY, THEN**, did LAWA not take this opportunity to present ... or *EVEN SUMMARIZE* ... **ISSUES-RAISED** during the 2001. EIS/EIR review? *COMMENT OFFERED*

ADVANCE PUB DISCOURSE

FACILITATE CURRENT REVIEW

STRENGTHEN ENV. PROT.

PROVIDE INSIGHT INTO LD. AG. THINKING

INCONSISTENT AND OUTDATED BASELINE DATA

The 2003 Supplmt makes *cont'd widespread use of 1996 baseline data -- that was outdated even in 2001.* Instead of actually UPDATING the baseline, individual Sectns offer **BRIEF** discns comparing '96 data w/ data from 2000 (also 3 yrs out of date). Several ~~assmts actually conclude that the 96 base data is more useful~~ because the 'lower volumes would result in a larger change' (p.4-221) comp w/ current LAWA proposals.

What we **DO NOT SEE** is an **ANAL** of the **SIG.** baseline **SHIFT** that occurred following 9/11, and how that **SHIFT CHANGED** the **BENCHMARK** for understndg proj imps.

GIVEN that condns at LAX have ***changed dramatically*** since 2000 (much less '96) ... and ... GIVEN that LAWA developed an ENTIRELY NEW ALT D in resp. to the **MAGNITUDE** of those very changes, and designated ALT D as their **PREFERRED ALT** ...

→ ~~Given these things,~~ **WHY did LAWA NOT CONSIDER IT WORTHWHILE TO PROVIDE THE PUBLIC - & its own DECISION MAKERS - w/ a BASELINE REFLECTNG CONDNS AT LAX AS OF 2003?** *THAT ALSO*

SECURITY

The Suppl EIS/EIR presents Alt D as the "**Enhanced Safety & Security Plan.**" However, our review of Appdx I (*Comp of NA/NP Plan w/ Alt D*), indicates that LAWA has relied on a theoretical assmt that falls **SGNFCNTLY SHORT** on detail.

~~Our review of this KEY TOPIC is still in the early stages — we expect to significantly expand our comments on security when the anal is complete.~~
~~—~~ **However,** considerable adv media attn has already focused on LAWA's proposed use of *UNPROVEN SECURITY TECHNOLOGIES*. **I'd like to offer JUST 1 EXAMPLE to illustrate the potential impact of this approach.**

Why this is a valid concern

Apdx I mentions possible use of 'face-in-the-crowd' technology. On Aug 20 '03 -- just this past week -- the **Tampa, FLA Police Dept.** announced it has **DISCONTINUED** use of facial-recognitn surveillance after 2 yrs. This software product **failed to make a SINGLE positive identifiactn** from a database of more than 24,000 'mugshots'.

ALSO

~~Though Alt D is presntd as 'Safety & Security Alt', our anal indicates~~ this plan FOCUSES on 'hardening' security for ^{gateway ELEMENTS} ~~frontal~~ aspects of LAX while **largly IGNORING** perimeter, cargo areas, maintnce & fuel farm fac.. We've found **NO DISCN in Apdx I that specifically addresses backside security.**

We undrstd that MANY SECURITY FEATURES are TOO *sensitive* for public disclosure. However, the ~~apparent absence of detail,~~ **lack of sound analysis & ABSENCE OF CLARITY** – these flaws suggest that Alt. D is fundamentally flawed -- and in the very area of security that it was created to address.

Thank you for opportunity to share these comments on BEHALF of Co of LA

SPC00089

GOOD MORNING NADIA AND GENTLE

for every one

10/20
ARRIVAL
LENNOX
ON
9/23/06

My name is Jose Luis Acosta. I have lived in Lennox for 23 years, in the flight path of LAX. Together my wife and I have raised 2 children in Lennox. My sons are 13 and 17 years old I've worked in tourism for 17 years as a Bartender in the Manhattan Beach Marriott.

~~TOURISM~~

Speaker 31

It is not easy to live in Lennox and raise children here. Our community is poor. We have traffic. Our schools are crowded and noisy from the planes flying overhead. But one thing that makes it worthwhile for me to raise my family here is that I have a good, stable job in the tourism industry.

(TOURISM)

Modernization will effect us in Lennox. It can hurt us, or it can help us. Modernization could cause more traffic, more noise, more pollution, without giving anything in return. Or, the city can do everything possible to make sure that modernization benefits our community and provides good jobs with living wages and health care. If modernization can benefits our community, then we are willing to support it.

health care

My name is Emma Worthington and I live in Inglewood. I also work at the airport and have worked there for almost 30 years. Like myself many people who work at the airport live in the surrounding communities. We live in Inglewood, Lennox, Hawthorne, El Segundo and Westchester. We understand the connection between good quality jobs and a quality life. We need ^{more} new jobs but we don't minimum wage jobs. What we need is jobs that provide a livable wage and affordable family health coverage. The companies at the airport provide those types of jobs and that is how I have been able to raise ^{as a single mom} my family and not be on welfare. ^{We Need} In order to insure that this modernization plan provides good employment opportunities for our communities, we encourage the mayor to include in his plan a local hiring program so that others in my communities can also raise their families and our youths can strive to emulate their parents. When we talk about modernization we say we are bringing the airport and Los Angeles into the 21st Century. Well we the workers would like to be able to bring our communities into the 21st Century along with the airport and the rest of Los Angeles. That is why we urge the mayor to ensure that his plan provides good paying jobs with good benefits and a community packet that will ensure we are along for the ride. **NOT LEFT BEHIND.**

Good Morning (Or Afternoon)

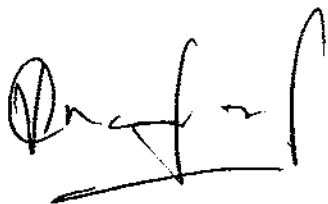

My name is Victor Crawford, **and I live at**
416 E. Regent St, **in the City of**
Inglewood Ca. 90301

I wanted to give my support to the proposal for Alternative D of the Airport Master Plan.

With Alternative D providing facilities for 78 million annual passengers and 3.1 million tons of cargo a year it supports the idea of Regional Airports. In past plans LAX was expected to have to handle as many as 98 million passengers a year and this was totally unexceptable to residents of the surrounding cities. Mayor Hahn has lived up to the commitment that he made before he was elected, that the modernization plan would limit airport usage.

Alternative D, according to the Environmental Impact Report, will provide the best design, including safety and security concerns, with the lest impact on area residents and I support that ideal.

Thank you for listening to my statement.

Hello. My name is Kevin Norton. I live at _____, in the City of _____.

I came today to let you know that I support the modernization of LAX. Mayor Hahn's design with Alternative D will fulfill the concerns that many area residents have had, especially in regard to the number of passengers that will be able to use the airport.

Mayor Hahn signed a letter that he would not support any airport design that allowed more than 78 million passengers a year to fly into or out of LAX. Alternative D, by design caps the number of passengers and cargo as well. This will push other airport sites to build airport facilities and redirect flights there.

A regional approach to air travel and cargo handling will be required when Alternative D is constructed and other area residents will realize that they should provide airport sites. This is a great plan and it should move forward as soon as possible.

Thank you.

My name is Maria Verduzco-Smith, my address is 10927 Grevillea Ave. Lennox, CA. 90304. I Serve as President of the Lennox Coordinating Council.

The Community of Lennox is severely impacted by airport operations but we feel we are mainly neglected. We have schools that jets fly directly over on their approach to the airport and most homes have not been sound proofed to protect against jet noise, as part of the sound mitigation program. Many of our residents can feel the oil and see the soot from the jets. Our children lose hours of education time yearly due to interruptions caused, each time a plane is landing.

There are many things to be taken into consideration when a community is located as close to an airport as Lennox: There is the health of the children, the quality of life for the residents and the impact of noise and traffic the airport causes. If the airport is going to modernize, then it is time for our community to modernize also. This plan must have some real community benefits in it so that future health problems can be alleviated, our schools can be safer, our community can be protected and measures are putⁱⁿ place to ensure that the people of Lennox are treated fairly.

Community benefits means that our community is not forgotten in the modernization process. It means that with \$9 billion being spent for airport modernization, there is money actually being spent in our community to make those infra-structural changes needed to accommodate the expected increase of noise and traffic. While there is a push for modernization, we also want to push for increased and visible benefits in our community of Lennox.

Thank you.

Good Morning (Or Afternoon)

My name is Robert Watson, and I live at _____, in the City of _____

Thank you for the opportunity to speak about the proposed LAX Modernization Plan.

Mayor Hahn has provided an excellent proposal for LAX and with his commitment to cap the airport passengers at 78 million a year, I think that he has satisfied many of the concerns of the residents who live and work near the airport. The idea that other areas, like Palmdale and Orange County will need to take some of the future airline passenger burden is a good one. Mayor Hahn's support for a Regional Approach should be commended as well.

We absolutely need to modernize LAX, not only for the economic and safety concerns that we have, but also so that the area residents will find solutions to their quality of live issues. I think that Alternative D provides many of these solutions, especially with the expanded use of the Green Line Light Rail system that will have a stop a the airport.

Thank you for holding these hearings.

In prior hearings such as this and numerous news paper articles regarding Alternative D, many factors as passenger caps, traffic, noise, jobs and security have been raised. Yet the major impetus behind alternative D continues to be security ^{regardless of the security initiated no security at all} so I'd like to address that ^{subject} particular issue. And frankly, it's not easy to assess the value of Alternative D in that light by reviewing the EIR document.

I offer these direct quotes from various sections of that document.

1. From the comparative analysis section of D vs No Action Page 34

***“Vehicular traffic in the Central Terminal area results in crowded terminal areas that create attractive targets for terrorists & allows baggage containing potentially significant explosive devices into passenger congregation areas.” AND
“People approach all facilities with unsecured baggage until they reach the TSA checks.”***

2. “Security screening stations at the Ground Transportation Center and the Intermodal Transportation Center will protect the Central Terminal area from attack by persons armed with weapons.”

By moving arrival & departure passengers rapidly through the entry point, only a small number of people would be clustered as a potential terrorist target.

3. From the Development & Refinement Sectionparagraph 2.2.8

“First level screening at the Ground Transportation Center will be random baggage and passenger checking and use of video surveillance and sniffing dogs.”

4. Same Sect 2.2.8

“The architectural design intent for the GTC is to create a partially climate controlled open-air structures to help diffuse potential blast impacts at the curb front by eliminating glass curtain walls.”

5. Again, from the comparative analysis section:

“The people mover presents a problem as it is unsecured and subject to attack – but, this can be partially mitigated by use of technology”

6. Again from Development & Refinement Section Paragraph 2.2.81

“Passengers not using skycap services may carry baggage on the Automated People Mover to the Central Terminal area where screening will be made by the appropriate airline.”

So =

- 1). If unsecured baggage in the Central Terminal is a current problem it doesn't appear this multi-BILLION dollar Alternative D solves that.**
- 2). All passengers spread out through 8 terminals currently & you've seen lines all out down the sidewalk – Here all passengers must do through this one entry point but they will move rapidly so as not to present but a small number as a potential terrorist target?**
- 3). The 6 car people mover really sounds like an exciting entry to the “world class” LAX with baggage carts being rolled in & out among the travelers as well as the meeters and greeters, who are able to ride to the central terminal area.**
- 4). Of course, in a curbside blast, one would want nothing but “partially climate controlled air” between them & the explosion.**

A security solution?

NO – A JOKE !

SPC00076

Good morning (or Good Afternoon)

My name is Romeo Gonzalez. I live at _____, in the City of _____.

I would like to show my support for the LAX Master Plan and Alternative D. After almost 8 years of planning and dozens of hearings and testimony Mayor Hahn has introduced a plan that takes into account all of the concerns that have been raised.

With the heightened awareness of the possibility for airport disaster, either by accident or by human hand this plan will reduce and consequences. With the remote passenger and baggage handling facility, the flying public should have much more confidence in LAX security. This design, with the early scanning of passengers, carry-ons and baggage, makes the Central Terminal area and airline gates much safer.

I also like the use of people movers and trams in the design. Moving around LAX today is very difficult. The only way to get from airline to airline or different terminals is to walk or wait for a bus. Alternative D's transportation system saves time and confusion.

I hope Alternative D is adopted, and soon.

Thank you for taking my comments.

Good Morning (Or Afternoon)

My name is HOMER ANDERSON, and I live at 15824 S. WESTERN Ave., in the City of Gardena, CA 90247

All of us here today use airports at some time or another and if you have been at LAX lately, you know how difficult it can be to get through the check in procedures or even to pick-up someone.

That's why I support the new proposal for the Master Plan. As it is indicated on the boards that are set up outside, there will be new passenger ticketing and baggage handling building built away from the central terminals and gates. With the larger area for passenger drop-off and pick-up and the baggage checking facilities being expanded, passengers should be processed much faster.

Getting the people in and out of the drop-off area faster will also give us a safer and more secure airport. The chances that someone will be injured in any disaster will be greatly reduced with the new design.

Thanks

AFTERNOON

Good ~~morning~~ and welcome to Westchester. My name is Harry Rose, 7725 Hindry Avenue, Westchester 90045. I come before you today on behalf of Osage Neighbors Association, representing approximately 3600 homes in Osage Park and Westport Heights.

Because it would seem that none of our City officials have noticed, we would like to point out that most modern airports operate on a much larger footprint than LAX and are not located in densely populated urban areas. Denver had the vision to build a world-class airport on 53 square miles in a rural area and actually close their old airport. Total cost? Less than half the price of Alternative D. Los Angeles, where is the vision?

While we love a good Public Works boondoggle just as much as anyone else, this one is ill conceived and a violation of Mayor Hahn's election pledge to our community. Airport use of residential property violates his pledge to operate the airport within its current boundaries. The capacity of 78.9 MAP stated in the EIS violates the Mayor's election pledge to us by nearly 1 million passengers a year.

Alternative D would dramatically enhance flight field throughput and lay the groundwork for vastly increased ground transportation infrastructure setting the stage for future expansion of LAX operations. We have heard that the FAA is currently studying the feasibility of simultaneous landings on three runways under the new configuration. Do LAWA and FAA plan to visit this practice upon us in the future?

Alternative D would move airport bound traffic two miles to the east subjecting East Westchester, Lennox and Inglewood to increased vehicular air pollution and noise. How does this even begin to comply with the environmental justice provisions of CEQUA?

Alternative D locates a Ground Transportation Center in a tract of land currently zoned R1. The EIS clearly states that no residential property is to be acquired for the project. This leads us to assume that LAWA plans to use property acquired through an ongoing and supposedly Voluntary Noise Mitigation Acquisition program. This method of residential property acquisition for airport use ignores FAA guidelines in Order 5100.37A, Chapter 3, Section 9 implementing the Uniform Act of 1970. We would like a complete explanation as to how LAWA's acquisition and conversion of this property to airport use approaches any semblance of legality.

Thank You
Harry Rose, Osage Neighbors Association

Thank's for the opportunity to speak:

My name is Malcolm Joseph **I live at**
_____, **in the city of**
_____.

LAX has been a very large factor in the daily lives of all of us in Los Angeles County. Those who live near the airport have special concerns, even though the airport is an economic boon to us all. Obviously, traffic and noise have to be dealt with and I think that the LAX Master Plan with Alternative D does that.

The traffic plan, with improvements being proposed for intersections, extra lanes on La Cienega Boulevard and the improvement to the cargo delivery accesses roads will aid the flow of traffic in the airport's immediate area. But, the greatest change to increased traffic will be the connection of the Green Line Light Rail to the Transportation Center. Finally, a public transportation system will be available from Fly Away Parking facilities or Stations where passengers and be dropped off at over 50 sites throughout Los Angeles County.

Alternative D is my choice and I hope that the FAA and the City will approve the plan

Thank you.

LAX MASTER PLAN - SPENDS \$ 9 BILLION PLUS TO:

- * **Tear Down Airport Structures Possibly Not Yet Even Paid For**
- * **Concentrate Airport Congestion in Single Vulnerable Location**
- * **Promote Traffic Gridlock around LAX and Provide No New Rail Transit Access to LAX**
- * **Make LAX the Most Inconvenient Airport in the World**

Simply moves Airport Congestion & Likely Point of Terrorist Attack to another more congested site without equal replacement parking and still further away from Green Line to Blue Line to Red Line and Urban Destinations. Is it really convenient to go to Park and Ride Lots in Long Beach, Norwalk or Inglewood and ride busses to Manchester Square Airport Security Center ?

Our past leaders were visionary in buying a large airport site at Palmdale. Tokyo, Seoul, Hong Kong and Washington D.C. all built new larger International Airports far from their cities. Most now use old airports for Domestic Flights Only. Transit Links to other Airports and Cities.

HOW TO SPEND LESS AND GET MORE.....a possible Alternative Plan

LOS ANGELES AIRPORTS AND RAIL TRANSIT SCHEME * *

As Illustrated with Detailed Map - Plans & Text shown on Large Display Boards.
(Prevented from Showing at Airport Public Hearing. Want to See ? Contact Me.)

*** New Secure Los Angeles International Airport at Palmdale**

With all passenger and baggage screening and check -in features now in LAX Master Plan Using only a small portion of this vast site. Passenger Drop-Off at Tram-Transit Link.

Links Palmdale Metrolink Station (uc) with one-mile Elevated Airport Tram connecting to Security Center for Passenger and Luggage Screening, Flight Check-In and Baggage Check.

Continuing Tram to Huge International Terminal and on to even larger Domestic Terminal for Connecting Flights.

2.5 Mile Elevated Tram Loop from Terminals to Parking, Bus, Taxi and Car Rental Lots; to Security Center; and Metrolink Station.

Vehicle Entry Security Check Points. 500 acres of Open Parking Lots with approximately 50 to 70 thousand Car Capacity. 180 acres for Bus and Taxi Terminals and Car Rental Lots.

Existing Metrolink Travel Time from Union Station to Lancaster is 1 hour and 40 minutes. Would be less from Red Line/Metrolink Station to Palmdale Airport and even less by car on 14 Freeway.

Transit Travel Time to Airport could be greatly reduced by (1) Better Track Alignment (2) Improved Rail Roadbed (3) Grade Separation (4) Double Tracking and (5) Electrification.

*** Los Angeles Westchester Domestic Airport at LAX**

Linked by Terminals Tram to Metro Rail Line.

Passenger Drop Off and Security Check Point at Transit-Tram Entry Station

Security Check Stations at all Vehicle Entry Points.

Airport Conference Center & Corporate Jet parking at now Tom Bradley International Terminal.

Retain all LAX Terminals, Parking Structures and Runways as they now exist.

LAX Flights Actually Reduced. No Homes or Businesses Taken.

*** Easy Rail Transit to ALL Los Angeles Airports.**

Including Direct Metro Rail between LAX and Burbank Airports.

Only 15 miles of new Metro Rail lines could link Green Line and LAX to Burbank Airport and Metrolink Rail Line to Palmdale Airport.

Two mile Red Line Valley Metro Rail Extension to Burbank Airport Terminal. Then one mile more to new Antelope Valley Metrolink Station and Rail Transit Service to L.A. Int. Airport at Palmdale. Also increases low income workers access to large nearby affordable housing stock.

Ebony Metro Rail Line from Union Station to Wilshire-Western Stub. Then 12 miles to LAX. Subway down Crenshaw Blvd. and Elevated on MTA owned railroad right-of-way to Century/Aviation Station Link with LAX Airport Terminals Tram. Ending at Green Line Light Rail Aviation Station. Bay Area BART elevated everywhere except in Downtown City Areas.

Long Beach Airport Alternative Terminal Transit Links to Long Beach Blue Line Light Rail.

Now no direct rail access to Ontario Airport. Alternative Plan has new Ontario Airport Stations on Riverside and San Bernardino Metrolink Lines with Transit Links to Airport Terminal.

May not be Copied or Used in Any Way Either in it's Entirety or in Any Part Without Prior Written Approval of Tony Neil Kom or Heirs. Dated August 1, 2003. Los Angeles, California

Creating jobs is a good thing, and keeping ALL of our U.S. airports modern and maintained is always a good thing.

But I have to say NO, emphatically, to the mayor's Alternative "d".

Mayor Hahn's PR machine keeps repeating that the 9 billion dollar plus LAX "Alternative d" will be safer and more secure. Experts from the Rand Corporation, in a study requested by Congresswoman Jane Harman, disagree. After studying the plan they found that the airport would, in fact, be less safe and less secure than the existing LAX.

In fact, the study concluded, modernization could be accomplished at a much lower cost than alternative d.

Concentrating all the travelers into one check-in just creates an even more attractive target for any terrorist activities. We all will be put at tremendous risk if we allow Mayor Hahn to create one giant bull's-eye at what once was Manchester Square.

Not safer, nor more secure, certainly not more convenient. and unnecessarily expensive.

Alternative "d" is not good community planning, Mr. Mayor, and it's not good governance.

LAX Master Plan Office
P.O. Box 92216
Los Angeles, CA 90009-2216

Dear Sirs:

While Alt. D is a definite improvement over Alts A, B, and C, it does not achieve its stated purpose: to provide safety and security.

Alt. D would cost over \$9 billion, exacerbate the traffic and air pollution problems, expand the boundaries of LAX, and provide very little in mitigation measures.

By expanding LAX into the Manchester Square area, Alt. D would merely transfer the dangers from the facilities in the Central Terminal Area out to the community, thereby leaving the traveling public and the residents still at risk. Gathering a large number of people into one area would create a terrorist target - and that is what a Ground Transportation Center in Manchester Square would be.

Concrete, metal and plastic would get protection; people would not.

Extending LAX boundaries into Manchester Square sends the message that LAWA intends to just keep expanding LAX and it can handle all the Southern CA traffic - no regional approach is needed. Other counties and communities should be taking on their share of the air traffic, not told they can rely on LAX.

SPC00083

There have been very few Category A runway incursions at LAX - certainly not enough to warrant a \$9 billion renovation which includes moving runways. Adequate safety precautions could be instituted with the cooperation of FAA, LAWA, and the airlines.

Air traffic has not rebounded to pre-9-11 levels. This gives us the luxury of taking time to reexamine the assumptions previously made that air travel would return to and increase from those levels. There is no reason to rush to prejudgement. There is time to explore more options on bringing other airports into compliance with a regional approach to air traffic.

I will be making written comments on specifics of the proposal prior to the November deadline.

Sincerely,

Danna Cope

Quoting from the supplement to the draft EIR/EIS --

“As of October 31, 2002, progress in acquiring properties under the Voluntary Residential Acquisition/Relocation Program for Manchester Square and Belford indicates that 62 percent of the property owners (351 properties and 1130 dwelling units) have volunteered to participate in the acquisition program.” What about the other 38 percent? What about the people who lived there for over fifty years and DON'T want to move? I guess no one from LAWA or L.A. city really cares, but then why should they?

Then, as I was randomly leafing through the EIR/EIS, I found an interesting report on the residences which will be most impacted with the plans. Guess which city is impacted most -- Inglewood of course!

At more than 120 “Newly Exposed Residential and Noise -Sensitive Uses Outside of the 1992 CNEL Noise Contour” for the Alternative D, and over 2,000 listed under “Alternative D 2015 dBA SEL Noise Contours Listing of Newly Exposed Residential Uses Outside of the 1992 65 CNEL Noise Contour”, we -- Inglewood -- are the most impacted area in the communities surrounding LAX.

But I guess that really doesn't matter. We -- Inglewood residents -- are just low income NIMBY's who want to stop this “Modernization” -- or is it expansion? -- plan.

Also in the Supplement to the Draft EIR/EIS was that wonderful interchange on Arbor Vitae ST. -- which our beloved L.A. Co. Supervisor pushed for -- under the title:

“Model Update Information -- Regional Roadway Improvements.”

Our county supervisor had once mentioned that the Arbor Vitae Interchange has nothing to do with Airport Related issues -- at least that is what I remember.

Even worse though, a LAWA staff member had once said it was for our -- now nonexistent -- Kmart!

I don't think so!

Councilmember Kelly McDowell,
City of El Segundo
Comments on the
LAX Master Plan Draft EIS/EIR Supplement
August 2003

- Good Evening. I am Councilmember Kelly McDowell, representing the City of El Segundo.
- Given the length and complexity of the Master Plan and environmental documents, our full comments on technical issues will not be ready for some time, therefore the City's comments tonight are preliminary.
- The City continues to oppose Alternatives A, B, and C for the many reasons the City expressed orally and in writing during the public review and comment period for the initial Draft EIS/EIR in 2002.
- *ES* ~~We feel the stated objectives of preferred Alternative D support a regional aviation approach that makes proper use of Inland Empire airports.~~ *not endorsed alt. D, but*
- *MY* ~~The City supports an alternative with fewer environmental impacts. We would like to see the adverse impacts of the airport minimized and mitigated to the greatest extent feasible.~~ *(i+s)*
- *ES* ~~The City supports enhanced safety and security at LAX.~~
- *MY* And the City supports an alternative that by design will accommodate passenger and cargo levels no greater than the physical capacity of the airport as it exists today.
- Limiting LAX's capacity to its current capacity has always been our number one goal and we believe limiting LAX's capacity will allow other airports in the region to develop and handle a fair share of future regional aviation demand,
- will result in fewer environmental impacts,
- and will improve safety and security at the airport.

- However, the City is greatly concerned about the impacts of southside airfield changes that *would* move the southernmost runway 50 feet closer to El Segundo.
- LAWA has stated that it believes these changes are necessary to improve runway safety.
- However, we are currently studying the impacts of the reconfiguration, and the options for the southern runway complex.
- In particular, we urge a full public consideration of end-around taxiways as an alternative that could provide greater safety at lower cost and with fewer new burdens on local communities.
- Safety at LAX must be a priority for all of us.
- The City is prepared to support measures necessary to enhance safety, even if those measures increase our burden, but only if we are assured, through an independent expert, that other alternatives are not equally effective.
- In conclusion, we are grateful for Mayor Hahn's responsive leadership and his pledge to constrain growth at LAX and foster a regional approach to meeting future aviation demand.
- It is our hope that the ultimate outcome of this Master Plan process will be a regional airport approach that ensures that LAX does not exceed its current capacity.
- Thank you.

Jart Reed

Subject: FW: Talking points for LAX EIR hearings with respect to rail/airport connections

Sent: Sunday, August 10, 2003 1:59 PM

Subject: Talking points for LAX EIR hearings with respect to rail/airport connections

To All:

The following "talking points" below are the result of many meetings and discussions of rail advocates, the latest of which was last Thursday evening's Friends of the Green Line (FoGL) Meeting in El Segundo.

Key: Since the MTA has no money to pay for a Green Line extension to Westchester, the notion of a Green Line extension should fall under traffic and/or environmental mitigation, with a final EIR of any Alternative D including a specific design--preferably one that has the written blessing of the FAA.

More talking points:

1) Our goal is for the Green Line to connect to the GTC, wherever it ends up.

Manchester Square is being discussed as a site for the GTC solely because it's on the drawing board as the current site--FoGL is neutral on where the actual location should be..

2) A Green Line Westchester extension would enhance the usefulness of the People Mover by connecting it to local hotels and businesses.

FoGL supports the LAWA People Mover for airport transportation purposes, but not a People Mover that would harm future regional transportation efforts.

3) FoGL recommends a direct connection of the Green Line to the GTC as an alternative to a potentially-superfluous Intermodal Transit Center adjacent to the Aviation/Imperial Green Line station.

A direct Green Line/GTC connection would not interfere with the People Mover designed to connect Parking Lots C and D with the GTC, but would instead separate rail- and car-bound LAX traffic.

4) Federal funding for both a rail connection from the south (along the MTA Harbor Subdivision Line to the GTC), as well as funding for rail connections from the north and Downtown, might be a better argument for LAX-related traffic mitigations than "a Green Line extension to Westchester".

The northern connection would be from the previously-planned Westchester extension, and from Downtown and Inglewood via the MTA Harbor Subdivision Line to the GTC.

5) The Bay Area just established a rail/airport connection, and Orange County has just started looking into its own airport/rail connection via its Centerline--L.A. County should strive for nothing less than its own rail connection(s).

The nine Public Hearings for the Supplement to the Draft EIS/EIS and Draft Master Plan Addendum are scheduled as follows:

Date

Location

8/10/03

Activities of The Coalition

What ideals do we stand for?

The Transit Coalition is a grass roots volunteer organization that advocates a balance of bus, subway, commuter rail, light rail, bike, airport access, goods movement, physically challenged access and automobile transportation to get Los Angeles Region moving again.

What issues do we advocate?

Short term: We deal with improving the quality of the existing rail and bus systems such as hours and frequencies of service, working facilities and improved signage.

Long Term: We work with political officials and staffers to encourage continued and increased Operating and Capital Funding. We work with the media to provide facts and to correct myths, misinformation and misperceptions. We work with the community and transit users to demonstrate and mobilize a solid base of support to expand bike, bus and rail systems.

Programs we are involved in:

- Meetings with Elected Officials and their staffs in Washington, DC, Sacramento, CA and Southern California.
- Community Outreach meetings to garner public support.
- Dinner Meetings with Key Speakers.
- Websites and Discussion Boards to educate and evaluate issues.
- Effective E-mail and Letter Writing Campaigns to Officials and Media.
- Assembly of large supportive crowds at public hearings.

Who Are We?

Mission Statement

The Transit Coalition is a broad based group of concerned citizens mobilized to passionately demonstrate community support for the economic development and continuing operation of improved transportation in Southern California.

Objectives and Vision Statement

Education and outreach activities will highlight congestion relief opportunities and mobility alternatives that will allow the area to move forward to reach full potential as a dynamic, culturally advanced and livable world-class region.

How Can You Help?

The Transit Coalition is a 501 [c] (3) non-profit organization. Please contact us if you would like to attend our meetings, make a tax-deductible contribution, volunteer your time or help in any other way.

Would You Like To See Transportation Improved In Southern California?

A Range of Coalition Objectives:

The Coalition works to develop a safe, integrated, cost effective and environmentally sound public transportation system for the greater Los Angeles Region. The Transit Coalition realizes that government must not only look at the tangible cost of running and building a public transportation network, but also the intangible benefits that such a system provides, such as better health, less pollution, reasonable travel time, ease of use, coordinated schedules with a minimum amount of transferring between routes.

Varieties of Transportation Modes

Los Angeles has many different modes of public transportation. Commuter Rail, Heavy Rail (Subway), Light Rail, Rapid and Express Bus, Local Bus and Shuttle Bus. Even with the opening of the Gold Line, Los Angeles still has much work ahead to make our Public Transportation System even better than we have today.

What Specific Actions has The Transit Coalition Done For You?

- Converted the EXPO Bus Rapid Transit project to a Light Rail Line.
- Influenced increased bus service, new routes, additional service hours in the San Fernando Valley and Los Angeles.
- Met numerous times with Elected Officials and their staff in Washington and Sacramento to discuss transportation funding.
- Testified on a continuing basis before the MTA, Metrolink and OCTA Board of Directors and before Public Meetings regarding various transportation issues.
- Public Outreach programs for EXPO and other large public events such as Festival of Books, Mobility 21, MTA service hearings and the Gold Line Opening.

Transit Projects in the Works

Preliminary Engineering of the EXPO Light Rail from downtown Los Angeles to Santa Monica.
 Metro SFV Rapidway connecting the North Hollywood Red Line to Warner Center using Bus Rapid Transit opens August 2005.
 Rapid Bus Lines to be implemented by 2008.
 Gold Line extensions to East Los Angeles and to Claremont / Montclair.
 Implementation of the SmartCard fare system.
 New Metrolink line from Riverside to Perris.
 Straighten and add additional double track on Metrolink Routes.
 Improve transit stations and shelters.

New Breda Light Rail Vehicles on order by the MTA

Projects The Coalition Supports

Extend the Red Line to the North and West Valley. Continue the Red Line west along Wilshire Blvd. to Santa Monica. Extend the Green Line to Westchester via LAX, to the Norwalk Metrolink Station and to the South Bay.

Provide rail service between LAX and Union Station, rail service between downtown Los Angeles and Whittier, rail service along the Lincoln Blvd. corridor, along the I-405 corridor between LAX and San Fernando Valley and rail service between Silver Lake and El Monte.

Enhanced Quality of Life

Support the initial CenterLine adopted route and proposed extensions to serve most Orange County residents.

Provide bike paths and walking trails along transit Rights-of-Way, coastal areas and other Southern California scenic locations.

Provide more bike rack capacity on buses and trains and adequate bike storage lockers at transit stations and other popular spots.

Provide noise and weather protection for freeway bus and rail transit stations.

Install benches and functional transit shelters along bus and rail routes.

Develop additional Park-and-Ride locations and expand overflow parking lots.

Provide intelligent, accurate signage and current schedules at transit stations.

Provide better bus and rail scheduling at transfer hubs to minimize waiting time.

Keep the momentum going for projects to prevent delays, cancellations and increased construction costs.

Provide landscaping, art and comfort stations as appropriate at key transit stations.

Improve rider safety and security at stops and onboard transit vehicles

Encourage Transit Oriented Development for a more pedestrian friendly environment and less orientation towards the automobile.

The Coalition is dedicated to improving and expanding all modes of transit in Los Angeles and throughout Southern California.

The Transit Coalition (a project of SEE) is a non-profit public charity exempt from federal income tax under Section 501(c)(3) of the Internal Revenue Service.

transitcoalition@earthlink.net

Why The Green Gap?

Extending the Green Line 2.5 miles north to Westchester with stations at LAX would save 15-30 minutes per trip by eliminating the walking and shuttle transfer currently needed to get from the Green Line to LAX.

Extending the Green Line 2.5 miles east to the Norwalk Metrolink Station would save 15-45 minutes per commute by not having to use the current shuttle bus system.

Extending the Green Line 2.5 miles south to the South Bay Galleria would move the terminus to an existing transit hub, a busy shopping mall and provide a friendlier pedestrian environment.

Commuters on this Shuttle bus will miss the East Bound Green Line Train by seconds and have a 15-minute wait for the next mid-day train to arrive.

Save Our Health

Traffic noise at all I-105 freeway median Green Line stations frequently reaches the 85 to 90 db range.

This is not only uncomfortable but also unhealthy. Prolonged exposure to noise levels over 85 db may gradually lead to some hearing loss. Simple measures such as sound barriers can significantly reduce noise levels at the station platforms.

Protection from noise and weather is urged at all Green Line Stations.

Friends Of The Green Line Goals

- ❶ Extend the Green Line thru LAX to Westchester to allow access from the North and the South
- ❷ Provide Express Train Service between LAX and Union Station
- ❸ Extend the Green Line South to the South Bay
- ❹ Extend the Green Line East to the Norwalk Metrolink Station
- ❺ Provide shelter from noise and weather at Green Line Stations

Conceptual Westside Rail

Who Are We?

Friends of the Green Line (FoGL) is an all-volunteer organization of frustrated commuters and transit users working for improved mobility and less pollution in the Greater Los Angeles Region. FoGL is not affiliated with the MTA or LAWA.

FoGL recognizes the Green Line as a form of mass transit that is positioned to improve ground and air transportation throughout Southern California, in particular because of its proximity to LAX, the Westside, the South Bay and the Norwalk Metrolink Transit Center which would link MetroRail to Orange, Riverside and San Diego Counties.

How Can You Help?

The Transit Coalition is a 501 (c) (3) non-profit organization. Please contact us if you would like to attend our meetings, make a tax-deductible contribution, volunteer your time or help in any other way.

Green Line Extensions:

The Ones That Got Away!

Friends of the Green Line

LAX Express Proposal

Most world-class airports offer direct rail service to the heart of their cities. Friends of the Green Line (FoGL) advocates the LAX Express with rail service between Los Angeles International Airport (LAX) and downtown Los Angeles Union Station.

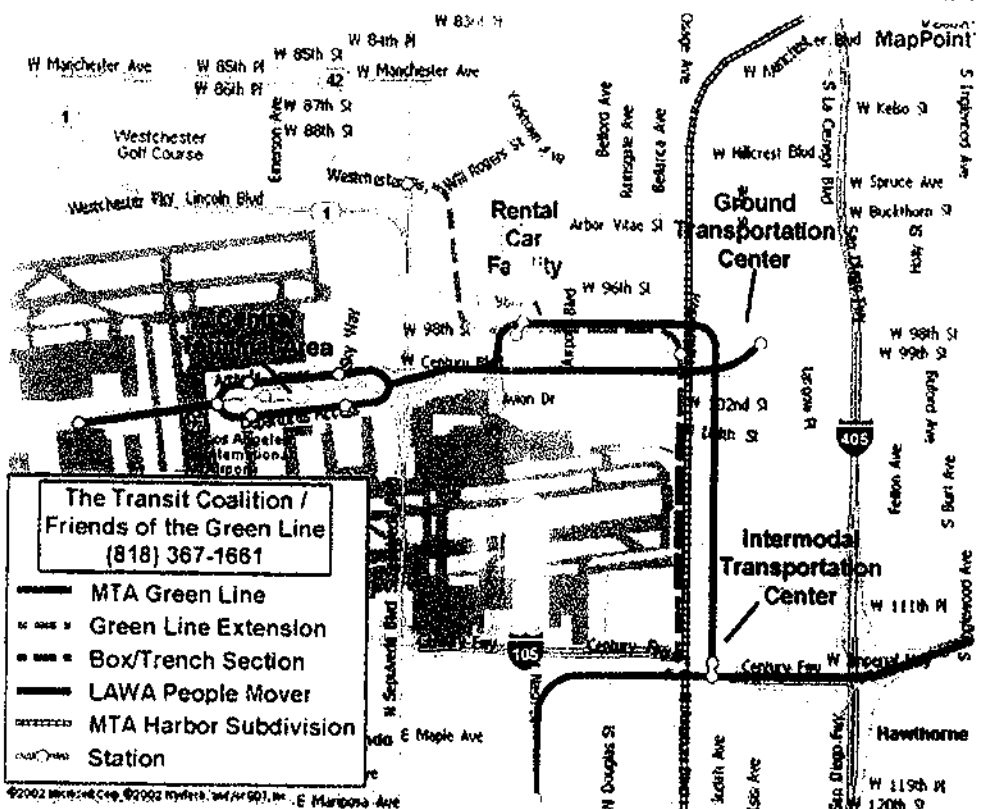

The Metropolitan Transportation Authority owns a lightly used existing Right-of-Way known as the MTA Harbor Subdivision.

This map shows the complete Right-of-Way, which runs northwest from San Pedro, past LAX, then continuing northeast on to Redondo Junction, a rail interchange with connections to Los Angeles Union Station (LAUS). At LAUS there are connections to existing rail lines and future proposals like the High Speed Rail to the Bay Area.

The LAX Express proposal could provide Local and Crosstown Express service for South Bay and West Los Angeles residents between transit hubs at LAX and LAUS.

Green Line Rail Access To Westchester Via LAX

Friends of the Green Line (FoGL) recommends that any plan for improvements in security, noise abatement and traffic include the FoGL LAX Express proposal and the FoGL Green Line extension proposal to Westchester via LAX as an integral part of the overall LAX Master Plan and not just a connection to the Green Line on the outskirts of LAX. By reducing the number of transfers, more passengers will utilize public transit and this will reduce traffic congestion, air pollution and noise around LAX.

FoGL recommends a regional airport system, and the LAX Express can be modified for direct transit between most of the major Airport in the Los Angeles Region. The above map shows the Green Line as originally adopted by the MTA, and includes the Los Angeles World Airport (LAWA) proposed People Mover. FoGL remains neutral on any LAWA proposal and supports efforts to regulate passenger capacity at LAX.

Light Rail and Airports A Perfect Match

Construction of the Green Line past LAX was halted in the 1990's due to concerns about interference from the trains' overhead power collectors interfering with airplane landing systems. An exhaustive study showed a shallow trench, which lowers the light rail trains below the line of sight of the radar beacons, solves the problem.

The Santa Clara Valley Transportation Authority (VTA) Light Rail system in San Jose California was extended past the end of the runways at NAS Moffett Field with its highly sensitive electronic equipment without any problems, using the same exact configuration recommended by the Green Line Interference study.

This photo shows the train's overhead wires—the source of the potential interference—just above the level of the fence and just feet from the end of the runway as a VTA Light Rail train passes under the flight path in a trench that helps shield any interference from the train.

FoGL advocates extending the Green Line in a trench, similar to the one shown in the above photo, past LAX's south runways and continuing on to Westchester.

Redstone Plaza
3515 Wilshire

Notes Re LAX

I'm.....

Speak in support of the Masterplan that's before you.

Our organization represents an industry:

~~\$11.8 billion~~ ^{10 billion}

23 million visitors

240K jobs

LAX is the shelf from which our customers buy LA.

The MasterPlan, Option D has 100's pages of detail.

There is and will be lots of discussion of those details.

But, I am here to ask that the strategic ~~vision~~ ^{perspective} reflected in this plan not get lost the discussion of details.

There are three ^{parts} parts to this ^{strategic perspective} strategy:

1. Building a Safe and Secure facility: This is elemental to the future on a both practical and perceptual dimension. *Sadly,*
2. Designing an airport that maintains LA's status as an international gateway: The international customer is the most sought after in the world. Either we build a user-friendly facility for this customer or they will go elsewhere.
3. Last, this plan recognizes a truth that Southern California's demand for air-travel cannot be built on the backs of the citizens of single city. This plan addresses the truth that there must be a regional solution to regional demand.

Thank you.

not exact

Speaker 11

Good afternoon, my name is Richard Slawson and I am the Executive Secretary of the Los Angeles/Orange Counties Building and Construction Trades Council. Our Council represents over 130,000 Craftsmen and women who live and work throughout Los Angeles. We enthusiastically support Mayor Hahn and his master plan alternative for LAX.

When this plan gets underway, besides moving forward the needed modernization of our airport, nearly 49,000 construction-related jobs will be directly generated during the entire construction phase.

Statement #4

This is welcome news for our regional economy because putting 49,000 men and women to work, at good wages, is a boost not only to those on the job but throughout Southern California. This many new jobs will have a tremendous ripple effect that will in fact support 100,000 jobs around the region and \$11 billion to total economic activity.

This region desperately needs the economic stimulus from this LAX Master Plan.

Our other concerns are also being met by the Alternative D Plan. As in the case of many other world class airport, including Washington Dulles International Airport , Orlando International Airport and Denver

International Airport, their terminals are linked by the use of trams, people movers and trains. Washington Dulles uses what they call movable lounges. Orlando uses trains and Denver uses a combination of moving walkways and an underground train.

All of these are similar to the Ground Transportation Center and the Intermodal Transportation Center included in alternative D in the LAX Master Plan.

These then connect with the main or Central Terminal Area by the automated people mover. With the heightened security measures that are needed today, this makes absolute sense.

I would also like to commend Mayor Hahn for the commitment that he made to hold

LAX to 78 Million Annual Passengers. We all know that LAX must be modernized, but it must also meet the needs and concerns of the residents of Los Angeles and surrounding communities and especially those residents who live near the airport. This plan addresses, traffic, security and noise in its design and regulations.

We support the LAX Master Plan and asked that you give it your approval.

Thank you.

Testimony by Mayor James K. Hahn

Joint Hearing of the Federal Aviation Administration and
The City of Los Angeles/Los Angeles World Airports
Radisson Plaza Hotel
3525 Wilshire Blvd.
Los Angeles, California
5 p.m., Monday, August 11, 2003

Good evening. My name is Mayor Jim Hahn of the City of Los Angeles.

I am here to voice support for the Enhanced Safety and Security Plan - Alternative D. I believe this alternative that has evolved over the past year breaks new ground in airport design and planning for the 21st century and can serve as a model for airports throughout our nation and the world.

This plan designs the future LAX to accommodate approximately 78 million annual passengers and 3 million annual tons of cargo. Modernizing LAX in this way will help to secure LAX's role as the airport of choice for long haul operations - both passengers and cargo.

78 million annual passengers is consistent with the goals established in the Southern California Association of Governments Regional Transportation Plan. These goals promote growth of underutilized airports in outlying areas and allow us to achieve a more decentralized distribution of future air traffic around the region. It is also fair for the surrounding communities who will also have to bear a burden with increased traffic. Previous proposals that called for up to 98 million annual passengers were unrealistic.

I am pleased that support for my plan is growing. As people learn more about it, they come to understand that my plan is the environmentally superior alternative of all the concepts and plans studied over the past decade. They also realize that my plan incorporates leading-edge technology and design standards to provide travelers and airport workers with unmatched safety and security at the world's largest origination and destination airport.

LAX Master Plan means improved airport safety.

- Alternative D modernizes the airfield to improve safety for aircraft, traveling passengers, and airport workers.
- Center taxiways will provide additional protection against runway incursions.
- Parallel taxiways and full taxiway spacing improve aircraft movement and reduce taxiing times, improves safety and reduces delays for passengers.

LAX Master Plan means improved airport security.

- Alternative D provides for multiple layers of security protection for the traveling public, airport workers and the surrounding communities.

- Alternative D eliminates the high concentration of people as a potential terrorist target - it disperses the passengers and moves them rapidly among four separate and secure entry portals.
- Alternative D eliminates roadway traffic in the Central Terminal Area and significantly reduces the chance of an oversized vehicle explosive device being delivered to the Central Terminal Area.
- Alternative D permits early observation and assessment of passengers and baggage.

LAX Master Plan supports a regional transportation plan.

- Alternative D addresses community interests and concerns; Alternative D supports only LAX's fair share of the total regional air service market.
- Alternative D allows other regional airports to accommodate a greater share of the air traffic demand.

LAX Master Plan means a modern airport.

- Alternative D offers a redeveloped Central Terminal Area that provides for increased security screening and enhanced passenger conveniences.
- Alternative D will have new passenger terminals that provide for improved ticketing, baggage processing, circulation and concessions
- An Automated People Mover offers convenient access from the new facilities to the Central Terminal Area every two minutes
- The Automated People Mover trains will be modern, designed to easily accommodate rolling luggage and baggage carts.

LAX Master Plan improves ground transportation.

- Alternative D provides key improvements to the ground transportation system in and around LAX.
- Alternative D reduces thousands of private vehicles and commercial shuttle buses from the roadways and significantly reduces the impacts on surface streets and freeways.
- Alternative D designs convenient, easy access to the new facilities and proposes mitigation measures that provide direct access to and from the I-405 and I-105 Freeways to discourage residential street use.
- Alternative D means a direct connection to the Metro Green Line and encourages the use of mass transit.
- An expanded FlyAway Program encourages the use of high-occupancy vehicles and eliminates thousands of vehicles from the region's roadways.

LAX Master Plan sustains a region's key economic engine.

- LAX Master Plan means jobs; 351,000 jobs in the region by 2015, 295,000 jobs in LA County and nearly 139,000 jobs in the City of Los Angeles.
- LAX Master Plan means LAX will contribute \$64 billion to the regional economy in 2015, \$22 billion annually to the City of Los Angeles.

- Alternative D means nearly 49,000 construction-related jobs.

In conclusion, I want to emphasize that the goal of creating the Enhanced Safety and Security Master Plan is to modernize LAX to protect one of Los Angeles' key economic engines. At the same time, the plan addresses community interests and concerns by designing the facility to serve only LAX's fair share of the total regional air service market.

I thank the staffs of the Federal Aviation Administration and Los Angeles World Airports for your dedication and support of the master plan process. I look forward to the process continuing so that we can begin the long-overdue modernization of LAX as soon as possible. Thank you.

Speaker 1615

Testimony for LAX Master Plan Hearing
August 11, 2003

I am here to support the Enhanced Safety and Security Plan for LAX – also known as Alternative D. I believe this alternative breaks new ground in airport design for the 21st century and can serve as a model for airports throughout the world.

My staff and I have briefed thousands of stakeholders on this plan, including community residents, airlines, labor, and local business leaders. I believe that this plan incorporates many of their suggestions and addresses their concerns with the other alternatives.

Alternative D puts safety and security first. It includes modernization of the airfield, including the addition of center taxiways, to improve **safety** for aircraft, traveling passengers, and airport workers.

It also provides for multiple layers of **security** for the passengers, airport workers and the surrounding communities. It disperses travelers and moves them rapidly through four separate and secure entry points. It also allows security screeners to make assessments of passengers and baggage before they get into the Central Terminal Area.

Most importantly, this plan significantly reduces the opportunity for a vehicle with an explosive device to get close to the Central Terminal Area by eliminating traffic through the area. Security experts believe that the Central Terminal Area and its impact on our economy – not passengers – are the key targets for terrorists.

Alternative D also supports my goal of creating a regional air transportation plan. It designs LAX to accommodate approximately 3 million annual tons of cargo and 78 million annual passengers, which is consistent with the goals established in the Southern California Association of Governments Regional Transportation Plan. We are also working to promote use of our other regional airports to meet demand.

Alternative D also means a more modern and convenient LAX for our passengers. The plan includes new passenger terminals with improved ticketing, baggage processing, circulation and concessions. An Automated People Mover designed to easily accommodate rolling luggage and baggage carts will offer convenient access to the Central Terminal Area every two minutes.

Alternative D also provides key improvements to the ground transportation around LAX to reduce congestion and pollution. It will finally provide a direct connection from the Metro Green Line and direct access to and from the 405 and 105 freeways. Approximately 36 new lane-miles and improved curb access will improve passenger access and reduce traffic congestion on surface streets. An expanded FlyAway Program will eliminate thousands of vehicles from the region's roadways.

Finally, Alternative D means jobs and is expected to contribute \$64 billion to the regional economy.

As people learn more about Alternative D, I have found that they support the leading-edge technology and design standards that will provide travelers and airport workers with unparalleled safety and security. They also find that this plan is the environmentally superior alternative compared

with the other plans that have been studied over the past decade.

I want to thank all of the community leaders, business leaders, airline representatives, labor leaders, and others who shaped Alternative D. I want to acknowledge Deputy Mayor Troy Edwards and Patricia Torres of my staff. And I want to especially thank the Federal Aviation Administration and Los Angeles World Airports staffs for your dedication and support of the master plan process. I look forward to the process continuing so that we can begin the long-overdue modernization of LAX as soon as possible.

Thank you.

Today, the Los Angeles World Airports continues to celebrate 75 years of connecting Southern California to the World. Commonly known as LAWA, the Los Angeles World Airports actually consists of FOUR airports...VAN NUYS is the world's BUSIEST general aviation airport. ONTARIO INTERNATIONAL serves the Inland Empire, the fastest growing region in Southern California. The PALMDALE REGIONAL has its' 25 year Master Plan for residents in Antelope & Santa Clarita Valleys, plus portions of San Bernardino/Inyo Counties. And the fourth one, LAX, where travelers throughout the world think of LAX as not only a ~~an~~ airport but an ^{entire} city, LOS ANGELES. True, LAWA has had a spectacular past BUT now we must ^{now} prepare for a SAFE future.

Prior to 9/11, LAX contributed \$60 BILLION per year in economic output, contributed 59,000 JOBS at or near LAX, plus 408,000 JOBS in the southern California region.

~~The~~ LAX security is of major importance to not only our state, but ^{our} the nation. Since California has the 5th largest economy in the world, we ^{must begin} ~~must start~~ improving security NOW; not ^{Please} waste time on a Master Plan that will be out dated in 15 years, when the war will be over. The terrorists will have been hunted down. ^{is just too long to wait} Just think in 15 years, ~~this project may be nearing completion.~~ ^{for alternative D.}

With TSA/Home Land Security, the walls came tumbling down in the terminals, moving in a 100 huge explosive scanners, costing ^{million dollars} ~~1.9 MILLION~~ each, plus a ^{yearly} \$100,000 maintenance fee. Unfortunately, these monsters had ^{with a} 25% false positive readings with food being a problem! ^{far too many}

* WHO PAYS for Alternate D? We're told a major part will be passed on to airlines via landing fees, etc. NOW that sounds like just what airlines need, especially those who are either in or fighting off bankruptcy!! Besides, the small businesses & hotels around LAX will have a very difficult time for many years and some may not survive. This plan was said to cost 9.1 BILLION, then 9.6. How many billions more will it be?

^{Honestly,} * Proponents like to couch this whole scenario around "security" as cars and LAX facilities DON'T MIX! Now how do they think people are going to get to this Ground Transportation Center? If you were a terrorist wanting to inflict major loss of life and damage, would you rather have the passenger load widely distributed around 9 different terminals or where EVERYONE for ALL flights congregated at 1 check in/drop off site?

Speakers 18/17

STATEMENT BY ALAN B. WAYNE
REGIONAL DIRECTOR - GOVERNMENTAL AND PUBLIC AFFAIRS
UNITED AIRLINES / LOS ANGELES

SUPPLEMENT TO THE DRAFT ENVIRONMENTAL IMPACT STATEMENT/
ENVIRONMENTAL IMPACT REPORT
LOS ANGELES INTERNATIONAL AIRPORT MASTER PLAN

MONDAY, AUGUST 11, 2003
RADISSON PLAZA HOTEL, LOS ANGELES

FOR THE RECORD, MY NAME IS ALAN WAYNE. I AM DIRECTOR OF
GOVERNMENTAL AND PUBLIC AFFAIRS FOR UNITED AIRLINES' WEST
REGION.

I AM APPEARING TONIGHT ON BEHALF OF NOT ONLY UNITED, BUT
ALSO TEN OTHER FELLOW MEMBERS OF THE STAR ALLIANCE, THE
LARGEST AIRLINE CONSORTIUM OPERATING AT LOS ANGELES
INTERNATIONAL AIRPORT. IN ADDITION TO UNITED, WHICH OPERATES A
HUB AT LAX, THE STAR MEMBERS INCLUDE AIR CANADA, AIR NEW
ZEALAND, ALL NIPPON, ASIANA, LUFTHANSA, MEXICANA, SINGAPORE,
THAI, VARIG AND U.S. AIRWAYS.

THOSE ELEVEN CARRIERS, PLUS UNITED'S REGIONAL MARKETING
PARTNER SKYWEST, WHOSE 133 DAILY DEPARTURES ARE THE MOST OF
ANY CARRIER AT LAX, WISH TONIGHT TO UNDERScore OUR COLLECTIVE
SUPPORT FOR MAYOR HAHN'S ONGOING EFFORT TO CRAFT A MASTER

PLAN FOR LAX THAT WOULD ULTIMATELY IMPROVE AND MODERNIZE THIS CRITICAL, BUT SADLY ANTIQUATED FACILITY.

UNITED AND THE STAR CARRIERS, PLUS SKYWEST, WHO ACCOUNT FOR 30 PERCENT OF THE FLIGHT ACTIVITY HERE, ARE WORKING WITH THE CITY TO ADDRESS THE AIRFIELD SAFETY, AIRPORT SECURITY, GROUND ACCESS, AND PASSENGER TERMINAL ENHANCEMENTS THAT MUST BE ACHIEVED IF THIS AIRPORT, WHICH IS SO IMPORTANT TO THE REGION'S ECONOMIC COMPETITIVENESS, AND THE THOUSANDS OF JOBS THAT DEPEND ON IT, IS TO REMAIN IN THE FOREFRONT OF COMMERCIAL AVIATION.

TO DO NOTHING, OR TO NOT DO THIS PROJECT REALISTICALLY, IS NOT ACCEPTABLE. THIS PROJECT IS OVERDUE AND MUST GET UNDERWAY. OTHER AIRPORTS - SEATTLE, PORTLAND, SAN FRANCISCO, LAS VEGAS, DENVER, PHOENIX - TO NAME A FEW, HAVE MODERNIZED OR ARE ADVANCING PROGRAMS TO DRAW BUSINESS AWAY FROM LAX.

UNITED AND THE STAR CARRIERS BELIEVE THAT THIS PLAN FOCUSES ON THE ISSUES AND ELEMENTS THAT WILL MOVE LAX FORWARD, AND WE PLAN TO CONTINUE OUR COLLABORATION WITH THE CITY AND THE AIRPORT TO MEET THESE FUTURE REQUIREMENTS.

THANK YOU.

SPC00091

It seems to me that too much is ^{being} concentrated in one area. This project, as proposed would increase traffic congestion in that one small area. There is no room for another freeway, and increased traffic in the immediate area will overwhelm the surface streets with people getting off the freeway looking for alternative ways to ~~get to~~ by pass the freeway congestion.

What about the mitigation studies done to address the traffic? Well, complex studies have been done ~~for~~ for the 405 Fwy expansion. Yet, after the expense and long years of construction, it is just as congested as if no work were done to reduce the congestion.

← I believe the same results will be likely for the current traffic mitigation plan for ~~the~~ Alternative Plan D.

To mitigate traffic and improve security for people arriving and returning to their cars, I think the parking should be spread out in smaller lots through out ~~the~~ ^{the} region. From those parking areas have shuttles ^{transport} ~~move~~ the passengers to the people ^{rovers}.

As people buy their air line tickets, ^{they} ~~people~~ can be ^{assigned} ~~directed~~ to the various parking facilities. ~~We control the flow of~~ ~~traffic by spreading it out~~ This would be an effective means by which to spread the traffic ~~out~~ through out that area and prevent large concentrations of traffic.

Many are concerned with a car bomb going off in the terminal area, but a giant parking structure full of thousands of travelers is just as juicy a target ^{terrorist's} for a car bomb.

~~By creating~~ ^{more} smaller parking facilities

By creating smaller, more numerous parking structures, the attractiveness of such a target is reduced, and even if such an ~~one~~ attack occurred at one structure the loss of life and injuries would be reduced.

There would also be plenty of other structures to fall the increased ^{parking} demand of a lost structure

It would also be easier to distribute the loss of one or two lost structures among the remaining parking structures, than if one giant structure were lost.

ARSAC

Jim Ritchie
City of Los Angeles
LAWA, LAX Master Plan Office
P.O. Box 92216
Los Angeles, CA 90009-2216

Dear Mr. Kessler

ARSAC is a community grass roots organization representing members from Playa del Rey to Whittier, and Van Nuys to Redondo Beach. We played an integral role in the last Mayoral election by getting every Mayoral candidate to sign the "ARSAC Pledge" committing to a regional approach to air commerce for Los Angeles and Southern California.

We acknowledge Mayor Hahn's attempt to abide by the ARSAC pledge he signed to constrain capacity at LAX while establishing a regional approach to support air transport in Southern California.

We thank Mayor Hahn for eliminating Alternative C concepts from Alternative D that were especially troublesome such as: A western terminal; the ring road incorporating Imperial Highway, Pershing Drive, Westchester Parkway and Lincoln and Sepulveda Boulevards for exclusive use as airport ingress and egress; and 98 MAP.

First, the 45 day public comment period is much too short for public review of some 5,000 pages of the Draft EIR/EIS of the Master Plan. We ask that the FAA confirm extension of the comment period to 120 days. Can we count on you to support extension of the public comment period? We are still in the process of reviewing all 5,000 pages of Alternative D.

Will FAA and the City of Los Angeles' responses to public comment and inquiry will be canned responses or actually address specific issues addressed by members of the public?

Mayor Hahn touts Alternative D as a "safety and security plan." I had the opportunity to participate on a "Blue Ribbon" panel appointed by Mayor Hahn to review Alternative D (without having been given anything in writing while on that panel). During those months, panel members asked pointed questions about safety and security issues. Representatives of LAX and LAX's consultants did not have answers for many basic concerns, many of which had not even been considered when asked by panel members and which remain unanswered by the EIR/EIS. I urge you to consider the following:

SPC00093

1. We appreciate the fact that Mayor Hahn limits capacity to "78.9" MAP (the MAP agreed to was actually 78 MAP) by limiting the number of gates at LAX. However, Mayor Hahn fails to live up to the ARSAC pledge he signed on March 26, 2001 which states that "LAX should be constrained to operate safely within the capacity of its existing facilities."

Mayor Hahn has violated the ARSAC pledge by attempting to expand the footprint of the airport to incorporate the area of Manchester Square into Alternative D as the Ground Transportation Center(GTC). LAX is in the process of purchasing lots piece by piece from homeowners in Manchester Square. How is it possible that Alternative D cites Manchester Square for usage in Alterative D when it only owns about 40% of Manchester Square as of this date?

2. Our Community Plan designates Manchester Square as residential; doesn't LAX have to obtain a zone change before they could even use Manchester Square for airport use?

3. Remarkedly, Alternative D does not provide for screening at the Ground Transportation Center (GTC). Removing parking and check-in from the Central Terminal to the GTC appears to protect buildings, not passengers and other people in the GTC. To prevent terrorists from targeting the GTC, since remote check-in and parking are located in one area, if this is truly a safety and security plan, shouldn't there be baggage screening (as well as screening of all cars entering the GTC) at the GTC *before* people and their baggage get on the people mover to go to the terminals?

4. The studies and information used to prepare this EIR/EIS is old information, some of it dating back to at least 1996. Wouldn't it be a more reliable study if the information compiled relied on current information incorporating data relating to current environmental conditions rather than outdated information?

5. The plan fails to specifically identify which airports will be used to meet regional demand. Shouldn't the plan address ways of directing air travelers and traffic to regional airports to encourage regional use of other airports?

6. Shouldn't Alt D address noise and health risk mitigation recommendations?

7. Proponents of Alt D, mainly labor unions, support Alt D as it will create jobs. No matter where air commerce is supported, jobs will be created. The creation of jobs is not particular just to the development of LAX.

We all want LAX to be safe and secure for our family, friends, tourists flying in and out of LAX as well as safe for our surrounding community. But Alterative D does not achieve safety or security. Therefore, for these and many other reasons, we do not support Alterative D and

ask that you send LAWA back to the drawing board to devise a truly safe and secure plan that establishes a regional approach to air transport.

Thank you.

Sincerely,

A handwritten signature in black ink, appearing to read "Valeria C. Velasco". The signature is written in a cursive style with a large initial "V".

Valeria C. Velasco
President

IF LAX REMAINS THE PREPONDERANCE OF AIR COMMERCE CAPACITY IN SOUTHERN CALIFORNIA THE ECONOMY WILL BE CONSTRAINED AND HURT

- Aircraft passenger and cargo needs are increasing. Currently all eggs are in one basket—LAX. A natural or terrorist catastrophe can devastate the Southern California economy if LAX has a major incident. We need a regional solution.
- Two of the prime runways at LAX (including the longest which is used for fully loaded cargo flights) have a major highway running beneath. One truck bomb can close both.
- LAX is the third busiest airport. Even since 9/11 cargo demand continues to grow and be concentrated at LAX. It has one of the smallest land masses of any large airport. The corresponding sky above it is also limited and can become a severe safety risk.
- LAX is situated in the inner city where the population is highly concentrated. It thereby impacts many more people than airports situated in outlying areas.
- Transportation infrastructure around LAX is already over stressed. People travel two or three hours to use LAX. This traffic gridlock wastes large amounts of energy and creates pollution in addition to one of the largest polluters, LAX.
- It takes about 10 years to expand an airport. If capacity remains concentrated at LAX the next time more capacity is needed there will be no alternatives but to constrain the economy. Slack capacity in outlying airports is currently available but will disappear if action is not taken soon. Further, population (incompatible land uses) will grow around the other airports if not addressed now.
- Los Angeles World Airports, a Department of the City of Los Angeles, owns four airports including outlying ones. It is only now starting to address building their capacity because the City derives taxes from the businesses surrounding LAX.

**CONTACT YOUR STATE AND FEDERAL GOVERNMENT OFFICIALS.
WE NEED A COALITION IN CONGRESS TO PROTECT OUR COMMERCE.
DEMAND A REGIONAL SOLUTION TO PROTECT THE ECONOMY AND TO
ENSURE FUTURE GROWTH IS UNHAMPERED.**

Alternative E

- ④ *World events reduces the urgency for increasing capacities and allows the opportunity for extended time to review this proposal.*
- ④ *It will be a far less expensive alternative to implement and have less negative impacts on surrounding communities.*
- ④ *Two areas are designated for passenger security and check in at Century/Airport to Aviation and Lot C—both within or adjacent to the LAX perimeter (more conducive to safely operating under red alert).*
- ④ *Baggage to be inspected at check in and transported along secure routes without digging a \$1 billion tunnel.*
- ④ *Supports Green Line access and improves bus access at Century location.*
- ④ *Plan is based on the Westchester-Playa del Rey Community Plan Update that is in the approval process.*
 - *It creates park areas in Manchester Square to help fight pollution.*
- ④ *Creates a convention center and associated green belt and encompasses ideas derived from the Gateway to LA Business Improvement District. Enhances business area, mobility access, and beautifies the area.*

Alternative E (2)

- ④ *The consolidated rental car area has been moved to the Continental City area right off the freeway so that navigation is simplified and the traffic is not directed through a residential community.*
- ④ *Additional dedicated roadways to reduce neighborhood traffic and to encourage airport entrance via the freeway.*
- ④ *Many roadway improvements and people mover ideas of Alternative D are retained to benefit from the work done on Alternative D.*
- ④ *Runway 25L remains unchanged; 25R (inboard) moved north to accommodate new centerline taxiway.*
- ④ *Northern runway complex and terminals remain intact as is thereby saving substantial, unwarranted expense for restructuring north complex terminals.*

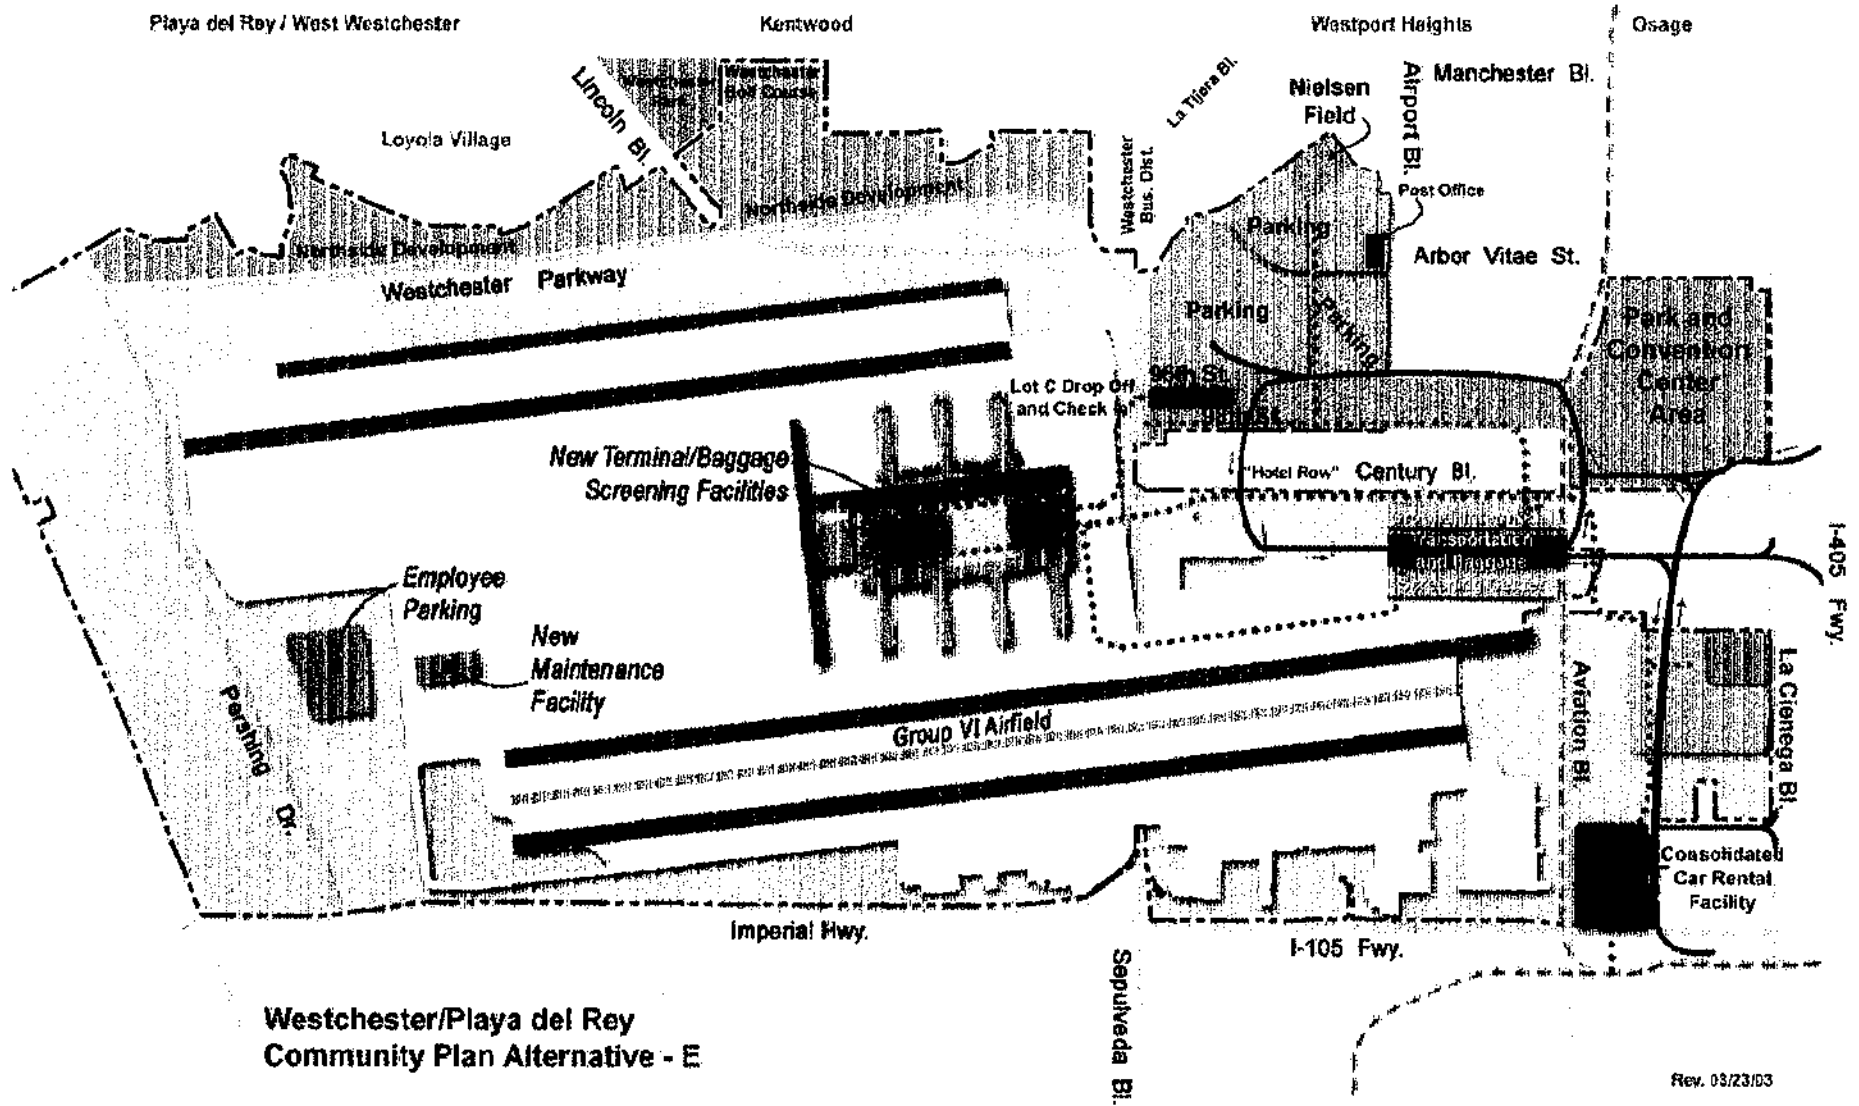

Comparing Alternatives

Alternate C	Alternative D	Alternative E
Creates Ring Road disturbing community	Eliminates Ring Road	Eliminates Ring Road
Adds Western Terminal Complex	Adds smaller complex; eliminates some gates	Gates unchanged in CTA;remotes removed
Auto access to Central terminal areas	Manchester Square check in	Redundancy-Check in & security on Century & Lot C
Adds traffic & congestion	External people mover and baggage handling	Check in Adjacent to LAX; ↑ security control
Lengthens runways adds taxiways; expands north & south	Lengthens runways & adds taxiways; moves south	Lengthens runways & taxiways on exist position South; No N.
Increases Capacity for passengers & adds cargo up to 405 fwy	Potential increase; states passenger limits; some cargo	Maintains current status

Summary of Alternative D Deficiencies

- ④ *Continues consolidation of air passenger and cargo in one location for all of Southern California.*
- ④ *Manchester Square GTC potential single point failure.*
- ④ *Difficult for safety equipment to access off LAX site areas.*
- ④ *Manchester Square GTC in place of the City Council promised park.*
- ④ *Increases runway capacity while plan is purported to limit growth.*
- ④ *Doesn't resolve safety for passengers or community.*
- ④ *Fails to mitigate traffic and adds more pollution in a concentrated area near residential areas.*
- ④ *Doesn't resolve alternate transportation interface issues.*
- ④ *While the North complex would be modified to accommodate new larger aircraft, only the south runway meets the takeoff length requirements of a loaded A380 per the Airbus website.*
- ④ *Realigns and widens spacing of runways prior to finalization of Group VI requirements.*
- ④ *Unwarranted expenditure of public funds.*

LAX Master Plan Alternative E

Westchester/Playa del Rey
Community Plan Alternative - E

Rev. 03/23/03

(310) 673-0789 Maria Cardon
4145 Lennox Bl
Lennox, CA 90304

I am a resident of the community of Lennox. Every day I and thousands of other Lennox residents are subject to a tremendous amount of air and noise pollution because of the planes landing at LAX. Right now over 50 million passengers go through LAX every year—this number under the modernization plan is set to expand up to 78 million passengers per year. Undoubtedly the problems being faced by the Lennox community as a result of its proximity to the airport will only get worse.

Lennox and Inglewood, unfortunately, have to bear the brunt of the problems associated with LAX, as most planes fly over these two communities when landing. Right now a plane can be heard over Lennox every 45–90 seconds—this will increase under the modernization plan. The noise generated by the night time flights will also get worse because after its modernization LAX will be able to handle more planes and bigger planes. Already many of these cargo planes take off heading east during the night. The noise generated during take-off, as you know, is tremendous. Lennox residents, every night, are subject to this noise—many are jostled from their sleep every night because of these planes taking off directly over the community. Despite our efforts to reduce this practice LAWA has made it clear that they cannot compel these cargo planes to take-off westward like other passenger planes. The carriers flying these cargo planes use the excuse that taking off westward would impose a significant extra cost as they would have to circle around to go eastward. This practice cannot be allowed to increase---it must either be stopped or used only in extenuating circumstances.

Despite the problems engendered by the airport the community does realize that LAX is a vital component of the region's economy. However, LAWA has not taken minimal measures to ensure that airport related damage to Lennox is minimized. LAWA's attempts to address airport related problems in the community have been perfunctory at best. Also, there has been no dialogue with the community to explore ways for LAX to become a better neighbor; or to discuss what LAWA can do to compensate the Lennox community for bearing a disproportionate share of the burden associated with LAX.

We have come up with a list of steps that LAWA can take to become a better neighbor and to address the negative externalities associated with LAX.

LIVING

- **Meaningful Soundproofing: Lessening of the code stipulations, free inspections; no signing of easements.**
- **Moratorium on Flights between 11:00pm and 5:30am (part 161 of the EIR)**
- **Sound Wall along the 405 Freeway**
- **Ongoing funding for Healthy Start**
- **Air conditioners and purifiers for homes and school classrooms**
- **Special Emergency Response Unit (make community aware of disaster plan)**

Lennox
(310) 673-0789

RECREATION

- **Enclose Lennox Pool. Provide for Staff and Life Guard presence throughout the year**
- **Youth Activity League (YAL)—funding to help with the conversion of the Sheriff's Station**
- **Skate Park that is covered by insurance**

BEAUTIFICATION

- **Road and sidewalk improvements. Reconstruct 104th, 111th, Inglewood, and Lennox Blvd.**

JOBS

- **Training or apprenticeship program with on-site job placement**
- **Airport employers must show evidence of community outreach**
- **New hires from the community are tracked for promotion**
- **Shuttle/Van Pool to and from LAX for new hires**
- **Land for St. Margaret's Center.**

SCHOOL DISTRICT

- **Land to build a High School for Lennox Students**
- **Permanent indoor PE facility.**
- **Support School District's lobbying efforts for placement of billboards on Schools adjacent to 405 freeway**
- **Periodic school painting (maybe every 10 years)**
- **Finance School District Emergency AID kit**
- **Tours of LAX for kids, a career day at LAX**

I challenge Mayor Hahn's claim that moving the southern runway 50 feet closer to El Segundo homes improves safety or security. Safer for whom? I now experience daily near overflights at my home of 48 years. Living in fear is not living! My quality of life has been destroyed by the fear of "what if", noise and air pollution. The black contaminants falling from above demands undue property maintenance plus the unknown of what we are breathing. I cannot plant anything that could be edible. A new environmental impact report needs to be made. The old lumbering cargo airplane pilots (FEDX is the most blatant) and the larger capacity airplane foreign carriers are the cause of my fear. The airplanes MUST stay north of Imperial Highway. "DRIFT" is NOT an excuse! And specifically, the 1:30 AM to 4:00 AM cargo flights over our homes are also my concern. El Segundo residents have an intolerable airplane problem currently--moving the runway 50 feet closer to our homes will exacerbate the NOW occurring safety issue. PLEASE, DO NOT COMPOUND THIS PROBLEM. And one last comment--it is obvious that those of us who are detrimentally impacted, El Segundo, were not given a forum convenient to our area--why? I respectfully request the courtesy of your reply.

Mrs. Yvonne Wills

COMMENTS ON LAX MASTER PLAN

Name: Dwight Abbott, 1825 Via Estudillo, Palos Verdes Estates, CA

Background includes: ASEB, Univ degree in Aero Engr, licensed pilot, freq user of LAX & other major airports.

My review finds deficiencies in three important areas: 1) passenger convenience, 2) safety and security, and 3) costs.

Passenger Convenience

This master plan imposes great inconvenience on the passengers that will use it.

The FAA now recognizes passenger convenience as an important airport design factor and defines it in terms of time to move the passenger from the parking lot of the departure airport to the parking lot of the arrival airport - not simply airline gate to airline gate as previously defined. The LAX Master Plan will greatly increase the parking lot to parking lot time required over that of the current LAX configuration.

The proposed Ground Transportation Center (GTC) and Intermodal Transportation Center (ITC) are nearly a mile removed from the terminal area. They are connected via a train (people mover) that passengers must ride to the terminal. The passengers must carry any carry-on baggage and packages on the train. The current LAX configuration imposes no such inconvenience.

Safety & Security

Aircraft collisions during taxi, takeoff and landing can result in more casualties than any terrorist attack. I believe that the proposed reconfigured runways are an improvement, however, I believe that the proposal to move the runway 25L only 50 feet to the south is short sighted. Moving it farther south would provide greater aircraft separation, less wake turbulence interference between runways, and improve safety.

The location of the new Rental Car Facility very near the end of the newly positioned runway 24L is unsafe. An aircraft landing short of the runway or not successfully taking off when the runways are operating in an easterly departure pattern will risk impacting with the proposed Rental Car Facility.

The master plan puts high importance on security as it should, but it includes several factors that appear to reduce security.

Centralizing passenger check-in at the proposed Ground Transportation Center provides a single location that if incapacitated will shut down the entire airport operations. Incapacitation could come from earthquake, fire, electrical outage, and other factors as well as from terrorist activity. The current multi-terminal, decentralized check-in configuration does not have this weakness.

The proposed train (people mover) is another single point failure that can shut down airport operations. A small bomb, bomb scare, mechanical failure, or even protestors on the tracks could bring the entire airport operations to a halt.

An independent RAND Corporation study of the security afforded by the proposed LAX Master Plan found that the proposed changes would not increase security compared to the current LAX configuration.

Cost

The proposed cost of about \$10 billion is simply too high. My written statement explains this conclusion.

Summary

The proposed LAX Master Plan is unacceptable.

Los Angeles County Supervisor Don Knabe has called the LAX Master Plan unacceptable.

Congresswoman Jane Harmon also does not support the plan.

Media reports state that the airlines don't favor it.

The communities near the airport do not favor it.

Certainly the user passengers can not favor it due to the high costs it will impose on them, the lengthened parking lot to parking lot time, the greater inconvenience, and the dubious added security.

A new plan is needed. That plan should have 4 features:

- 1) minimize parking lot to parking lot time for travelers
- 2) improve aircraft safety
- 3) not include centralized facilities that when incapacitated can cause shutdown of the entire airport
- 4) reduce development costs to a level half or less of those proposed.

FAX (310) 670 3633

August 21, 2003

The new plan for LAX upgrading, is still faulty for much the same reasons as the old one is:

1. SAFETY

Even though safety has acquired a new dimension since Sept 11, 2001, the safety hazards that existed prior to that time have yet to be addressed.

The air space around LAX is already over saturated. Witness the Cerritos accident of a few years ago and various near misses of midair collisions over the Los Angeles area. LAX should be limited to the traffic for which it was designed, about 48 MAP, not the 78 MAP that currently exists and is being used for the security plan, even though this number is a rollback from the 98 MAP that was proposed previously. Development of the Palmdale facility would alleviate the currently existing safety hazard. The safety problem is not just an LAX problem, it is a Los Angeles and vicinity problem. Airplane crashes are equal opportunity killers, both for passengers and those on the ground, regardless of which part of town gets devastated. These have nothing to do with terrorism, but could be just as devastating.

2. GROUND TRANSPORTATION

The existing ground transportation congestion has the potential for real gridlock. I have recently been driving to Claremont from Westchester about once per week in the early morning and each time that I see the traffic crawling West on the I105 and the I210 I am thankful that I am headed East. Expansion of various venues around LAX such as Playa Vista can only make these traffic jams worse, all over town, not just in the vicinity of LAX, and not just on those particular freeways. The proposed traffic mitigation plans do not address these situations.

3. BUSINESS

How many businesses will get displaced by LAX acquiring additional real estate for the planned security improvement? That's job loss. However, at Palmdale, jobs are just as important as they are around LAX, and the potential for growth is much greater.

4. AIRPORT ACCESS

A significant percentage of the population, and business, in Los Angeles is North of the Santa Monica mountains, and recent projections show that the fastest growth in the near future will be North of that, in the Santa Clarita valley. People in these areas can get to Palmdale just as easily; if not easier than to LAX. This will get even more true as traffic congestion increases and Palmdale access improves.

5. AIR QUALITY

Los Angeles already can not meet federal air quality standards. Pollution is a problem for the entire city of Los Angeles since the prevailing wind tends to send Westside pollution to other parts of town. Development of Palmdale should decrease overall pollution by reducing traffic congestion both on the ground and in the air.

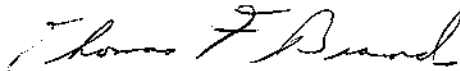

6. COST

The proposed security plans I hear are estimated at about \$9.5 billion. The new facility at Palmdale could be designed from the ground up for maximum safety and still save money over any existing LAX upgrade proposal.

Besides, when we hear an estimate as high as 9.5 billion dollars, based on virtually all previous experience, that number is just for starters. It will inevitably go up from there. How much more money will then be required to alleviate the problems caused by additional traffic jams and pollution?

7. CONSTRUCTION

During the construction phase, the current LAX capacity will be reduced as existing runways and terminals are razed. What kind of safety and other problems will that situation engender? Development of Palmdale obviates this concern.

Thomas F. Brands

LAX Hearing
Furama Hotel
8601 Lincoln Boulevard
Los Angeles, Ca. 90045

Re: LAX Expansion

I am totally opposed to further expansion to the airport based on security and safety measures as referenced in Mayor Hahn's Alternative D proposal. The Regional Solution needs to be fully explored before any further expansion for security and safety measures are determined.

Right now Alternative D plans are to relocate 6,000 homeowners and renters where the check in terminal is planned. This would be a true dismantling of Westchester, a viable active community. This recommendation is for LAX to create jobs, so people can travel, perhaps, 20 to 100 miles from their homes and further congest the freeway. Why, because there is no place affordable to live.

Our freeways are already jammed specifically at the airport juncture, and there are no current plans to easily change this problem which will only be magnified in the near future. The proposed interchanges would be a present time bottleneck that cannot be considered, as we have overloaded freeways and this construction will only hamper travelers with time delays, accidents and more frustration of driving on the 405 freeway. This would also cause greater noise, traffic and air pollution with further deterioration to an already over-whelmed Westchester/Playa Del Rey/Inglewood community.

Existing property tax revenues would be lost from removing homes and rental properties as well as commercial properties and existing parking lots, just to increase the size of the project. This planning process has already cost the tax payers multi-millions of dollars, while the airport looks horrible with filthy and dilapidated bathrooms, functionally obsolete and dirty terminals with poor signage. It is a passenger's worst nightmare instead of what is expected from a world class city. What a shame our money has not been spent to make the existing interiors and passage ways more comfortable, safe, clean and inviting.

The airport is responsible for the surrounding vacant land by LAX all along the Eastern part of Vista Del Mar and Pershing. It has become an eyesore with trash, graffiti marked toilets in a "park" area with decaying streets left in total abandon. There should be a fine to the airport for

SPC00103

its active neglect of a once pristine area that has caused surrounding property values to be reduced because this vacant LAX owned area has been left in decline.

No mitigation fees have been anticipated in the report for removing natural habitat which again will increase the budget and dismantle an established eco system.

The temporary security measures that has been in effect could have been improved instead of spending money for additional new plans for the airport. The "barricades" on Pershing and on Westchester Parkway are totally useless, and could be removed easily, by terrorists or those seeking to harm people. There is a North Outfall abandoned access point Project on airport grounds on Vista Del Mar. That is a prime target which should be removed. Instead it is left totally unsecured, instead of being removed. This access point could do untold damage to the underground sewer system and the surrounding area by a terrorist. I do not feel my security has been enhanced. What has been done is merely a band aid, and a poor one at that.

All security measures to date, could have been enhanced, but, Mayor Hahn decided to spend more money on new designs to enlarge the airport venue, instead of keeping the existing footprint and truly working to enhance security, comfort and safety of passengers and neighbors.

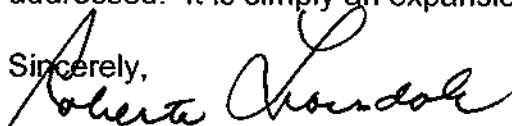

My sense is that we can keep the airport with its present footprint, remove cargo and have it relocated at the Palmdale Airport, and let the airport facilities expand south, where existing cargo facilities are located. This would make the necessary improvements in an existing open area, with accessible buildings making it more functional, less expensive and fully utilizing the area.

Airlines do not want to spend anymore money than is necessary now, with their own future in abeyance, and enlarging the airport at this time is not good for the Los Angeles residents and neighbors. LAX neighbors have long been besieged with building of Playa Vista, Loyola Marymount, airport parking facilities, the 105 offramp, Howard Hughes Center and other building which has caused its own increased traffic, pollution and noise.

All other counties, particularly Orange County residents should be charged an access fee to use this airport, as this will promote the desire to have their own airport facility in the south counties which need more access. By charging an access fee, they may choose to fully utilize John Wayne, Ontario and Long Beach airports. These LAX access fees should be completely audited and used directly to improve the existing LAX interior space like Vancouver Airport, which is truly a world class facility.

I am opposed to the present proposed Mayor Hahn Alternative D proposal, and do not feel that the basis for this project, security and safety, for its neighbors and passengers has been addressed. It is simply an expansion project under this false label.

Sincerely,

Roberta Trousdale

Re: Public **Hearing on August 23 / LAX Masterplan**

To whom it may concern:

Unfortunately, I will not be able to attend the public hearing at the Furama Hotel on August 23 to voice my opinion on the LAX Masterplan, but am thankful that I may submit my opinion in writing.

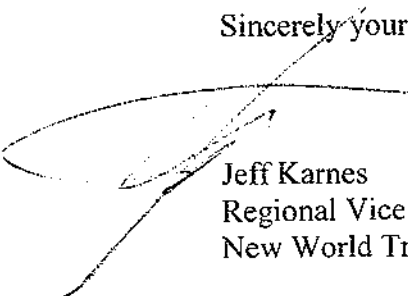

New World Travel is a receptive operator, handling contracting, and group arrangements and representation for international clients traveling to the United States. Our clientele stems from Europe, including Germany, Holland, Italy, France, Switzerland, Austria and the United Kingdom as well as Brazil, Mexico, Tahiti, Australia and New Zealand. We currently bring over 75,000 passengers annually to the United States through LAX.

Los Angeles serves as one of three major gateways into the United States for our passengers, the other 2 being Miami and New York. When our clients package and sell US travel products to their passengers, the gateway city and airport experience is important to them and is the first impression that the passenger has of the city. It must be perceived as safe, well organized and efficient.

The tenets of the LAX Masterplan assure that LAX is and is perceived as safe, well organized and efficient for our arriving passengers and maintains LAX's status and reputation as a modern and relevant airport for the international passenger.

Please consider our opinion and, should you have any questions, feel free to contact me.

Sincerely yours,

Jeff Karnes
Regional Vice President & General Manager
New World Travel

LAX MASTER PLAN MEETING AT FURAMA HOTEL:

Last year at this time and for the two years I have been living in Marina Del Rey there was no plane noise. None. Nothing. Now it seems as if I am living on an LAX runway! My left ear was hurt by an insane overflight bang on the night of July 16, 2003. To whom do I send my doctor bills? Since June 21, 2003 I have been attacked by noise from LAX but I am told by the FAA that nothing has changed!?

I received a letter from Mr. Swanson, the FAA Operations Unit Supervisor which said that pilots of aircraft must operate their aircraft in accordance to Title 14, Code of Federal Regulations (CFR), Part 91.119 of the General Operating and Flight Rules in airspace controlled by the FAA. He wrote that these rules state that:

“such aircraft, except for take off and landing, cannot fly over congested areas at an altitude of less than 1,000 feet above the highest obstacle within a 2,000 foot radius of the aircraft except over open water or sparsely populated areas. In those cases, aircraft may not operate closer than 500 feet to a person, vessel, vehicle or structure.”

He also wrote that “These regulations address safety of aircraft operation and not noise abatement. Our investigation was unable to substantiate any violation of the Federal Aviation Regulations.”

My questions are: (1). is this Marina Del Rey area and the adjacent areas considered “*sparsely populated areas*”? Is the water encompassing Marina Del Rey and Playa Del Rey still considered “*open water*”? In “*sparsely populated areas*” and “*open water*” aircraft can legally operate within 500 feet of a person, vessel, vehicle or structure. The Regulations are probably antiquated and out of date.

Concerning “*take off and landings*” which are exempt from the above rules, my major problem is with departures as I presently see it.

(2). Has LAX and/or the FAA moved the “*landings and take offs*” to a runway(s) closer to me or changed the flight patterns of “*take offs and landings*” so that the aircraft fly lower and/or come closer to me, especially since June 2003? As I comprehend it, there are no boundaries for “*take offs and landings*.” Aircraft can fly within *less* than 500 feet of a building or person.

SPC00106

The noise has thankfully subsided somewhat. (3). I am wondering was the big change at LAX since June 21, 2003 a security measure to secure air space for Air force 1, for the President's visit which just took place? Are things returning to normal?

But now a problem has arisen that has overshadowed the noise problem!

Since the trees where I am living were just pruned back drastically on August 1, 2003, I taste, smell and feel the immense pollution from LAX. Talk about Hell! I don't know whether to close my windows and suffer indoor pollution or keep my windows open! My skin is irritated from the pollution. I gargle constantly! Looking at the AirportMonitor Internet Flight Tracking System is depressing. It shows how the planes converge on the Marina and have really polluted the whole coast line from nearly Hunting Beach to nearly Malibu.

I moved to the Marina for the quiet and fresh air. I now realize that I was in a "fool's paradise" all along living this close to LAX. The pruned trees have really brought the message home now that there is no barrier to abate the cancer causing pollution. I have not slept in my apartment for nearly two weeks! It is costing me a lot of money to have nightly lodgings. I need help to move from my apartment. I need help from the agencies within the city of L.A., the FAA and the LAWA.

The FAA does not care about the subsequent noise, because noise abatement is not their concern. Well noise abatement should be their concern and added to the updated Regulations that are sorely needed. Pollution should be a major priority!!!!!! People are dying from it!!!!

(4). Is aircraft exhaust pollution the responsibility of the FAA or is that left to the city of Los Angeles just like the aircraft noise pollution is left to the city?

(5). Is the FAA required to have less loud and filthy engines, like automobiles? When?

(6). Are there agencies in the city of L. A., the FAA and the LAWA that assist people to move if they are affected by the noise and pollution from LAX? I need that assistance now!

I continue to fight the GOOD fight of FAITH. *Please respond* quickly. I am suffering physically and monetarily.

Thank you.

Dr. Nimrod.

Comments:

Santa Monica Convention & Visitors Bureau recognizes that in order to increase travelers to the Los Angeles County area, we need to support ~~DAX being modernized~~ the modernization of DAX. We may not agree with every detail of the Masterplan, however, we do agree with the value of two, mutually supporting segments of LA's visitor economy: the transcontinental domestic market and its linkage with the international travel customer. In order to maintain its standing as a viable international gateway, LAX must be able to provide passengers with direct connections to the primary domestic carriers. This plan understands that to be a gateway DAX, we will need to protect its access to the primary USA markets.

Subsection (if applicable):
Number: _____ Title: An Improvement LONG Overdue

Comments:

- ① Present facility is outdated & CROWDED.
- ② Needs Newer Customs, Immigration, Quarantine facilities.
- ③ Incoming International guests are unnecessarily held for longer times because of lack of proper screening Customs/Immigration facilities.
- ④ The congestion created from transiting guests & L.A. incoming guests should be controlled with more & better facilities to lessen International passenger arrival wait times.

⑤ Conclusions:

New Mayor proposal will solve the above & we believe and hope it will allow smoother more efficient and quicker International guest arrivals & departures.

Support alternative D

- LAX is a global airport designed/enhanced approximately 25 years ago.
- We need to improve LAX as the other regional airports, i.e. Burbank, John Wayne, Ontario, Long Beach, are not global airports and cannot support a global system.

This will:

- create high paying jobs.
- improve & streamline traffic, creating efficiency.

We must continue to improve LAX!

I would like to say that the Lax Modernization Plan D is a very good plan and should be implemented as soon as possible. We need to get LAX updated for better security, safety and the plethora of jobs it will open up. We must get on board and get this modernization going. It will greatly help the economy of L.A. a surrounding area; we need the jobs and of course the revenue.

Respectfully,
Russell Ingham

Comments:

I have ~~my~~ concerns about Plan D. It seems it would be very inefficient for residents of the LAX area who drop off people or want to wait with people who are departing from LAX. Right now it takes me 5 minutes to drop off someone at the curb from my home. With Plan D, it would take 5-10 minutes to get to the parking area, and an additional 8 minutes to get to the terminal on the people mover. If it's inefficient for one who lives only 5 min. away, it will ~~be~~ likely be more time-consuming for others, who are coming from further away.

Plan C seems to be a more reasonable & efficient plan - maintaining people movers w/in the airport.

I'm concerned that Plan D ~~would~~ ^{as drafted} primarily ~~be~~ satisfy special interests, instead of the public interest of Los Angeles, particularly airport area residents.

General Comments:

I've been fortunate to be able to travel to many of the world's great cities: London, Paris, Rome, Tokyo, & Amsterdam. The one thing these cities have in common is that they've located their international airports far outside the urban area. Travel is fast and efficient, and there are plenty of airport related jobs.

In light of this, it's just plain nutty that Los Angeles wants to refurbish its urban airport rather than migrate operations to Antelope Valley outland it already owns. Expansion of LAX is contrary to both trends and logic, and I am not in favor of it.

My name is Trini Jimenez. I am the School Board President in the Lennox School District. Lennox is a small, mostly Latino community, located west of LAX and sandwiched between the 405 Fwy and the 105 Fwy. The Lennox School District serves over 7,000 children in this very densely populated area. We have a paramount interest in the LAX Master Plan because of the direct impact on our community.

We have carefully analyzed the impacts of the new option in the Master Plan and found that mitigations are crucial in our community because of the extreme proximity of the airport. The Lennox School District has conveyed our community's impacts and specific concerns in September 2001. The Lennox School District looks forward to working with Mayor Hahn, the Los Angeles City Council, The LAWA Board of Airport Commissioners, and the Los Angeles World Airport Staff.

We are confident that with appropriate mitigation we can support the Mayor in his effort to improve safety and security at Los Angeles International Airport. Thank you.

Comments: *I am NOT in favor of the LAX Expansion Project.*

The vibration from the air traffic has caused numerous amount of cracks in both bathroom and bedroom located in the southern part of my property. Not only has it caused these cracks it has caused the bathroom door to rattle when some flights are flying lower than others.

If this project is approved, I am convinced that there will be an increase NOT ONLY IN NOISE, but also an increase in health risk from fuel dumping as well. Also, these things will cause a huge decrease in property value as well.

It seems to me that minorities are always the victims of unwanted projects in their communities

Office Use Only

Thank you for this opportunity to speak about the LAX Master Plan and EIS/EIR.

I come before you as Vice President of ARSAC, Alliance for a Regional Solution to Airport Congestion, an active participant in many of the Westchester-Playa del Rey and Southern California area community organizations.

EACH OF THE BUILD ALTERNATIVES ARE AN EXPANSION AND DO NOT MEET THE MAYORS CAMPAIGN PLEDGE.

I oppose Alternative D on several levels, but let me say **IT IS NOT AS ONEROUS AS ALTERNATIVES A, B, OR C.**

It is too expensive—whatever the real costs turn out to be.

It perpetuates the continued concentration of air commerce in one place by focusing on increasing LAX NOW and other airports as afterthoughts. We CAN expand LAX again now, but there is a consequence. When the next round of expansions are needed at the other airports their surrounding communities will have built up and become highly concentrated populations just like we already have around LAX.

This Plan adds even more environmental impacts on areas already having more than their fair share. The plan is to take all of Manchester Square as a check in facility whereas the LA City Council promised us almost three years ago that it could be used as a much needed park—if the local residents chose to be purchased by LAWA as sound mitigation. Unfortunately the remaining residents will in all likelihood be forced out by the LAWA demolition of those homes purchased so their leaving will not be voluntary.

Focusing on the EIS/EIR Documentation. The data is old, incomplete, and contradictory. Even recognizing that this is a program level environmental document instead of a project, every facet is covered by several options so we really can't do an evaluation of what will be the real impacts.

Examples are the people mover. We don't know where it will stop and even the details of what it will look like. Baggage handling includes building a billion dollar tunnel as well as making everyone carry their own from Manchester Square. Runway "improvements" also state differences such as the northern most runway 24R will be looking to be widened 50' at some time...north, south or some combination? The other northern runway movement calls for various differences in movement too.

I have to also ask what safeguards we'd have that the next phase after this is done won't impact the community even more with another round of expansion?

In terms of fast tracking of this process, I have doubts that the State has formally supported this activities and many surrounding cities and Counties have definitively opposed this action.

Further, what happened to all of the answers to questions from two years ago? Nothing has been released to us to see why ANYTHING is planned. What makes us believe that

the new questions will be adequately addressed? I note that a community prepared alternative, we called it E, was not accepted for comments prior to these hearings and that we are supposed to submit it simply as another comment.

Why should we trust this process to protect us from anything? The determination can be made that any impact MITIGATED OR NOT, CAN BE ACCEPTED and the projects moved forward. Most every mitigation is being done by an agency other than LAWA since it is not on airport properties. How can we be assured that the other agencies will follow through? It hasn't happened in the past.

Thanks for your time...

COMMENTS FROM AN OLD TIMER

Mr. Jim Ritchie

Los Angeles World Airports
LAX Master Plan Office
P.O.Box 92216
Los Angeles, CA 90009-2216

In reviewing LAX (D) and LAX (E) I find them full of holes and VERY EXPENSIVE.

1. Leave the terminals and existing access as is. This allows people to drop off and pick up the elderly and handy capped right at their terminals. This scatter of terminals is safer than the proposed concentration.
2. Moving runways and putting a taxiway between them has not improved wing tip clearance versus 45 degree holding between existing runways. Nobody shows which way the airplanes would be going in those center taxiways. This very unsafe.
3. The time and cost moving a runway will effect a shortage of operational runways for a long time and with the existing air traffic will cause a real problem.
4. The location of the new tower solved the visibility problem that occurred on the north runway and taxiway that one time. NO PROBLEMS SINCE.
5. With the financial shortage in Federal, State and City, leave as is except to improve the security in the existing terminals.
6. I went to the library to review the airport plan D and was shocked by the extent of the environmental study. About 6 feet of books full of GOBBLED- GOOK. When there wasn't an acceptable plan to evaluate. What a waste of taxpayer funds.
7. Cargo truck traffic mixed with passenger traffic could be solved by utilizing Ontario airport where the truck traffic can come and go in all directions and not restricted to approach only in one direction.

Background Summary for LAX Expansion

LAX is operated by Los Angeles World Airports, LAWA, an independent department within the City of Los Angeles. Prior to Sept 11 LAX was the world's third busiest passenger (67.8 million annual passengers, MAP) and third busiest cargo facility (almost 2 million annual tons, MAT). LAX has slipped to being the fifth busiest passenger facility having lost about 15-20 percent of its passenger base. It continues to be number 3 in cargo with slightly over 2 MAT and increasing. LAX handles approximately seventy five percent of all commercial air traffic in all of Southern California and is the only International airport of consequence south of San Francisco. LAX land mass is one of the smallest major airports at 3500 acres compared to a typical of about 10,000 acres. LAX is located in the densely populated Westside and is surrounded by a substantial amount of "non-compatible land uses"—people's residences.

LAX is noted as a top terrorist target. The economic impact on Southern California would be devastating if there were either a man-made or natural disaster at LAX.

Attempts to truly diversify air traffic have stalled. Establishment of an airport at the former El Torro military base in Orange County has been defeated by south Orange County interests. The Southern California Regional Airport Authority has apparently died due to lack of support by Los Angeles City and some other participants.

The last major expansion of LAX authorized by a Master Plan (and full environmental impact review) was 1978-1982 which increased LAX to 40 MAP. This was promised to be the last. Past expansions have removed one third of the local residences. Subsequent incremental project expansions (no environmental impact study was required because each individual project was only a small percentage increase) raised the stated potential capacity to 78 MAP with ground traffic access to LAX as the prime constraint. BOAC President Ted Stein estimated that without this constraint LAX capacity is 83 MAP.

The FAA no longer establishes airline routes or schedules. This responsibility ended with the 1980's deregulation of the airline industry. Airlines establish their own frequency to any airport. The FAA states that they will work to safely facilitate all desired flights based on the ability of an airport to safely handle aircraft take offs, landings, and gate availability—even if it maximizes air traffic all 24 hours of the day.

Mayor Hahn was elected in 2001 after signing a pledge by the Alliance for A Regional Solution to Airport Congestion, ARSAC, that he would not increase LAX capacity. Subsequent to September 11 Mayor Hahn had a new Master Plan alternative, "the Safety and Security Alternative D," added to the Riordan Master Plan. Reissue of the Riordan Master Plan with this new alternative is anticipated this summer. More than \$125 million has been spent preparing this plan. The \$9-11 billion Alternative D estimates capacity at 78 MAP. This pronouncement is NOT universally accepted. Alt. D safety and security benefits are questioned by local "activists" and most recently by a RAND Corporation study.

Southern California Association of Governments, SCAG, a four county coordinating body, projects an increased air capacity need for Southern California. Their "allocation" of air capacity usage to various airports (not an enforceable number) calls for a percentage reduction of overall So Cal flights at LAX from three-fourths down to two-thirds by 2020. The Riordan expansion LAX Master Plan released (and defeated) about two years ago called for increases in LAX capacity to between 94 MAP to 100 MAP plus. SCAG estimated building equivalent capacity in areas other than LAX would cost \$2 billion less.

More than twenty years ago it was anticipated that Southern California would need more airport capacity. The LAWA Board of Airport Commissioners owns and operates Palmdale Airport and Ontario Airports. There is currently no commercial air service from Palmdale and about 6.7 Million Annual Passengers leave/return to Ontario Airport. Although LAWA has slack capacity at both Ontario and Palmdale, LAX remains the preferred site. During portions of the day LAX operates at near maximum capacity.

The initial Riordan plan was 12,000 pages long and environmental impacts were justified using 1996 data. The Hahn alternative has been added to the Riordan Master Plan and will be reissued. This approach allows continued use of the 1996 data rather than more current data. Although thousands of comments were submitted and major flaws found within the Riordan plans and support data, there have been no responses to the public comments. LAWA instead proceeded with development of Alternative D "with the comments in mind." They removed some of the significantly objectionable elements from the Riordan alternatives. Alternative D would have far less severe local impacts than Alternatives A, B, or C. None-the-less significant undesirable local and Southern California impacts remain.

Alternative D Master Plan development has been largely uni-directional. Little criticism has been tolerated and schedules appear to get all approvals before the next Mayoral election. Eleven months have past, for instance, since the most impacted homeowners area was promised a meeting. The initial Alternative D press announcement was by invitation only. The Plan has enjoyed much general exposure by LAWA, but few details exposed. Virtually all meetings are of the "this is what it is" nature. Only the Mayor's Blue Ribbon Committee on Manchester Square allowed some give-and-take, but was convened with major assumptions such as expansion into Manchester Square residential area fixed as a condition. Attendance was by invitation only in a secure location with no handouts or recording allowed. The public and press were not given admittance. Manchester Square procurement by LAWA is under GAO investigation for irregularities. If the area were to be procured, it was promised to remaining local residents as a park by the City Council in March 2001.

Local residents were told from the start that the general aspects of the plan are "not negotiable." Numerous requests to address plan objections were consistently met with the phrase, "we thought about it and decided against it." Alternative D continues to lack support from the Airlines, local community, or surrounding governmental entities. Only LA City Council and Mayoral approval is required to proceed.

Local community leaders independently developed their own Alternative E without support from LAWA consultants already being paid \$1 million per month. Alternative E addresses Alt. D shortcomings. The Mayor and LAWA remain unwilling to address this plan despite a Neighborhood Council request.

The Riordan review period was more than a six months long. This time we will be required to inspect the initial 12,000 page documentation for changes in addition to what we have been told will be 4,000-8,000 additional pages covering Alternative D—all within 45 days! Numerous requests from all levels of government and interest groups to extend the comment period have been rebuffed.

The enclosed CD contains numerous annotated named documents including a Powerpoint presentation on the history of LAX development, Alternative D, and Alternative E.

There are many nuances to this dollar give-away. Feel free to call me at (310) 641-4199 or e-mail me at DennySchneider@WeLiveFree.com for more details.

Re: Mayor Hahn's LAX Master Plan Proposal

Mayor Hahn's LAX Master Plan Proposal simply trades one security hazard for another. If safety is the primary motivation for this proposal, then it falls seriously short of its promises.

A recent Rand Corp. study has indicated that congregating all commercial passengers in one location increases the risk and harm to a greater number of people by a terrorist attack.

The proposal creates a major loophole. The added inconvenience of additional time required to be screened and transported to the airline terminals encourages business and wealthy travelers to engage private business jets, charters, and fractional share aircraft for transportation. These general aviation options are not regulated as strictly as commercial aircraft nor are the aircraft or their passengers screened for security purposes at LAX or any general aviation airport in the area.

I urge Los Angeles World Airports (LAWA) to thoughtfully consider the risks of this proposal and to address the lack of security at the general aviation passenger access to LAX at the Imperial entrance. In addition, encourage the FAA to increase security standards nationwide for access to all general aviation areas and other airports with general aviation traffic.

Lax's Current Plan for Expansion

Techonology for the future cannot be predicted at this time so the coast involved to build the new Airport Plan cannot be estimated today - which is only a rough estimate --

*Our lives here in the United States changed on 9/11
Security and Time is of the Essence*

The Rand Corporation and the Airlines have given some helpful information for modernizing security at the airport. Nine years and million of dollars have already been spent on un-practical plans without taking into consideration -- The Big Picture -- A Regional Solution --

To enlarge LAX on the small and confined acreage including off-site check in facility in this metropolitan area should not be an option.

For serious safety, security, effieency and convenience the City of Los Angeles should follow the lead of the major Cities in the United States, Europe and Asia by using larger acreages outside of metroploitian areas. Los Angeles already owns larger acreages in Palmdale and Ontario. These Airfields should be developed and enlarged with connecting Metro-Link-Rail Transporation Systems to accommdate the new Jumbo Jets that will hold 500 passengers that are already in the planning stages.

More people's lives could be spared in the event of this type of catastrophe that has already occured on 9/11 in New York City.

Comments:

Office Use Only

With the ITC in place, two of the greatest assets in the area are being overlooked: The Union - Station - LAX train tracks, and the Green Line.

- Plans should be made to accommodate ~~with~~ a Metrolink-type train station adjacent to either the ITC or GTC. Such a train line is inevitable as LA County's rail system continues to grow and quick transfers between LAX and Union Station are increasingly desired.
- Plans should also be made to accommodate a Green Line extension north through LAX to Westchester, connecting Westsiders to the rail system.

Attach additional sheets if necessary.

RE: Mayor Hahn's LAX Master Plan Proposal

It is essential that Los Angeles World Airports review its current Master Plan Proposal.

Although, Mayor Hahn's LAX Master Plan Alternative was intended to focus on "safety and security" issues, it has become apparent that there are very serious flaws in this proposal.

A recent Rand Corp. study has indicated that congregating all commercial passengers in one location increases the risk and harm to a greater number of people by a terrorist attack.

The added inconvenience of additional time required to be screened and transported to the airline terminals encourages business and wealthy travelers to engage private business jets, charters, and fractional share aircraft for transportation. These general aviation options are not regulated as strictly as commercial aircraft nor are the aircraft or their passengers screened for security purposes at LAX or any general aviation airport in the area.

This Plan would also drastically alter traffic patterns. As a resident of Santa Monica, I am well aware that the majority of travelers who live in the North Western area including Santa Monica, Pacific Palisades, Marina del Rey, Venice, Playa del Rey, Topanga, and Malibu access LAX via Lincoln Blvd and other surface streets. I would imagine a similar situation exists from communities accessing LAX from the South Western area.

Will all this traffic be routed through residential areas of Westchester? That probably doesn't sound very appealing to that community. Or perhaps be forced to use the 405 Freeway which already doubles as the largest parking lot in the world?

I urge Los Angeles World Airports (LAWA) to thoughtfully consider the risks of this proposal and to address the lack of security at the general aviation passenger access to LAX at the Imperial entrance. In addition, encourage the FAA to increase security standards nationwide for access to all general aviation areas and other airports with general aviation traffic.

Also, any future change in LAX design that alters auto access must include traffic mitigation measures that don't exacerbate an already significant problem.

Sincerely,

Cathy Larson

Dear Mr. Kessler and Mr. Richie,

Attached you will find my letter to Antelope Valley Press regarding my opinion and concern in the master plan proposal to expand LAX to meet aviation growth demand.

As a citizen of Antelope Valley, I would like to express my opinion and hoping that your good office would provide the City of Los Angeles the best plan and recommendation to include Palmdale Regional Airport. The success and failure of Mayor Hahn's master plan is in your good hands including the future of Antelope Valley.

I will pray to our Greatest Architect of the Universe to keep you steadfast in your decisions. Thank you and should you have any question, please do not hesitate to contact me.

Palmdale Regional Airport

Mayor James Hahn mega bucks proposal of 9 Billion Dollars to renovate LAX would be another blow to Los Angeles taxpayers. However, for the sake of security and environmental impact to the City of Los Angeles, the Palmdale Regional Airport should be considered as an alternative solution to solve over congestion in LAX. Let us built an infrastructure, such as speed rail transportation from LAX to Palmdale Regional Airport. We can move the Cargo Airlines from LAX to relieve some of the 3.1 million tons of cargo and some of the 8 million passengers each year to Palmdale Regional Airport. Proper planning can control traffic congestion and smog pollution.

It's about time that a Mayor of Los Angeles and members of the City Council includes Palmdale Regional Airport to meet the growth of aviation demand in Los Angeles. Thanks to Mayor Mike Gordon of El Segundo for supporting the utilization of Palmdale Regional Airport. I also wish to thank our County Supervisor Mr. Mike Antanovich for his long time support of using Palmdale Regional Airport.

May I suggest to Mr. David B. Kessler of AICP, US Department of Transportation, Federal Aviation Administration and Jim Richie, City of Los Angeles, Los Angeles World Airports, LAX Master Plan Office to use their professional and unbiased non-political decisions to include Palmdale Regional Airport in the master plan expansion of LAX.

If the master plan to include Palmdale Regional Airport fails, it would be time for the citizens of Antelope Valley to purchase Palmdale Regional Airport from Los Angeles. If this also failed, we should legally claim this land, since LAX has no use for it. Then and only then, we would be free from the politicians of Los Angeles City and would be able to determine the destiny of our airport.

RE: Mayor Hahn's LAX Master Plan Proposal

Although, Mayor Hahn's recent proposed LAX Master Plan Alternative was intended to focus on "safety and security" issues, it has become apparent that there are very serious flaws in this proposal.

A recent Rand Corp. study has indicated that congregating all commercial passengers in one location increases the risk and harm to a greater number of people by a terrorist attack.

The added inconvenience of additional time required to be screened and transported to the airline terminals encourages business and wealthy travelers to engage private business jets, charters, and fractional share aircraft for transportation. This will detrimentally effect the increase of the already overwhelming air traffic related noise and air pollution from jet fuel exhaust at smaller airports adjacent to family oriented residential communities (such as Santa Monica Airport).

In addition, these general aviation options are not regulated as strictly as commercial aircraft nor are the aircraft or their passengers screened for security purposes at LAX or any general aviation Airport in the area. Based on media reports and our personal experience with Santa Monica airport, the increasingly larger commercial jets are pushing the limits of utilizing the smaller and unregulated airports, which leaves a dangerous and gaping hole in our nations aviation security apparatus.

We urge Los Angeles World Airports (LAWA) to thoughtfully consider the risks of this proposal and to address the lack of security at the general aviation passenger access to LAX at the Imperial entrance. In addition, encourage the FAA to increase security standards nationwide for access to all general aviation areas and other airports with general aviation traffic.

Yours truly,

Adrian Harewood

Subsection (if applicable):
Number: Title:

Comments:

1. One of the first things we should have learned from the terrorist attack of 9/11/01 is that enlarging LAX will make it a more desirable target. Spreading the flights and passengers to other areas would make an attack less likely.
2. Establishing a check-in facility in Manchester Square, makes that a good target for terrorists; adding the 2 mile trams also adds inviting and easy targets.
3. This does tend to make the buildings less vulnerable at the expense of increased vulnerability for the people.
4. The traffic congestion on the 405 and 105 freeways and in the check-in area will be significantly increased, causing many problems.
5. The destruction of facilities and construction of new ones is a terrible waste of money with no significant improvement in operations.
6. Expansion to the east will have a major impact on the citizens east of the airport.
7. A very important factor making this such a terrible waste of time and money is the fact that population growth in Southern California is north toward Palmdale and east to Riverside and San Bernardino. Long before the LAX expansion is complete, airport expansion in those areas will be necessary. Where does that money come from?
8. One of the biggest things lacking in this plan is Common Sense.
9. No other major airport is located in the middle of the city. Cities around the world have expanded and built new airports, but not in the middle of the city. Check Hong Kong, Milan, Italy, and Munich, Germany for examples.
10. It is clear that this is a plan where special interests will make a lot of money, rather than a plan to improve airport transportation and its impact on the surrounding community.

I ~~do~~ live in Culver City and work in Lennox. Rand shows that we should restrict growth to lessen LAX as a target. How dare the business community continue to exploit people of color in Lennox. We all know that this "investment" in security leaves the door wide open for continued growth at LAX. Why are we investing 9 billion in LAX when we need to be redistributing the sound, environmental and medical burden to the greater community. Anyone who supports spending money at LAX is slitting the throats of the immigrant community that is the backbone of this community.

RE: LAX Master Plan

I am a Quality Assurance Inspector of aircraft maintenance for American Airlines. I have worked at LAX in this capacity for the last 20 yrs as both an aircraft inspector **and** mechanic. I intimately see everyday the problems LAX has gone through over the years, and the current problems it faces in trying to maintain safety and security, and in dealing with increasing air traffic.

I have studied Mayor Hahn's plan for LAX thoroughly and quite honestly find it laughable. Nothing about it makes any common sense in trying to solve the current, and future problems facing LAX. The only logic for this plan, is to "make work" (since I think it is a waste of labor and resources) for the construction firm(s) that will be doing this job. I wouldn't doubt that these contractors gave Hahn a heap of money in his campaign for mayor.

First and foremost lets talk about security. Hahn' plan claims this will improve security at LAX. His plan calls for having everyone check in at one central location and then "people-move" them to their gates. **THIS PLAN IS A TERRORIST DREAM!** Yea, lets gather the massive crowds of people that go through LAX and put them all in one area. Even a moron should be able to see that this isn't a very bright idea. A suicide bomber then could mix in with this crowd before they check in, and wipe out a hell of a lot of people.

Hahn's plan would severely hamper the efficiency and order of LAX for an estimated 11 yrs, and that's if they do it on schedule which rarely happens. This is 11 yrs of inconvenience to the passengers, airlines, and vendors. The airline industry is already severely hurting financially and this will impact operations here at LAX for 11 yrs. On top of that the cost of this massive project that will do nothing to improve anything. It will be financed by higher air fares, and **this will** hamper the airlines, and also any business that relies on air travel, like tourism, business travel, airport vendors, etc.. What is Hahn and all those that support this thinking!?

Stop this insanity! You don't need to mess up LAX. You need to develop a **regional approach** to handle air traffic around Los Angeles. Most of the people that work for the airlines, and those that fly that live in the LA area, don't live near LAX! They live elsewhere and would be better served by airports like Ontario, San Bernadino, Orange County, Burbank, and Palmdale. That is where you should expand, and you can make improvements to LAX if needed, but don't do anything stupid and major, like move runways, or terminals, and make a centrally located check-in area. Most of my co-workers here at American Airlines feel the same way. We don't need your so called "improvements".

Sincerely,

Randall E Hartman

7/7/2003

DEAR MAYOR HAHN (A)

I VOTED FOR YOU BUT I'M SORRY
I DID THE ACTION.

YOUR PLAN TO SPEND \$9.6. ~~THE~~ BILLION
ON AIRPORT MODERNIZING IS WASTFUL
WHAT THE CITIZENS NEED IS A TRAIN
TO LAX AS E.G. ATLANTA, BART (S.F.),
N.Y.C. IS BUILDING ONE.

PLEASE FOCUS ON MOVING TWO
PARALLEL RUNWAYS ON THE SO SIDE
OF THE AIRFIELD FARTHER APART. I
WAS ON A PLANE WHEREBY WE HAD A
NEAR MISS.

(B)

WE NEED ADDITIONAL EFFICIENCY IN
THE USE OF OUR POLICE MANPOWER
E.G. DO WE NEED TWO OFFICERS
PER CAR DAY + NIGHT SHIFTS?

(2) DO WE NEED 2 AND 3 POLICE
CAR AT TRAFFIC ACCIDENT LOCATION?

(3) WHY MUST THE CITY PAY

SPC00146

SPC00146

TIME AND HALF TO POLICE
OFFICERS THAT APPEARS IN
TRAFFIC COURT. ?

WHEN WILL THE CRA,
M.T.A. AND OTHER DEPARTMENT
STOP THEIR WASTEFUL
SPENDING AND BECOME MORE
COST EFFECTIVE.

YOU'RE THE LEADER OF
THE BAND. HOW ABOUT SOME
COMMON BUSINESS SENSE IN
LEADERSHIP. ?

Sincerely,

Ken Stolle

P.S. A REPLY WOULD BE
APPRECIATED.

13 July, 2003

Mayor James K. Hahn
200 North Spring Street
Los Angeles, CA 90012

Dear Mayor Hahn,

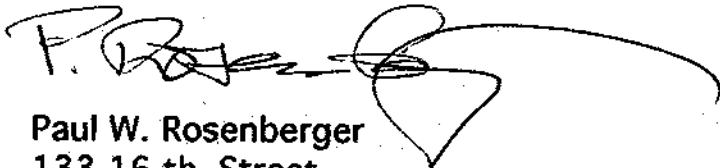

Although admirable in many respects, your airport plan does not address the traffic congestion that is already paralyzing the 405 virtually around the clock, much of it attributable to the airport traffic. As the airport capacity expands, this problem will become catastrophic.

The current plan calls for passengers to be processed at a central baggage screening facility, after which they board buses to be transported to their departure terminals.

A much better alternative is to have multiple regional facilities (down town LA, the valley, Orange county, etc.) and bus passengers from there to the terminals. As long as passengers have to board a bus, they might as well board it where it is convenient to their home location. This may be more expensive in the short run, but would pay huge dividends in passenger convenience, traffic reduction, and avoidance of extremely expensive freeway expansion.

Please give consideration to this important issue as you refine your air port modernization plan.

Sincerely,

Paul W. Rosenberger

Re: The LAX Master Plan

Dear Mayor Hahn:

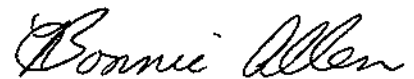

We are writing to ask you to increase the minimum public comment period for the LAX Master Plan, Alternative D, from 45 days to 180 days because 45 days is simply too little time for public review and comment. Fairness to all interested parties requires adequate time to receive, review and comment on such an important document that will affect everyone in the city of Los Angeles and well beyond.

We therefore urge you to increase the public review period to 180 days.

Sincerely,

Lucille Allen

SPC00149

LAX MASTER PLAN - SPENDS 9 BILLION PLUS TO:

- * **Tear Down Airport Structures Possibly Not Yet Even Paid For**
- * **Concentrate Airport Congestion**
- * **Promote Traffic Gridlock**
- * **Make LAX the Most Inconvenient Airport in the World**

Simply moves Airport Congestion & Likely Point of Terrorist Attack to another more congested site without equal replacement parking and still further away from Green Line to Blue Line to Red Line and Urban Destinations. Is it really convenient to go to Park and Ride Lots in Long Beach, Norwalk & Inglewood and ride busses to Manchester Square Airport Security Center ?

Our past leaders were visionary in buying a large airport site at Palmdale. Tokyo, Seoul, Hong Kong and Washington D.C. all built new larger International Airports far from their cities. Most now use old airports for Domestic Flights Only. Transit Links to other Airports and Cities.

HOW TO SPEND LESS AND GET MORE.....a possible Alternative Plan

LOS ANGELES AIRPORTS AND RAIL TRANSIT SCHEME * *

As Illustrated with Detailed Map - Plans & Text shown on Large Display Boards.
(Prevented from Showing at Airport *Public Hearing*)

*** New Secure Los Angeles International Airport at Palmdale**

With all passenger and baggage screening and check -in features now in LAX Master Plan Using only a small portion of this vast site.

Links Palmdale Metrolink Station (uc) with one-mile Elevated Airport Tram connecting to Security Center for Passenger and Luggage Screening, Flight Check-In and Baggage Check.

Continuing Tram to Huge International Terminal and on to even larger Domestic Terminal for Connecting Flights.

2.5 Mile Elevated Tram Loop from Terminals to Parking, Bus, Taxi and Car Rental Lots; to Security Center; and Metrolink Station.

500 acres of Open Parking Lots with approximately 50 to 70 thousand Car Capacity.
180 acres for Bus and Taxi Terminals and Car Rental Lots.

Existing Metrolink Travel Time from Union Station to Lancaster is 1 hour and 40 minutes.
Would be less from Red Line/Metrolink Station to Palmdale Airport and even less by car on 14 Freeway.

nsit Travel Time to Airport could be greatly reduced by (1) Better Track Alignment
mproved Rail Roadbed (3) Grade Separation (4) Double Tracking and (5) Electrification.

*** Los Angeles Westchester Domestic Airport at LAX**

Linked by Terminals Tram to Metro Rail Line. Possible Security Check Point at Tram Station.

Airport Conference Center & Corporate Jet parking at now Tom Bradley International Terminal.

Retain all LAX Terminals, Parking Structures and Runways as they now exist.

LAX Flights Actually Reduced. No Homes or Businesses Taken.

*** Easy Rail Transit to ALL Los Angeles Airports.**

Including Direct Metro Rail between LAX and Burbank Airports.

Only 15 miles of new Metro Rail lines could link Green Line and LAX to Burbank Airport and Metrolink Rail Line to Palmdale Airport.

Two mile Red Line Valley Metro Rail Extension to Burbank Airport Terminal. Then one mile more to new Antelope Valley Metrolink Station and Rail Transit Service to L.A. Int. Airport at Palmdale. Also increases low income workers access to large nearby affordable housing stock.

Ebony Metro Rail Line from Union Station to Wilshire-Western Stub. Then 12 miles to LAX. Subway down Crenshaw Blvd. and Elevated on MTA owned railroad right-of-way to Century/Aviation Station Link with LAX Airport Terminals Tram. Ending at Green Line Light Rail Aviation Station. Bay Area BART elevated everywhere except in Downtown City Areas.

Long Beach Airport Alternative Terminal Transit Links to Long Beach Blue Line Light Rail.

Now no direct rail access to Ontario Airport. Alternative Plan has new Ontario Airport Stations on Riverside and San Bernardino Metrolink Lines with Transit Links to Airport Terminal.

RE Airport hearing and meeting on August 23, 2003,
Furama Hotel, Westchester, CA.

Suggestion: Please next time, NO CHILDREN

I am a resident of Westchester, who attended the airport meeting on August 23. I couldn't hear the speakers because two children chattered throughout the meeting.

The children would not stop talking, even though the union representatives told their children to be quiet. This did no good, in fact, the two small girls were asked to be quiet about a dozen times, but never stopped talking for a second, until finally at the break they were taken out. It was unbelievably rude not to keep them quiet or take them out of the room during the meeting.

In addition, three other children in this group played a game for quite awhile which was distracting, also disruptive to trying to hear the speakers. No attempt was made to stop the game or ask these children to go outside.

We all want to hear every speaker at the meeting. I'm sure the union wants its message to be heard--it was a shame their own noisy children prevented us from hearing their message too.

Next meeting, please, no children.

Thank you

Comments:

On behalf of the Los Angeles Convention + Visitors Bureau, I'm here to speak in support of the LAX master plan.

Our organization represents LA's tourism industry, the second largest industry in L.A. providing over 240,000 jobs. Last year, tourism injected \$11.8 billion in direct visitor spending.

LA's ^{growth} ~~position~~ as a top travel destination is largely due to LAX which provides easy access + competitive airfares from all major cities around the world.

In today's environment, competition for the visitor is fierce. Travelers today have more choices than ever before in history. ~~and~~ They can choose airports such as Phoenix, SFO and Las Vegas that have updated facilities.

We are here to underscore the core elements of this plan.

Attach additional sheets if necessary.

Comments:
Please register my opposition to Master Plan LAX. The proposed changes will do little to increase airline safety. They will in fact, set up an increase in passenger capacity - an issue opposed by all the neighboring communities for reasons of increased traffic as well as noise and air pollution. We here in the South Bay continue to ask why other regional airports are not asked to increase their capacity. Finally, the price tag (\$9 Billion plus?) is much too high. During these fiscally trying times, couldn't that money be better spent on something else?

Attach additional sheets if necessary. Thank you for your time, Andrew Leighton

Re: LAX Master Plan

Dear Jim:

Thank you for participating so actively in the LAEDC Critical Infrastructure Council's efforts to develop a position on the LAX Master Plan. As you know, the Council is most concerned about the region's need to meet its growing demand for airport capacity and the functionality and ease of use of its airports for travelers and cargo. Based upon the presentation by Ted Stein, President of the LAWA Airport Commission, we would appreciate your response to the following questions:

- 1) What flexibility exists in Alternative D to enable LAX to grow beyond 78 MAP if other regional airports prove unable to satisfy future demand for growth?
- 2) Why does Alternative D contemplate the Ground Transportation Center, Automated People Mover and new Central Terminal Area as Phase I changes rather than projects to be considered in later phases depending on the development of security technologies and TSA procedures?
- 3) Why does Alternative D postpone the enhancement of Bradiey Terminal upgrades to later phases considering the age and growing obsolescence of the facility for international passengers?
- 4) Why wouldn't Lot C be a better location for a Ground Transportation Center considering the following:
 - a. A location closer to LAX reduces the "security envelope" to be protected?

Hahn's LAX Plan Draws County Fire

Supervisors question if the proposal would discourage growth, as promised by the mayor.

By JENNIFER OLDHAM
Times Staff Writer 8-20-03

Los Angeles County lawmakers attacked Mayor James K. Hahn's \$9-billion modernization plan for Los Angeles International Airport on Tuesday, questioning whether the proposal would limit growth at the aging facility as the mayor promises, and criticizing an environmental study of the plan that was released last month.

Despite a plea from the city's airport agency to discuss the item at a later meeting, county supervisors voted unanimously to submit their critical comments at a public hearing Saturday.

The move is a setback for Hahn, who has worked feverishly over the last year to build political support for his LAX plan, which he says promotes security and safety over expansion. An airport expansion plan favored by his predecessor, Mayor Richard Riordan, ultimately was shelved because of intense opposition from residents, the county and others.

In addition, county officials will have an opportunity to weigh in on Hahn's plan through the county's Planning Commission, which will determine whether the airport renovation is consistent with the county's land-use plan.

If the commission finds that Hahn's plan doesn't measure up, a super-majority of the City Council would be required to approve the proposal — 10 votes rather than the eight required otherwise.

Hahn's plan would dramatically rework the airport by demolishing Terminals 1, 2 and 3, knocking down parking structures in the central terminal area and replacing them with a new terminal complex, and moving the airport's two sets of parallel runways farther apart.

On Tuesday, county supervisors reviewed a four-page report drafted by Andy Lazzaretto, whose firm, A.C. Lazzaretto & Associates, was hired by the county last month to analyze the plan.

The report, which will be presented as the county's position on Hahn's LAX plan, said the mayor's proposal may not constrain growth at LAX or make the airport more secure.

Hahn's plan misrepresents the number of gates that would be available for aircraft, the report found, and would redesign gates to allow more capacity and improve the airfield to accommodate larger aircraft. All those changes would allow LAX to serve more passengers, the report said. Hahn has said that by limiting the number of gates at LAX he could persuade airlines to take flights to other airports in the region.

County supervisors said the mayor's plan to build a passenger check-in center near the San

Diego Freeway would allow the airport to accommodate double the number of travelers that it does today.

"They're laying the groundwork for a massive expansion of this airport," said Supervisor Zev Yaroslavsky. "I said to the mayor a few weeks ago that if you want to sell airport growth, go out and sell it like Riordan did."

The county report also contended that the environmental study for Hahn's plan does not adequately address how the project would affect minority residents, relies on outdated statistics and fails to adequately address increased traffic projected for surrounding neighborhoods.

Hahn signed a pledge during his campaign in 2001 promising to discourage growth at LAX past 78 million travelers a year. The airport served 56 million passengers last year, about 40% more than it was designed to handle. The last major overhaul of the airport occurred in preparation for the 1984 Olympics.

On Tuesday, supervisors reacted angrily to an offer by Carlyle Hall, an attorney who represents the city's airport agency, to meet with county officials to discuss their comments before Lazzaretto submits them to the city.

"We think A.C. made a number of comments that could benefit from additional time," Hall said. "There are a number of factual inaccuracies. We would like to have our consultants sit down with your consultants to discuss this further."

Yaroslavsky declined the invitation.

"I don't see the security aspect of this," he said. "I don't want to be convinced privately in my office. I want you to come out publicly and tell me."

Lazzaretto's report misstates the number of gates available at the airport today, Hall said. There are 163 gates at LAX, not the 153 listed in the report, he added. The consultant's report said that more than 200 gates would be available under Hahn's plan, but Hall said that is not true.

"The airlines are looking at this plan and complaining because it would limit growth," Hall said after the meeting. "There's a big disconnect there with what Zev says."

Costs of Remodeling LAX May Exceed \$9-Billion Price Tag

LAT 8-10-03 Manchester Square

[LAX, from Page B1]

6,000 people out of a Westchester neighborhood where Hahn wants to build a new passenger check-in center. Nor does the proposal include the financing costs of the mayor's LAX project, such as interest and insurance on revenue bonds.

Hahn is already facing skepticism from airlines, residents and business groups that his plan is necessary to make LAX more secure and efficient. The disclosure that the \$9-billion estimate may not represent the true cost of the plan is adding to their concerns.

"The number is already so huge that the airlines are unbelievably concerned," said Kelley Brown, an airline consultant. "The airlines also know in situations like this at airports it's not unusual for costs to rise as time goes on."

Airline representatives cite the nation's largest public works project to date — Boston's Big Dig, which is reworking a congested roadway system by placing most of it underground. Costs for that project have escalated from \$10.8 billion in 1997 to \$14.6 billion today — with mitigation measures taking up one-fourth of the project's budget, according to the Massachusetts Turnpike Authority.

Mitigation measures included in the environmental study for Hahn's plan range from reconfiguring roads and intersections around the airport, including constructing a new off-ramp and freeway interchange, to building new park-and-ride centers, conducting noise studies and relocating endangered species.

Estimating the cost of such projects is difficult because the number of mitigation measures could grow, or they could be refined or taken out of Hahn's plan before the final environmental study is released next year, airport consultants said.

"In a situation like this you have five live alternatives and four different mitigation programs," said Anthony Skidmore, vice president at CDM, a firm hired by the city to draft the envi-

ronmental studies. "In some ways they're notably different, so it's often premature to try to do costs for all those mitigation measures."

Hahn's plan would dramatically rework LAX by demolishing Terminals 1, 2 and 3; knocking down parking garages in the current central terminal area; building a passenger check-in center about a mile east of the airport; and moving sets of parallel runways on either side of the airfield farther apart. The mayor released the environmental study for his plan on July 9 and will hold hearings on the document starting Monday.

To save time and money, Hahn chose to add his LAX plan to the environmental studies completed for an airport expansion project proposed by his predecessor, Mayor Richard Riordan.

Riordan wasn't required to include as many mitigation measures in his three expansion alternatives because central elements of his plans, such as a road encircling the airport and a new terminal to the west near the El Segundo dunes, would disperse traffic, pollution and noise. Consequently, the \$12-billion estimate for the expansion alternative favored by Riordan, known as "Alternative C," already included most mitigation costs. Manchester Square

One of the biggest expenses not reflected in environmental studies for Hahn's plan is completion of a voluntary program to buy properties in a Westchester neighborhood near LAX. The mayor hopes to build a check-in center there, but must first move 6,000 homeowners and renters and demolish their homes.

This process is likely to cost at least \$300 million, according to estimates provided by the city's airport agency. The city relies on federal grants to pay for the acquisitions, but that money could be used to complete other airport projects, such as a request by carriers to modernize the Tom Bradley International Terminal.

Economists who follow air-

port expansion projects say it's also important to look for unintended costs that may result from Hahn's LAX plan, such as tax revenue that would be lost after the city buys 77 acres of commercial property near the airport. The acquisition of 26 parcels is necessary in part to obtain rights of way for a rental car facility and a people mover, officials say.

A parking lot at Sepulveda and Century boulevards is included in that proposal. The lot generated \$538,000 in tax revenues in 2002, according to Los Angeles County tax records.

Hahn's environmental study also features several proposals to reroute traffic around LAX that would surely carry a high price tag, a Times review of the 11-volume document found. These include an elevated ramp from the Century Freeway near Aviation Boulevard to a check-in center at Manchester Square, and a new interchange off the San Diego Freeway at Lennox Boulevard. To obtain the right of way to build the interchange, the city would need to purchase nine to 12 homes and four to seven businesses, planners said.

Freeway interchanges can cost \$50 million to \$80 million, said Hasan Ikhata, the Southern California Assn. of Government's director of transportation planning.

If Hahn's LAX plan goes forward, these road improvements might qualify for federal or state grants, said Patrick Tomcheck, a transportation engineer with the city agency that operates LAX.

The city also hopes to ease traffic around LAX by persuading passengers to take buses to the airport from FlyAway lots. Hahn's study proposes that the lots be built in Long Beach, Inglewood, the San Fernando Valley, at a proposed Norwalk/Santa Fe Springs transportation center and at Union Station.

No cost estimates were provided for those park-and-ride lots, but the city would be required in most cases to purchase property and design and construct a terminal and parking fa-

cilities.

In comparison, design and construction costs to remodel the existing Van Nuys FlyAway — a project that started earlier this year and is not included in Hahn's plan — are expected to run \$50 million, according to airport documents.

Another major issue is airport noise. To offset additional aircraft noise, the city proposes prohibiting airlines from taking off to the east between midnight and 6:30 a.m. To do so, the city must conduct a study that proves such a policy would not economically harm airlines that fly during these hours.

The Federal Aviation Administration must also approve the change. Because of the time and expense involved, these studies are fairly rare. A similar study to limit nighttime flights at Burbank Airport has cost \$3 million to date with one phase to go. Noise and pollution also are expected to affect wildlife in the area.

The mayor has said his modernization plan is the most environmentally friendly of the five alternatives. But his proposal still affects wildlife, and the environmental study proposes relocating species around the airport, including jackrabbits, spade-footed toads and fairy shrimp. The shrimp lie dormant in dirt on the southwestern side of the airport. To offset the destruction of habitat, the city proposes ripping up streets on 470 acres above Dockweiler State Beach. The city demolished nearly 800 homes on these dunes in the 1960s and 1970s, leaving the broken streets. Demolition costs are not provided in the environmental study.

Building new vernal pools to provide a home for the spade-footed toads and the shrimp could start at \$40,000 an acre, said Travis Longcore, science director for the Urban Wildlands Group, a Los Angeles-based conservation organization, who has studied wildlife living near LAX.

"Compared to building a parking lot," he said, "this is cheap."

Price of LAX Project Could Jump

Hahn's \$9-billion proposal to expand airport does not include costs of much of the work required to complete construction.

By JENNIFER OLDHAM
Times Staff Writer 8-10-03

The sea monkeys that call Los Angeles International Airport home need Mayor James K. Hahn's \$9-billion modernization plan to survive.

That's the argument made on Page 29, in Appendix H, Volume 3 of the 5,323-page environmental study for the mayor's proposal to dramatically rework the aging airport. Just how much money it would take to save the microscopic invertebrates — long a fixture in comic book ads and tiny plastic tanks on kids' dressers — is unclear.

What is clear is that relocating the sea monkeys, also known as Riverside fairy shrimp, an endangered species, to other quarters is just one of dozens of projects that Hahn proposes in an effort to compensate for the increased traffic, noise and pollution that would result from overhauling LAX.

These mitigation measures, required by state and federal law to lessen the effects of construction, would probably add significantly to the project's \$9-billion price tag. But their costs are absent from the 11-volume environmental study.

The \$9-billion estimate also does not include the cost of buying the remaining houses and apartment buildings and moving

[See LAX, Page B14]

Chester Square

LAX Airport

Hello! My name is Gordon Michael Megó, ~~my~~ my address is 4535 W. 141st Street, ^{and my phone # is (310) 675-8674.} I am a native and resident of Hawthorne and the South Bay region since Oct. 8, 1952. And I am a former aerospace engineer who has worked on the F-18 and the B-2 aircraft at Northrop Corp., the B-1 bomber at Rockwell Intl., and the C-17 transport at McDonnell Douglas from the mid 1970's to the late 1980's.

I grew up in an era when propeller-driven airplanes were a common sight and sound. I flew aboard ~~an air~~ ^{on air} lines for the first time in the ^{late} 1950s with TWA on a Lockheed Constellation plane that had a triple-tail design and small air cond vents by the windows. It was ~~an interesting~~ ^{an interesting} experience on flights to and from New York where the sister of my mother had lived in Brooklyn since the 1930's.

My father worked for American Airlines during the 1950's as a Senior and then Lead Mechanic who always maintained the aircraft in nearly perfect flying condition.

On some occasions, I had the opportunity to see ^{the} behind-the-scenes activities at the airport, including visits to the old control tower building with its Spanish-style architecture.

LAX Airport

Over the course of decades, from the 1960's onward, I had the pleasure of flying aboard various aircraft with different airlines. Of particular enjoyment was my trip to Washington, D.C. where I stayed for eight days ^{in July of 1983}, including ^{the} Washington Hotel near the White House, ~~and~~ visited many places around the historic capital, and rode on their fantastic Metro Rail system. As the Los Angeles region, and especially the South Bay area, increased in residential population and with various businesses, LAX Airport expanded the size and scope of its operations accordingly to meet the demands of the growing region of So. Calif.

By the year 2000, LAX Airport had reached a level of 67 million passengers who traveled to various destinations in the United States and around the world. While the annual capacity for passengers at the facility is currently 78 million, there are proposals to increase the capacity to as much as 120 million.

After the Sept. 11, 2001 tragedies in New York, Washington, D.C., Pennsylvania, and elsewhere, the number of people who flew aboard commercial airlines was reduced by 10% to 25% depending on the airline company. At LAX Airport, the annual level is down by 10%-15% or approximately 52 million to 55 million passengers from the 2001 rate of 61 million.

Apr. 14, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927
(310) 675-8674

LAX Airport

Even at the current levels of airline flights, the residents of the South Bay area in Los Angeles County, and especially in the City of Hawthorne, are experiencing and enduring significant amounts of air pollution, loud noise, road traffic, population density, etc. which affect the quality of life for all the people of the region.

Of particular annoyance is the roaring sounds of engines from low-flying commercial aircraft which occasionally traverse the skies of the South Bay area in an effort to shorten their travel from LAX Airport. Pilots must be required to follow certain protocols with respect to flight paths, altitudes, etc. over Hawthorne and other surrounding cities. Violations of these procedures should result in financial penalties and/or restricted access to LAX Airport.

There have been various proposals to expand LAX Airport which would increase the annual level of passengers not only from the record high of 67 million to a maximum of 78 million, but even to as much as 120 million. The proposals will essentially require moderate to major reconstruction of the airport facility and significant destruction of residential neighborhoods in the area.

APR. 14, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927
(310) 675-8674

LAX Airport

The Manchester Square area of Los Angeles, which is located between Century Blvd. and Arbor Vitae, and between La Cienega and Aviation Blvds., is a residential neighborhood that was mainly comprised of single-family homes, which date back to the 1940's, and even included an elementary school which served the surrounding community.

Los Angeles World Airports (LAWA) is currently in the process of acquiring property and demolishing buildings in the Manchester Square area in order to build a passenger, check-in facility. IF LAWA achieves their goal of owning every property in the ^{Manchester Square} area, ~~it~~ will cease to exist as a residential neighborhood in the Los Angeles region where there is a shortage of housing.

Since LAWA has not approved of any expansion plan for LAX Airport, it should cease further acquisition of property in the Manchester Square area, resale purchased property to residential homeowners, insulate homes that are currently available or eventually built, and reopen the public elementary and/or middle schools for students.

According to a proposal by Mayor James Hahn of Los Angeles, there would be a major transformation of LAX Airport. It would involve tearing down some terminal buildings,

~~April 14, 2003~~
April 14, 2003

Gordon Michael Mego

Hawthorne, CA 90250-6927
(310) 675-8674

LAX Airport

Apr. 14, 2003

and parking structures, building a remote ~~AP~~ passenger check-in facility in ~~the Manchester Square area of L.A.~~ ^{the Manchester Square area of L.A.}, closing off the two-level inner roadway to the general public, building a "People Mover" system to connect the remote facility with the main part of the airport, moving and adding taxiways and runways, and other changes. The price tag for this enormous project is approximately \$10 billion that will surely increase during the years ahead.

As with previous efforts to expand or renovate LAX Airport, the new proposal is not an acceptable solution for the South Bay region of Los Angeles County.

The implementation of any such changes would lead to increased levels of possible terrorism and other criminal activity, of ~~invasive~~ security measures, of business slowdowns and failures, of unemployed people, of various taxes, fees, etc., of vehicle traffic on streets and highways, of loud noise from more aircraft, of air, land, and water pollution, and of population in the region.

The establishment of a remote, check-in facility for airport passengers would greatly expand the overall size of LAX that will stretch east to the 405 Fwy and substantially increase the residential and business areas that could be affected by a major terrorist act, especially ~~from~~ ^{from} a nuclear weapon or conventional missile.

Gordon Michael Meago
4535 W. 141st St.
Hawthorne, CA 90250-6927
(310) 675-8674

LAX Airport

Apr. 14, 2003

Without even considering the latest proposals for change at LAX, the current security environment creates the feeling of an armed encampment. The intrusive and invasive measures treat people in an undignified manner and abusive ways as if they were criminals.

There is something quite wrong when elderly folks, soccer moms, various celebrities, government officials, and other innocent people are forced to endure long delays, physical searches, shoe scans, identity verification, personal background checks, luggage inspections (some without the consent and presence of the owner), surveillance cameras, traffic and parking difficulties, and other situations.

Until LAWA implements an approach to security that is based upon reasonable suspicion and common sense, there will be an increasing number of people who will not travel aboard commercial airlines or spend money at businesses within the airport and around the region.

As if the effects of Sept. 11, 2001 were not bad enough for the U.S. economy, the current activity at and proposed changes for LAX will cause more financial problems to the airline industry, retail stores, hotels, restaurants and other businesses who will reduce operations or file bankruptcy which means higher unemployment, lower tax revenue, etc.

Gordon Michael Meggo
4535 W. 141st St.
Hawthorne, CA 90250-6927
(310) 675-8674

LAX Airport

In order to facilitate the smooth flow of people into and out of LAX Airport, it is absolutely necessary that the double-decker roadway and the parking structures within the facility must remain open for use by the general public who want to drop off or pick up passengers and luggage at the terminal gates, sidewalks, or parking areas.

Further, the Green Line of the Metro Rail system must be extended into LAX Airport where the passenger trains would travel around the inner perimeter of the facility and stop in front of each airline terminal. This will provide an alternative mode of transportation from other parts of California which will reduce highway traffic, improve air quality, provide convenience, and save money for people in the long term.

Efforts must be pursued to create a regional system that will handle the significant number of airline passengers in Southern California, particularly in Los Angeles and Orange Counties. LAX Airport must not be forced to accommodate the increased loads from other areas.

Therefore, LAX Airport must not be expanded beyond its current capacity of 78 million passengers and preferably should be limited to 67 million passengers, which is a peak annual level in year 2000.

Apr. 14, 2003

Gordon Michael Mege
4535 W. 141st St.
Hawthorne, CA 90250-6927
(310) 675-8674

LAX Airport

The current layout of LAX Airport must be limited to only necessary improvements of the facility within its current land boundaries for the convenience of the passengers and the efficiency of airport operations.

In conclusion, I am hopeful that my comments about LAX Airport will resonate with the board members of Los Angeles World Airports. LAWA has the difficult task of upgrading the existing airport and handling the various criminal elements while trying to promote the commercial aspects of aviation travel. But it is incumbent upon the board members of LAWA to pursue courses of action that will improve the quality of life and the economic vitality of the region for the vast majority of the people without spending enormous sums of money on unnecessary projects and sacrificing our personal freedoms as stated in the U. S. Constitution and in the Bill of Rights.

David Keseller, AICP
U.S. Dept. of Transportation
Federal Aviation Admin.

August 25, 2003

As a person who was born in ^{California} of 1952, I have had the opportunity to see the airport of Los Angeles evolve into LAX Airport. It has changed and grown over the decades to become one of the top five major airports in the nation.

I have flown on many aircraft to various destinations over the decades that include my first flight aboard TWA's Lockheed Constellations in the late 1950's.

When my father worked for American Airlines in the 1950's as a senior and lead mechanic, I was allowed to see behind-the-scenes operations at the airport.

My interest in airplanes eventually lead me to become an aerospace engineer who has worked for various defense-related businesses, including Rockwell, Intl. in the Weapons Systems Div. for the B-1 Bomber during the 1980's.

LAX Airport certainly needs changes in order to modernize the facility. It is necessary to improve 1) convenience, that is make it more user friendly, for passengers, visitors, etc., 2) efficiency of operations that reduce time involved from arrival to departure for passengers, visitors, and others, 3) level of safety and security for people in and around the area, ~~and~~ 4) amount of permanent jobs from businesses in the airport, nearby areas, and L.A. region, and 5) the quality of life for people from air and noise pollution, heavy traffic, etc.

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

August 25, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

Unfortunately, the earlier plans by L.A. Mayor Richard Riordan would not and the current proposals by Mayor James Hahn will not achieve any of the objectives, but will actually make everything, to one degree or another, worse than before at LAX Airport while costing at least \$10 billion.

While the downturn in the U.S. economy has affected the number of passengers who take flights to and from LAX Airport, the level of security is another factor that has impacted the yearly amount of people traveling, which is now about 52 million.

The implementation of the Ground Transportation Center in what is now a residential neighborhood of Manchester Square, of the Baggage Screening Center in place of the parking structures in the Central Terminal area, and the people mover rail system that will connect the two sections will certainly slow down the overall operations of the airport, will definitely increase the amount of time and the level of inconvenience for people at the airport, and will surely expand the areas where more lives will be affected by any terrorist attack.

In fact, if an explosive device(s) were to be detonated in the Ground Transportation Center, literally thousands of people could be killed or injured not only there, but also in the surrounding residential areas that are located north and east of it, in

August 25, 2003

the nearby commercial areas which include large hotels, and along the 405 freeway which is a heavily traveled route that may be shut down.

Curiously, the Los Angeles World Airports (LAWA) has been purchasing homes from property owners in the Manchester Square neighborhood during the past six years with the goal of owning all the property in the area. The question is how can they legally expend public funds to buy these or any other properties for some unauthorized future project? They have never received approval from residents and businesses in the area nor from the various governing bodies at the local and national levels.

Also, Mayor Hahn is trying to seek approval of his LAX Airport proposal based upon an outdated Environmental Impact Report (EIR) that was commissioned by Mayor Riordan for earlier renovation proposals. He has chosen not to initiate a new Environmental Impact Study (EIS) as required by law for his proposed changes for LAX Airport.

On May 15, 2003, the Rand Institute of Santa Monica, which is a highly regarded private research group, issued its report on Mayor Hahn's proposal for LAX Airport. It was critical of nearly every aspect of the proposed renovation for \$10 billion.

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

August 25, 2003

In their analysis, they concluded that the Hahn proposal would not achieve its stated goals and would negatively impact the region at an enormous cost to taxpayers, businesses, etc. and that the safety and security of the people at LAX Airport could be easily improved with simple, common-sense upgrades at a small fraction of the \$10 billion.

On Aug. 19, 2003, A.C. Lazzaretto & Assoc. issued their report that was commissioned by the L.A. County Board of Supervisors on the Hahn proposal for LAX Airport.

It was critical about issues of security, environment, growth, etc. that affect the quality of life for people.

The viability of the airline industry in the United States is questionable considering the filings for bankruptcy by various air carriers which have lost billions of dollars in recent years. Where does Hahn suppose that they find the money to renovate LAX Airport? What does Hahn think will happen to them while they are subjected to constant disruption of their operations during the 11-year construction period? Obviously, there will be airlines that will simply go out of business! The economic fallout for the L.A. region, the state of California, and the rest of the nation would be significant.

Gordon Michael Mege
4535 W. 141st St.
Hawthorne, CA 90250-6927

August 25, 2003

LAX Airport should not be expected to handle an increasing number of passengers from other parts of Los Angeles and surrounding counties. There must be a regional approach that utilizes the large airports to the maximum extent possible with approval of residents, businesses, and others in the affected communities.

As part of the solution to traffic congestion in Los Angeles County, LAX could serve as a model for a futuristic airport with diversity in transportation which allows people the option of using private vehicles, shuttle buses, railroad trains, etc. to reach any of the airline terminals.

Of particular importance, it will be necessary to extend the Green Line of the Metro Rail into the central terminal area of LAX Airport along the inner, double-deck roadway. At some point in time, there could be a connection of a rail line that will travel north to West L.A., Santa Monica, etc.

During the past few years, the U.S. economy has been in a downturn with significant losses in employment among the various sectors of business. Therefore, it is understandable that labor unions are seeking work for their members who can't afford to be unemployed.

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

August 25, 2003

But I would ask the leaders of the various unions in California to withhold or to withdraw their support for the Hahn proposal for LAX Airport. In doing so, they can help create a more realistic and viable plan that a majority of the people will approve.

Under any new proposal for LAX Airport, it is imperative that we retain the airline terminals at their present locations, the parking structures in the central terminal areas, and the double-deck roadway for private vehicles, ~~and~~ that we limit any changes to the facility to necessary improvements for the convenience and the safety of the passengers, visitors, and others as well as the efficiency of operations at the airport, and that we prevent the expansion of LAX into any unused or new areas.

In conclusion, I am hopeful that my comments about LAX Airport will resonate with those individuals who are considering any proposed changes to the facility. It is incumbent upon the governing bodies to pursue courses of action that will improve the quality of life and the economic vitality of the region for the vast majority of people without spending enormous sums of money on unnecessary projects.

RE: Mayor Hahn's LAX Master Plan Proposal

Dear Mr. Ritchie,

We write in opposition to Mayor Hahn's proposed LAX Master Plan Alternative.

Although his proposal was intended to focus on "safety and security" issues, it has become apparent that there are very serious flaws in this proposal.

First and foremost, the recent Rand Corporation study indicated that congregating all commercial passengers in one location increases the risk and will probably result in harm to a greater number of people in the event of a terrorist attack.

Also, the added inconvenience of additional time for screening and transportation to the airline terminals encourages business and wealthy travelers to engage private business jets, charters, and fractional share aircraft for transportation. These general aviation options are not regulated as strictly as commercial aircraft nor are the aircraft or their passengers screened for security purposes at LAX or any general aviation airport in the area.

In general, we oppose this proposal and urge that it not proceed.

In addition, please encourage the FAA to increase security standards nationwide for access to all general aviation areas and other airports with general aviation traffic.

Very truly yours,

Michael S. Klein

Julie Janower Klein

SPC00158

Creating jobs is a good thing, and keeping ALL of our U.S. airports modern and maintained is certainly a good thing.

But I have to say NO, emphatically, to the mayor's Alternative "d".

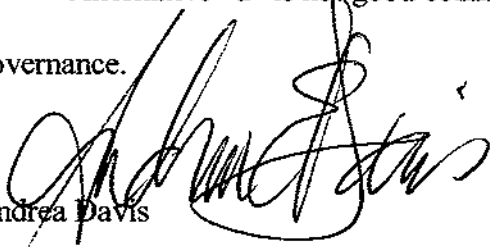

Mayor Hahn's PR machine keeps repeating that the 9 billion dollar plus LAX "Alternative d" will be safer and more secure. Experts from the Rand Corporation, in a study requested by Congresswoman Jane Harman, disagree. After studying the plan they found that the airport would, in fact, be less safe and less secure than the existing LAX.

In fact, the study concluded, modernization could be accomplished at a much lower cost than alternative d.

Concentrating all the travelers into one remote check-in just creates an even more attractive target for any terrorist activities. We the residents that surround LAX, we the travelers, we ALL will be put at tremendous risk if we allow Mayor Hahn to create one giant bull's-eye at what once was Manchester Square.

Not safer, nor more secure, certainly not more convenient. and unnecessarily expensive.

Alternative "d" is not good community planning, Mr. Mayor, and it's not good governance.

Andrea Davis

7352 Vista del Mar Lane

SPC00159

As your former airport commissioner, you told me, "We need a \$3 FLYAWAY to LAX just like what the Valley has!"

^{also} You asked, "Why doesn't the GREEN LINE go to LAX?" ^{make it} It would be so easy to get to work.

NOW the FLYAWAY IS REALLY GOING TO HAPPEN!But, how about the Green Line?

Instead of Alternative D, extend the GREEN LINE north 2.5 miles up Aviation, turning left on 98th St., ^{then} and it goes right to LAX at Sepulveda. Combine this change with ^a the north runway extension over Pershing Drive, not only is their more land space available for LAX passenger dispersion, but the 2 mile perimeter for shoulder firing missiles is also extended out over the ocean for shared protection by the Coast Guard. Construction on the runways should start NOW, not 2014.

~~Thus~~, Contrary to Alternative D, the plane & traffic noise levels and the congestion will be considerably less for the 105, 405, Sepulveda and Inglewood communities. There would be no need for a people mover; no disruption of Century Blvd. Manchester Squares would become a beautiful park for not only the tourists to enjoy, ^{but} also the community.

Seeing that there is to be a Green Line station, ^{planned} on Aviation, between 98th & Century, one could visualize the Retail/Recreation Center at this stop where tourists could enjoy a 6 hour layover. LAX could become the most tourist- friendly airport in the world, benefiting all Angelenos.

The GREEN LINE has the Right-of-Way to go north on Sepulveda Blvd., hooking up with Slauson for a **GREEN LINE LAX EXPRESS** to downtown Los Angeles Union Station. However, the community won't like the Green Line going through downtown Westchester & I certainly don't want it to go down MY street! THEN when I focus in on 20 years later, ^{I realize} I'll be almost 90. With just a short walk, I could go ANYWHERE. And best of all, our grandchildren will enjoy the positive environmental impact on our city.

~~Just as for the butterflies, there are inconveniences for EVERYONE.~~

Comments:

As a homeowner in the Westchester community, I would like to register my strong concerns with Alternative D. While modernization and security are important, this plan doesn't improve either enough to justify a \$9B price tag, 12 years of construction-related impacts to our community, and loss of proposed open space.

Specifically, Alternative D will:

- Require 12 years of construction, causing significant noise, traffic, and air quality impacts.
- Increase congestion on Sepulveda Blvd.
- The Ground Transportation Center (GTC) will remove a promised park at the site and become a vulnerable target, very near existing residential neighborhoods.
- Drain \$9B from the airlines and passengers to construct unneeded facilities.

There are viable proposals that are cheaper and less disruptive. The Mayor's Blue Ribbon Committee on Manchester Square has proposed a scaled down "Alternative E" plan and the L.A. Airline Airport Affairs Committee has proposed their own \$3B plan. Both these plans envision the Manchester Square area as a the previously-promised and much-needed community park, limit demolition of perfectly usable airport parking structures and garages, while improving security checkpoints and freeway access via the Green Line and freeway links. The large scale GTC is not required in either of these plans.

The NEPA/CEQA process has been valuable to identify these better alternatives. Now it is the City of Los Angeles' obligation to find a better plan than Alternative D.

Additional comments if necessary.

5 airports to avoid if you can

"LAX is oppressive," says one traveler. "I dread it," says another about Miami's airport. But New York's 3 are the worst. Here's why.

5 best airports for layovers

Power Trip / Christopher Elliott

Airport layovers are as inevitable these days as cramped economy class seats, annoying security checkpoints and nitpicky ticket agents. But unlike the other realities of flying, you've often got a choice about the terminal you're trapped in.

Which airport should you pick? J.D. Power and Associates tried to answer that question a few years ago when it released its "inaugural" customer satisfaction study on U.S. airports. It named Orlando, Fla., the No. 1 airport, a choice I'm inclined to agree with. But then it offered a bizarre selection for runner-up: Las Vegas (Nev.) McCarran International Airport.

What's wrong with McCarran? Well, just walk through the doors and take a whiff. If you're a nonsmoker, you'll know what I mean. Even though passengers are only allowed to light up in limited smoking "areas" in the terminal, those places seem to be everywhere — in bars, waiting areas and almost anywhere there's a slot machine. I dread landing in Las Vegas.

My point is that customer satisfaction surveys seem to be just about as reliable as calling a few frequent travelers and asking them which airports they like. So that's what I decided to do.

Here are five favorite airports for layovers, as determined by my completely unscientific, random poll of road warriors. And by me.

1. Orlando International Airport (MCO).

I've been stuck at Orlando several times for up to a whole day, have flown into and out of every one of its terminals, and I think J.D. and company are right about this one. Orlando is the best airport in the United States for a layover, bar none. It's easy to find, parking isn't a problem and the terminals are incredibly user-friendly. Like some of the other highly-rated Florida airports, notably Tampa, Orlando

4.

5 best airports for layovers

1. **Orlando International Airport (MCO).**

Orlando is the best airport in the United States for a layover, bar none. It's easy to find, parking isn't a problem and the terminals are incredibly user-friendly.

2. **Denver International Airport (DEN).**

The layout of its terminals is highly intuitive and the food is palatable, which is more than I can say for a lot of other airports. Plus, it *looks* great. "It's the coolest-looking airport,"

3. **Chicago O'Hare International Airport (ORD).**

The international terminal is really a work of art "Best Airport in North America"

4. **Hartsfield Atlanta International Airport (ATL).**

1996 Summer Olympics, when this airport gave itself a much-needed facelift and opened a new international terminal.

5. **San Francisco International Airport (SFO).**

The new San Francisco International is much better than what it was, and it's still improving. I like to think of it as a work in progress, with coming-soon train service, redesigned road and new parking facilities, a vice president for a San Francisco computer company, counts the new SFO among his favorites.

5 airports to avoid if you can

1.

2.

3.

4. **Los Angeles International Airport (LAX).** Friends don't let friends fly into LAX. The circular design isn't well suited, a desperately needed expansion. "LAX is oppressive," "It's dingy and dilapidated, noisy and overcrowded, unfriendly and with poor facilities."

*Victims of
Environmental & Governmental Havoc
Caused by **LAX** Airport*

Since initiation of the LAX voluntary acquisition project in 1999, the Los Angeles World Airport has acquired private land for public use and subsequently demolished and moved acquired homes out of the noise-impacted area, leaving the remaining Manchester Square neighborhood "damaged" desecrated, unsafe and un-fit to live. Tall chain link fences have been erected throughout most parts of the neighborhood, enclosing old broken concrete foundations of former-standing homes and other vacant lots and abandoned houses. Today, Manchester Square is a mere skeleton of its former thriving community.

The residents of Manchester Square are denied the option for soundproofing and insulation of jet noise for this noise-mitigation project and are forced to indefinitely endure unsafe and unfit environmental conditions perpetuated by LAX, or concede to LAX's voluntary acquisition project which is wrought with violations of federal law for land acquisition and relocation of displaced persons including discrimination, coercion, and under-valued purchase offers for property. Resident appeals to the FAA in Washington D.C. have resulted in *lack of uniform* treatment of minority persons and a subjective disregard of FAA Guidelines for airport acquisition procedures prescribed in FAA Order 5100 37A.

Your review of the previously mailed (MARCH 07, 2003) document and exhibits and your subsequent attention to this matter will serve the mass of Californians victimized by LAX.

Respectfully Submitted, In Truth and Light

“Coercive action was taken by LAX to intimidate homeowner to rescind advocacy of rights and representation to a willing minority individual”

LAX's full-fair-offer policy is an inflexible one-price procedure...

LAX denied homeowner a sound proofing option for this noise-mitigation project, exacting the only alternative: to participate in Acquisition, or to remain in a noise impacted neighborhood -which has been “damaged,” demolished, nearly abandoned of single-family homes and residents, unsafe and un-fit to live, due to the airport’s destructive actions in this Acquisition and Relocation project.

Los Angeles World Airport practiced unlawful subjective omissions and deviations from the Uniform Act using the term “voluntary” acquisition as their authority.

**IN THE STATE OF CALIFORNIA
CITY OF LOS ANGELES, COUNCIL DISTRICT 11**

**C. L. Parrish/
Manchester Square Resident and Homeowner,**

Petitioner,

v.

**Theodore Stein, Jr./
President, Airport Commission
Los Angeles World Airport,**

Respondent.

**PETITION FOR AUDIT OF "VOLUNTARY" ACQUISITION EXEMPTION AND
ACQUISITION AND RELOCATION PROCEDURES**

Petitioner, C.L. Parrish, pursuant to Public Law 91 -646 Uniform Relocation Assistance and Real Property Acquisition Policies, 49 CFR Part 24 and FAA Order 5100.37A, petitions Honorable persons and Agencies of California to take notice of, act against, and implement corrective action for a particular havoc of state and federal law and abuse of power committed by the Los Angeles World Airport (LAWA).

The Petition for Audit is a result of the Los Angeles World Airport's (LAWA) procedurally barred and unlawful practices and policies, inequitable treatment, coercive actions, and denied benefit entitlements causing material damage to residents, within the current acquisition of private property from specific and designated areas within the community of Westchester known as Manchester Square/Belford.

The purpose of the Petition for Audit is to determine whether LAWA violated state and federal law for conformity and compliance of Acquisition and Relocation procedures prescribed in the Uniform Act; whether LAWA failed to administer a *uniform* corrective action of a prevalent, known violation, and states:

1. Petitioner is a citizen of the State of California, a resident and homeowner in Los Angeles County, Council District 11, and currently resides in the neighborhood of Westchester known as Manchester Square. Respondent Theodore Stein, Jr., is President of the Board of Airport Commissioners that governs the operating department of the Los Angeles World Airport (LAWA) for the City of Los Angeles.

2. Respondent failed to strictly adhere to the Uniform Act procedures for acquisition and relocation, to such a degree that displaced persons are materially affected; accordingly, LAWA invalidates its certificate of assurances for compliance of the Uniform Act to FAA, thus requiring forfeit/withdraw of all future FAA funding or reimbursement for airport projects utilizing acquired land void of Uniform Act requirements, till such time corrective action is taken to correct known violations or until property owners are compensated for material damage.

3. Respondent's use of a "voluntary" acquisition exemption does *not* meet all federal regulation requirements.

4. Respondent practiced unlawful subjective omissions and deviations from the Uniform Act using the term "voluntary" as their authority.

5. Respondent's Noise mitigation project *does* need to acquire all, or substantially all designated residential property for redevelopment into noise compatible land uses to accomplish the noise mitigation project –not voluntary.

6. Respondent denied Petitioner a sound proofing option for this noise-mitigation project, exacting the only alternative for Petitioner: to participate in Acquisition, or to remain in a noise impacted neighborhood -which has been "damaged," demolished, nearly abandoned of single-family homes and residents, un-safe and un-fit to live, due to the airport's destructive actions in this Acquisition and Relocation project.

7. Respondent refused negotiated purchase; engaged in an inflexible one-price Offer policy

8. Respondent denied Petitioner's request to *uniformly* correct a prevalent violation of "timeliness of purchase offers" for an individual case involving a minority and project-wide; a correction that was granted to Petitioner upon appeal to the FAA in Washington D.C..

9. Issue. Respondent invoked coercive action in order to compel an agreement for the price to be paid for property in violation of Uniform Act and FAA Guidelines.

10. Issue. Respondent invoked coercive action to intimidate Petitioner to rescind advocacy of rights and representation of a willing minority individual in violation of Uniform Act and FAA Guidelines [S. R. Sribour case]

11. Petitioner's extraordinary measures and volumes of research and time necessary to become proficiently knowledgeable of Public Law 91 -646, Uniform Relocation Assistance and Real Property Acquisition Policies, federal regulations 49 CFR Part 24, FAA Order 5100.37A, in order to present technically sound case to FAA and LAWA and obtain only one correction of a basic acquisition procedure for "timeliness of purchase offers," which recouped monumental amounts of material damage, is incomprehensible, unorthodox, and nearly unattainable by most residents.

12. Respondent unlawfully charged specific "Close of escrow" fees to displaced persons, despite technical merit evaluation by FAA to reconsider practice.

13. Petitioner is alleging specific and unlawful procedures and inappropriate determinations of entitlements within the Relocation Phase, personally experienced as an advocate for Rights of Manchester Square residents and as a voluntary representative of a minority individual.

14. Respondent violated his own declared Appeal Process procedures.

15. Respondent failed to update *inadequate* Purchase Price Differential (PPD) under Housing of Last Resort (HLR) provisions; derived unlawful payment determinations of PPD from inferior neighborhoods with home sale values less than that of displaced neighborhood; causing substantial financial consequences affecting purchase of comparable replacement dwelling.

16. Petitioner in this case has exhausted the remedies by the airport by filing appeals to the Los Angeles World Airport staff, the Airport Commission, the City Attorney's Office, and other governmental representatives, and by meeting with an Ombudsman and retaining legal council. The request for Audit of Acquisition and Relocation Procedures has been drafted following repeated written appeals spanning twelve months (one year) for *uniform* correction of violations in LAWA's acquisition policy.

17. Petitioner experienced extreme stress, and financial hardship, and suffered disproportionate injuries as a result of the airport project.

18. The Honorable persons and Agencies of this review can exert significant influence on this Petition and the issues raised pursuant to oath of office to serve people, especially when a large mass of Californians is affected, particularly those residing in Manchester Square within the community Westchester and because violations herein are continuing to present date, and not limited to Petitioner's standing, advocacy claims, investigation and evidence.

19. Petitioner incorporates by referencing the Memorandum of Points and Authorities in support of the Petition for Audit of Voluntary exemption and Acquisition and Relocation Procedures of the Los Angeles World Airport and the Exhibits in the Appendix.

WHEREFORE, Petitioner C. L. Parrish moves Honorable persons and Agencies of this review and enclosure to seek the following relief:

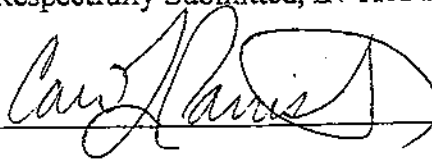

- a. Accept responsibility to pursue and resolve issues of this case.
- b. Accept responsibility to pursue and resolve issues on project-wide magnitude
- c. Require the Respondent to answer the allegations in this Petition and Points and Authorities in Support
- d. Seek a project-wide audit for “timeliness of Purchase offer” presentations following an approved appraisal and establishment of just compensation
- e. Seek a project-wide audit for *uniform* corrections of known violations
- f. Seek a project-wide audit for evidence of negotiated purchase(s) –flexible offers.
- g. Seek an evidentiary audit of federal requirements for a “voluntary” acquisition
- h. Seek an evidentiary audit for intended use of acquired land
- i. Seek a project-wide audit of “close of escrow” fees charged to displaced persons, particularly those evaluated by FAA and recommended to reconsider not charging
- j. Seek a project-wide audit for appropriate benefit entitlement determinations and strict conformity to procedures deriving a Purchase Price differential (PPD) payment
- k. Seek an evidentiary audit for HLR provision for “updates” of inadequate PPDs
- l. Seek a project-wide audit of actualized Relocation Appeal Process
- m. At the conclusion of the evidentiary audit find that:

1. Respondent failed to strictly conform to Uniform Act procedures for individual parcels of land.
2. Respondent failed to strictly conform to Uniform Act procedures for project-wide acquisition.
3. Respondent violated state and federal law by exceeding the prescribed thirty day (30 day) time span permitted from an establishment of just compensation to Purchase Offer presentation date; Respondent's delays have ranged between two and six months (2 – 6 months)
4. Respondent failed to *Uniformly* correct known violations of a basic acquisition practice requiring "timeliness of Purchase Offers"
5. Respondent failed to implement a "negotiated Purchase" policy; LAWA's full-fair-offer policy is an inflexible one-price procedure
6. Respondent invalidated a certificate of assurance for conformity and compliance of the Uniform Act procedures, policies, and practices
7. Respondent failed to meet "voluntary" acquisition requirements narrowly defined in FAA Order and Uniform Act
8. Respondent intends to purchase and redevelop acquired land to noise compatible land use; not reconveyed to continual residential use with avigation easements
9. Respondent abused it discretion and power in failing to provide full benefit entitlements of relocation provisions for "separate household"

10. Coercive action was taken by Respondent to unlawfully defer negotiations in order to compel an agreement for the price to be paid for Petitioner's property
11. Coercive action was taken by Respondent to intimidate Petitioner to rescind representation and advocacy of rights to a willing minority individual; and a *Reversal* of favorable determinations [S.R. Sribour]
12. Respondent erroneously charged: Reconveyance fees, Recording fees and documentation [Fax] fees, in close of escrow of acquired dwelling; despite technical merit evaluation by FAA to reconsider practice
13. Respondent violated Uniform Act procedures by improperly deriving Purchase Price Differential (PPD) payments from comparables located in *inferior* neighborhoods with lower home sales values than displaced neighborhood; not from "same or better" neighborhoods
14. Respondent failed to *update inadequate* PPD payments under provisions of Housing of Last Resort (HLR)
15. Respondent failed to comply with own declaration of Appeal Process
 - n. Seek professional services of independent company specializing in Acquisition and Relocation provisions to conduct Audit, EE, O.R. Colan & Associates; Alliance
 - o. Seek continuous professional monitoring from a Federal Cognizant Agency of all present and future airport procedures till completion of the airport project
 - p. Seek project-wide mandated corrective action and/or compensation for material loss for all present and past land acquisitions found in violation of the Uniform Act.

- q. Inform the lead agency (FHWA) and the Federal Aviation Administration, (FAA) of Respondent's repeated procedural non-conformity and non-compliance with Uniform Act for individual parcels of land and throughout entire airport project, and request subsequent appropriate consequences of actions.

Respectfully Submitted, IN TRUTH AND LIGHT

C. L. Parrish,
Manchester Square Resident/ Homeowner

POINTS IN SUPPORT OF PETITION FOR AUDIT

INTRODUCTION

The spirit of the Uniform Act is clearly people-oriented; the implementation of the Uniform Act by the Los Angeles World Airport clearly is not. The allegations of violations in the Acquisition Phase and Relocation Phase are written from first-hand experience and knowledge of the Petitioner. Also, the mentioned plights of S.R. Sribour, henceforth, are from first-hand knowledge, as the Petitioner has served as a volunteer advocate for the Rights of this neighboring Thai family, single father and daughter, who case is wrought with violations including coercion, discrimination, denial of entitlements and indefinite delays of *small-business* and *residential* relocation payments.

Since initiation of the airport project in 1999, the Los Angeles World Airport has acquired private land for public use and subsequently demolished and moved acquired homes out of the affected area leaving Manchester Square nearly abandoned of single-family residents. This growing airport project has left the remaining Manchester Square neighborhood "damaged" demolished, unsafe and un-fit to live. Tall chain link fences have been erected throughout most parts of the neighborhood, enclosing old broken concrete foundations of former-standing homes and other vacant lots and abandoned houses. Today, Manchester Square is a mere skeleton of its former community. EXHIBIT A.

C.L. Parrish, hereinafter referred to as "Petitioner" desires to participate in this airport project, and to relocate out of affected area, as Acquisition is the only alternative to remaining on an irreversibly demolished street within a baron neighborhood of Manchester Square. Petitioner, however, is unable to proceed with the acquisition because of the airport's procedurally barred and *unlawful* practice of a utilizing an inflexible one-price procedure for purchase offers, which is presented in a "take-it-or-leave it" manner. This unlawful situation has continued for twelve months.

"If you truly do not agree with our offer then you may rescind your interest to participate in the program." - Intissar Durham, of LAWA September 21, 2002

Respondent also demonstrated lack of veracity and unresponsiveness to Petitioner's earlier requests for a correction of a basic acquisition procedure that violated the Uniform Act policy. LAWA declined to respond to Petitioner's repeated letters of appeal, certified mailings, and telephone queries which compelled Petitioner to present case directly to the FAA in Washington D.C. to encourage a response from LAWA and to remit a technical review of merits of the alleged violation of the Uniform Act requiring "timeliness of Purchase offers."

Petitioner's indispensable, extraordinary measures and volumes of research and time necessary to become proficiently knowledgeable, well beyond the handbook of Benefits and Rights of Displaced Persons provided by the airport, to present a technically sound case to FAA Officer Rick Etter in Washington D. C., perpetuated a favorable technical merit evaluation by FAA of Petitioner's appeal. LAWA, in turn, implemented corrective action for the violation of "timeliness of purchase offers" resulting in "significant agency delays" and granted Petitioner an updated appraisal—a reestablishment of valuations recouping \$60,000 (sixty-thousand dollars), an amount necessary to correct the violation of the Uniform Act. Petitioner stated that LAWA's inefficient procedures resulted in "significant agency delays" of two and one half months (2 ½ months) from the date of the purchase offer presentation following the establishment of the estimate of compensation. The FAA Order 5100 37A Chap. 3. SEC 1. 3 --3(a), guidelines for proper airport procedures in implementing the Uniform Act, clearly allows for a thirty-day (30-day) time-span to present a purchase offer following establishment of just compensation. Again, material damages recouped totaled \$ 60,000 (sixty thousand dollars) in corrective action by airport.

LAWA *denied* Petitioner's requests for correction of this prevalent violation for a minority individual, S.R. Scribner, whom the Petitioner serves as a willing representative and advocate of Rights, at the choosing of S.R. Scribner, and LAWA also denied a project-wide correction of this same violation of the Uniform Act claiming a "voluntary" acquisition exemption of the Uniform Act policies and FAA Guidelines therein.

Accordingly, LAWA must invalidate its certificate of assurances to

"In this case (Scribner) it happened to take three months to complete the process. Despite the timeframe of the process and because the program is voluntary it is ultimately the decision of the property owners whether the offer is fair and just"
— Lourdes Romero, LAWA, Aug. 23, 2002

FAA for conformity and compliance of the Uniform Act, thus requiring withdraw of all federal funding or reimbursement for each parcel of land or entire project void of Uniform Act provisions during acquisition and relocation.

Petitioner also presented evidence to LAWA of appraisal procedural violations within the updated appraisal, which repeated the appeal process; Requests of "amicable negotiations" for an agreed purchase price based on the inexact nature of the appraisal process, an expeditious acquisition of property and corrections of appraisal procedural violations. LAWA repeatedly denied all requests and refused a *negotiated purchase* for twelve months (one year) to date, with NO foreseeable resolution -coercive action taken by the airport to *defer negotiations* in order to compel an agreement for the price to be paid for the property, in violation of the Uniform Act.

Respondent's lack of veracity, unresponsiveness, and non-conformity to Uniform Act procedures is not limited to Petitioner's allegations of this case. LAWA also practices inequitable treatment of certain displaced persons within the acquisition relocation process including: coercion, discrimination, inadequate payment determinations, and denied entitlements.

S. R. Sribour has suffered serious financial hardship from this airport project and has received *no* Relocation Payments for his *small business*, or his *residential move*, both occurring on August 01, 2002. LAWA's continuing unresolved issues, inadequate determinations and violations of the Uniform Act policies are prolonging issuance of proper entitlement payments indefinitely.

On October 09, 2002 the Respondent invoked coercive actions of intimidation over S.R. Sribour, of minority race, and Petitioner during an airport meeting. LAWA denied S.R Sribour the Right to representation by another willing party of his choosing to speak on his behalf, namely the Petitioner in violation of the Uniform Act.

During the same October 09, 2002 meeting, Dario Polintan, of LAWA and Bob Swenson,

'The business portion of your (S.R. Sribour) relocation claim does not seem to a point of contention and we will process your claims for your two business expeditiously' – Lourdes Romero, Aug. 23, 2002

W.D. Schock Company Inc, *reversed* a previously favorable determination of Aug. 23, 2002 to expeditiously issue a small-business relocation payment to S.R. Sribour, per letter by Lourdes Romero, dated Aug. 23, 2002. *No* payment for small business relocation was

ever issued.

LAWA AND FAA FAIL TO UNIFORMLY IMPLEMENT UNIFORM ACT

LAWA denied Petitioner's request for a *uniform* correction of the violation of "timeliness of purchase offers" causing "significant agency delays"; FAA denied technical merit of appeal to Sribour for this issue, but granted favorable merit to Petitioner. FAA stated to the Agency that in the case referencing, *specifically*, S.R. Sribour, the three month (3 month) agency delay *was* conforming to Uniform Act and its FAA Guidelines; in the case of the Petitioner, the two and one half month (2 ½ month) delay was not conforming -contradicting his earlier technical merit review & FAA Order 5100 37A Chap. 3 SEC 1. 3 -3(a) *The Offer to purchase the property should be within thirty days (30 days) of the establishment of just compensation.* LAWA practices delays ranging from 2 -6 months.

The result of this havoc of laws and subjective deviations of the Uniform Act policies is loss of Rights, *material damage* and substantially under-valued offers to purchase property.

Both Petitioner and S.R. Sribour have similar properties in location (neighbors), lot size and living space and had airport-appointed appraisals conducted within thirty days of each other, by the same appraiser, Lea Associates. LAWA's failure to grant *uniform* corrective action for S.R. Sribour, resulted in a \$70,000 (seventy-thousand dollars) difference in the purchase Offer.

EXHIBIT B.

It is the duty of the airport to *uniformly* make all corrective actions necessary if procedural violations actually occurred on individual parcels of land or if violations are prevalent in the project-wide acquisition, or risk the consequences. Also, the FAA, in an advisory capacity to the airport for appeals, becomes a critical entity in this airport project and the recommendations provided by an FAA Officer must be delivered in a *uniform* manner that strictly adheres to its own FAA Guidelines for an airport's proper implementation of procedures prescribed for the Uniform Act.

The Petitioner claims that The Los Angeles World Airport's (LAWA) project-wide acquisition and relocation procedures are amiss of the Uniform Act provisions and are preventing *full entitlements* and denying *full rights* and causing *material damage* to the displaced residents from Manchester Square. A favorable assessment of this Petition by way of an Audit of conditions herein, to be conducted by knowledgeable individuals and/or an independent professional company familiar with acquisition and relocation procedures prescribed by the Uniform Act of 1970, will confirm validity of the facts presented.

POINTS OF AUTHORITIES

POINTS OF AUTHORITIES

Under the Uniform Act of 1970, known as 49 CFR Part 24 in the Code of federal regulations, the Legislative effort was to address the burden of public projects on private individuals. The purpose of the Uniform Act was to establish uniform policy of fair and equitable treatment of persons to be displaced and provide certain eligible protections and relocation benefits that go beyond the just compensation allowed under the Fifth Amendment of the United States Constitution [Fourteenth due process], [California Constitution Article 1 SEC. 19]. The provisions of these benefits are outlined in the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970.

MAJOR COMPONENTS of the Uniform Act in particular interest to this case are as follows: 1) It requires an "approved" appraisal be prepared prior to presentation of Purchase offer 2) No coercion is allowed in the negotiation process 3) If the agency intends to acquire the real property, it shall not intentionally make it necessary for the property owner to institute legal council 4) Appraisal must be completed by qualified independent appraisers 5) Appropriate financial assistance shall be provided to all displaced parties

The Uniform Act was amended in 1987 and the Department of Transportation (DOT) was appointed lead agency. D.O.T. in turn delegated this responsibility to the Federal Highway Administration (FHWA).

On March 02, 1989, the FHWA published the government-wide single rule in the Federal Register. The objective of the single rule was to maintain a consistent application of the regulations as well as the following duties: 1) encourage the expeditious acquisition of property through "negotiation" 2) establish public confidence in land acquisitions 3) provide fair treatment of persons displaced 4) minimize litigation and relieve congestion in the courts 5) ensure that agencies implement the regulations in an efficient manner.

FAA Order 5100 37A is not a regulatory order but it is the implementing procedure to assist airport owners in carrying out provisions of the Uniform Act, 49 CFR Part 24 for airport projects.

CLAIMS OF "VOLUNTARY" ACQUISITION SUSPECT

Certain major components of the Uniform Act are subjectively omitted and modified by LAWA causing under-valued offers to purchase, loss of benefits, entitlements and provisions to displaced individuals, under a false authority that a "voluntary" acquisition allows for deviations and/or omissions of prescribed Uniform Act procedures. The requirements for a voluntary acquisition are narrowly defined in Uniform Act and FAA Order 5100 37A Chapter 3. SEC. 3 -9

et al. and when applicable invoke optional use of the Uniform Act; however, subjective omissions of procedures and deviations from practices and policies are not permitted. The Uniform Act, when engaged, provides full rights and entitlements and procedures *uniformly* to displaced persons within the entire project; with or without eminent domain power.

Petitioner alleges that the Manchester Square acquisition *may not* be a voluntary acquisition and states the following: specific Manchester Square/Belford noise-impacted properties are intended to be purchased by Acquisition *without* the option for soundproofing for this Noise-mitigation program, then demolished or moved, in order to accomplish the noise-mitigation project; not reconveyed to continued residential use with aviation easements. Noise mitigation projects, which acquire designated residential property for redevelopment into noise compatible land uses do require the acquisition of all or substantially all of the property in the project area to accomplish the intended noise mitigation. Therefore acquisitions for these projects may NOT be considered “voluntary” transactions; with or without the eminent domain authority to acquire needed property FAA Order 5100 37A Chap. 3. SEC. 1. 3 –9(3).

The Los Angeles World Airport’s (LAWA) project-wide procedures are amiss of the Uniform Act policies contained herein, under which the Petitioner is appealing.

The spirit of the Uniform Act is clearly people-oriented. The implementation of the Uniform Act by the Los Angeles World Airport clearly is not.

Re: Comments on the Supplement to the Draft EIR/EIS (Alternative D)

Dear Jim:

The Gateway to LA Property-Based Business Improvement District (PBID) continues to appreciate the extensive dialogue we have had with you as well as other LAWA and City officials on Alternative D.

We understand that the Alternative D Draft EIR is a "program-level" document, therefore all the details that Gateway would like to see in such a document are simply not part of the record, but will be provided as project-level reviews take place.

With the detail that Gateway to LA has obtained, we believe that Alternative D does a better job responding to the needs of the Century Corridor than the other Master Plan alternatives that have been prepared. This belief, based on the current level of information available, leads us to an endorsement in concept of Alternative D.

Gateway to LA looks forward to working with you, LAWA and City officials as project-level details are developed for Alternative D and we appreciate LAWA's offer to create a Gateway to LA Working Group to facilitate dialogue on specific aspects of Alternative D. As you are aware, Gateway continues to plan for the revitalization of the area through a day-use conference center and shopping destination. We believe this effort complements Alternative D and we look forward to pursuing this vision of unifying the entire area from a transportation standpoint to visitor serving uses through the Gateway to LA Working Group.

As we look toward the development of project-level details, Gateway submits the following set of questions for your review and comment as you finalize the Environmental Impact Report for Alternative D.

98th Street/Automated People Mover/Consolidated Rental Car Facility

- 1) How will pedestrians, vehicles and the people mover inter-relate along 98th Street?
- 2) What land will need to be acquired for the APM system?
- 3) What businesses and or facilities would be lost in the process?
- 4) What is the exact route of the APM?
- 5) Even though the APM is an elevated structure after Sepulveda Boulevard, will it eliminate a traffic lane on 98th Street or have other traffic impacts?
- 6) Has a potential location for the future spur line extension of the AMP (page 2-72 of the Master Plan Addendum) been determined? If not, *why? (Please elaborate)*
- 7) Has a specific traffic study for 98th St. been conducted to determine how the APM will interface with vehicle traffic? If not, *why? (Please elaborate)*
- 8) How will vehicles enter/exit the RAC?

6151 West Century Boulevard
Suite 121
Los Angeles, CA 90045
310.216.7328 (phone)
310.216.7346 (fax)

SPC00165

- 9) How will public access be facilitated to the RAC for both pick-up and drop off of passengers headed to LAX?
- 10) How will public access be facilitated to the Ground Transportation Center (GTC) from Century?
- 11) Will there be a Gray Bus entrance from Century into the GTC? If so, where would it be located and how would access be regulated?
- 12) The DEIR discusses closing 98th St. during construction. Is there a way to minimize impacts to 98th St. and only closing parts of the street thereby allowing traffic to pass during construction? What ideas are being proposed?

New LAWA Parking Structures

- 13) Have parking rates and fees for users of the new parking structures been developed? If not, why? *(Please elaborate)*
- 14) The DEIR states there would be 12,890 private parking stalls. Where will these stalls be located?
- 15) Is 12,890 an estimate of existing stalls or does it include future stalls to be added?
- 16) What percentage of the parking stalls in the GTC will be designated "short term parking" vs. "long term parking?" Is this consistent with what was stated in the original Master Plan EIR/EIS? What will the daily rates be for each of these particular types of parking?
- 17) What percentage of the parking stalls in the ITC will be designated "short term parking" vs. "long term parking?" Is this consistent with what was stated in the original Master Plan EIR/EIS? What will the daily rates be for each of these particular types of parking?

Transportation Issues

- 18) If Gateway was to undertake a universal shuttle system, could the shuttle be allowed access directly to the CTA? If not, why? *(Please elaborate)*
- 19) What is the exact route of the proposed cargo roadway network?
- 20) Why doesn't the DEIR study traffic impacts at 102nd and 104th streets as part of the cargo roadway network?
- 21) How many construction truck trips will occur along Century Boulevard during a.m./p.m. peak construction?
- 22) Have alternative routes that would create less of an impact to the businesses along Century Boulevard been studied? What are those routes?
- 23) How will overall average daily trips from all vehicles change on Century Boulevard?
- 24) How will other project area street segments change from existing conditions under Alternative D and under the no project alternative?

Miscellaneous

- 25) Alternative D looks to require the acquisition of approximately 77 acres of land. Which specific parcels have been identified in all or in part for potential acquisition? Have specific guidelines been established for land acquisition/condemnation?

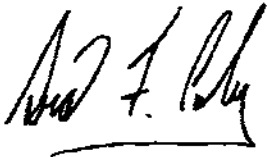

26) Will LAWA make special arrangements to replace gas stations that are displaced by Alternative D? If not, why? *(Please elaborate)*

27) What are LAWA's specific plans for beautification of the Century Corridor and 98th Street during construction and at build out of Alternative D?

We appreciate your attention and input on these issues as part of the EIR process and we look forward to continuing to work with you as Alternative D takes shape.

Thank you.

Sincerely,

ARP-1

I am providing you a copy of my speech that I gave to the Board of Commissioners of the Los Angeles World Airports (LAWA) on May 6, 2003 regarding LAX Airport.

As you may be aware, Mayor James Hahn of Los Angeles recently presented his plan for significant changes to LAX Airport.

The major renovation will do little or nothing, and possibly even worsen, for the convenience and safety of the traveling public, and for the efficiency and profitability of the airlines and the airport.

Many individuals; citizen groups, homeowner organizations, businesses and corporations, private researchers (e.g. Rand Institute), and government officials at various levels are adamantly opposed to Mayor Hahn's plan for LAX airport.

We hope that you will exert your influence to prevent a disaster of a plan from getting off the ground.

Gordon Michael Mego

4535 Wilh1st St
Hawthorne, Calif.
90250-6927
(310) 675-8674

SPC00166

LAX Airport

Hello! My name is Gordon Michael Mego, ~~my~~ my address is 4535 W. 141st Street ^{and my phone # is (310) 675-8674.} I am a native and resident of Hawthorne and the South Bay region since Oct. 8, 1952. And I am a former aerospace engineer who has worked on the F-18 and the B-2 aircraft at Northrop Corp., the B-1 bomber at Rockwell Intl., and the C-17 transport at McDonnell Douglas from the mid 1970's to the late 1980's.

I grew up in an era when propeller-driven airplanes were a common sight and sound. I flew aboard ~~an~~ ^{an air}liner for the first time in the ^{late} 1950s with TWA on a Lockheed Constellation plane that had a triple-tail design and small air cond vents by the windows. It was ~~an interesting~~ ^{an interesting} experience on flights to and from New York where the sister of my mother had lived in Brooklyn since the 1930's.

My father worked for American Airlines during the 1950's as a Senior and then Lead mechanic who always maintained the aircraft in nearly perfect flying condition.

On some occasions, I had the opportunity to see ^{the} behind-the-scenes activities at the airport, including visits to the old control tower building with its Spanish-style architecture.

Apr. 14, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927
(310) 675-8674

LAX Airport

Over the course of decades, from the 1960's onward, I had the pleasure of flying aboard various aircraft with different airlines. Of particular enjoyment was my trip to Washington, D.C. where I stayed for eight days ^{in July of 1983} including ^{the} Washington Hotel near the White House, ~~and~~ visited many places around the historic capital, and ~~rode~~ ^{on the} ~~fantastic~~ Metro Rail system. As the Los Angeles region, and especially the South Bay area, increased in residential population and with various businesses, LAX Airport expanded the size and scope of its operations accordingly to meet the demands of the growing region of So. Calif.

By the year 2000, LAX Airport had reached a level of 67 million passengers who traveled to various destinations in the United States and around the world. While the annual capacity for passengers at the facility is currently 78 million, there are proposals to increase the capacity to as much as 120 million.

After the Sept. 11, 2001 Tragedies in New York, Washington, D.C., Pennsylvania, and elsewhere, the number of people who flew aboard commercial airliners was reduced by 10% to 25% depending on the airline company. At LAX Airport, the annual level is down by 10%-15% or approximately 5.2 million to 5.5 million passengers from the 2001 rate of 61 million.

Gordon Michael Megoo
4535 W. 141st St.
Hawthorne, CA 90250-6927
(310) 675-8674

Apr. 14, 2003

LAX Airport

Even at the current levels of airline flights, the residents of the South Bay area in Los Angeles County, and especially in the City of Hawthorne, are experiencing and enduring significant amounts of air pollution, loud noise, road traffic, population density, etc. which affect the quality of life for all the people of the region.

Of particular annoyance is the roaring sounds of engines from low-flying commercial aircraft which occasionally traverse the skies of the South Bay area in an effort to shorten their travel from LAX Airport. Pilots must be required to follow certain protocols with respect to flight paths, altitudes, etc. over Hawthorne and other surrounding cities. Violations of these procedures should result in financial penalties and/or restricted access to LAX Airport.

There have been various proposals to expand LAX Airport which would increase the annual level of passengers not only from the record high of 67 million to a maximum of 78 million, but even to as much as 120 million. The proposals will essentially require moderate to major reconstruction of the airport facility and significant destruction of residential neighborhoods in the area.

Apr. 14, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927
(310) 675-8674

LAX Airport

The Manchester Square area of Los Angeles, which is located between Century Blvd. and Arbor Vitae, and between La Cienega and Aviation Blvds., is a residential neighborhood that was mainly comprised of single-family homes, which date back to the 1940's, and even included an elementary school which served the surrounding community.

Los Angeles World Airports (LAWA) is currently in the process of acquiring property and demolishing buildings in the Manchester Square area in order to build a passenger check-in facility. IF LAWA achieves their goal of owning every property in the ^{Manchester Square} area, it will cease to exist as a residential neighborhood in the Los Angeles region where there is a shortage of housing.

Since LAWA has not approved of any expansion plan for LAX Airport, it should cease further acquisition of property in the Manchester Square area, resale purchased property to residential homeowners, insulate homes that are currently available or eventually built, and reopen the public elementary and/or middle schools for students.

According to a proposal by Mayor James Hahn of Los Angeles, there would be a major transformation of LAX Airport. It would involve tearing down some terminal buildings,

~~APR 14, 2003~~
APR 14, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927
(310) 675-8674

LAX Airport

and parking structures, building a remote passenger check-in facility in ~~the Manchester Square area of L.A.~~ ^{the Manchester} Closing off the two-level inner roadway to the general public, building a "People Mover" system to connect the remote facility with the main part of the airport, moving and adding taxiways and runways, and other changes. The price tag for this enormous project is approximately \$10 billion that will surely increase during the years ahead.

As with previous efforts to expand or renovate LAX Airport, the new proposal is not an acceptable solution for the South Bay region of Los Angeles County.

The implementation of any such changes would lead to increased levels of possible terrorism and other criminal activity, of ~~invasive~~ invasive security measures, of business slowdowns and failures, of unemployed people, of various taxes, fees, etc., of vehicle traffic on streets and highways, of loud noise from more aircraft, of air, land, and water pollution, and of population in the region.

The establishment of a remote, check-in facility for airport passengers would greatly expand the overall size of LAX that will stretch east to the 405 Freeway and substantially increase the residential and business areas that could be affected by a major terrorist act, especially ~~from~~ ^{from} a nuclear weapon or conventional missile.

Apr. 14, 2003

Gordon Michael Mego

4535 W. 141st St.

Hawthorne, CA 90250-6927

(310) 675-8674

LAX Airport

Without even considering the latest proposals for change at LAX, the current security environment creates the feeling of an armed encampment. The intrusive and invasive measures treat people in an undignified manner and abusive ways as if they were criminals.

There is something quite wrong when elderly folks, soccer moms, various celebrities, government officials, and other innocent people are forced to endure long delays, physical searches, shoe scans, identity verification, personal background checks, luggage inspections (some without the consent and presence of the owner), surveillance cameras, traffic and parking difficulties, and other situations.

Until LAWA implements an approach to security that is based upon reasonable suspicion and common sense, there will be an increasing number of people who will not travel aboard commercial airliners or spend money at businesses within the airport and around the region.

As if the effects of Sept. 11, 2001 were not bad enough for the U.S. economy, the current activity at and proposed changes for LAX will cause more financial problems to the airline industry, retail stores, hotels, restaurants and other businesses who will reduce operations or file bankruptcy which means higher unemployment, lower tax revenue, etc.

Apr. 14, 2003

Gordon Michael Meago
4535 W. 141st St
Hawthorne, CA 90250-6927
(310) 675-8674

LAX Airport

In order to facilitate the smooth flow of people into and out of LAX Airport, it is absolutely necessary that the double-decker roadway and the parking structures within the facility must remain open for use by the general public who want to drop off or pick up passengers and luggage at the terminal gates, sidewalks, or parking areas.

Further, the Green Line of the Metro Rail system must be extended into LAX Airport where the passenger trains would travel around the inner perimeter of the facility and stop in front of each airline terminal. This will provide an alternative mode of transportation from other parts of California which will reduce highway traffic, improve air quality, provide convenience, and save money for people in the long term.

Efforts must be pursued to create a regional system that will handle the significant number of airline passengers in Southern California, particularly in Los Angeles and Orange Counties. LAX Airport must not be forced to accommodate the increased loads from other areas.

Therefore, LAX Airport must not be expanded beyond its current capacity of 78 million passengers and preferably should be limited to 67 million passengers, which is a peak annual level in year 2000.

Apr. 14, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927
(310) 675-8674

LAX Airport

The current layout of LAX Airport must be limited to only necessary improvements of the facility within its current land boundaries for the convenience of the passengers and the efficiency of airport operations.

In conclusion, I am hopeful that my comments about LAX Airport will resonate with the board members of Los Angeles World Airports. LAWA has the difficult task of upgrading the existing airport and handling the various criminal elements while trying to promote the commercial aspects of aviation travel. But it is incumbent upon the board members of LAWA to pursue courses of action that will improve the quality of life and the economic vitality of the region for the vast majority of the people without spending enormous sums of money on unnecessary projects and sacrificing our personal freedoms as stated in the U.S. Constitution and in the Bill of Rights.

RE: LAX Master Plan

I am a Quality Assurance Inspector of aircraft maintenance for American Airlines. I have worked at LAX in this capacity for the last 20 yrs as both an aircraft inspector and mechanic. I intimately see everyday the problems LAX has gone through over the years, and the current problems it faces in trying to maintain safety and security, and in dealing with increasing air traffic.

I have studied Mayor Hahn's plan for LAX thoroughly and quite honestly find it laughable. Nothing about it makes any common sense in trying to solve the current, and future problems facing LAX. The only logic for this plan, is to "make work" (since I think it is a waste of labor and resources) for the construction firm(s) that will be doing this job. I wouldn't doubt that these contractors gave Hahn a heap of money in his campaign for mayor.

First and foremost lets talk about security. Hahn' plan claims this will improve security at LAX. His plan calls for having everyone check in at one central location and then "people-move" them to their gates. THIS PLAN IS A TERRORIST DREAM! Yea, lets gather the massive crowds of people that go through LAX and put them all in one area. Even a moron should be able to see that this isn't a very bright idea. A suicide bomber then could mix in with this crowd before they check in, and wipe out a hell of a lot of people.

Hahn's plan would severely hamper the efficiency and order of LAX for an estimated 11 yrs, and that's if they do it on schedule which rarely happens. This is 11 yrs of inconvenience to the passengers, airlines, and vendors. The airline industry is already severely hurting financially and this will impact operations here at LAX for 11 yrs. On top of that the cost of this massive project that will do nothing to improve anything. It will be financed by higher air fares, and this will hamper the airlines, and also any business that relies on air travel, like tourism, business travel, airport vendors, etc.. What is Hahn and all those that support this thinking!?

Stop this insanity! You don't need to mess up LAX. You need to develop a **regional approach** to handle air traffic around Los Angeles. Most of the people that work for the airlines, and those that fly that live in the LA area, don't live near LAX! They live elsewhere and would be better served by airports like Ontario, San Bernadino, Orange County, Burbank, and Palmdale. That is where you should expand, and you can make improvements to LAX if needed, but don't do anything stupid and major, like move runways, or terminals, and make a centrally located check-in area. Most of my co-workers here at American Airlines feel the same way. We don't need your so called "improvements".

Sincerely,

Randall E Hartman

Mr. David B. Kessler, AICP
U. S. Department of Transportation
Federal Aviation Administration
P. O. Box 92007
Los Angeles, CA 90009-2007

Dear Mr. Kessler:

May this communication find you and yours prospering in health, wealth and peace of mind.

I attended the Environmental Justice meeting held on August 2, 2003 at Inglewood High. Included are comments and insights I gathered at that meeting concerning the Draft EIS/EIR and an on going problem I am having with LAX noise since June 21, 2003.

Another subject I will address at those Public Hearings on the LAX Master Plan that I will be attending, other than my present problem with the arbitrary plane noise from LAX is, will Inglewood High be soundproofed and any other school that is in the path of those loud planes which are actually Weapons of Mass Destruction (WMDs)?

The planes were almost landing on the school grounds and the noise was astonishing! What I found interesting is that I could see and hear those low flying planes as could everyone at that workshop. The noise at my home is comparable but I cannot see the planes. Amazing. I wonder how the children can properly study with that constant noise? Environmental Justice must take into consideration the teaching environment of the children and the soundproofing of schools, especially Inglewood High.

The plane noise has gotten lower at my home this morning due to my complaints at that workshop yesterday. They got the word in that LAX Tower and now know that I am truly serious. But the noise will rise again as usual when the urge hits them. I want them to abide by the law. I want the noise stopped, not only lowered at their whim!

Also, what is the make-up of those in the Air Traffic Control Tower? Do they empathize and live in the low-income communities impacted by the LAX plane noise? Are there any women and other minorities in that Tower?

SPC00168

Or are they all middle class white men who are not being properly supervised and who can increase the volume and rate of noise anytime and direct the planes anywhere they choose thereby posing a great security risk? Airport Security is concentrating on the passengers and not the workers in the Towers. This is a big mistake!

These questions I will ask at the meetings and they must be answered before any Plan is ratified. Because I truly believe there is a god-complex disease and racist attitude in the LAX Tower. And they are terrorizing many neighborhoods.

You probably disagree with me, but these are the facts. Keep an open mind. People lives are at stake.

Sincerely,

Dr. Nimrod

Dr. Nimrod

Enclosure: 7/28/03 *Newsweek* article: "The 9-11 Report: Slamming the FBI."
7/20/03 Letter to Ms. Lydia H. Kennard, Executive Director of LAWA

Periscope

EXCLUSIVE

The 9-11 Report: Slamming the FBI

THE FBI BLEW repeated chances to uncover the 9-11 plot because it failed to aggressively investigate evidence of Al Qaeda's presence in the United States, especially in the San Diego area, where two of the hijackers were living with one of the bureau's own informants, according to the congressional report set for release this week.

The long-delayed 900-page report also contains potentially explosive new evidence suggesting that Omar al-Bayoumi, a key associate of two of the hijackers, may have been a Saudi

government agent, sources tell NEWSWEEK. The report documents extensive ties between al-Bayoumi and the hijackers. But the bureau never kept tabs on al-Bayoumi—despite receiving prior information he was a secret Saudi agent, the report says. In January 2000, al-Bayoumi had a meeting at the Saudi Consulate in Los Angeles—and then went directly to a restaurant where he

FAILED INTELLIGENCE—Mourning: loved one lost in the World Trade Center

met future hijackers Khalid Almahdhar and Nawaf Alhazmi, whom he took back with him to San Diego. (Al-Bayoumi later arranged for the men to get an apartment next to his and fronted them their first two months' rent.) The report is sure to reignite questions about whether some Saudi officials were secretly monitoring the hijackers—or even facilitating their conduct.

Questions about the Saudi role arose repeatedly during last year's joint House-Senate intelligence-committee inquiry. But the Bush administration has refused to declassify many key passages of the committee findings. A 26-page section of the report dealing with the Saudis and other foreign governments will be deleted. "They are protecting a foreign government," charged Sen. Bob Graham,

who oversees the inquiry.

The report emphasizes the Pentagon for releasing military strikes against Al Qaeda camps in Afghanistan prior to 9-11 and the CIA for failing to act on a dramatic affirmation about Almahdhar and Alhazmi at a security summit in Malaysia. But the FBI was the target of a treatise a few months after al-Bayoumi took them to San Diego. Almahdhar and Alhazmi moved into the home of a local professor who was a longtime FBI "asset." The prof also had earlier contact with another hijacker, Hamzi Hanjour. But even though the informant was in regular touch with his FBI handler, the bureau never pieced together that he was living with terrorists. The bureau also failed to pursue other leads, including a local imam who dealt with several 9-11 figures. The report, one congressional investigator said, "is a scathing indictment of the FBI as an agency that does not have a clue about terrorism." Furious bureau officials say the report misstates the evidence. They say the bureau checked up on al-Bayoumi, now back in Saudi Arabia, and concluded he had not given the hijackers material support. As for Almahdhar and Alhazmi, "there was nothing there that gave us any suspicion about these guys," said one FBI official.

Mrs. Lydia H. Kennard,
Executive Director
Los Angeles World Airports
Mail Stop 101
Los Angeles, CA 90045

Dear Mrs. Lydia H. Kennard:

May you and your family be engulfed in all that is good for your peace of mind, your body, your spirit, your faith and your finances.

I live in Marina Del Rey. On the night of June 21, 2003 around 1:00am I was startled out of bed by an aircraft overflight. That single event noise exposure level (SENEL) had to be around 120 decibels! The duration was quite long. As we know an increase of 10 decibels is perceived by the human ear as a doubling of noise. Well if you have been used to sleeping during the night for about two years without any noise at all, an aircraft overflight suddenly shaking your home, in the middle of the night, even at 5 decibels is traumatic. Would I be listened to if I lived in Inglewood instead of Marina Del Rey?

Since June 21, 2003, that distressing single event has multiplied and has become a day and night constant. The ambient noise level has become horrendous since the people in the Air Traffic Control Tower have, evidently, taken it upon themselves to change flight plans, loop departures, westerly operations, easterly operations and also over-ocean operations that operate between the hours of 12:00am (midnight) and 6:30am. Since June 21, 2003, there has been big change, or a shifting of noise from somewhere to the Marina.

On July 7, 2003, the FAA gave me the number of the Traffic Mgmt. Unit (TMU) and Mike there gave me the number of Marv Chappie in the Air Traffic Control Tower. Marv Chappie was on vacation until July 15, 2003, so I then called his back-up Frank Sweeny who told me nothing has changed and that in fact aircraft traffic has declined(!?).

The noise continued so loud that about midnight (12:35am) Sunday morning July 13, 2003, I called the Tower again and left a voicemail message to stop this violation and let me sleep. Something very evil is going on here. It seems that the noise tends to subside from approximately 1:00am to 5:00am. then starts up with a big bang at 5:00am! The other 20 hours are pure hell. Prior to June 21, 2003, the first day of summer, I would peacefully sleep through the quiet night from 10:00pm to 6:00am. Was an insidious change made for summer air traffic?

SPC00168

I need no aircraft overflights as daily 5:00am headache-producing wake up calls! As I write you now Mrs. Lydia Kennard, at 3:00pm, it seems I am sitting on an LAX runway!

I sleep majorly on my back. I have reversed my sleeping position so that my left ear will not be pointing towards the window and the airport noise which has irritated my left ear. This offered some relief. But on July 16, 2003, at around 5:00am there was a single event aircraft overflight "bang!" right over my head that has my left ear still hurting because I was lying on my side with my left ear pointing towards the ceiling, not the window. But the bang came from above and not the side. I had to ice my ear the next day.

Nobody seems to know what's going on. You and I know the Day/Night Noise Level (DNL) used by the FAA penalizes noise which occurs between 10:00pm and 7:00am by 10 decibels. Prior to June 21, 2003, there was no noise level. Now the DNL every night sounds above 65 decibels to maybe 120 decibels, especially single event noise!

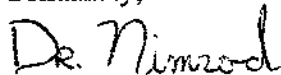

The Run-Ups were very loud all day long but they must have put this procedure back in another area because it is not as loud. It's a real dull roar. But the noise of helicopters and small aircraft are constantly overhead all day and that noise is loud joined frequently by the roar of jets. It's all very disturbing since I think, read, study and write a great deal.

The noise monitoring system used by LAX, may show the noise expansion of LAX. The Noise Contour should reveal significant noise exposure in a wider area encompassing Marina Del Rey. We both know the FAA and Caltrans define significant noise exposure as any area within the 65 decibels DNL or CNEL Contour. This is too high.

As was stated earlier, an increase of 10 decibels is perceived by the human ear as a doubling of noise. In an area where there was not any DNL noise, just 10 decibels is monstrous! I want an explanation and I want this stopped immediately! There is no way that such drastic environmental and flight changes can take place and no one knows about it at Los Angeles World Airlines. If this is the case then LAX poses a grave threat to the community, and airport security must now include the daily mental evaluation and drug testing of those in control of aircraft flight no matter their position. Millions of people in the air and on the ground are assuming that those in charge of LAX are competent, aware and truthful. Sadly this seems not to be the case, especially in the Tower.

I have spoken to the LAX Tower to no avail. I also made out two complaint forms over the phone and left a message for "Noise Abatement" and I have not heard back from anyone. Mrs. Lydia H. Kennard, Executive Director; on July 11, 2003, Ms. Carol Watkins of Mayor Hahn's office was professional and kind enough to send you a copy of my letter. This is a more comprehensive letter. The silence I am getting from people at LAWA I wish would transfer to silence in my community. I understand that you must have time to research this severe matter, but please understand my health is at risk. I desire a meeting with you at your earliest convenience to discuss this matter. Peace.

Genuinely,

Dr. Nimrod

Public Hearing
Supplement to the Draft EIS/EIR
for the Proposed LAX Master Plan
Doubletree Hotel, Rosemead, CA
Testimony from Rep. Maxine Waters
October 20, 2003

Alternative D is a \$9 billion project that would demolish homes and disturb communities without improving the safety and security of LAX. The Supplement to the Draft EIS/EIR is an inaccurate and misleading document that fails to reflect the true impact of this project.

The centerpiece of Alternative D is the Ground Transportation Center (GTC), a large remote passenger check-in facility that would be constructed at Manchester Square, several blocks away from the airport terminals. An Intermodal Transportation Center (ITC) would be constructed at Aviation Blvd. and Imperial Highway, which would provide a connection to the Green Line. According to the Supplement to the Draft EIS/EIR, the GTC and the ITC would be the primary access points for all passenger drop-off and pick-up and vehicle parking. An Automated People Mover (APM) would be constructed to transport people to the airport terminals, and a baggage tunnel would be constructed to transport baggage. A Consolidated Rental Car (RAC) facility would be constructed in Westchester.

Local families could no longer drive to the Central Terminal Area (CTA) in order to drop off passengers. Instead, all passengers and employees would access the CTA from the GTC, the ITC and the RAC via the APM, carrying their carry-on baggage with them. This would be extremely inconvenient for most passengers, and it would present special hardships for the elderly, the handicapped and families traveling with small children.

Airport Security Issues

Supporters of the proposed project to construct a remote passenger check-in facility claim that the facility is necessary to improve the safety and security of LAX and prevent terrorist attacks at LAX. Theoretically, diverting all vehicular traffic to remote parking structures and the remote passenger check-in facility would protect the Central Terminal Area from car bombs.

The RAND Corporation conducted a security study of the proposed remote passenger check-in facility, which was released on May 14, 2003. The study concluded that the proposed project would not significantly improve the security of LAX. The study also concluded that concentrating passengers in the proposed remote passenger check-in facility could make the check-in facility the likely target of a terrorist attack. Finally, the study concluded that concentrating several airport functions in the remote passenger check-in facility could exacerbate the effects of an attack on airport operations.

Statement
PLF/DEF 1
EXHIBIT
DATE 10-20-03 RPTR
SPC00169

On July 25, 2003, I introduced H.R. 2985, a bill to condition construction of a remote passenger check-in facility at LAX upon a finding that such a facility will promote the safety and security of the public. H.R. 2985 would require the Secretary of Homeland Security to review the proposed facility prior to its construction to determine whether it will protect the safety and security of air passengers and the general public more effectively than the existing facilities at LAX. If the Secretary of Homeland Security does not determine that the facility will improve public safety and security, the Federal Aviation Administration (FAA) would not be allowed to approve its construction. On Sept 2, the Board of Supervisors of Los Angeles County passed a motion to support my legislation.

Ironically, Alternative D does not even significantly improve security at the Central Terminal Area. According to the Supplement to the Draft EIS/EIR, Alternative D calls for the installation of new baggage screening facilities in the Central Terminal Area -- not the remote passenger check-in facility. If Alternative D were designed to protect the Central Terminal Area from terrorist attacks, one would think that the baggage would be fully screened before it is transported through the baggage tunnel to this area. Nine billion dollars is an extremely high price to pay for a project that provides a single building protection from car bombs but not from suitcase bombs.

Housing Issues

The Supplement to the Draft EIS/EIR makes the astounding claim that Alternative D would not displace any residents. Instead, the Supplement predicts that 2,500 houses and apartments will be acquired and the residents relocated under LAWA's existing Voluntary Residential Acquisition/Relocation Program, through which LAWA may acquire property and relocate residents on a voluntary basis in order to mitigate the impact of airport noise. The Supplement then concludes that Alternative D would not require the acquisition of any additional dwelling units or the relocation of any additional residents. This claim is especially ironic, given the fact that several Manchester Square residents and apartment owners have already said that they will not leave their homes voluntarily.

In reality, Alternative D would displace thousands of Manchester Square residents. In order to construct the remote passenger check-in facility, the City of Los Angeles would have to acquire and demolish 38 houses, 179 apartment buildings and a 52-year-old elementary school, in addition to the 263 structures it has already acquired. It would also have to relocate about 6,200 people, some of whom have federally subsidized housing vouchers. I strongly oppose the forced relocation of any of these residents.

Cost of the Alternative D

Alternative D would cost \$9 billion, an exorbitant amount of money, at a time when budget deficits are growing and the economy is weak. Airlines would be required to increase their passenger fees in order to fund the proposal, which would amount to a tax increase for air passengers. American taxpayers have already provided loan guarantees to the airline industry to keep the airlines in business following the terrorist attacks of September 11, 2001. They should not have to pay increased passenger fees for unnecessary airport construction projects as well.

Air passengers and other taxpayers are willing to provide reasonable expenditures to pay for measures that provide real increases in security, such as the installation of baggage screening facilities. However, the remote passenger check-in facility, the automated people mover and the baggage tunnel included in Alternative D are not reasonable expenditures and do not provide real increases in security.

The American people are sick and tired of deficits and bloated government spending. The State of California is now running a \$38 billion deficit, and the federal government has a \$525 billion deficit. Furthermore, Congress is in the process of providing the President an additional \$87 billion for continuing operations in Iraq and Afghanistan. Alternative D is an outrageously expensive boondoggle, which the American people cannot afford.

Conclusion

Alternative D is simply a continuation of former Mayor Richard Riordan's plan to expand the airport in the name of safety and security. I urge the City Council of the City of Los Angeles to reject this ill-advised and expensive scheme that will displace thousands of Manchester Square residents without improving the safety and security of LAX.

August 25, 2003

As a person who was born in October of 1952, I have had the opportunity to see the airport of Los Angeles evolve into LAX Airport. It has changed and grown over the decades to become one of the top five major airports in the nation.

I have flown on many aircraft to various destinations over the decades that include my first flight aboard TWA's Lockheed Constellations in the late 1950's.

When my father worked for American Airlines in the 1950's as a senior and lead mechanic, I was allowed to see behind-the-scenes operations at the airport.

My interest in airplanes eventually lead me to become an aerospace engineer who has worked for various defense-related businesses, including Rockwell, Intl. in the Weapons Systems Div. for the B-1 Bomber, during the 1980's.

LAX Airport certainly needs changes in order to modernize the facility. It is necessary to improve 1) convenience, that is make it more user friendly, for passengers visitors, etc., 2) efficiency of operations that reduce time involved from arrival to departure for passengers, visitors, and others, 3) level of safety and security for people in and around the area, 4) amount of permanent jobs from businesses in the airport, nearby areas, and L.A. region, and 5) the quality of life for people from air and noise pollution, heavy traffic, etc.

Gordon Michael Mege

August 25, 2003

Gordon Michael Mego
4535 W. 14 1st St.
Hawthorne, CA 90250-6927

Unfortunately, the earlier plans by L.A. Mayor Richard Riordan would not and the current proposals by Mayor James Hahn will not achieve any of the objectives, but will actually make everything, to one degree or another, worse than before at LAX Airport while costing at least \$10 billion.

While the downturn in the U.S. economy has affected the number of passengers who take flights to and from LAX Airport, the level of security is another factor that has impacted the yearly amount of people travelling, which is now about 52 million.

The implementation of the Ground Transportation Center in what is now a residential neighborhood of Manchester Square, of the Baggage Screening Center in place of the parking structures in the Central Terminal area, and the people mover rail system that will connect the two sections will certainly slow down the overall operations of the airport, will definitely increase the amount of time and the level of inconvenience for people at the airport, and will surely expand the areas where more lives will be affected by any terrorist attack.

In fact, if an explosive device(s) were to be detonated in the Ground Transportation Center, literally thousands of people could be killed or injured not only there, but also in the surrounding residential areas that are located north and east of it, in

August 25, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

the nearby commercial areas which include large hotels, and along the 405 freeway which is a heavily traveled route that may be shut down.

Curiously, the Los Angeles World Airports (LAWA) has been purchasing homes from property owners in the Manchester Square neighborhood during the past six years with the goal of owning all the property in the area. The question is how can they legally expend public funds to buy these or any other properties for some unauthorized future project? They have never received approval from residents and businesses in the area nor from the various governing bodies at the local and national levels.

Also, Mayor Hahn is trying to seek approval of his LAX Airport proposal based upon an outdated Environmental Impact Report (EIR) that was commissioned by Mayor Riordan for earlier renovation proposals. He has chosen not to initiate a new Environmental Impact Study (EIS) as required by law for his proposed changes for LAX Airport.

On May 15, 2003, the Rand Institute of Santa Monica, which is a highly regarded private research group, issued its report on Mayor Hahn's proposal for LAX Airport. It was critical of nearly every aspect of the proposed renovation for \$10 billion.

August 25, 2003

Gordon Michael Mege
4535 W. 141st St.
Hawthorne, CA 90250-6927

In their analysis, they concluded that the Hahn proposal would not achieve its stated goals and would negatively impact the region at an enormous cost to taxpayers, businesses, etc. and that the safety and security of the people at LAX Airport could be easily improved with simple, common-sense upgrades at a small fraction of the \$10 billion.

On Aug. 19, 2003, A. C. Lazzaretto & Assoc. issued their report that was commissioned by the L.A. County Board of Supervisors on the Hahn proposal for LAX Airport.

It was critical about issues of security, environment, growth, etc. that affect the quality of life for people.

The viability of the airline industry in the United States is questionable considering the filings for bankruptcy by various air carriers which have lost billions of dollars in recent years. Where does Hahn suppose that they find the money to renovate LAX Airport? What does Hahn think will happen to them while they are subjected to constant disruption of their operations during the 11-year construction period? Obviously, there will be airlines that will simply go out of business! The economic fallout for the L.A. region, the state of California, and the rest of the nation would be significant.

August 25, 2003

LAX Airport should not be expected to handle an increasing number of passengers from other parts of Los Angeles and surrounding counties. There must a regional approach that utilizes the large airports to the maximum extent possible with approval of residents, businesses, and others in the affected communities.

As a part of the solution to traffic congestion in Los Angeles County, LAX could serve as a model for a futuristic airport with diversity in transportation which allows people the option of using private vehicles, shuttle buses, railroad trains, etc. to reach any of the airline terminals.

Of particular importance, it will be necessary to extend the Green Line of the Metro Rail into the central terminal area of LAX Airport along the inner, double-deck roadway. At some point in time, there could be a connection of a rail line that will travel north to West L.A., Santa Monica, etc.

During the past few years, the U.S. economy has been in a downturn with significant losses in employment among the various sectors of business. Therefore, it is understandable that labor unions are seeking work for their members who can't afford to be unemployed.

Gordon Michael Meago
4535 W. 141st St.
Hawthorne, CA 90250-6927

August 25, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

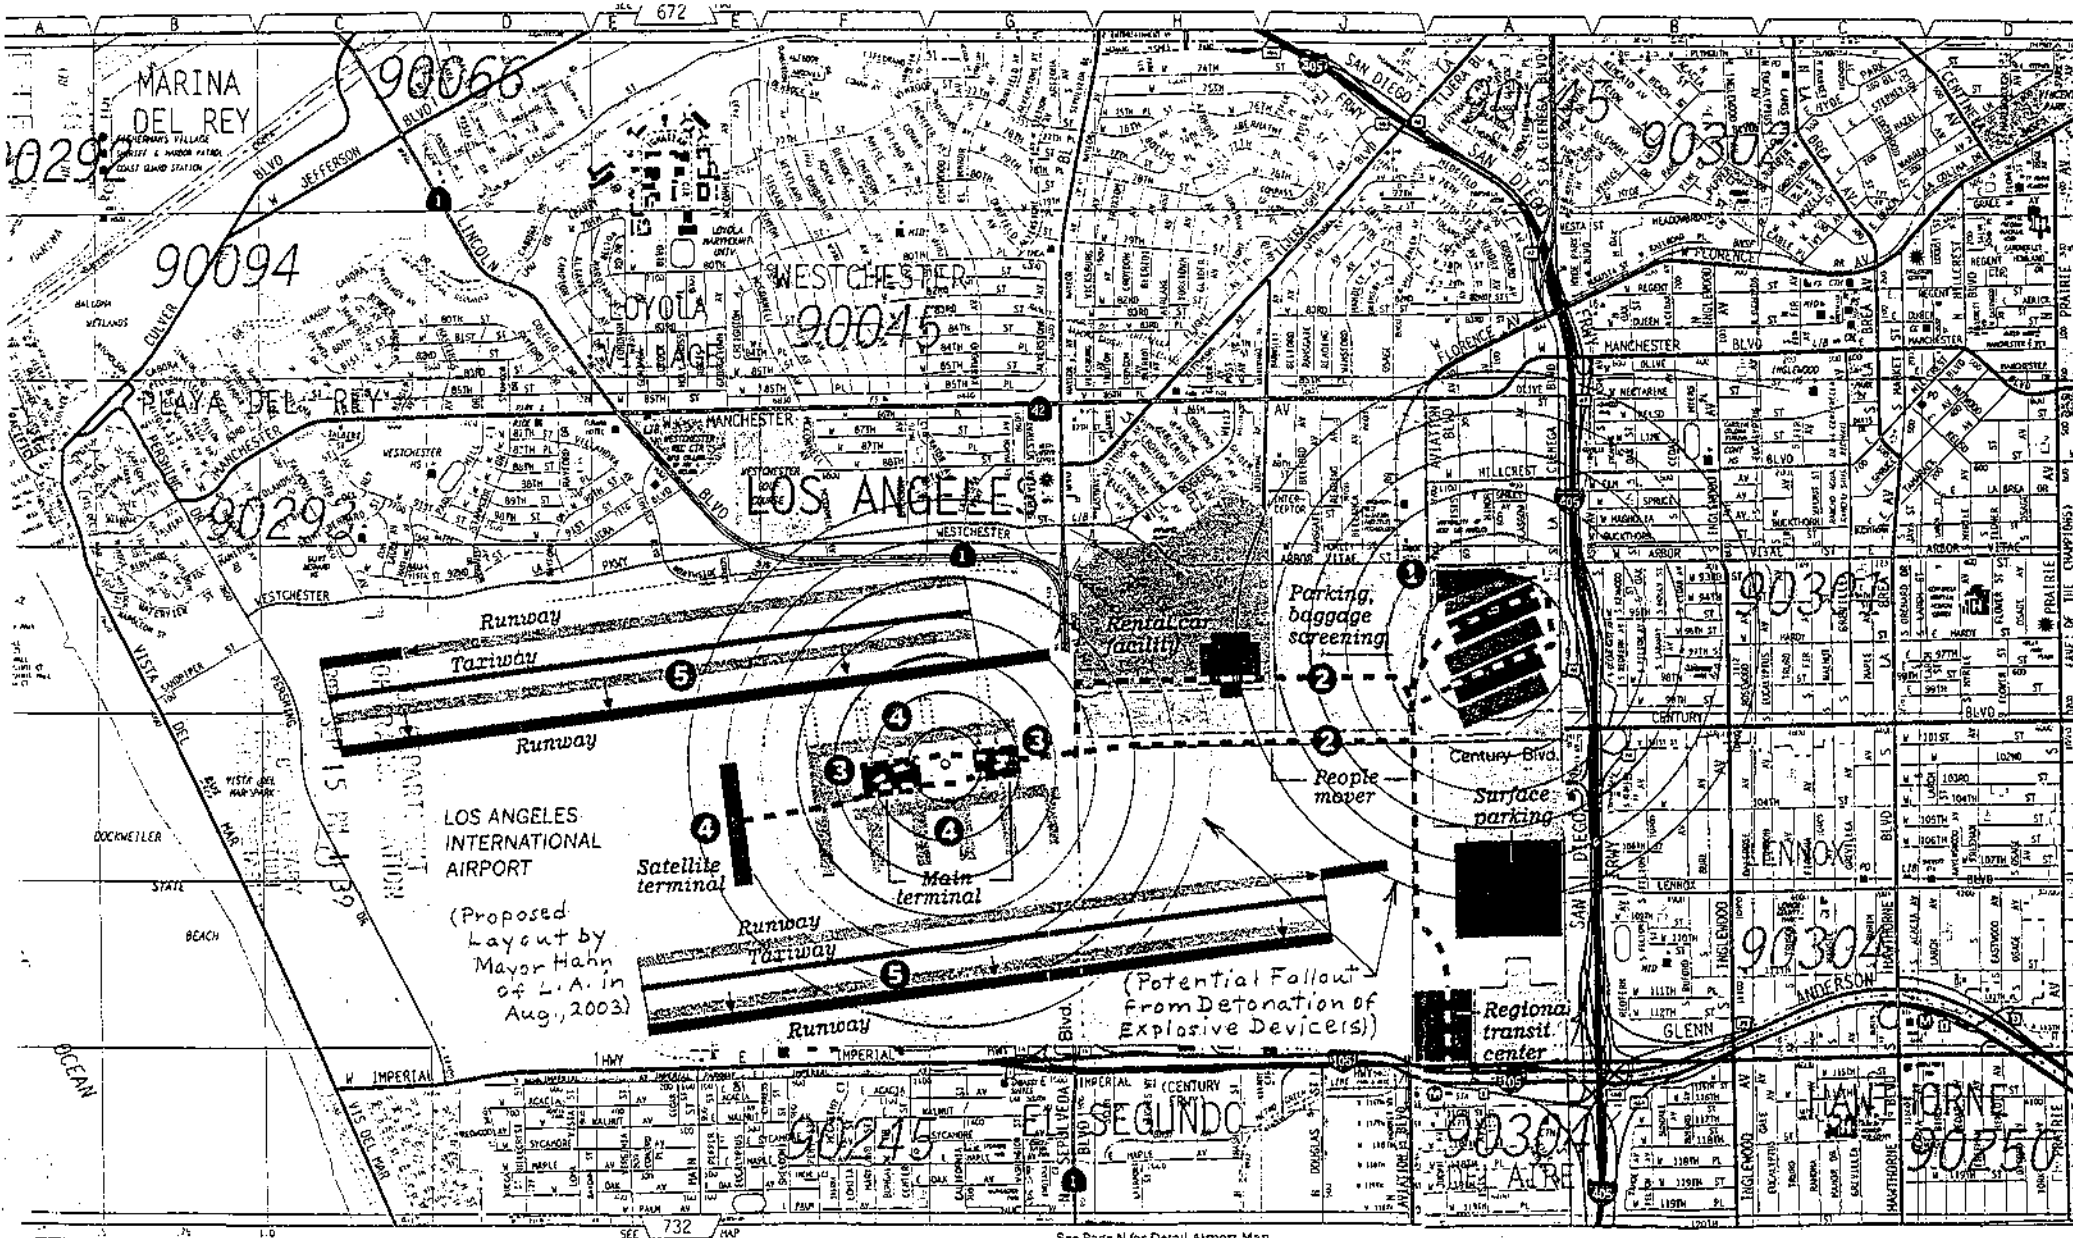

But I would ask the leaders of the various unions in California to withhold or to withdraw their support for the Hahn proposal for LAX Airport. In doing so, they can help create a more realistic and viable plan that a majority of the people will approve.

Under any new proposal for LAX Airport, it is imperative that we retain the airline terminals at their present locations, the parking structures in the central terminal areas, and the double-deck roadway for private vehicles, ~~and~~ that we limit any changes to the facility to necessary improvements for the convenience and the safety of the passengers, visitors, and others as well as the efficiency of operations at the airport, and that we prevent the expansion of

LAX into any unused or new areas, especially the Manchester Square neighborhood.

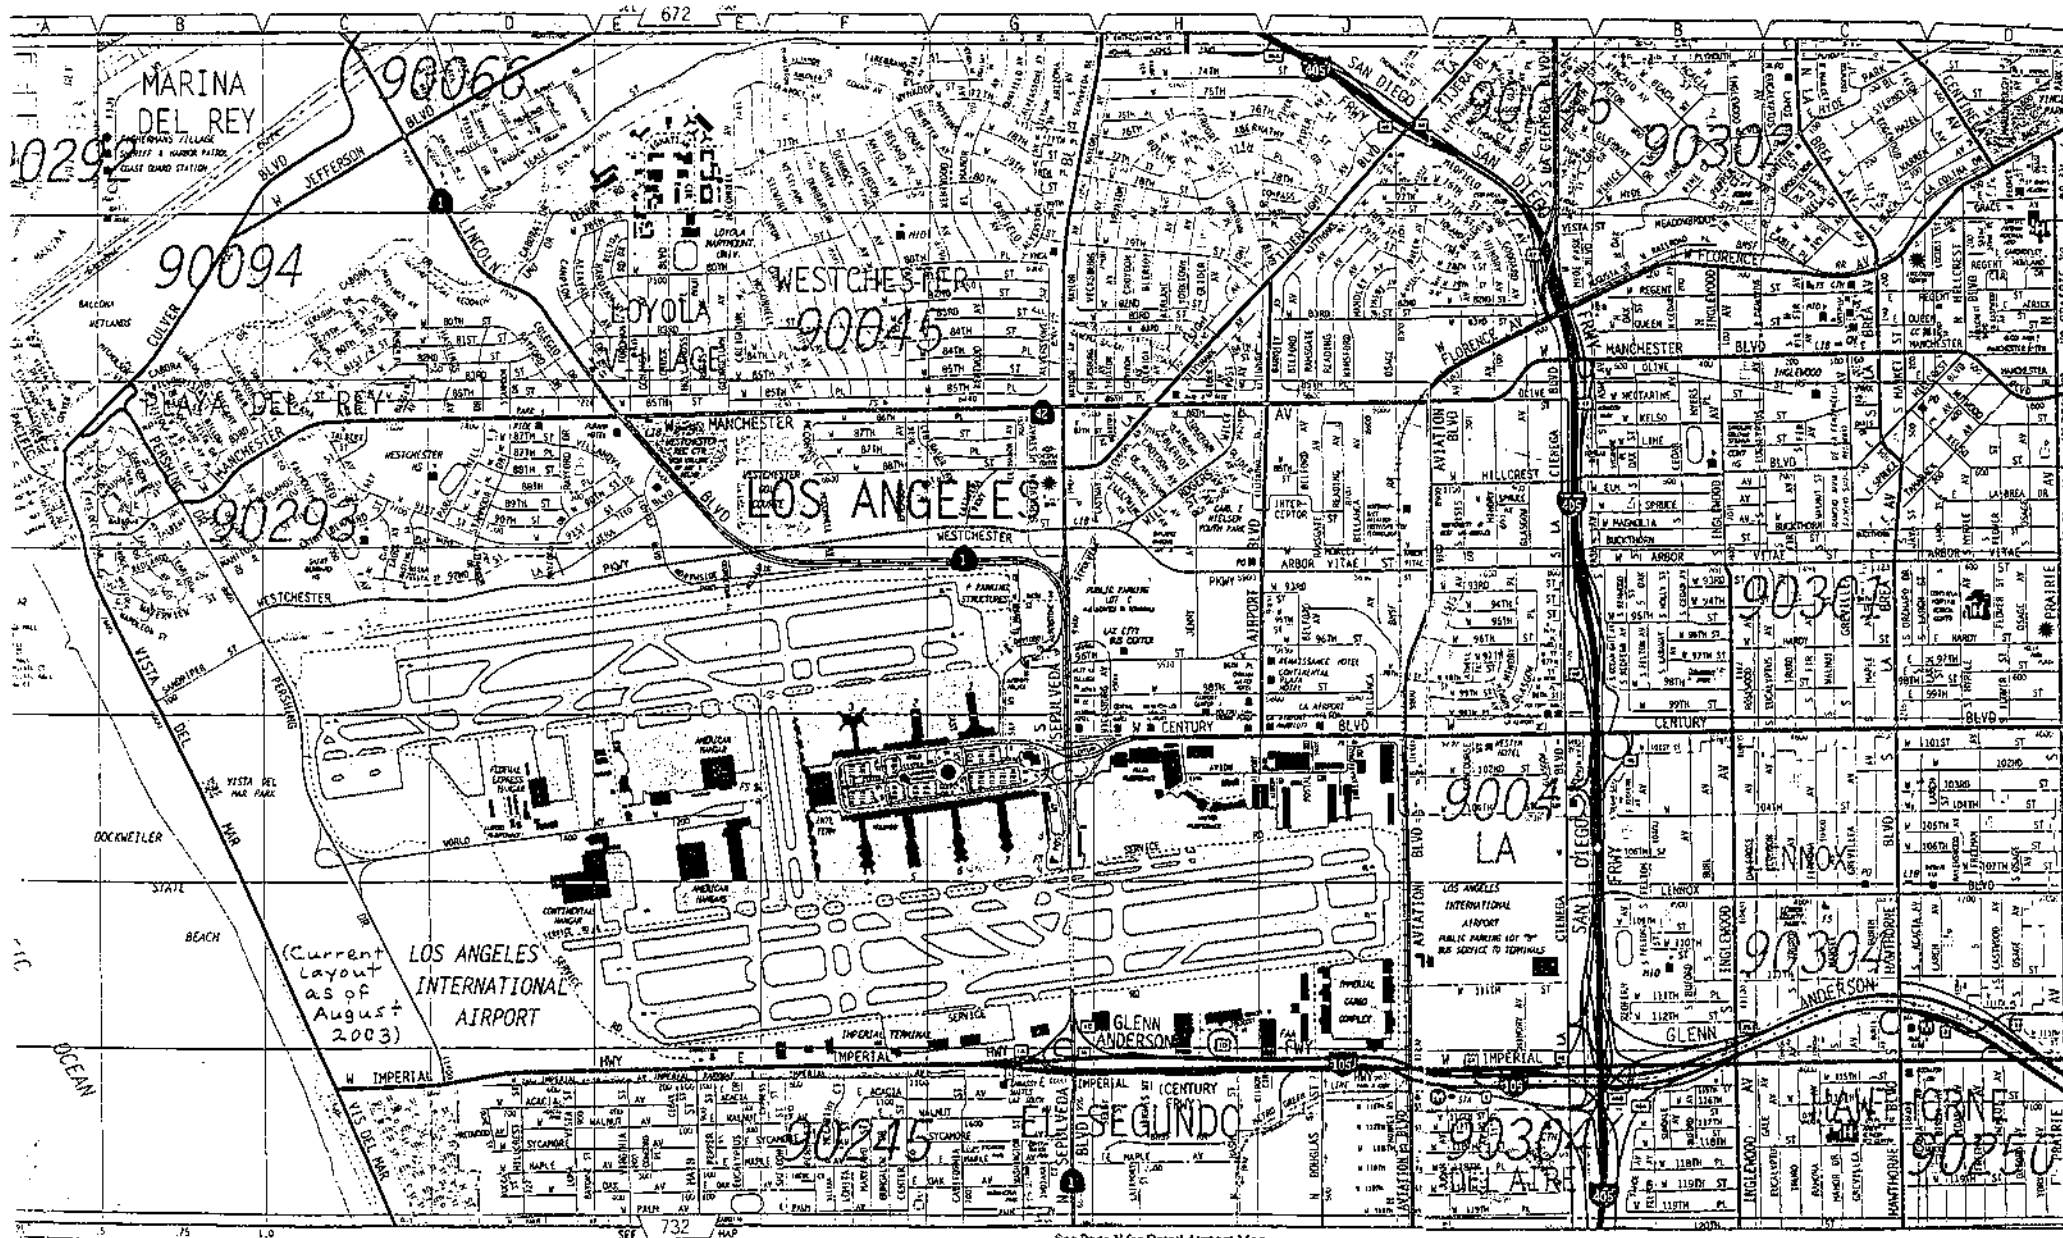

In conclusion, I am hopeful that my comments about LAX Airport will resonate with those individuals who are considering any proposed changes to the facility. It is incumbent upon the governing bodies to pursue courses of action that will improve the quality of life and the economic vitality of the region for the vast majority of people without spending enormous sums of money on unnecessary projects.

Comments:

Who is the mayor trying to fool with this plan of safety and security? Many questions remain unanswered as to whether this will add safety for the public. How about the RAND Study?

As a resident of the Valley, my concern is traffic. The nightmare of getting to LAX from Studio City will not be any more improved after spending \$9 billion. The 405 is still a parking lot. Air traffic is still down since Sept. 11 and yet the mayor feels this is what Los Angeles needs right now.

I am completely opposed to such an outrageously expensive "facelift" for LAX.

Subject: Supplement to the DEIS/EIR LAX Master Plan—"Governor's Certificate" and PUC 21661.6 and how they relate to Alternative D, cargo, and nighttime operations

The "*Governor's Certificate*" arose from the federal Airport and Airway Improvement Act of 1982. In California the governor delegated this certification responsibility to the California Air Resources Board, CARB. The CARB developed an Air Quality Certificate process to regulate air emission—Section 509(b) (7) (a).

QUESTION 1. What is LAX's interpretation of the invoking of the "*Governor's Certificate*" on Mayor Hahn's Alternative D plan?

Public Utility Code, PUC 21661.6 states that a California city cannot buy land for a project until the project has been officially approved. The City of Los Angeles owns LAX. LAX has acquired homes in Manchester Square, the Belford apartment area, plans to acquire approximately 57 homes in the Wiley Post area, and the Southern California Association of Governments has approved/allocated money to widen the I405 Freeway/Arbor Vitae Interchange at the expense of removing minority housing, businesses, part of a park, part of a school, and one church. All this acquiring and planning to acquire is being done without an approved LAX project. In fact, as far back as 1998 LAX expansion maps have shown cargo planes in the Manchester Square/Belford areas, again with no approved LAX expansion plan.

QUESTION 2. What legal "leg" does LAX have to violate *Public Utility Code, PUC 21661.6* by acquiring properties for the LAX expansion project when that project has not been officially approved by the Los Angeles City Council or the Mayor of Los Angeles?

Cargo A previous LAX expansion EIS/EIR stated that cargo was an exception to EIS/EIR regulation, rules, etc., in other words cargo was going to operate under variance rulings.

QUESTION 3. Does Alternative D treat cargo and passenger operations exactly the same or is cargo being treated under different rules/variances? If cargo has different rules what are they and what are their effects in the air, on the ground, and environment wise?

Nighttime operations LAX can expand to beyond 100 MAP as it exists today—August 21, 2003. This can be done by merely extending and expanding nighttime operations.

QUESTION 4. What are the nighttime hours, operation limits, and other regulations for passenger and cargo operations in this EIS/EIR Supplement? What guarantees are there that limit percentage-wise or operation-wise increases in nighttime operations—a cap guarantee on ALL types of operations and hours of operation?

Dear Mr. Kessler:

We oppose LAX Alt. D. This proposal would result in all airport-bound traffic coming through our neighborhoods. This would bring even more noise and pollution. The \$9.6 billion cost is unconscionable.

Thank you.

Sincerely

Mr. Jim Ritchie:

As my bizarre work schedule keeps me from attending the three EIR hearings regarding the LAX masterplan, I've compiled this brief letter to add my comments.

First of all, thank you for this wonderful, innovative plan for the future of LAX and the entire community. I assure you that I and every person over which I hold the slightest influence will accept and encourage this remarkable plan. Keep up the good work.

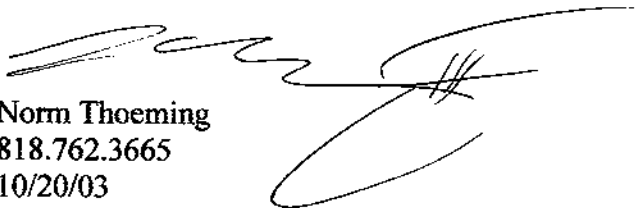

Another issue facing the future of Los Angeles is the expansion of the MTA system and the proposed California High Speed Rail project. While Alternative D does include a direct connection with the Metro Green line at Aviation via a pedestrian walkway (an option which will only help both MTA and cut down on Airport traffic), I haven't found details about what will be done with the existing northbound MTA-owned ROW along Aviation.

In the past, various parties have insisted that a Green Line extension northward or any rail into the airport may affect various controlling beacons and equipment. Having taken the El into O'Hare, obviously it is doable. Please encourage all parties included to think for the future of the city and the airport to preserve this right of way and to build into the construction budget the necessary trench west of Aviation Blvd along the MTA Harbor Subdivision ROW. This would allow the Green Line to proceed north from the current Aviation/Imperial Green Line station without interfering with LAX radar beacons and/or other electromagnetic operations associated with LAX.

On the same note, please encourage those involved to allow space for a future additional train station at the ITC or the GTC should the Green Line expand or should High Speed Rail come from Union Station to LAX via the former Slauson railroad tracks.

Thank you very much for your time, your efforts, and your open mind:

I am here today to give testimony on the damage being done to our homes as a result of the increased airline travel over our community. I have lived in this community for over 31 years.

This issue is not new to us. We have tried over the last ten years to engage in a constructive dialogue with the LAX Airport Representatives and time and time, they have ignored our concerns and request to assistance in repairing our home impacted by the air services.

Many of our home have cracks in the foundations, our doors and windows frame are out of alignment with the structure of the homes and our roofs have been damaged as a result of the low flying and the fumes traveling down.

The noise has been so loud when the airplanes are traveling over our homes, that we have to play an up and down game with the sound on our televisions or phone conversation in order to hear.

When Representatives have meet with us (only on a few occasions), and stated that the noise indicator do not show that we are in the direct noise flight path, we have shown them the actual map created by the LAX is out dated. The increase use of the airport and the ~~has~~ to expand, should be clear indicators that a new set of noise box indicator should be placed in ~~low~~ locations to determine the impact the airplanes. We have tried to convey this to the Representative, yet no one is willing to give us a definitive answer or allow us to identify some of the location if this were to take place.

We are requesting, no demanding that action take place to address our concerns and to establish a relationship with us in helping to resolving this issue and repairing our home in the same manner you have done with Westchester, Inglewood and a small portion of southwest LA close to the Inglewood city line.

Keep in mind that LAX is own by the City and we as residents of the City pay taxes and patronize the facility and should be entitle the level of customer service you pay to visitor using the airport.

INQUIRY FROM: Mr. Gordon Mego

RE: Input on Proposals for LAX Expansion

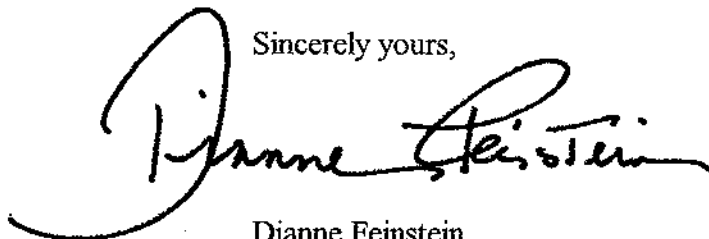

Dear Mr. Ritchie:

I am forwarding the attached constituent inquiry regarding the expansion of Los Angeles International Airport (LAX) for your review. I believe that my constituent would benefit from your response to the specific issues raised in the enclosed letter.

I would appreciate it if you would return your response to me as quickly as possible so that I can share the information with Mr. Mego. Should you have any questions, please contact my Washington, D.C. office at (202) 224-3841.

Best Regards.

Sincerely yours,

Dianne Feinstein
United States Senator

Sen. Diane Feinstein

As a person who was born in October of 1952, I have had the opportunity to see the airport of Los Angeles evolve into LAX Airport. It has changed and grown over the decades to become one of the top five major airports in the nation.

I have flown on many aircraft to various destinations over the decades that include my first flight aboard TWA's Lockheed Constellations in the late 1950's.

When my father worked for American Airlines in the 1950's as a senior and lead mechanic, I was allowed to see behind-the-scenes operations at the airport.

My interest in airplanes eventually lead me to become an aerospace engineer who has worked for various defense-related businesses, including Rockwell, Intl. in the Weapons Systems Div. for the B-1 Bomber during the 1980's.

LAX Airport certainly needs changes in order to modernize the facility. It is necessary to improve 1) convenience, that is make it more user friendly, for passengers, visitors, etc., 2) efficiency of operations that reduce time involved from arrival to departure for passengers, visitors, and others, 3) level of safety and security for people in and around the area, ~~and~~ 4) amount of permanent jobs from businesses in the airport, nearby areas, and LIA region, and 5) the quality of life for people from air and noise pollution, heavy traffic, etc.

August 25, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

August 25, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

Unfortunately, the earlier plans by L.A. Mayor Richard Riordan would not and the current proposals by Mayor James Hahn will not achieve any of the objectives, but will actually make everything, to one degree or another, worse than before at LAX Airport while costing at least \$10 billion.

While the downturn in the U.S. economy has affected the number of passengers who take flights to and from LAX Airport, the level of security is another factor that has impacted the yearly amount of people traveling, which is now about 52 million.

The implementation of the Ground Transportation Center in what is now a residential neighborhood of Manchester Square, of the Baggage Screening Center in place of the parking structures in the Central Terminal area, and the people mover rail system that will connect the two sections will certainly slow down the overall operations of the airport, will definitely increase the amount of time and the level of inconvenience for people at the airport, and will surely expand the areas where more lives will be affected by any terrorist attack.

In fact, if an explosive device(s) were to be detonated in the Ground Transportation Center, literally thousands of people could be killed or injured not only there, but also in the surrounding residential areas that are located north and east of it, in

August 25, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

the nearby commercial areas which include large hotels, and along the 405 freeway which is a heavily traveled route that may be shut down.

Curiously, the Los Angeles World Airports (LAWA) has been purchasing homes from property owners in the Manchester Square neighborhood during the past six years with the goal of owning all the property in the area. The question is how can they legally expend public funds to buy these or any other properties for some unauthorized future project? They have never received approval from residents and businesses in the area nor from the various governing bodies at the local and national levels.

Also, Mayor Hahn is trying to seek approval of his LAX Airport proposal based upon an outdated Environmental Impact Report (EIR) that was commissioned by Mayor Riordan for earlier renovation proposals. He has chosen not to initiate a new Environmental Impact Study (EIS) as required by law for his proposed changes for LAX Airport.

On May 15, 2003, the Rand Institute of Santa Monica, which is a highly regarded private research group, issued its report on Mayor Hahn's proposal for LAX Airport. It was critical of nearly every aspect of the proposed renovation for \$10 billion.

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

August 25, 2003

In their analysis, they concluded that the Hahn proposal would not achieve its stated goals and would negatively impact the region at an enormous cost to taxpayers, businesses, etc. and that the safety and security of the people at LAX Airport could be easily improved with simple, common-sense upgrades at a small fraction of the \$10 billion.

On Aug. 19, 2003, A. C. Lazzaretto & Assoc. issued their report that was commissioned by the L.A. County Board of Supervisors on the Hahn proposal for LAX Airport.

It was critical about issues of security, environment, growth, etc. that affect the quality of life for people.

The viability of the airline industry in the United States is questionable considering the filings for bankruptcy by various air carriers which have lost billions of dollars in recent years. Where does Hahn suppose that they find the money to renovate LAX Airport? What does Hahn think will happen to them while they are subjected to constant disruption of their operations during the 11-year construction period? Obviously, there will be airlines that will simply go out of business! The economic fallout for the L.A. region, the state of California, and the rest of the nation would be significant.

August 25, 2003

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

LAX Airport should not be expected to handle an increasing number of passengers from other parts of Los Angeles and surrounding counties. There must be a regional approach that utilizes the large airports to the maximum extent possible with approval of residents, businesses, and others in the affected communities.

As part of the solution to traffic congestion in Los Angeles County, LAX could serve as a model for a futuristic airport with diversity in transportation which allows people the option of using private vehicles, shuttle buses, railroad trains, etc. to reach any of the airline terminals.

Of particular importance, it will be necessary to extend the Green Line of the Metro Rail into the central terminal area of LAX Airport along the inner, double-deck roadway. At some point in time, there could be a connection of a rail line that will travel north to West L.A., Santa Monica, etc.

During the past few years, the U.S. economy has been in a downturn with significant losses in employment among the various sectors of business. Therefore, it is understandable that labor unions are seeking work for their members who can't afford to be unemployed.

August 25, 2003

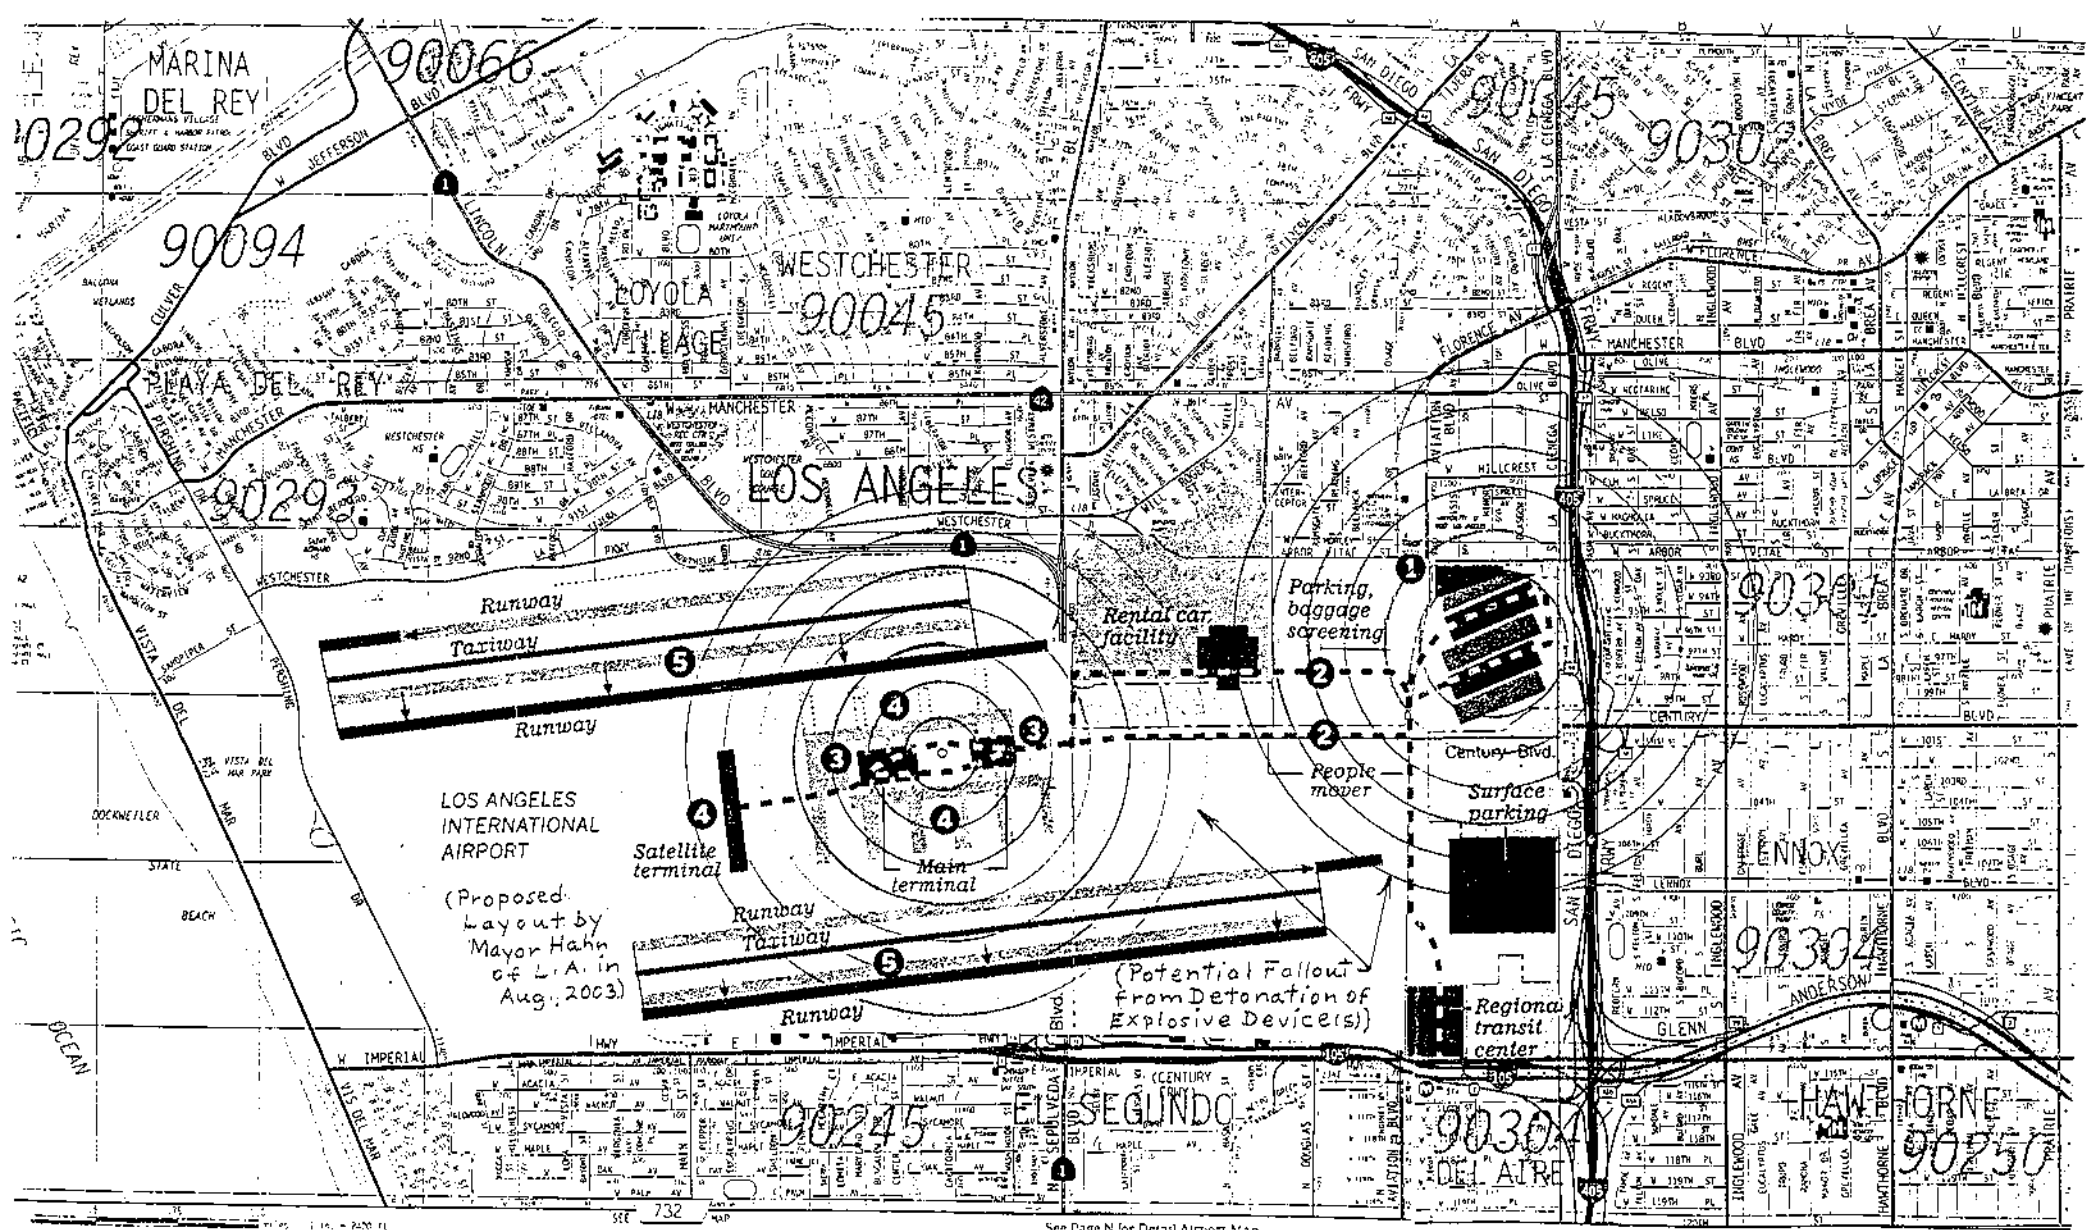

Gordon Michael Mego
4535 W. 141st St.
Hawthorne, CA 90250-6927

But I would ask the leaders of the various unions in California to withhold or to withdraw their support for the Hahn proposal for LAX Airport. In doing so, they can help create a more realistic and viable plan that a majority of the people will approve.

Under any new proposal for LAX Airport, it is imperative that we retain the airline terminals at their present locations, the parking structures in the central terminal areas, and the double-deck roadway for private vehicles, ~~and~~ that we limit any changes to the facility to necessary improvements for the convenience and the safety of the passengers, visitors, and others as well as the efficiency of operations at the airport, and that we prevent the expansion of LAX into any unused or new areas.

In conclusion, I am hopeful that my comments about LAX Airport will resonate with those individuals who are considering any proposed changes to the facility. It is incumbent upon the governing bodies to pursue courses of action that will improve the quality of life and the economic vitality of the region for the vast majority of people without spending enormous sums of money on unnecessary projects.

Gordon Michael Mego

Draft Master Plan Addendum

Supplement to the Draft EIS/EIR

Subsection (if applicable):

Number:

Title:

Comments:

1) ~~LAX~~ LAX is the main trans-Pacific Hub for the ~~US~~ United States. every flight into or out of LAX carries both local origin/Destination passengers and connecting passengers. It is not practical to ~~split~~ divide these passengers to different airports. Therefore to be realistic, we must either increase the capacity of LAX to meet demand, build ^{direct} high speed rail connections between airports, or replace LAX with a new larger airport in the inland empire

2) Moving the main parking area out of the central ~~terminal~~ terminal area is essential for both security and traffic management ~~reasons~~ reasons; However, concentrating all parking in a new "Surface transportation area" simply moves the security problems ~~and~~ Traffic congestion to a different location; Solving the congestion and ~~car bomb~~ Car bomb security issues requires creating an effective network of transit connections into LAX. The ~~intermodal~~ intermodal Transportation Center must be located in the central terminal area so that passengers

Can walk to the terminals from their trains without having to change trains. LAX needs to have a direct high speed rail link to Union Station downtown and John Wayne Airport in Orange County. It needs to have grade ~~separated~~ separated transit links from the San Fernando Valley/Westside, from downtown/San Gabriel Valley and from Burbank airport. LAX must work with MTA & SCA6 to develop the following Rail Lines:

- 1) LAX → Union Station → Ontario Airport High Speed Rail
- 2) LAX → ~~Anaheim~~ Anaheim → John Wayne Airport H.S. R.
- 3) LAX → Union Station → El Monte Subway
- 4) Aviation Sta → LAX → Westwood → Sherman Oaks → San Fernando Green Line extension
- 5) Redondo → Southbay Galleria → Del Amo Square → Long Beach Green Line extension
- 6) Burbank Airport → Hollywood → Beverly Center → LAX Subway

Incluya páginas adicionales si necesario.

Comments:

When Alternative D is continually referred to as the mayor's "Safety and Security" plan, it disturbs me a great deal. Although the plans are difficult to decipher, upon closer examination, it becomes very clear that the only thing that will be safe and secure is the airport itself.

It was my initial understanding that the Safety and Security plan was designed to protect the traveling public. This plan appears to do just the opposite. By having passengers concentrated in an area far removed from the physical structure of LAX, it is the same as painting a giant bullseye on the Ground Transportation Center and inviting terrorists to have a go at it. The propose 'people mover' has the same potential - an underground tunnel with thousands of passengers concentrated (trapped) in one area.

If the argument is for security, there seem to be many details / questions that have gone unanswered in this plan. Security technology that has not yet been developed, costs of implementation unknown - it would be irresponsible of the city, and the FAA to proceed with Alt. D without these answers.

Councilman Kelly McDowell
City of El Segundo
Comments on the LAX Master Plan Draft EIS/EIR Supplement
EPIC Center, Los Angeles
October 25, 2003

Good morning. I am Councilman Kelly McDowell, representing the City of El Segundo.

Given the length and complexity of the Master Plan and environmental documents, our complete comments, including those on technical issues, will be finalized soon and my City's comments today are preliminary.

The City of El Segundo continues to oppose Alternatives A, B, and C for the many reasons the City expressed orally and in writing during the public review and comment period for the initial Draft EIS/EIR in 2002.

The City of El Segundo has not endorsed Alternative D. However, we feel its stated objective of constraining LAX to its current capacity is appropriate and supports a regional aviation approach.

To be clear, the City of El Segundo can only support an alternative that by design will accommodate passenger and cargo levels no greater than the physical capacity of the airport as it exists today.

The City has retained a nationally respected expert to assess the capacity of Alternative D.

To the extent that our expert consultant's findings are that the passenger capacity of Alternative D, as currently designed, exceeds 78 MAP, we would hope that LAWA would cooperate with El Segundo in incorporating any revisions in the Plan necessary to ensure the capacity is not increased beyond 78 MAP.

Limiting LAX's capacity to its current capacity has always been our number one goal.

We believe that limiting capacity at LAX ~~will~~ allow other airports in the region to develop and handle their fair share of ~~the~~ future regional aviation demand.

However, my City is greatly concerned about the impacts of southside airfield changes that would move the southernmost runway 50 feet closer to El Segundo.

LAWA has stated that it believes these changes are necessary to improve runway safety.

However, we are currently studying the impacts of the proposed reconfiguration and the options for the southern runway complex.

In particular, we urge full public consideration of end-around taxiways as an alternative that could provide greater safety at lower cost and with fewer new burdens on local communities.

Safety at LAX must be a priority for all of us.

El Segundo is prepared to support measures necessary to enhance safety, even if those measures increase our burden, but only if we are assured, through an independent expert, that alternatives with fewer impacts are not equally effective.

In conclusion, we are grateful for Mayor Hahn's responsive leadership and his pledge to constrain growth at LAX and foster a regional approach to meeting future aviation demand.

It is our hope that the ultimate outcome of this Master Plan process will be a regional airport approach that ensures that LAX does not exceed its current capacity.

Thank you.

####

~~XXXXXXXXXX~~

My name is Emma Worthington and I live in Inglewood. I also work at the airport and have worked there for almost 30 years. Like myself many people who work at the airport live in the surrounding communities. We live in Inglewood, Lennox, Hawthorne, El Segundo and Westchester. We understand the connection between good quality jobs and a quality life. We need new jobs but we don't minimum wage jobs. What we need is jobs that provide a livable wage and affordable family health coverage. The companies at the airport provide those types of jobs and that is how I have been able to raise my family and not be on welfare. In order to insure that this modernization plan provides good employment opportunities for our communities, we encourage the mayor to include in his plan a local hiring program so that others in my communities can also raise their families and our youth can strive to emulate their parents. When we talk about modernization we say we are bringing the airport and Los Angeles into the 21st Century. Well we the workers would like to be able to bring our communities into the 21st Century along with the airport and the rest of Los Angeles. That is why we urge the mayor to ensure that his plan provides good paying jobs with good benefits and a community packet that will ensure we are along for the ride. NOT LEFT BEHIND.

I've resided in Inglewood for 30 years. When I moved here the airport was innocuous. Inbound planes flew in a pattern which seemed to follow Century Blvd. Out bound planes did not affect us.

The air traffic was minimal. The street traffic was bearable. The air was breathable. My sleep was not disturbed at night.

Now residents anywhere in the city have either seen or heard an airplane over their houses.

And this has resulted in.....

Traffic Congestion

main arteries

neighborhoods (speeding)

street damage

Noise Pollution 24 hours per day

aircraft

street

freeway

neurosensory disorders

Air Pollution

Aircraft emissions

Traffic emissions

Particulate matter (that we have to breath day in and day out)

Most of our adults suffer from some respiratory disorder, but alarmingly the problem is wide spread among our children whose young lungs should be uncontaminated.

Neurological / Psychiatric Disorders

Sleep deprivation

Anxiety-depression

Learning disorders *airplanes are on the descent directly over many of our schools*

Safety Issues

Low flying aircraft

More airport related facilities moving closer and into our communities – bringing with them possible terror attacks

Too many aircraft flying in close proximity at a time

Property Damage

caused by air pollutants and sound waves

LAX has been methodically increasing the airport's capacity without the required environmental impact reports.

The current report is sorely lacking in validity. It does not address solutions to any of our quality of life issues, traffic, noise and air pollution, mental and physical health, property damage and safety. It's based on old, erroneous, unsubstantiated, and irrelevant data.

LAX is not an asset Inglewood. It is the worst possible neighbor any community could have. It profits from our misfortune. But what better place to exploit than a low income minority community?

If I had any lung capacity left, I'd like ^{to go out of my house} to be able to fill them with clean air.

LAX PUBLIC HEARING

Questions from constituents of the 8th District concerning flight schedules, noise and employment:

- Why are planes permitted to take-off and land between the hours of 11:00 PM and 6:00 AM?
- Referring to jet noise levels - why haven't new criteria been established to account for flight patterns over areas such as Vermont Knolls?
- Why can't jet engines noise be muffled 10 miles before landing?
- How can the residue from jet fuel be reduced over our community?
- Why not extend the airport and runways out into the ocean?, Japan has done this successfully?
- What methodology has been devised to mass transit passengers to terminals if no curbside drop off is permitted?
- Local residents were told from the start that the general aspects of the plans were not negotiable, then why are you holding public hearings?
- Since the existing airport was designed to accommodate 40 million passengers, last year 56.2 millions used the facilities and the expansion will accommodate 78.9 million, what are your plans to not further impact our quality of life or has it been factored into your plans?

✓ ECONOMY: ✓

- Of the 49,000 jobs that the airport expansion is projected to create, how many jobs for the residents in those communities that have and will be impacted be made available?
- The Mayor has addressed unions with the expansion plans, are there plans to reach out to none union workers, giving them an opportunity for employment?
- How will the public be notified of available employment?

AA (NAME) W. SOLOMON
LIVE, SOUTHEAST
NEI COUNCIL

SOUTH
EAST

SPC00220

Dear Counsel Members,

My name is Tarlise Netherly; I am addressing you today for two reasons.

First, I am here to ask you not to approve "Alternative Master Plan D" for the Los Angeles International Airport and its surrounding area. I am making this request because there is a problem with the proposed plan. ~~THE WAY IT IS.~~

It took me a total of 12 days, 3 hours a day, to read and understand the proposed plan and the drastic changes being proposed. I originally began reading the plan to get insight on a piece of property in your proposal that I would like to develop; however, in doing my research I found something quite alarming.

With myself being handicapped I am thoroughly aware of my surroundings; therefore, I noticed that the proposal has not stated specific handicapped or disabled safety precautions being developed. The "alternative master d plan" states is "it's accessible" but what does that mean?

For instance in the proposed "People Mover", there are no intended railings for the blind to hold onto, there are no seating schematics, and there are no wheelchair safety locks. Anyone who knows anything about wheelchairs knows the wheel locks on the wheelchair are not always sturdy. There is also no mention of our exceptional four-legged friends (dogs) who assist some of us in getting around; they too are a part of us. Posting the well-recognized handicap placard is meaningless if there is no actual assistance to back it up.

Your suggestion of "Alternative Master Plan D" utilizes a great deal of paper, and yet leaves out a part of a social class that is alive, well and extremely vital in the community, it is imperative that precautions for the handicapped and disabled are included on paper and not just phased in while construction takes place; this would be improper procedure.

All too often, society ignores the fact that someone who looks, talks, and walks differently may indeed have feelings just like the next "normal" person. This is precisely why I am asking the counsel to go back and review the schematics for "Alternative Master Plan D", before making a commitment to spending millions of dollars in order to reconstruct and redevelop LAX and its surrounding areas. Should you decide to research the information I have given you regarding the handicapped and disabled, you will find there are a substantial amount of people both young and elderly who enjoy and/or are required to travel. Your "people mover" must accommodate us as well.

The second reason for my coming before you is, as I have previously stated, there is a piece of property in your plan that I would very much like to develop.

The current address of the property is 9011 S. Airport Blvd, Los Angeles, Ca. Its location is on the north/south corner of Arbor Vita and Airport Blvd; [directly adjacent the Post Office]. Please see map 2.3-1 and 2.3-2 in Alternative Master Plan D Volume I The

SPC00221

property has been vacant for approximately five years; previously, it was occupied by the Hertz Corporation, as a car rental station.

I would like to take this land and establish a nightclub. Allow me to emphasize that this will not be a strip club but an establishment where all diversities can go and enjoy themselves. The club will promote class, excitement, and relaxation, as there will be "Spoken Word" and Jazz on Wednesday's and Sunday's. There will also be Hip Hop and disco Thursday through Saturday, with hopes of diverting attention away from the adult entertainment in the area. In doing so, we will introduce a higher quality of entertainment in correlation with the image you are trying to establish with the reconstruction of the LAX area. Thus, generating additional positive revenue for the various surrounding communities around the Los Angeles International Airport.

My proposal of the nightclub will generate positive revenue for the area. As you may already know there is currently a law on the table regarding lap dancing which if passed would mean that exotic dancers would have to remain six feet way from the customer; no doubt that this will cripple the adult entertainment industry. Should this law come to pass, it will affect the three adult clubs in the airport area. From a strategic standpoint, I would like for my nightclub to take a positive spin from the negative outcome. Bring a positive outlook to the situation while still maintaining and generating more revenue for the area, ~~thus raising the property value of the said target area.~~

According to your "Alternative Master Plan D-section A2.2- Passenger Operations 1996 vs. 2000". LAX in 1996 had 57,975 visitors to the Los Angeles area vs. in 2000 there was 67,303, a difference of 9,328 (1.7%) in approximately 4 years. With ~~the~~ precise advertising, considering future demographics of the area, I believe that there will be an approximate growth increase of 2% to 5% in 5 years to support the financial burden needed for the redevelopment of the area.

I know that I am solely one person, however I am one person taking a stand for not only myself but for others in my community. The handicapped and disabled persons issue came up only after doing the research required for the nightclub. I now leave you with two major issues to contemplate. First, how to incorporate safety precautions for the handicapped and disabled into your plan, and second, allowing me to lease a plot of land that has been vacant for quite some time. My objective is to turn it into a positive influence for the community and the LAX area as well.

I have taken the liberty of visiting the land, as well as have taken (show pictures) as you can see, the surrounding area is a place where an influx of revenue can have a positive influence on the area. Since the current night spots are the sports bars in hotels. with the nightclub in this central area there will be a diversion of revenue from the distant surrounding areas to the main area in which you are trying to redevelop.

The areas that will be influenced by the nightclub's location; 1) more employment, 2) parking structures, 3) eateries, 4) the hotels in the area, 5) airport travelers, and 6) the ~~raise of value for the airport and~~ the surrounding business and residential communities.

Now I am not going to tell you that everything is going to be completely positive, because this is not Utopia. The downside to all this is going to be a security issue for both the Airport and the nightclub, however that can be minimized, with the right Security firm that coincides with the Security implemented in the surrounding parking structures and the Airport, that downside can become null and void.

I urge you, the counsel, to please consider this alternative, ^{in the} as opposed to using taxpayer money to ~~redevelop and reconstruct LAX.~~

Document: Draft Master Plan Addendum Supplement to the Draft EIS/EIR

Subsection (if applicable):

Number: Title: EXECUTIVE DIRECTOR

Comments:

In L.A. County African American, Latinos and Asians are three times more likely to have a hazardous waste treatment, storage or disposal facility within one mile of their homes than white population. Schools with more than 50% people of color population are three times more likely to a facility reporting to the Federal Toxic Release Inventory within a mile of the school. Children attending schools with the highest risk to respiratory health problems score significantly lower achievement (from poor air quality)

People of color have historically been burdened with the negative impacts of development that benefits the broader society while forced to live in poverty. People of color are now declaring this environmental racism unjust. We demand environmental justice. Any project at LAX will have impact on the surrounding communities of color and we demand justice for these communities. Any project that benefits the economy has to benefit the people impacted.

Los Angeles, CA 90009-2216

Skimming through the supplement to the draft EIS/EIR, and listening to different LAWA staff people (and elected officials) I have come to believe that they seem to be more concerned and careful of the infrastructure and economics of the buildings and money-making resources, than of the health, welfare and sanity of the surrounding communities. All I see in this plan is greed on all levels of government. Why don't people who are ~~are~~ ^{not} elected officials get the compensation and quality of life they deserve?

In 2001 SCAG had an item in its RTP about the Arbor Vitae interchange. Time and again elected officials had said that it had nothing to do with the airport or its expansion, and LAWA staff even went so far as to say that the interchange was for the Forum (which is now a church), Hollywood Park (which needed financial help from the city of Inglewood) and a Kmart that is no longer existent. So if the interchange is not for the airport why is it in the EIS/EIR?

There is a MOU between LAWA and Inglewood that is mentioned in the EIS/EIR, that its aviation easement requirements are currently suspended—the requirements to the aviation easements that the residents had/have to sign takes away their right to sue the airport.

In the past Inglewood's mayor had wrongly stated at a City Council meeting that the Easements had been eliminated while in fact they *were* merely suspended.

With Manchester Square as the GTC how will it improve security and safety? I guess if you want to keep the CTA safe Manchester Square helps, but how is putting all the people closer to the residents of Westchester going to keep the passengers and residents safe? If someone really wanted to do something to improve safety and security they would do the best thing and regionalize.

QUALITY OF LIFE COMMENTS:

- Pollution - both noise and aerosols components will increase dramatically, because airline traffic will expand to the level required by the planned MAP goal.
- Included in the plan, should be a proposal to provide funds to complete the existing soundproofing contracts and identify the remaining homes that are affected, based on 55 DNL noise levels and above.
- The infrastructure- Century Blvd. from the 110 freeway to La Cienega and other heavily traveled streets to and from the airport should be resurfaced regularly with funding support from LAWA to eliminate pot holes and other irregularities.
- Homeowners residing in the flight path of Los Angeles International Airport are significantly impacted by airplane noise, making it difficult to plan and enjoy activities in the backyard or leave doors and windows opened for ventilation. The constant drone of airplanes taking off or landing does not permit normal phone conversation without interruptions or the enjoyment of a television program without exceeding the 60 decibels dBA level, which have been determined to be a normal level for conversation.
- Environmental issues, health issues and soundproofing for residents living in the flight path and around LAX must be mitigated prior to approval of any plans to expand.

ENVIRONMENTAL:

- The environmental impact, particularly air pollution and noise will be substantially increased during the physical construction as well as when the expansion is complete.

HEALTH ISSUES:

- Studies dating back to 1977 reports that continued exposure to loud noise is a health hazard to individuals living near or around flight corridors.
- Airplane noises are linked to:
 - Stress
 - Hypertension
 - Sleep deprivation and interruptions
 - work-related performance
 - learning and academic performance

The residents of the 8th District would like to go on record opposing any expansion until the environmental, health and economic issues are mitigated to assure that our quality of life will not be further compromised.

CANA CA 90006 #112

MY NAME IS SUSAN KIM
AND I REPRESENT KOREAN WELFARE ORGANIZATION
I have come here today to ~~testify on~~ support
~~of~~ of ~~the~~ Alternative D of the
LAX MASTER plan.

I believe that Mayor Hank's proposal
is a balanced plan because it allows
for some growth while taking into
consideration the impacts to the surrounding
communities plus this project will create
some what 50,000 jobs. construction
related jobs for the people of Los Angeles

The plan will improve operations and
create a greater level of customer
service by improving the passenger
experience for travelers

I ~~believe~~ myself believe it is time to
~~modernize~~ modernize LAX. ~~and~~ ~~that~~
and I believe Alternative D is step
in the right direction
Alternative D isn't for Mayor Hank.
IT'S for the Thank you
CITY OF LOS ANGELES.

October 24, 2003

The Honorable James K. Hahn
Mayor's Office
City of Los Angeles
200 North Spring Street
Los Angeles CA 9012

LOS ANGELES, CA 90017

213/482-6660
213/482-6673 FAX
800-LOCAL347

www.seiu347.org

Dear Mayor Hahn:

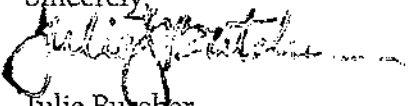

On behalf of the Service employees International Union - AFL-CIO (SEIU) Local 347, I would like to express our strong support for Alternative D of the LAX Master Plan.

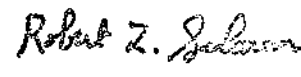

SEIU Local 347 represents over 700 employees that work at LAX and thousands that live in the surrounding communities. The employees we represent are directly impacted by what happens at LAX. We feel that your efforts to modernize LAX are a step in the right direction. Alternative D is a balanced approach to maintaining LAX as an economic engine for our regional economy while considering the environmental and traffic impacts to the surrounding communities.

Your Safety and Security Alternative addresses many security concerns at LAX and allows the flexibility to accommodate evolving federal security requirements and technology. SEIU Local 347 has a great interest in providing a safe and secure work environment for its members at the airport and in the surrounding areas.

SEIU Local 347 feels strongly that the modernization of the airport is long overdue and necessary. The improvements that alternative D proposes will provide for improved operations and increased efficiencies that will benefit passengers and concessions at LAX. Maintaining LAX as an international gateway to the country will maintain hundreds of thousands of jobs directly related to LAX. We recognize the importance of preserving LAX as a premiere airport in the world.

We appreciate your leadership and continuous efforts to modernize LAX. We look forward to working closely with you throughout the master plan process.

Sincerely,

Julie Butcher

SPECIFIC GOALS FOR LAX RECONFIGURATION PLANS—GREEN LINE CONNECTIONS

Friends of the Green Line has concluded as its realistic goals to ask the City of Los Angeles and LA World Airports to **NOT PREVENT LAX RAIL ACCESS FROM THE NORTH AND/OR TO PREVENT THE GREEN LINE FROM PROCEEDING NORTH BEYOND LAX:**

Where Friends of the Green Line now stands with respect to the Green Line and LAWA Traffic Mitigation as part of its final EIR is that non-automobile-related traffic measures should include:

1) A written promise for LAWA to fund the necessary trench west of Aviation Blvd. along the MTA Harbor Subdivision ROW to allow the Green Line to proceed north from the current Aviation/Imperial Green Line station without interfering with LAX radar beacons and/or other electromagnetic operations associated with LAX

2) A written promise for LAWA to fund and construct its final Ground Transportation Center (whether it is at Manchester Square or anywhere else) in a manner that allows for a future Green Line station.

LAX-bound passengers from the north should not overshoot LAX to reach the future Intermodal Transit Center at Aviation/Imperial in order to connect with the Central Terminal Area via the LAX People Mover

3) A written promise for LAWA to fund and staff any future preliminary engineering for a Green Line that connects to Westchester and the Westside in a manner that does not preclude the Green Line from reaching these destinations, and in a manner that complements, not competes with, the future LAX People Mover

Testimony from Rep. Maxine Waters

**Public Hearing on the Supplement to the Draft EIS/EIR
for the Proposed LAX Master Plan**

**Granada Hills Charter High School
10535 Zelzah Avenue
Granada Hills, CA 91344**

October 22, 2003

Alternative D is a \$9 billion project that would demolish homes and disturb communities without improving the safety and security of LAX. The Supplement to the Draft EIS/EIR is an inaccurate and misleading document that fails to reflect the true impact of this project.

The centerpiece of Alternative D is the Ground Transportation Center (GTC), a large remote passenger check-in facility that would be constructed at Manchester Square, several blocks away from the airport terminals. An Intermodal Transportation Center (ITC) would be constructed at Aviation Blvd. and Imperial Highway, which would provide a connection to the Green Line. According to the Supplement to the Draft EIS/EIR, the GTC and the ITC would be the primary access points for all passenger drop-off and pick-up and vehicle parking. A Consolidated Rental Car (RAC) facility would be constructed in Westchester.

Inconvenience for Passengers

Local families could no longer drive to the Central Terminal Area in order to drop off passengers. Instead, an Automated People Mover would be constructed to transport people to the airport terminals, and a baggage tunnel would be constructed to transport baggage. All airport employees and passengers would access the Central Terminal Area from the GTC, the ITC and the RAC via the Automated People Mover, carrying their carry-on baggage with them. This would be extremely inconvenient for most passengers, and it would present special hardships for the elderly, the handicapped and families traveling with small children.

Airport Security

Supporters of the proposed project to construct a remote passenger check-in facility claim that the facility is necessary to improve the safety and security of LAX and prevent terrorist attacks at LAX. Theoretically, diverting all vehicular traffic to remote parking structures and the remote passenger check-in facility would protect the Central Terminal Area from car bombs.

The RAND Corporation conducted a security study of the proposed remote passenger check-in facility, which was released on May 14, 2003. The study concluded that the proposed project would not significantly improve the security of LAX. The study also concluded that concentrating passengers in the proposed remote passenger check-in facility could increase the likelihood that the check-in facility would be the target of a terrorist attack. Finally, the study concluded that concentrating several airport functions in the remote passenger check-in facility could exacerbate the effects of an attack on airport operations.

On July 25, 2003, I introduced H.R. 2985, a bill to condition construction of a remote passenger check-in facility at LAX upon a finding that such a facility will promote the safety and security of the public. H.R. 2985 would require the Secretary of Homeland Security to review the proposed facility prior to its construction to determine whether it will protect the safety and security of air passengers and the general public more effectively than the existing facilities at LAX. If the Secretary of Homeland Security does not determine that the facility will improve public safety and security, the Federal Aviation Administration (FAA) would not be allowed to approve its construction. On September 2, the Board of Supervisors of Los Angeles County passed a motion to support my legislation.

Ironically, Alternative D does not even significantly improve security at the Central Terminal Area. According to the Supplement to the Draft EIS/EIR, Alternative D calls for the installation of new baggage screening facilities in the Central Terminal Area -- not the remote passenger check-in facility. If Alternative D were designed to protect the Central Terminal Area from terrorist attacks, one would think that the baggage would be fully screened before it is transported through the baggage tunnel to this area. Nine billion dollars is an extremely high price to pay for a security project that provides protection from car bombs but not from suitcase bombs.

Displacement of Residents

The Supplement to the Draft EIS/EIR makes the astounding claim that Alternative D would not displace any residents. Instead, the Supplement predicts that 2,500 houses and apartments will be acquired and the residents relocated under LAWA's existing Voluntary Residential Acquisition/Relocation Program, through which LAWA may acquire property and relocate residents on a voluntary basis in order to mitigate the impact of airport noise. The Supplement then concludes that Alternative D would not require the acquisition of any additional dwelling units or the relocation of any additional residents. This claim is especially ironic, given the fact that several Manchester Square residents have already said that they will not leave their homes voluntarily.

In reality, Alternative D would displace thousands of Manchester Square residents. In order to construct the remote passenger check-in facility, the City of Los Angeles would have to acquire and demolish 38 houses, 179 apartment buildings and a 52-year-old elementary school, in addition to the 263 structures it has already acquired. It would also have to relocate about 6,200 people, some of whom have federally subsidized housing vouchers. I strongly oppose the forced relocation of any of these residents.

The Cost of Alternative D

Alternative D would cost \$9 billion, an exorbitant amount of money, at a time when budget deficits are growing and the economy is weak. Airlines would be required to increase their passenger fees in order to fund the proposal, which would amount to a tax increase for air passengers. American taxpayers have already provided loan guarantees to the airline industry to keep the airlines in business following the terrorist attacks of September 11, 2001. They should not have to pay higher passenger fees for unnecessary airport construction projects as well.

Air passengers and other taxpayers are willing to support reasonable expenditures to pay for measures that provide real enhancements in security, such as the installation of baggage screening facilities. However, the remote passenger check-in facility, the Automated People Mover and the baggage tunnel included in Alternative D are not reasonable expenditures and do not provide real enhancements in security.

The American people are sick and tired of deficits and bloated government spending. The State of California is now running a \$38 billion deficit, and the federal government has a \$374 billion deficit in 2003. Furthermore, Congress is in the process of providing the President an additional \$87 billion for continuing operations in Iraq and Afghanistan. The American people cannot afford to spend \$9 billion on an outrageously expensive boondoggle at LAX.

Conclusion

Alternative D is simply a continuation of former Mayor Richard Riordan's plan to expand the airport in the name of safety and security. I urge the City Council of the City of Los Angeles to reject this ill-advised and expensive scheme that will displace thousands of Manchester Square residents without improving the safety and security of LAX.

Nine billion dollars is an extremely high price to pay for a security project that provides protection from car bombs but not from suitcase bombs.

Displacement of Residents

The Supplement to the Draft EIS/EIR makes the astounding claim that Alternative D would not displace any residents. Instead, the Supplement predicts that 2,500 houses and apartments will be acquired and the residents relocated under LAWA's existing Voluntary Residential Acquisition/Relocation Program, through which LAWA may acquire property and relocate residents on a voluntary basis in order to mitigate the impact of airport noise. The Supplement then concludes that Alternative D would not require the acquisition of any additional dwelling units or the relocation of any additional residents. This claim is especially ironic, given the fact that several Manchester Square residents have already said that they will not leave their homes voluntarily.

In reality, Alternative D would displace thousands of Manchester Square residents. In order to construct the remote passenger check-in facility, the City of Los Angeles would have to acquire and demolish 38 houses, 179 apartment buildings and a 52-year-old elementary school, in addition to the 263 structures it has already acquired. It would also have to relocate about 6,200 people, some of whom have federally subsidized housing vouchers. I strongly oppose the forced relocation of any of these residents.

Noise and Traffic Congestion

For several years, I have been working to limit the environmental impact of Los Angeles International Airport (LAX) on the surrounding community. My constituents living next door to LAX, in Westchester, Inglewood, Hawthorne, Gardena and South Central Los Angeles, must contend with excessive noise, pollution and traffic congestion caused by the airport. These residents suffer many sleepless nights due to deafening jet noise. They must wipe the soot from aircraft emissions from their cars and driveways everyday. Residents have reported increased cases of asthma, respiratory ailments and hearing problems.

I do not accept the claim in the Supplement to the Draft EIS/EIR that Alternative D would reduce by 1,300 the number of residents exposed to noise levels of over 65 CNEL by the year 2015. Most airport noise is the result of airplane landings and departures, and Alternative D does not propose any reduction in landings and departures. In fact, Alternative D would increase the airport's capacity from 78 million air passengers per year to 78.9 million air passengers per year. Consequently, Alternative D could allow the number of landings and departures and the corresponding jet noise to increase. Of course, Alternative D could reduce the number of residents exposed to high levels of airport noise as a result of the forced relocation of residents from Manchester Square. However, forcing residents to leave their homes is no way to respond to their complaints about noise.

The claim in the Supplement to the Draft EIS/EIR that Alternative D would reduce traffic congestion is also not credible. Alternative D would concentrate airport traffic on the east side of the airport near the proposed remote passenger check-in facility, causing a shift in airport traffic to the I-405 freeway near the Arbor Vitae/Manchester Avenue exits. This could cause a tremendous increase in traffic congestion on I-405, which is already heavily congested. It could also increase traffic congestion in the surrounding communities as airport passengers and other drivers seek alternative routes to get to, from and around the airport. Concentrating airport traffic at a single facility will not reduce congestion.

The Cost of Alternative D

Alternative D would cost \$9 billion, an exorbitant amount of money, at a time when budget deficits are growing and the economy is weak. Airlines would be required to increase their passenger fees in order to fund the proposal, which would amount to a tax increase for air passengers. American taxpayers have already provided loan guarantees to the airline industry to keep the airlines in business following the terrorist attacks of September 11, 2001. They should not have to pay higher passenger fees for unnecessary airport construction projects as well.

Air passengers and other taxpayers are willing to support reasonable expenditures to pay for measures that provide real enhancements in security, such as the installation of baggage screening facilities. However, the remote passenger check-in facility, the Automated People Mover and the baggage tunnel included in Alternative D are not reasonable expenditures and do not provide real enhancements in security.

The American people are sick and tired of deficits and bloated government spending. The State of California is now running a \$38 billion deficit, and the federal government has a \$374 billion deficit in 2003. Furthermore, Congress is in the process of providing the President an additional \$87 billion for continuing operations in Iraq and Afghanistan. The American people cannot afford to spend \$9 billion on an outrageously expensive boondoggle at LAX.

Conclusion

Alternative D is simply a continuation of former Mayor Richard Riordan's plan to expand the airport in the name of safety and security. I urge the City Council of the City of Los Angeles to reject this ill-advised and expensive scheme that will displace thousands of Manchester Square residents without improving the safety and security of LAX.

COPY

The Honorable James Hahn
Mayor of Los Angeles
200 North Spring St., Room 303
Los Angeles, Ca. 90012

October 25, 2003

Dear Mayor Hahn,

The past two weeks have been among the worst in our lives. The cause? The constant and unrelenting noise from LAX that has gone on late into the night and started up early in the morning. We live one mile north of the airport, have insulation and double paned windows. The week-end of the 10th was a week-end from hell and we averaged four and a half hours of sleep on Friday, Saturday and Sunday. Mayor Hahn, you wouldn't want to live like this and neither should the people in Westchester/Playa del Rey. We deserve something better.

The plan D you're proposing will only make things worse. This "modernization" which would also allow for 12+ million more passengers, sounds like an expansion to us. You can pour 9 billion or 90 billion into LAX and, in the long run, it will still be a second class, tiny airport which is over-crowded and obsolete for today's needs. LAX should have been used as a secondary air port two decades ago, but no one has had the foresight to realize it or take the necessary steps.

Every other major city in this country and Europe has recognized the need to build a new airport outside the inner city and has done so. Los Angeles is the only one lagging behind in all forms of transportation, but especially air. We have lived in Los Angeles for over 50 years and heard Palmdale, Palmdale, Palmdale from day one. Yet no one has had the boldness and vision to build a state-of-the art International airport there where there is plenty of acreage for future expansion. There would be room for nice hotels and restaurants also. Of course, there has to be ground transportation to accompany an airport, but there are many choices there as well. There are thousands of people in the Valley and inland areas that would be delighted not to have to come to LAX. It will take someone with vision to do this and that person could be you.

Where would our city be if the movers and shakers of the past had listened to the "naysayers"? We'd still be a small town. The recent and wonderful additions to our down-town, especially the spectacular Concert Hall, will undoubtedly attract thousands of visitors if Frank Gehry's museum in Bilbao, Spain is any indication. The Staples center and new Cathedral are also major attractions.

Where will these people land? Will it be in some dinky, obsolete air-port or a modern terminal where they can be quickly and comfortably transported to down-town (think Union Station).

This is your chance, Mayor Hahn, to step into a new age, a new millennium, and plan for the future. All too often, your predecessors have looked to the past and applied the "band-aid" approach to solve the problems of Los Angeles. This could be your chance to make our city BETTER, not just bigger. It would then become the great city it was intended to be.

Sincerely yours,
Ruth and Don Glennon
(Mr. and Mrs. Donald F.)

Comments:
 My home is situated along the aircraft landing approach to LAX. Therefore, I am requesting that my home and those in my surrounding neighborhood be retrofitted with sound-proof windows and air-conditioning as a part of the airport noise abatement program.
 As a member of the Manhattan Place Block Club organization, I am also requesting an immediate response to these concerns on behalf of those I represent.

Office Use Only

Comments:

Why is Los Angeles the only major city that is serviced by one airport? LAX can only be improved/modernized to a certain extent. Rather than putting a bandaide fix on this problem, wouldn't it be better to be looking at a regional solution that would distribute passengers throughout Southern California?

Trying to expand LAX is like trying to put a square peg in a round hole. The area around the airport will NOT support the growth proposed, yet the city is willing to pull out all the stops to make this work. Why not put that energy into development of Palmdale and Ontario where the projected growth is? These areas would welcome the business it would bring to their communities. It doesn't look like the desire or will is there to find a truly workable solution to the problem.

Comments:

Nothing about the plan that has been presented to the public sounds like it is very secure. It sounds like the airport, the airplanes and buildings are more important than the passengers are.

It sounds like the city (the mayor) just wants to get anything finished done and get this airport issue behind him.

This alternative all plan doesn't seem like it will actually do anything to make traveling in and out of Los Angeles more safe. I don't like the idea of having to go all the way to the other side of the airport from where I live to catch a flight.

Comments:

As a resident of a neighborhood near LAX, I'm quite concerned about the transportation issues involved in Alternative D of the Master Plan.

In all of the meetings I've attended, I still haven't heard specifics addressing traffic mitigation. There do not seem to be hard and fast answers about how the mitigation measures offered to our community will be funded.

Traffic on the 405 freeway around LAX is always congested, but there are several offramps to choose from. Frequent travelers know that they have several alternate routes. From what I've observed, Alternative D would funnel all airport traffic through one offramp. The plan claims that this would increase freeway speeds and reduce traffic. Although I'm not an engineer, I can't imagine that taking traffic from 3 exits and squeezing it into ONE exit will do anything to relieve airport traffic from the 405.

I would like to know what type of traffic studies have indicated that Alternative D will do anything to alleviate the already congested traffic situation.

Attach additional sheets if necessary.

Mr. David Kessler:

As my bizarre work schedule keeps me from attending the three EIR hearings regarding the LAX masterplan, I've compiled this brief letter to add my comments.

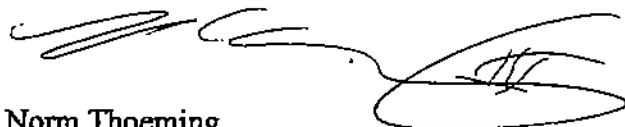

First of all, thank you for this wonderful, innovative plan for the future of LAX and the entire community. I assure you that I and every person over which I hold the slightest influence will accept and encourage this remarkable plan. Keep up the good work.

Another issue facing the future of Los Angeles is the expansion of the MTA system and the proposed California High Speed Rail project. While Alternative D does include a direct connection with the Metro Green line at Aviation via a pedestrian walkway (an option which will only help both MTA and cut down on Airport traffic), I haven't found details about what will be done with the existing northbound MTA-owned ROW along Aviation.

In the past, various parties have insisted that a Green Line extension northward or any rail into the airport may affect various controlling beacons and equipment. Having taken the El into O'Hare, obviously it is doable. Please encourage all parties included to think for the future of the city and the airport to preserve this right of way and to build into the construction budget the necessary trench west of Aviation Blvd along the MTA Harbor Subdivision ROW. This would allow the Green Line to proceed north from the current Aviation/Imperial Green Line station without interfering with LAX radar beacons and/or other electromagnetic operations associated with LAX.

On the same note, please encourage those involved to allow space for a future additional train station at the ITC or the GTC should the Green Line expand or should High Speed Rail come from Union Station to LAX via the former Slauson railroad tracks.

Thank you very much for your time, your efforts, and your open mind:

The LAX Community Noise Roundtable Draft EIR / EIS Comments

The LAX Community Noise Roundtable was created in September 2000. It is composed of elected officials or their designees from Rancho Palos Verdes, Palos Verdes Estates, Redondo Beach, Hermosa Beach, Manhattan Beach, El Segundo, Culver City, Monterey Park, Los Angeles (Districts 11 and 8), Inglewood, Hawthorne, Los Angeles County, the FAA, the ATA, Los Angeles International Airport Area Advisory Committee and representatives from area groups.

1. The dates used do not satisfy the baseline for comparison to be as of the time that the Supplemental to the Draft EIS/EIR was submitted. The baselines were outdated at the time they completed the Supplemental to the Draft EIS/EIR.
2. 4.1.6.1.5 states, " the increase of the size of aircraft would result in louder individual noise events and consequently greater total noise energy levels and slightly increased contour size". This is against our stated policy of shifting noise from one community to another.
3. 4.1.6.1.5.3 - Page 4-65. This is against our stated policy of shifting noise from one community to another. S4.1-27 indicates a 2000 increase in population newly exposed to 65 CNEL or greater; an increase of 150 dwellings added within the 65CNEL; and 4 schools, 2 churches and 3 hospitals are newly added. Where are the precise mitigation measures for these increases?
4. The LAX Noise Roundtable does not support any flight track alteration or airfield alteration that shifts noise from one community to another. The FAA has also stated that to be their policy.

The moving and/or extending of runways 24L, 24R, and 25L results in the shifting of the noise contours and/or the shifting of noise from one community to another. Moving a runway changing the take off and landing of an aircraft flight path causes a significant shifting of noise. Why does the document indicate that there is not a significant change? What metric is used to determine 'significant'?

5. The development of the A-380 and other potential jumbo jets noise characteristics have not been analyzed or incorporated. Will this increase or decrease the single event noise and the CNEL Contours? The actual noise characteristics of these advanced aircraft should be used in your study. Why does the document not mention these characteristics? How do the larger jumbo's perform with tail winds below 2, 4,6, 8, and 10 knots?

6. The World Health Organization (WHO) has upgraded noise pollution from a nuisance to a serious hazard. According to the WHO, "prolonged or excessive noise exposure has been linked to high blood pressure, heart disease, concentration problems and, of course, hearing loss. People who live in neighborhoods near highways and airports experience noise risks". Why were the affects of noise from health studies not presented in the document?

7. The threshold of significance for SEL single event noise used was 94 dba for exterior noise and 81 dba for interior noise for awakenings and is inadequate. The 94dBA and 81dBA is too high a threshold. We feel the SEL single event dba should more closely be associated with 'annoyance' and not just 'awakenings'. Why didn't the EIS/EIR deal with annoyance? Why were the reputable WHO statistics not evaluated in the guidelines?

8. Why in the N/ANP alternative is there an increase in nighttime noise?

9. We recommend that SEL single event noise be used to expand the areas for noise insulation. No one complains about a CNEL infraction. They call about single event noise. The Supplemental to the Draft EIS/EIR does not use as a mitigation measure a program to incorporate the single event criteria as a useful tool to a soundproofing program. Seeing as this is something that should have been included years ago it is only appropriate that LAX use this new legal tool to expand the area of dwellings in the soundproofing program. Why wasn't this issue addressed in the Supplemental to the Draft EIS/EIR? How many times a day are single event noise thresholds exceeded?

10. The outcome of a WHO expert task force meeting in London in March 1999, includes guideline values for community noise:

<u>Environment</u>	<u>Critical Health Effect</u>	<u>Sound Level dB(A)</u>	<u>Time hours</u>
Outdoor Living Areas	Annoyance	50 - 55	16
Indoor Dwellings	Speech intelligibility	35	16
Bedrooms	Sleep disturbance	30	8
School Classrooms	Disturbance of communication	35	During class

11. Percentages are very misleading when used in noise disturbance statistics. The actual numbers including percentages are needed for analysis. Facts, figures, noise levels, estimated values, decibels, and comparisons should have been provided. Why were the actual metrics not presented?

12. Will simultaneous landings of aircraft, on 24L, 24R, 25L, 25R runways, take place during the construction of the aforementioned runways? If so, what impact will that have on the CNEL and singles event noise?

13. What impact will simultaneous landings and/or takeoffs have on noise contours and single event noise?

14. Will simultaneous landings take place when all runways are completed?
15. What will be the noise impact of air traffic rerouting during runway reconstruction?
16. Easterly direction take offs are very disturbing to airport neighbors for awakenings and annoyance. It is apparent to the Roundtable that the awakenings of easterly takeoffs at night is far more disturbing than one out of ten instances that your report indicates. How were your figures determined?
17. Low frequency noise measurements are neglected in the Supplemental to the Draft EIS/EIR. Low frequency noise is a serious disturbance. Why aren't there any measurements and mitigation measures for low frequency noise included in this Supplemental to the Draft EIS/EIR? Please provide any information you have pertaining to this problem.
18. We recommend the suspension of all aviation easement requirements on all noise insulation programs. Why weren't the state requirements for avigational easements included in the noise insulation programs? Why hasn't LAWA included air conditioning units in all past and future noise insulation programs even though not funded by the Federal government?
19. Why is there no noise information about the Beach communities and Palos Verdes Peninsula, even though they have had noise annoyance problems for some time? Why have they been omitted? Explain the failure to look at noise impacts at CNEL levels below 65 that might include Palos Verdes Peninsula and the beach communities? (For example 50, 55, 60 CNEL)
20. Single event noise levels should expand to include a 20 mile radius. How can you determine an annoyance factor area if you don't expand your area of investigation? Why were areas negatively impacted by single event noise not included in the EIR/EIS? (See comment 10)
21. What feet mix in 2015 was used to arrive at the conclusions in the document? How many are turbo-props?
22. The EIR/EIS states the Alternative D capacity of 78.9 MAP is a theoretical number, which may be exceeded. The use of 78.9 MAP as a limiting factor in the future growth of LAX is not enforceable. Why weren't noise impacts above 78.9 MAP investigated and documented? What is your plan? Will the relocation of the "curb front" allow more passengers to use the airport and thus more operations and thus more noise? Why were there no new theoretical MAP numbers applied to Alternative D when it increases the capacity of LAX beyond 78.9 MAP?

If the theoretical capacity as stated in the EIR/EIS can exceed 78.9 MAP if demand increases where is the regional plan which would reduce the demand on LAX? If there is no regional plan then where are the numbers showing impacts above 78.9 MAP?
23. Why hasn't the City of Los Angeles continued to support the Southern California Regional Airport Authority if they believe in a regional approach in airport capacities and a cap of 78.9 MAP at LAX?
24. As demand increases when will the capacity of normal operations start to impact over ocean operations? At what point does demand cause LAX to remain in normal operations past the 12 a.m. to 6:30 a.m. window?

25. The EIR/EIS relies on mitigation measures based on the successful Part 161 approval by the FAA. Is this a guaranteed approval process? Why was it assumed that this would happen? Why are there no studies that show the impact without the Part 161?

26. The EIS/EIR states 6.2.3: "Prior to the determination of sound treatment eligibility, however, a new study of the relationship between specific aircraft noise levels and childhood learning abilities will be undertaken by LAWA as part of the continuing environmental monitoring process obligated under CEQA. This study will seek a predictive statistical relationship between the level of aircraft noise present at a school and the ability of children to learn, as expressed by standardized test results. When that study is complete and acceptable results are achieved, the potential for additions to the sound insulation program for schools will be revisited as part of LAWA's continuing environmental management responsibilities."

How do you plan to test the impact of noise on the ability of children to learn in affected schools like the Lennox Elementary School District when the only learning environment has been one with aircraft noise? What would be their learning abilities without noise when they haven't had the opportunity to learn without noise.

27. Speech interference was the level of significance used in the analysis. Why was this not used to measure impacts that would result in the need to identify mitigation actions?

28. The word 'significant' is used throughout the SUPPLEMENT TO THE DRAFT EIS/EIR MASTER PLAN for LAX. We have come to the conclusion. After making several inquiries about the definition of the word 'significant' to high level Deputy Executive Directors of LAWA and others, there is no one definition capable of applying to all instances of its use. The Executive Summary of Volume One of this Supplemental Draft to the EIS/EIR does not address the definition of "significant." Therefore it is necessary to ask the same question about similar but different statements included in the Supplemental Draft to the EIS/EIR. Please refer to the Executive Summary, Volume One of the Supplemental Draft to the EIS/EIR for titles and page numbers of the Executive Summary Tables. Please do not use words that are synonymous with 'significant' to explain. Define, and interpret the word 'significant'. Some of the words to avoid in explaining the definition are: important, meaningful, weighty, notable, profound, Pivotal, serious, momentous, Substantial, and other synonyms of this type. Facts, figures, noise levels, Estimated values, decibels, and comparisons should have been provided what metric values were used to determine these levels of significance?

Executive Summary pages 51-76 4.1 Noise

1. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
2. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
3. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
4. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
5. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
6. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
7. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.

4.2 Land Use

1. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
10. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
11. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.

4.24.2 Health Effects of Noise

1. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section

4.27 Schools

3. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section

29. How can noise impacts that are 'unavoidable' be acceptable?

30. Will the elimination of "avigation" easements for all impacted areas help reduce the number of legally impacted dwellings and people? How many households refused the sound insulation offers because of avigation easements requirements?

31. The California Airport Land Use Handbook concludes that no definitive, widely recognized, single event noise level guidelines currently exist relative to land use compatibility planning. This Supplemental to the Draft EIS/EIR would have been an ideal tool to establish single event noise level guidelines. Why didn't the document include the necessary research to accomplish that goal?

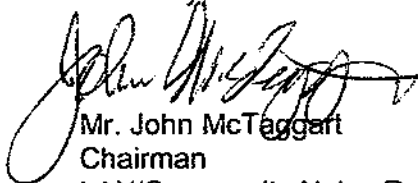

32. The Automated People Mover (APM) operation will impose undesirable noise on all 10 existing hotels in the Century Boulevard/98th Street area. The noise level; is rated by the EIS/EIR as a severe impact on 2 hotels and a significant impact on 4 others. High activity levels include 1755 day-trips (about 2 per minute) and 615 night-trips (about 1 per minute). What are the mitigation measures for noise of the APM?

33. Some requests for easterly takeoffs during over ocean operation are based the slant of runway 25R/7L from west to east. Why was the leveling of the runways on the south side of LAX not included in the EIS/EIR?

34. Do the characteristics and performance of the A380's and other jumbos interfere with its ability to comply with over ocean operations?

Thank you.

Sincerely,

Mr. John McTaggart
Chairman
LAX/Community Noise Roundtable

Comments:

1. I have reason to believe and allege that the public hearing venues are purposely chosen to maximize the inconvenience and dissuade people who live in the South Bay Area (Torrance, Redondo Beach, Manhattan Beach, Hermosa Beach, El Segundo, Lawndale, Hawthorne, Rancho Palos Verdes, Rolling Hills Estates, Palos Verdes Estates, & Rolling Hills) from attending. This is a blatant example of purposely inconveniencing people to limit adverse comments.
2. I saw no discussion about aircraft noise after departure heading south to southeast that affects the South Bay Area. Aircraft noise is a prime complaint of our residents. Planes fly too low and turn too soon. This issue is avoidable by demanding departures extend 5 miles west from the shore line and reach an altitude of 10,000 feet, whichever occurs first, before changing course and heading southerly and easterly over the Los Angeles basin.

When I read \$9 billion as the projected cost of Alternative D, I can't quite grasp the number. With friends who work in the airline industry fearful of job losses and the public traveling less since 9-11, how can this expenditure be justified?

My main concern after reading parts of the Risk Study printed in the paper was that this Alt. D will not actually guarantee safety or security. As a community member, I'm not sure we can't find ways of implementing security measures now for a fraction of the cost proposed by Alt. D. The \$9 billion price tag is really a red flag to those of us who already think that this plan is a boondoggle!

Alternative D of the LAX Master Plan still does not address the major concerns of the airport's neighbors.

How long will it take to get answers to what health impacts we are being subjected to by living in close proximity to the airport?

So far, the studies still do not answer question parents have about pollution, toxic emissions, learning issues, sleep disturbance and noise associated with increased operations at LAX. These questions will not go away. Until air quality can be measured and deemed safe for the surrounding communities, Alternative D should not be given the green light to move forward.

Comments:

Since those who conducted the RAND study have nothing to gain in the ongoing airport expansion debate, I think the city should take heed to the points it makes rather than dismissing it. The cost of the project for Los Angeles airport has raised many questions about how (and if) it can be financed. I was under the impression that you could build a couple of airports for what it would cost to improve or modernize this existing one.

I agree that something needs to be done to improve the current traffic congestion in and around the airport – especially for those of us who live nearby. But the RAND study does point out that there are many things that could be done in the way of improvements that would have an impact such as the Avion Boulevard cargo road and putting all the rental car companies on one location to take the burden off streets surrounding the airport. It seems like these would be more cost-effective solutions to current challenges.

I guess what I'm trying to say is that I'm not convinced of the safety and security argument that we are hearing as the reason for Alternative D. It just sounds like the new name for the Riordan Master Plan that we heard about years ago. It seemed like a bad idea then and this one seems to be no better.

I THINK EXPANDING THE CAPACITY OF LAX IS THE WRONG DIRECTION FOR OUR FUTURE. OTHER SURROUNDING AREAS REJECT AIRPORTS WHICH COULD LESSEN THE NEEDS FOR A LARGER, NOISIER LAX.

MINIMIZING LAX GROWTH SHOULD HAVE THE EFFECT OF FORCING PLACES SUCH AS ANTELOPE VALLEY AND ORANGE COUNTY TO FIND WAYS TO SERVE THEIR POPULATIONS AIR TRAVEL NEEDS WITHOUT USING LAX.

OUR AREA IS BEING STAMPED BY MEGA-LAX PROPONENTS WHO GIVE NO THOUGHT TO THE DETERIORATING QUALITY OF LIFE IN THE AREAS IMPACTED BY LAX TRAFFIC, NOISE AND GROWTH.

EXPANDING LAX AN INFINITUM IS NOT A WISE SOLUTION TO THE AREA'S TRANSIT PROBLEMS.

PLEASE STOP ENDLESS LAX GROWTH BEFORE ALL OF SOUTH BAY IS ONE ENDLESS AIRPORT!

Comments:

After reviewing the presentation of the latest LAX Master Plan and supporting documents, I find that the plan has no benefits other than the runway changes and urge those making the decision to reject it.

1. The LAX proposal does not address the congestion and environmental problems that will result from concentrating our air transportation at one location. It does not recognize that future air travel growth will be due to growth in population in San Bernardino County, Northern Los Angeles County and Ventura County. The proposed plan does indicate that Ontario airport will have to carry part of the increase in future airport traffic, but provides no funding or plans to accomplish this. It shows no utilization of Palmdale at all. It makes no sense to put \$9 billion into one location, when this funding could be used to create alternative airports that could be a great convenience to the additional population in the area. With the added congestion and off-site check-in, a person flying out of LAX from Riverside or Palmdale would have to leave home 4 or 5 hours before their flight
2. Experts are also correct in calling the proposal a step backward in safety. It provides no safety benefits, only moving the target to another location. It also seems very unwise to become dependent on one major airport. Expanding to regional airports will insure that air transportation is available in case of some major disaster or threat at one airport.

With the large government deficits we now have we cannot afford to waste \$9 billion on construction that accomplishes nothing. Regional airports will be needed and this funding could be used for them and improved transportation to them.

Attach additional sheets if necessary.

RE: SOUNDPROOFING

To Whom It May Concern:

I am writing to you to request to be considered and added to your master plan of soundproofing my home at the above address. My property and the area that I live in is also in the flight path of the airplanes that fly to LAX Airport daily. Can you please re-evaluate the decibal sound of the flight path above my property and in the area. Thank you very much for your time and consideration.

Sincerely,

Mary Harrington

REFERENCE: LAX Master Plan -
 Supplement to the Draft EIS/EIR - Alternative D
 Also Alternatives A, B and C

The following comments are submitted be included in the public record of the LAX Draft Master Plan and Draft EIS/EIR.

In 1988, LAX publicly announced that at 65 MAP the airspace would reach its maximum capacity. Alternative A, B, C and D, as well as the No Action Alternative exceed this capacity by up to 50%. All alternatives in the LAX master plan would cram more air traffic into already overcrowded space. This is not rational. This is not safe.

In the vicinity of LAX, there are ten other commercial airports ready to be used. Homeland Security compels us to consider a regional approach to handle passenger and cargo aircraft.

All the existing variations and alternatives in the current LAX Master Plan should be rejected.

A regional planning committee composed of representatives from all areas of Southern California, including residents and activists in the various communities, should be immediately formed to develop a five-county air transportation master plan to cope with the realities of the 21st century.

REFERENCE: LAX Master Plan -
Supplement to the Draft EIS/EIR - Alternative D
Also Alternatives A, B and C

The following comments are submitted to be included in the public record of the LAX Draft Master Plan and Draft EIS/EIR.

The most essential ingredient for "Enhanced Safety and Security" has been omitted from the Alternative D Supplement to the LAX Master Plan and that is dispersion of both passenger and cargo aircraft among many airports in Southern California. Lacking this vital feature, Alternative D is unacceptable and should be rejected.

For the same reason, Alternatives A, B and C should also be rejected.

Other immediate problems that are not addressed in any of the alternatives, but which should be considered are:

1. Runway incursions. Pilots rank LAX as one of the most dangerous airports in the nation.
2. Overflights above El Segundo. These are unnecessary and hazardous, but frequent.
3. Noise and traffic in the communities impacted by LAX. These safety, health and environmental concerns must be addressed under the present level of MAP and MAT before any changes in the structure or operations of the airport should be considered.

Dear Mr. Kessler,

I remember that after the last Public Hearing for the Supplement to the Draft EIS/EIR for the Los Angeles International Airport Master Plan you had asked if I had a question. At the time I did not, although afterwards I thought of one that I hope you will be able to answer.

For what length of time will the Draft, and Supplement to the Draft, EIS/EIR for the LAX Master Plan be available for public reference at the Inglewood main library?

I greatly appreciate your time, and would respectfully inquire why the Draft EIS/EIR for the first four LAX master plan alternatives was removed from the Inglewood main library in 2002.

Thank you for your time,
Sincerely,

Sparky Carpio

 November 4, 2003

Unfortunately, the SYSTEM IS NOT WORKING!!! Therefore, I must insist on NO ACTION on Alternative A, B, C, D, and E.

The wishes of the airline carriers necessitate priority consideration. As I've worked through the public hearings, it is obvious that we must start over, accommodating the demands security & modernization in historical times. The following recommendations are submitted:

- 1). Moving two parallel runways on the south side farther apart so that they conform to FAA Standards.**
- 2). Move new runway 50 feet closer to El Segundo and farther westward; thus using available land reducing noise/pollution for the entire city, plus obtain the much needed housing.**
- 3). Must remodel Bradley to welcome the air bus to truly remain a competitive International airport.**
- 4). Make every effort to divert cargo traffic to Ontario & Palmdale.**

It appears to me that there is NO city planning that brings the communities all TOGETHER to best serve southern California. Therefore, I propose that LYDIA KENNARD, the person who is most knowledgeable about LAWA, to head a lockdown conference with one representative from the following government agencies and communities that live with the traffic, pollution, noise, and financial benefits of LAX. No doubt impossible, but worth a try.

Gov't agencies: Gov. Schwarzenegger, Congresswoman Waters/Harman, TSA Loy, Transportation Sec'y Mineta, Supervisors Burke/Knabe, Mayor Hahn, Gordon (El Segundo), Oviatt (Ontario), City Councilpersons Miscikowski/Parks, FFA, Green Line, MTA, L A Co. Planning Officer,

Communities: Central LA., Culver City, El Segundo, Inglewood, LAX, Lennox, Marina del Rey, Manhattan Beach, Osage, Playa del Rey, Playa Vista, Westchester

Other: Alliance for Regional Solution to Airport Congestion, Gateway to LA, LA Airliners Airport Committee, LA Co. Economic Development Corp., LAX Community Noise Roundtable, Rand Corporation, Regional Solution to Airport Congestion

Many THANKS for the opportunity to speak out at the public hearings. Also submitting my fast-track opinion which City Council really didn't want to hear, cutting the three minutes to one. Good Luck with successful LAX planning,

R. Mahala Walter

Former Airport Commissioner

SPC00247

Honorable L.A. City Council Members:

9/12/03

As a former airport commissioner, I am asking you, CITY COUNCIL, to vote YES on this MOTION. If the consultants had done their job properly in the first place, there wouldn't be so many questions about Alternative D. Why don't the CONSULTANTS stand up and answer the questions about their design? Why send LAWA people out to face the public?

Let's start with....the underground luggage tunnel. Its' construction is due to start in 2005, but the safety features recommended by the FAA for runway & taxiway safety are not scheduled for completion until 2015. The underground luggage tunnel, is there going to be one...or NOT! Where's it going to run?

Last year I warned a couple Congressional Representatives & NATE HOLDEN that our own crazies could put timers on bombs in their luggage and sent them through to the CTA and not even have to commit suicide! Now YOU union PEOPLE, do you really want your union brothers & sisters to work there?.....And by the way, what makes you think you'll be getting the job. Time & time again, I objected to subcontractors coming in from out of state to do the work!

You know, proponents like to couch this whole scenario around security as "Cars & LAX FACILITIES don't mix!" Now tell me, how do they think people are going to get to this Ground Transportation Center?.....And what if you were a TERRORIST wanting to inflict major damage & loss of life, where would you rather have the PASSENGER LOAD WIDELY DISTRIBUTED AROUND 8 DIFFERENT TERMINALS or where EVERYONE for ALL FLIGHTS CONGREGATE AT one CHECK in/DROP off site? You see now why proponents have had to scrap security and recently invent "*modernization.*"

Sounds like a Disneyland attraction to use the Automated People Mover to funnel an increased number of people, travelers plus meeters & greeters, into the 200 additional businesses proposed by the mayor, shifting money from existing businesses for the benefit of increasing airport revenues. What happens now to the small businesses & hotels around LAX, who will have a very difficult time for many years? SOME MAY NOT SURVIVE. And what about the AIRLINES, especially those who are either in or fighting off bankruptcy!!!

By the way, Ted Stein, were these consultants paid by the word or by the page? It certainly wasn't for the quality of work. Why spend millions more for a plan that will not FLY?

Vote YES to stop fast-track planning of Alternative D.

Signed *R. Mahala Walter*

Re: Comments on Supplemental EIR/EIS

Dear Sirs:

Although I commend Mr. Hahn for making improvements in his proposed Alternative D over the prior plans for the airport, I do not believe there has been sufficient consideration of other alternatives for handling safety and security at LAX and in the region. Your EIR/EIS should have more thoroughly analyzed Alternative D, considered options other than just Alternative D, and considered data more recent than 1996.

The most significant thing you could do to impact LAX security would be to disperse air traffic throughout the region. Instead, Alternative D would give terrorists a spruced-up, more compact and more inviting target. A terrorist bombing of LAX would be devastating to the region's economy, but it would be far less devastating if there were other airports that could handle the traffic that would have to be diverted from LAX.

The Palmdale airport should be expanded and developed, and airlines and cargo companies given encouragement to use it. To respond to the naysayers who contend that it is too far away to develop, I suggest looking at the experience of Dulles airport. When it was initially built, there was very little development anywhere around it, and much skepticism about how much it would be used. Now it is the center of a thriving commercial district, mostly businesses attracted to that area because the airport is there. The same thing would happen if you were to expand the Palmdale facility.

The proposed 12-year construction project at LAX is of concern to me as a neighbor of the airport. I have seen what has happened to the Waterview landscaping project, where a lovely concept has become a neighborhood blight because the airport failed to do adequate research or planning with the Coastal Commission. How can you

SPC00249

ensure that Alternative D, if adopted, would not run into similar, but much more substantial, problems and delays?

As a procedural matter, I would like to know if the City Attorney has given an opinion regarding whether it would be a conflict of interest for LAWA Commissioner Miguel Contreras to vote on the various proposals coming before the Commission, given that he spoke out in favor of Alternative D as a representative of a labor union at the public meeting held at the Furama Hotel on August 23. To what extent was he involved in organizing union members to attend the various public meetings?

As a neighbor of LAX, I am not totally opposed to anything happening at the airport. I agree that it needs modernization and improvements in vehicular access. I am opposed to anything that would allow the airport to expand beyond its current borders, which would be in violation of Mayor Hahn's campaign promises. Alternative D would appear to be designed to allow future expansion.

Please ensure that whatever is done at LAX is fair to the surrounding communities, and that other areas of Southern California shoulder their fair share of the burdens of an airport.

Very truly yours,

Linda S. Peterson

November 4, 2003

Mr. Jim Ritchie
City of Los Angeles
Los Angeles World Airports
LAX Master Plan Office
Post Office Box 92216
Los Angeles, CA 90009-2216

Dear Mr. Ritchie:

In accordance with Section 102(2)(c) of the National Environmental Policy Act of 1969, the California Environmental Quality Act of 1970, Section 509(b)(5) of the Airport and Airway Improvement Act of 1982, as amended, I reviewed the Los Angeles International Airport (LAX) Draft Master Plan Addendum and the Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR).

Based upon my review, I respectfully offer the following observations and enclosed comments for your consideration. My review focused on Ground Transportation into and out of LAX.

As a member of the business community, I understand how important international trade is to this region's and my community's economy and future economic growth. LAX and other regional airports provide a vital international trade link for the region.

A strong regional economy requires a regional air transportation system capable of continued accommodation of demands for such services. In this regard, projected shortfalls of 10 to 30 million annual passengers (MAP) are disconcerting. The discussion in the Planning Objectives Section of the Addendum raises considerable doubt regarding the region's ability to meet future demands for air transportation. The proposed Alternative D does little to satisfy these future needs.

To really take control of the situation and make truly regional decisions in this matter, decision-making regarding how and when airports are served cannot remain the sole purview of the airlines. I am not suggesting regulating airlines and reestablishing the Civil Aeronautics Board abolished by the federal Airline Deregulation Act. However, under the current unregulated environment, local or regional caps on numbers of flights and passengers are meaningless. Additionally, suggested allocations of air traffic growth are meaningless unless and until sponsors of other regional airports expand to handle their share.

One of the more serious issues with the EIS/EIR is the cost of traffic mitigation measures and funding sources have not been identified. Also, ground transportation projects of other jurisdictions are used to mitigate impacts without regard to their validity. Because identified mitigation measures are primarily north of the airport, problems created south of the airport remain unresolved.

SPC00250

My observation of past events regarding LAX improvements strongly suggests justifiable concern about proposed caps on the number of flights, inadequacy of identified mitigation measures, and lack of funding for mitigation measures.

When the airport was expanded in the early 1980s, the EIS/EIR provided for expansion to 40 MAP. That level proved to be meaningless. Moreover, the mitigation measures identified at that time were inadequate (and similarly not funded) at the 40 MAP level, let alone at today's level of operation. No measures have been implemented to mitigate increases over the 1980 EIS/EIR-approved level. Consequently, ground transportation mitigation measures for the Master Plan Addendum must therefore use 40 MAP as the baseline.

In addition, conditions of approval must contain specific funding sources, schedules, legally binding commitments to implement signed by the responsible agencies, and remedies in the case of non-performance. Without such funding sources, implementation commitments, and remedies, any mitigation measures are illusory.

If you have any questions or require clarification of any comments, please contact me at (310) 643-5906.

Respectfully,

Edwin W. A. Peura
Vice President

LAX Master Plan Addendum

And

Supplement to Draft EIS/EIR

Comments

General

1. Considerable uncertainty regarding Los Angeles World Airports' (LAWA's) intention to complete proposed mitigation measures is raised by the following comment:
"Mitigation measures are applicable only to the extent that the use of airport revenues to fund such measures is permissible under federal law and policies." (Technical Report 2a, page 41 and elsewhere as indicated by specific comments below.)
2. As with the 2001 Draft Master Plan and Draft Environmental Impact Statement/Environmental Impact Report Draft EIS/EIR, the study area for Off-Airport Ground Access is primarily north of LAX. Little attention is paid to streets and freeways south of the airport. More significantly, mitigation measures appear to be limited to LADOT jurisdictions with little regard to traffic problems created in surrounding areas outside of the City of Los Angeles.
3. It is not clear how moving passenger access east outside of the Central Terminal Area improves security. Requiring passengers with luggage and visitors to use a 1.5-mile long Automated People Mover before entering security makes no sense. What is being protected? Obviously not passengers because they could be subject to numerous threats while in transit. Granted the Central Terminal Area will no longer be as insecure with removal of parking structures. That threat has been moved to the new Ground Transportation Center and the new Intermodal Transportation Center.

EIS/EIR Supplement, Chapter 4, Affected Environment, Consequences, and Mitigation Measures

1. Page 4-2 to 4-3, Mitigation Measures Bullet. – The comment – "It should be noted that mitigation measures, as well as Master Plan commitments, are applicable to the extent that the use of airport revenue to fund such measures and commitments is permissible under federal law and policies." creates considerable uncertainty regarding the validity of any proposed mitigation measures.
2. Page 4-3, The Environmental Baseline. – Using the 1998 Revision to CEQA Guidelines - "as they exist at the time the notice of preparation is published...." as a basis for establishing an environmental baseline ignores all environmental impacts since LAX was expanded in the 1980s and 1990s from 40 MAP to the

current baseline. Unmitigated impacts have resulted in uncontrolled traffic growth with significant impact on neighborhoods north, south, and east of LAX.

3. Pages 4-3 and 4-4, The Environmental Baseline, Third Paragraph - The discussion in this paragraph regarding “incremental” and “cumulative” impacts raises the issue of incremental changes to LAX since the last Draft EIS/EIR of 1978 from 40 MAP to the current baseline. Our view is these incremental changes and their impacts especially with regard to traffic should be addressed by this Supplement to allow mitigation to 40 MAP. This would necessitate an Environmental Baseline of 1984 vice 1996/97.
4. Page 4-6, Formulation of Master Plan Commitments and Mitigation Measures, Third Paragraph – What is the timetable for “formulation” of the referenced Mitigation Monitoring Plan? How will mitigation measures be enforced?

EIS/EIR Supplement, Chapter 4.3.2, Off-Airport Surface Transportation

1. Page 4-243, 4.3.2.2 General Approach and Methodology, Second Bullet, Third Sentence and Figure S4.3.2-1, Off-Airport Surface Transportation Study Areas – What is the rationale for limiting the area of study south of LAX to north of Rosecrans while including a more extensive area north and east of LAX? As indicated in our June 12, 2001 comments, the study area is biased toward those areas within the jurisdiction of LADOT to the exclusion of other neighboring jurisdictions.
2. Page 4-247, Sixth Paragraph, Last Sentence – What is the rationale for limiting coordination to LADOT?
3. Pages 4-248 to 4-250, 4.3.2.5 Master Plan Commitments – Will off-airport traffic control actions, necessitated by these commitments, be coordinated with jurisdictions other than LADOT?
4. Pages 4-254 to 4-261, Figure S4.3.2-4, Year 2015 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – What are the Levels of Service and Impacts for the following intersections:
 - Sepulveda and Marine,
 - Sepulveda and Manhattan Beach,
 - Aviation and Marine,
 - Aviation and Manhattan Beach,
 - Nash and El Segundo,
 - Douglas and El Segundo,
 - La Cienega and El Segundo (east of the 405),
 - La Cienega and Rosecrans,
 - Inglewood and El Segundo,
 - Inglewood and Rosecrans,
 - Inglewood and Marine,
 - Inglewood and Manhattan Beach,
 - Hawthorne and El Segundo,
 - Hawthorne and Rosecrans,
 - Hawthorne and Marine, and

- Hawthorne and Manhattan Beach/Artesia?
5. Pages 4-254 to 4-261, Figure S4.3.2-4, Year 2015 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – What are the Levels of Service and Impacts for the following links:
 - Sepulveda south of Rosecrans,
 - Sepulveda Tunnel,
 - Aviation south of Rosecrans,
 - Inglewood south of Imperial,
 - Hawthorne south of Imperial, and
 - Rosecrans west of Hawthorne?
 6. Pages 4-254 to 4-261, Figure S4.3.2-4, Year 2015 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – What are the Levels of Service and Impacts for the following Freeway Ramps:
 - I-405 NB off-ramp and El Segundo,
 - I-405 SB off-ramp and LA Cienega S/O Century,
 - I-405 NB off-ramp and Rosecrans, and
 - I-405 NB off-ramp and Inglewood?
 7. Pages 4-265 to 4-269, Table S4.3.2-8, Year 2008 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – Concerns regarding status of Intersections, Links, and Freeway Ramps expressed in comments 4 to 6 above also apply to this table and supporting analysis.
 8. Page 4-273, 4.3.2.7.2 Alternative D - Enhanced Safety and Security Plan, Third Paragraph – Another Project to be considered is the construction of up to 750 units comprising a mix of single-family detached homes, attached and detached town houses, and high quality condominiums on the southeast corner of El Segundo and Aviation Boulevards in Hawthorne. The City Councils of El Segundo and Hawthorne recently approved this project, Pacific Glen.
 9. Page 4-273, 4.3.2.8 Mitigation Measures – The statement in this paragraph: *The following mitigation measures are applicable only to the extent that the use of airport revenue to fund such measures is permissible under federal law and policies.* casts doubt regarding the validity of any proposed mitigation measures. What agency will make the determination regarding use of airport funds? When will this decision be made?
 10. Pages 4-275 to 4-278, Table S4.3.2-11, Year 2008 Alternative D Mitigation Plan (Adjusted Environmental Baseline Comparison) – The assumed proposed improvement by County of Los Angeles of the Intersection of Aviation and El Segundo is not substantiated by the *Coastal Corridor Transportation Study, Phase II, Figure 9, Roadway Improvements Funded*, South Bay Cities Council of Governments, 2003. Widening of Aviation is funded, but intersection improvements are not funded.
 11. Pages 4-275 to 4-278, Table S4.3.2-11, Year 2008 Alternative D Mitigation Plan (Adjusted Environmental Baseline Comparison) and Pages 4-279 to 4-284, Table S4.3.2-12, year 2015 Alternative D Mitigation Plan (Adjusted Environmental Baseline Comparison) – The unstudied Intersections, Links, and Freeway ramps identified in comments 4 to 6 above must be added to planned mitigation measures as appropriate.

12. Page 4-295, 4.3.2.10.2 Alternative D – Enhanced Safety and Security Plan, Second Paragraph – Leaving two critical intersections nearest the new Ground Transportation Center and Intermodal Transportation Center (Century at La Cienega and Imperial at La Cienega) unmitigated will lead to serious access problems for vehicles from the South Bay using arterial highways. What is the intended plan? To ignore the issue is not acceptable.

Technical Report S-2a. - Supplemental On-Airport Surface Transportation

1. Pages 24 and 25, Table 5, Key Assumptions/Inputs 2015 Alternative D, Planned – Regional Access/Egress Directional Distributions and Attachment A – What is the basis for allocation of percentages of passengers between entrances and ramps?
2. Page 62, Table 17, Key Assumptions/Inputs 2015 Alternative D, Refined System – Regional Access/Egress Directional Distributions – What is the basis for allocation of percentages of passengers between entrances and ramps?

Technical Report S-2b. - Supplemental Off- Airport Surface Transportation

1. Page 3 and Figure 1, Revised Study Area and Key Study Locations – Why have study areas been limited to areas north of Rosecrans?
2. Page 8, Planned Development Projects Added to Background Assumptions. - Hawthorne should be included in your list for projects.
3. Page 15, First Paragraph – Another Project to be considered is the construction of up to 750 units comprising a mix of single-family detached homes, attached and detached town houses, and high quality condominiums on the southeast corner of El Segundo and Aviation Boulevards in Hawthorne. The City Councils of El Segundo and Hawthorne recently approved this project, Pacific Glen.
4. Page 25, 3.2. Geographical Distribution of Trips – As indicate in above comments regarding Technical Report 2a, the basis for trip allocation is not obvious. Here the implication is “Passenger Surveys”. Have these surveys been documented? If so where? If the basis is *Technical Report 2b, Off-Airport Surface Transportation, LAX Master Plan Off-Airport Existing 1996 Transportation Conditions Report* of the Draft EIS/EIR, the validity of this allocation is questionable. The intersections surveyed in that study were biased toward the use of I-405 to access the CTA via Imperial and Century. None of the intersections surveyed were west of I-405 and south of Imperial. Consequently no data was collected regarding LAX traffic from Palos Verdes, Beach Cities, and bailouts from I-405 northbound onto surface streets.
5. Page 26, Table S9, Existing and Future Transportation Deficiencies (RTP Background Assumptions) – What is the justification for arbitrarily limiting the study area to north of Rosecrans? If the following intersections, links, and ramps had been included in the analysis, the number impacted would probably be higher:
 - Sepulveda and Marine,
 - Sepulveda and Manhattan Beach,
 - Aviation and Marine,

- Aviation and Manhattan Beach,
 - Nash and El Segundo,
 - Douglas and El Segundo,
 - La Cienega and El Segundo (east of I 405),
 - La Cienega and Rosecrans,
 - Inglewood and El Segundo,
 - Inglewood and Rosecrans,
 - Inglewood and Marine,
 - Inglewood and Manhattan Beach,
 - Hawthorne and El Segundo,
 - Hawthorne and Rosecrans,
 - Hawthorne and Marine,
 - Hawthorne and Manhattan Beach/Artesia,
 - Sepulveda south of Rosecrans,
 - Sepulveda Tunnel,
 - Aviation south of Rosecrans,
 - Inglewood south of Imperial,
 - Hawthorne south of Imperial,
 - Rosecrans west of Hawthorne,
 - I-405 NB off-ramp and El Segundo,
 - I-405 SB off-ramp and LA Cienega S/O Century,
 - I-405 NB off-ramp and Rosecrans, and
 - I-405 NB off-ramp and Inglewood.
6. Page 27, Third Paragraph and Figure S3, Differences in LAX Passenger Trips – 2015 PM Peak Hour - Alternative D – Adjusted Environmental Baseline – What is the basis for the conclusion that shifting passenger access to the eastern end of the airport will cause a measurable shift in traffic using I-405? Should Lincoln be included in the discussion in the third paragraph? Reduction of traffic on Lincoln is not reflected in Figure S3.
 7. Page 27, Fifth Paragraph and Figure S4, Differences in Total Vehicle Trips – 2015 PM Peak Hour – Alternative D – Adjusted Environmental Baseline – What is the basis for the conclusion regarding traffic shift?
 8. Page 28, Table S10, Master Plan Impacts on Surface Streets, Freeways, and Intersections vs. Adjusted Environmental Baseline: RTP Background Assumptions – See comment 5 above regarding Table S9.
 9. Pages 33 and 34, 4.2 Study Area Transportation Benefits, Table 11 Study Area Average Speed and Congested Lane Miles, and Table S12 Study Area VMT and VHT – The conclusions reflected in these tables probably result from the arbitrary conclusion that traffic will shift as a result of the proposed shift in passenger access to the east.
 10. Pages 35 and 36, Essential Neighborhood Traffic Management Elements – Does this philosophy extend to neighborhoods outside of the City of Los Angeles? If not, it should. Because of the reference to LADOT procedures in the third paragraph, the impression is created that the intent is to limit to the City of Los Angeles. The new interchange at Lennox and shift of passenger access to the east

will not increase the capacity of NB I-405 south of the new interchange. Consequently, the risk of driver bailout using El Segundo, Rosecrans, and Inglewood Off-Ramps remains. This may well result in cut through traffic into neighborhoods south of LAX. This should be examined.

11. Page 36, 5.2 Mitigation Measures for Alternative D, third paragraph and Figure S6 Changes in Total Traffic Volumes Due to Lennox/I-405 Interchange and I-105 Ramps – 2015 PM Peak Hour – What is the basis for these conclusions?
12. Page 36, 5.2 Mitigation Measures for Alternative D, third paragraph, last sentence – Does this conclusion include the potential for increased bailouts from I-405 as discussed in comment 10?
13. Page 41, First Complete Paragraph – Leaving two critical intersections nearest the new Ground Transportation Center and Intermodal Transportation Center (Century at La Cienega and Imperial at La Cienega) unmitigated will lead to serious access problems for vehicles from the South Bay using arterial highways. What is the intended plan? To ignore the issue is not acceptable.
13. Page 41, Fourth Paragraph – What agency will decide which mitigation measures will be funded with airport revenues? In the event airport revenues are not to be used to fund the recommended mitigation measures, will the proposed actions cease?
14. Page 41, 5.3 Alternative Mitigation Plan for Alternative D, First Paragraph – Which agency has the authority to approve the proposed Lennox Interchange and when will they decide?
15. Page 41, 5.3 Alternative Mitigation Plan for Alternative D, Fourth Paragraph – Lennox Interchange should be deleted from the mitigation measures in this paragraph since this section addresses an alternative plan.
16. Pages 41 and 42, 5.3 Alternative Mitigation Plan for Alternative D, Last Paragraph, First Sentence – What agency will decide which mitigation measures will be funded with airport revenues? In the event airport revenues are not to be used to fund the recommended mitigation measures, will the proposed actions cease?
17. Attachment B, Geographic Distribution of Airport Trips - Alternative D – What is the basis for determining the distribution. See comment 4 above.

RE: Supplement to the Draft EIS/EIR – Alternate D

Culver City certainly not consulted in the new alternative. On April 19, 2001 you spoke to the Culver City Homeowner Assn. on the Master Plan of Los Angeles International Airport Perhaps our group too interested in traffic on the 405 and not runways, so you checked us off the list.

Alternate D accommodates around 78.9 million annual passengers, almost at the same level as no change. While previous plans had almost 19 million more passengers. Less traffic on the 405 for sure.

The runway extensions seem feasible, however, not really informed on flight safety my comments are not one of an expert. The new parallel taxiway between existing runways does seem like a necessary safety point.

Looking at Alternate D's Manchester Square you will find many security and safety points. Traffic into the square from the 405 is from Arbor Vitae ST. and Century Blvd. the commercial and private vehicle. Today there does not seem to be safe commercial inspection. To think this has eliminated curb side parking is one great safety factor.

Ancillary facilities will be consolidated. Maintenance into a smaller area, Fire Station 51 expanded, Fire Station 80 relocated and expanded. The existing police headquarters removed by a new 110,000 square foot airport police building on the northwest corner of Westchester Parkway and Emerson Avenue.

The public parking will consist of three garages, 7,515 stalls both short and long term parking. Even the employees will have a new garage of 12,400 spaces and shuttled to their work sections.

The MTA Green Line will be linked to the passenger terminal by a covered walkway.

Alternative D will require approximately 77 acres of property, the least amount of land of all proposed alternatives.

Continued

SPC00251

Alternate Plan D

Plan D – Construction

Construction workers will park from one mile to fifty miles away and be shuttle bused in. They will not work in peak hours --- 8 a.m. to 9 a. m. – 5 p.m. to 6 p,m, and at the high airport hours – 11 a.m. to noon

IMPROVEMENTS at 1-405 and 1-105

A new 1-405/Lennox Boulevard interchange, affly over the existing 1-105/Imperial Highway interchange near Aviation. Provide new ramps between Aviation and LaCienega at the 1-105. Create a new interchange at 1-405 and Lennox Boulevard.

They plan to build future FlyAway remote terminals and bus in passengers. This should cut the traffic to the airport down on the 405 for Culver City.

In my opinion the Safety and Security of Plan D is designed to be flexible and will accommodate any new requirements.

GOLFERS:

I would be remiss if I did not tell you – the three (3) holes at Manchester Golf course will be replaced.

Thank you for the opportunity to respond.

Number: Title: Alternative D

Comments:

Office Use Only

As a member of 50th St Block Club and as an Area Representative for the Dept of Neighborhood Empowerment, Neighborhood Development Congress, I have read and approved Alternative D as the best plan for the improvement of the airport at LAX.

However, the addition of shops and consumer locations will add to the already dense traffic, and is not an adequate security alternative to gates. I believe that segment of alternative D should be re-evaluated,

Attach additional sheets if necessary.

PERSONA STATEMENT

DEPART

Assez vu

La vision est reconverts a tous le airs.

Assez eu

Rumneurs de villes, le soir, et au soleil, et toujours.

Assez connu

La arrets de la vie.- O rumeurs et visions!

Depart dans la affection et le bruit neufs.

A. Rimbaud*ENVIRONS (UNDER SIEGE)*

Seen enough

The vision gleams (and has been meet) in every air.

Had enough

Sound from loud noise pollutes our skies,
In the evening and in the sunlight of every single day

Known enough

Oh tumult! Oh visions! And aching sounds. - Life comes to a halt

Departure from affection and sensitivity,

modern loud roaring raw thundering shining sound,

hovering constantly over us.

I have witness enough

You are destroying our *habitat*.

- You and I are fully aware of that.

- So please help us make them stop and have them come to a halt.

Our normal way of going about our daily life is being shattered, a once tranquil environment has been irreversibly disrupted by commercial development, perhaps beyond repair. Our senses witness and feel such repercussion.

American naturalists, who once studied the natural sounds and recorded their patterns, find today their task increasingly more difficult. Finding a noise-free environment, a refuge from the maddening crows is a more challenging task now than ever before in history. Thus, nature may well become, truly a Sanctuary for those who come to realize and vision what a healthy environment really is and means to some of us.

City officials are unable to respond to our concerns, let alone behave responsibly to demands placed in our environment and to those who happen to live in it. I have witness a blatant disregard to demands for an objective and accurate environmental impact study in our community.

Where I now live each and every single day, seek relief in silence, which I can only find between the midnight hours of 1:30 and 4:30 PM. In spite of our pleas for relief, we find ourselves increasingly shut-off from the policy process, and increasingly less able, helpless and more dis-able to respond.

In addition, we ask ourselves will this be a reversible trend? We all are suffering from constant distress and disruption in our daily activities, due to the neglect from private developers and our civil authorities and the unfavorable outcomes from policies issued and improperly enforced.

A sacrilege has been perpetuated on our senses, and our perception of wellbeing perverted.

A psychological assault as a result of this siege

August 1, 2001

Now more than ever I seek solutions and perhaps become instrumental in finding effective and immediate management of this alarming problem constantly hovering over us.

We have no where to go, so please before we regret future irreversible damage on our senses and our community. Do not neglect to respond to our request. The potential faculties of future generations are at stake and our well being is in jeopardy.

Study says noise affects neuron growth

SCIENCE: Exposure to constant sound delays auditory development in young mice.

By The Associated Press

WASHINGTON — The high noise of modern life may affect speech and language development in the very young, according to a study that found the auditory parts of the brains of young mice are slower to organize properly in the presence of continuous sounds.

Researchers at the University of California, San Francisco, reared a group of rats in an environment of continuous background noise and found that their brain circuits that receive and interpret sound did not develop at the same rate as animals that were raised in a quieter environment.

Edward F. Chang and Michael Merzenich, co-authors of the study appearing in the journal *Science*, said that the continuous noise delayed the organization of auditory neurons during a critical two-to-three-week period after the rat pups were born.

For rats not exposed to the noise, the auditory

cortex neurons during this period gathered into a smaller area and began developing a selective response to sounds.

But for the noise-exposed rats, this organization was slowed, causing a delay in the development of the ability to discriminate specific sound tones. The researchers said it took three or four times longer for the rats raised in a noisy environment to reach the basic benchmarks of auditory development.

Although the rat is not a perfect model for what happens in humans, the authors note, the study does suggest that high levels of noise might possibly affect some language learning in infants.

"These findings suggest that environmental noise, which is commonly present in contemporary child-rearing environments, can potentially contribute to auditory and language-related development delays," the authors write in *Science*.

The authors noted that although the brain development was delayed in rats exposed to the noise, their brains did eventually mature normally.

Researchers find DNA in permafrost soil

By Paul Recer

THE ASSOCIATED PRESS

WASHINGTON — Ancient plant and animal DNA found in undisturbed soil sediment can be used to unlock secrets about life hundreds of thousands of years ago, researchers say.

Scientists analyzing soil from Siberian permafrost and from caves in New Zealand said they found evidence of DNA from animals that died out thousands of years ago and from plants that lived about 400,000 years ago.

Eske Willerslev of the Univer-

sity of Copenhagen, a co-author of the study appearing in the journal *Science*, said the study found that soil fragments the size of a sugar cube can contain large amounts of DNA from those ancient life forms.

"You can obtain a lot of information about that extinct biota from just two grams of material," Willerslev said.

Permafrost is excellent at preserving the ancient DNA, the researchers said, because it is constantly cold. The scientists identified DNA from 19 categories

of plants and from eight kinds of animals, including the extinct mammoth and steppe bison. The animal DNA was thought to be up to about 30,000 years old.

Willerslev said that attempts to look further back in history, beyond 400,000 years, was unsuccessful.

"We tried to look for DNA in sediments dated one and a half to two million years, but those tests came up negative," he said. "There may be some sort of barrier that makes that impossible."

logical understanding and empathy with the others's point of view. A common task for every group in quest of a common truth. With best greetings,

Yours sincerely, C. C. JUNG

To Karl Offinger

Dear Professor Offinger,

September 1957

Unfortunately I am so old and tired that I am no longer able to comply with your wish.¹ You may be assured, however, that I have every sympathy with your project and understand it only too well. I personally detest noise and flee it whenever and wherever possible, because it not only disturbs the concentration needed for my work but forces me to make the additional psychic effort of shutting it out. You may get habituated to it as to over-indulgence in alcohol, but just as you pay for this with a cirrhosis of the liver, so in the end you pay for nervous stress with a premature depletion of your vital substance. Noise is certainly only one of the evils of our time, though perhaps the most obtrusive. The others are the gramophone, the radio, and now the blight of television. I was once asked by an organization of teachers why, in spite of the better food in elementary schools, the curriculum could no longer be completed nowadays. The answer is: lack of concentration, too many distractions. Many children do their work to the accompaniment of the radio. So much is fed into them from outside that they no longer have to think of something they could do from inside themselves, which requires concentration. Their infantile dependence on the outside is thereby increased and prolonged into later life, when it becomes fixed in the well-known attitude that every inconvenience should be abolished by order of the State. *Panem et circenses*—this is the degenerative symptom of urban civilization, to which we must now add the nerve-shattering din of our technological gadgetry. The alarming pollution of our water supplies, the steady increase of radioactivity, and the

¹ O., professor of law at the U. of Zurich, had founded an association to combat noise ("Liga gegen den Lärm") and asked Jung for a contribution to be published in a reputable newspaper.

primitive equivalents are yells, bull-roarers, drums, etc.) Noise, like crowds, gives a feeling of security, love it and avoid doing anything about it as they do the apotropaic magic it sends out. Noise protects reflection, it scatters our anxious dreams, it assures in the same boat and creating such a racket that it attack us. Noise is so insistent, so overwhelming, thing else becomes a pale phantom. It relieves us of or do anything, for the very air reverberates with the of our modernity.

The dark side of the picture is that we wouldn't didn't secretly want it. Noise is not merely inconvenient it is an unadmitted and uncomprehended means of pensation of the fear which is only too well found silence, their fear would make people reflect, and what might then come to consciousness. Most people silence; hence, whenever the everlasting chit-chat stops, they are impelled to say something, do something fidgeting, whistling, humming, coughing, whisper noise is almost insatiable, even though it becomes times. Still, it is better than nothing. "Deathly phrasel—strikes us as uncanny. Why? Ghosts walk hardly. The real fear is what might come up from all the things that have been held at bay by noise. You have taken on a difficult task with this abatement, for the more you attack noise the more the taboo territory of silence, which is so much be depriving all those nobodies whom nobody ever sole joy in life and of the incomparable satisfaction they shatter the stillness of the night with their bikes, disturbing everyone's sleep with their moment they amount to something. Noise is then a confirmation of their existence. There are far more supposes who are not disturbed by noise, for them that could be disturbed; on the contrary something to live for.

- When is the fuel storage system in Alternatives A+B
- I don't see in alternatives A+B when the incremental work justifies the marginal increase in daily operations potential.
- Encourage more passenger efficient aircraft by having cost incentives for larger aircraft - get rid of R/Ts, turbo prop traffic etc + small Boeing aircraft
- Don't worry about increasing capability at LAX, the freeway systems nearby can hardly handle what you have now. Develop the other airports or new airports as a region - just because you don't own other airports be practical and solve jointly with BUR, LGB, SNA the problem.
- Don't increase the airport size - yes I am a Westchester landowner!

*Economic Vitality,
Trade & Jobs*

**CRITICAL INFRASTRUCTURE COUNCIL
LAX MASTER PLAN ASSESSMENT**

THE CHALLENGE

Modernization of LAX is not an alternative, it is an *economic necessity!* As the region's most important economic engine, LAX is our front door to the world, welcoming visitors and business travelers, moving more than 2 million tons of air cargo with a value of \$60.9 billion annually and enabling more than 20 million residents to travel and do business regionally and internationally. In fact, LAX is currently the world's busiest arrival and departure airport and fifth busiest cargo airport. Yet it has not been significantly modernized since 1984 when it was upgraded to handle 40 million annual passengers per year (MAP). Prior to 9-11, LAX served 67 million passengers per year. It is currently operating at 59 MAP.

J.D. Powers recently ranked LAX 18th out of 20 major international airports in terms of passenger satisfaction. Doing nothing is unacceptable. Southern California must meet the growing needs for air travel and commerce or forfeit the economic benefits. Other metropolitan areas like Phoenix, Denver, Las Vegas, San Francisco, and Vancouver have been aggressively expanding their airports to attract the business. A regional solution is required for Southern California and should include Ontario, Burbank, Long Beach, John Wayne, Palmdale, San Bernardino, March, George (and yes, El Toro) airports. Given the limitations at these airports, however, LAX is vital because of its unique mix of international and regional carriers, and its proximity to the region's frequent flyers and international air cargo shippers. LAX will remain Southern California's pre-eminent airport.

Starting the Master Plan and EIR process over is not an option. We must maintain the "legal" viability of this process which is based on an aging 1996 baseline. Unfortunately the process has already consumed 10 years of the 20-year planning horizon. Building incrementally to address each future crisis will merely result in the continuing deterioration and obsolescence of LAX. We are therefore compelled to operate within the existing record and the limits of the worst-case environmental statement it provides. Our only realistic choice is to identify and support those elements of the proposed alternatives or alternatives which can be assessed in the final EIR process which make the

most economic, operational, security and financial sense today. Other alternatives may need to be considered in a supplemental or subsequent EIR process.

LAX needs to address the economic future of the region, as well as a potential terrorist event. Plans to modernize LAX should be based first on function, usability and economic impact, closely followed by due consideration for safety and security. Otherwise, an inefficient reconfiguration of airport operations on the transportation and economy of Southern California could impose unacceptable economic costs with questionable security and safety trade offs. In the aftermath of 9-11, the need for airport security has taken on new importance. Protecting people and facilities from a terrorist attack is a daunting challenge because "terrorism is dynamic and terrorists adapt their methods to suit changes in weaponry and defense tactics." Technology developments will offer new protection options in the future. Flexibility in current planning as opposed to massive, irreversible reconfiguration of airport operations is clearly advisable at this time.

Impacts on local communities need to be considered and economically rational solutions developed. However, it seems that LAX modernization, as critical as it is to the region, has become the poster child of the "not-in-my-backyard" movement. When residents in Orange County decide they don't want the impacts of having their own airport at El Toro and suggest "L.A." needs to solve its "own airport problems" at the expense of local residents in El Segundo, Westchester and Inglewood, issues of equity and burden sharing are painfully evident. Communities surrounding LAX understandably want other regional airports to share the growth in passenger and cargo needs.

Mayor Hahn should be commended for taking the political risk to try to move LAX modernization (and the El Toro alternative) forward. The Mayor is in an unenviable position. The burden of developing a solution for a region of some 180+ cities and communities has fallen largely on a single proprietary department in one city (albeit the largest). Without the rejuvenation of a Southern California regional airport authority to represent the common interests of this mega-region, our economic future is at risk. Mayor Hahn has invited public input at this point regarding his Alternative D, and we appreciate the invitation to share the insight and experience of the LAEDC's Critical Infrastructure Council.

The LAEDC's Critical Infrastructure Council is comprised of experts in planning, transportation, airport and airline operations, engineering, safety and security, economics and business. This assessment draws on meetings and dialogue with LAWA, the Mayor's Office for the City of LA, El

Segundo's Mayor Gordon, SAIC, RAND and other security experts, the airlines and the Westchester Alternative E Group.

The Critical Infrastructure Council recommends that four guiding principles be applied in the final decision-making for the LAX Master Plan:

1. Flexibility

In this post-9-11 world, planning for something as important as the modernization of LAX and the future of a regional airport system in Southern California is fraught with uncertainties. How quickly will passenger service rebound? How will passenger demand and market forces develop? What will be the mix and relationship of international and short-haul service? Will the new large body A380 Group VI type aircraft dominate international service? What will the TSA ultimately adopt as required airport security measures and what technologies will develop to address these needs? These unknowns argue strongly for a flexible plan which can adjust to future market and security requirements.

2. Passenger Convenience

Without world-class user-friendly facilities and service, our region will suffer as a global competitor. Ease of access to and use of all of our airports should be a top planning goal.

3. Security

LAX will remain a terrorist target. Security is an obvious priority. Any new plan must address improvements in security of both airport operations and passenger safety. We must consider and address the trade off's inherent in such planning.

4. Cost Effectiveness

The airline industry remains financially unstable. Landing and passenger fees do provide one source of funding but are also a competitiveness factor for LAX and its carriers. The plan should seek the most cost-effective solutions to the needs being address.

ALTERNATIVE D

ECONOMIC IMPACT

Economic impact should be a primary consideration in the development of LAX and our regional airport alternatives. The Master Plan EIR sheds significant light on such impact. The "no growth" and

"Alternative D" scenarios, which cap LAX at 78 million annual passengers (MAP), result in regional economic outputs of some \$18-20 billion less than Alternatives A, B or C which support 89-98 MAP. While this comparison is not by itself determinative, policy makers and residents need to understand that this factor alone equates to potentially foregoing the benefit of the economic equivalent of more than 500,000 jobs for our future regional economy if Alternative D is implemented and other regional airports fail to meet the needs of travelers and cargo operations (estimated direct passenger and cargo related jobs approach 100,000. See Schedule A). With California facing fiscal crisis and future population growth of five million more people in Southern California by 2020, such a plan could lead to economic strangulation. The economic equivalent of half a million jobs equate to more than \$1 Billion in annual tax revenues to support schools and governmental services.

The region must not cap its future with a "No Growth" plan for LAX. Market forces and user preferences will determine which airport alternatives in Southern California meet our future passenger and cargo needs. Burbank, Long Beach and John Wayne airports are already constrained or capped. Even Ontario with its substantial expandability has not generated sufficient traffic for Jet Blue, Aloha Air, and Air Canada for their passenger service. Use of our other regional airports for expanded passenger and dedicated cargo operations is a desirable goal. But, any plan which creates a real physical or capped limitation on LAX is unacceptable from an economic impact standpoint. A "planning capacity" is one thing. A legal or physical cap is something else. The goal of a distributed regional airport system is something everyone can support. But any plan must be flexible enough to address changing market forces and the traveling publics' ultimate choices of air service and airports.

GETTING TO THE AIRPORT

The concept of capping MAP can be misleading. Today's capacity limitations are not the number of flights our airports can accommodate; they are the number of passengers current modes of ground transportation can move to and from our airports. If the number of ground trips can be reduced and the number of passengers per ground trip increased, capacity can be improved and congestion can be reduced.

LAX is physically constrained today by the limits of ground access to move passengers and cargo to and from the airport via Century and Sepulveda Boulevards. Alternatives to improve this "connectivity" include:

1. Expansion of direct light rail service eliminating the multiple transfer issues currently extant on the Greenline. (Rail service could also incorporate a pre-check in flyaway service component discussed below).
2. A satellite system of dedicated "flyaway" bus service to LAX (and other regional airports) with pre-checked baggage service.
3. Remote check-in options outside the Central Terminal Area. (CTA)

Alternative D proposes the creation of a new offsite Ground Transportation Center (GTC) at Manchester Square adjacent to the 405 freeway, approximately two miles from the Central Terminal Area (CTA). The current parking structures would be eliminated and a new CTA constructed in the center of the airport. Direct truck and vehicle access would be replaced with an Automated People Mover (APM) between the CTA and the GTC. It is unclear at this point whether passengers will be able to check their baggage at Manchester Square or will have to carry baggage through the GTC screening, onto the APM and into the CTA. Alternative D does propose limited flyaway service with direct bus access to the CTA. It also proposes an Internodal Transportation Center where people can transfer from the Green Line and buses to the APM.

From a ground access standpoint, the option of a remote drop off and check in facility could enhance connectivity to LAX. However, due to its location the Manchester Square site raises unanswered questions regarding bottlenecks and back ups onto the 405 freeway as well as limitations regarding access from other highways and streets in the area. Timing regarding acquisition of the necessary land (200 acres) for Manchester Square is also highly speculative and could delay the project 7-9 years into the future. A site nearer LAX already under LAWA's control such as the Lot C area appears to offer a more viable and flexible alternative.

However, the most immediate and cost effective opportunity to alleviate traffic congestion around LAX is the creation of a world class "Flyaway" system of offsite check-in locations (e.g., Burbank, Downtown, Ontario, Long Beach, Orange County, etc.) where passengers can pre check- in luggage and board high quality dedicated buses designed for business travelers to travel via freeway diamond lanes direct to their airline terminal with their luggage delivered directly to baggage screening for aircraft load on.

Rail and bus systems like this are being used at many other airports including Hong Kong and London, and have now been approved by the TSA for use in Orlando. This option in Alternative D should be the focus of major funding support at this time, not massive irreversible airport reconfiguration. Alternative D will only add a .2 MAP of access capacity at a cost of approximately \$5 billion. Imagine what \$1-2 billion would buy in terms of a network of flyaway options. Not only could flyaway service reduce traffic at LAX, high quality, low cost flyaway service to other regional airports (e.g., from Orange County to Ontario) would also stimulate more passenger interest in the use of other regional airports to further reduce demand on LAX. (One future opportunity if the Anaheim to Las Vegas high speed Maglev system is constructed would be a spur line to Ontario as a dedicated high-speed flyaway service.) Additionally, these flyaway facilities would provide for the ability to disperse traffic to other airports in the region by allowing passengers to leave from one airport and return to another with no concern about where their car is parked. Currently some business passengers are reluctant to use a secondary airport because of uncertainty about their return schedule. Having a network of flyaway services covering the regions' airports would alleviate this concern, promote use of other regional airports and significantly alleviate access congestion to all airports.

RUNWAY SAFETY

The need for safety enhancements and center taxiways for the South runway complex are already overdue. By completing these improvements now, LAX will be capable of accepting the new A380 Group VI large (600 passenger) aircraft which a handful of international airlines will begin operating in 2007.

However, the massive reconfiguration of the north runway complex, especially the elimination of Terminals 1, 2, and 3 is of questionable value. Heathrow Airport has only two parallel runways yet plans to accommodate in excess of 80 MAP using new Group IV aircraft, suggesting LAX's reconfigured south runways plus one of the north runways should be adequate for LAX.

Elimination of Terminals 1, 2, and 3 to accommodate Group VI international aircraft is a highly questionable trade off, especially when one considers the impacts of reduction in gate capacity and the elimination of low-cost short-haul flights and service provided by low-fare airlines such as

Southwest. Short-haul airline traffic is critical to feed LAX's national and international flights. Forty percent of all international passengers using the Bradley Terminal at LAX depend upon short-haul connections. Elimination of short-haul capacity is counter-productive to supporting international flights and service to LAX. SFO learned this when they lost more than 20% of their international flights after the departure of Southwest Airlines to Oakland. Baltimore-Washington International Airport on the other hand has seen a 20% increase in international traffic and a return to pre-911 travel levels due to Southwest Airlines expanding operations there. We need both types of service to be competitive.

Short-haul flights have grown much faster than international flights post 9-11. Loss of low fare service would also cause competitor's fares at LAX to rise. Without Southwest, Denver's commuter fares are some of the highest in the nation. Our region needs low cost airline service to remain economically competitive. Any modernization plan for LAX must maintain the *flexibility* to serve a changing mix of short-haul and international passenger demand. Unfortunately a change in fixed gates which dramatically shifts LAX capacity to dedicated gates for new Group IV large aircraft will eliminate three short-haul gates for every large aircraft gate created. Should north runway separation ultimately be needed, shifting the northern runway to the north would be the preferable option, not elimination of Terminals 1,2, and 3.

AIRPORT & PASSENGER SECURITY

Post 9-11, airport security standards are undergoing continuous change. The Transportation Safety Administration continues to review a broad range of threats posed by terrorists. New technologies are under development to address the protection of passengers and facilities. Warnings have again been issued regarding potential hijacking threats even after cockpit cabin doors have been hardened. Now concentrations of people appear to be the preferred target. Security is a moving target and committing now to an expensive, irreversible and radical change in airport passenger operations based on a single threat scenario is not the best strategy.

Alternative D and the SAIC Security Report are based on the premise that car or truck bombs are the primary threat to future LAX operations. RAND on the other hand cites historical evidence that attacks on aircraft and luggage bombs pose a more frequent and greater threat to passengers. RAND also points out the risks created by concentrating large numbers of people in confined areas.

Basic security doctrine recognizes that the more geography and facilities requiring protection, the greater the size and cost of the necessary security forces and protection equipment and the greater the margin for error due to the lack of sufficiently trained personnel. Even though Alternative D appears to be primarily focused on protection of airport operations as opposed to passengers, the new passenger access system proposed in Alternative D actually creates three new targets of opportunity for terrorists: The Ground Transportation Center (GTC), the exposed, three-mile long Automated People Mover System (APM) and the new Central Terminal Area (CTA). These facilities not only concentrate passengers as targets, they also present distinct new opportunities to halt LAX operations if damaged or destroyed. A hijacked private or commercial plane could be aimed at the new Central Terminal Area where upwards of 20-25,000 passengers could be transiting on a major holiday, rendering LAX totally unoperational at untold human cost.

When one further considers the potential for 7-9 years of delay due to property acquisition issues, "hassle factors" for passengers and congestion on the 405 freeway, initial screening at the GTC using as yet unproven technology, a two-mile journey on the Automated People Mover System (APM) and yet another final security check at the Central Terminal Area (CTA), and the value, if any, of this added security, major operational reconfiguration of LAX requires further critical evaluation, especially if this huge cost in the early years of the project delays needed improvements for international air travel at the Bradley Terminal.

AIR CARGO – A REGIONAL ECONOMIC IMPERATIVE

In 2002, air cargo exports from the region reached \$31.5 billion in value. Imports were \$29.4 billion. Cargo exported through our ocean ports was valued at \$30.5, less than that shipped by air. Air cargo service to and from the region is critical to the future growth of our economy. Hundreds of thousands of high-value jobs here depend on just-in-time shipments and deliveries of goods via air. The Southern California Association of Governments projects a tripling of air cargo over the next 20 years, from 3 million tons in 2000 to 8.9 million tons in 2020. Alternative D assumes a growth at LAX from 2.0 to 3.1 million annual tons. The capacity shortfall of 5.8 million tons will need to be accommodated at other regional airports such as Ontario, Norton, March, Palmdale and George, or the business and jobs will be rerouted to Phoenix and Las Vegas. Not addressed in Alternative D are the regional enhancements in ground access necessary to accommodate truck access to and from

these regional airports and the thousands of business and retail locations throughout Southern California.

Dedicated cargo carriers such as UPS and EVA have already agreed to operate out of Ontario. Others such as Fed Ex might also be capable of using non-LAX alternatives. However, most of our air cargo currently moves in the bellies of passenger aircraft and this makes it difficult or too costly for airlines to provide cargo operations at a location distant from their primary passenger operations. Alternative D does not address a solution to this problem. It merely limits LAX to 3.1 million annual tons. Alternatives A, B, and C capped LAX air cargo at 4.2 million tons. Either we address the 50-65% cargo capacity shortfall regionally or forfeit the business and related jobs to other regions. (Using the economic data developed by LAWA for the master plan suggests that every additional million tons of air cargo for the region equates to 50,000 additional jobs.)

CONSIDERATION OF COSTS AND BENEFITS

The new Denver Airport was built at a cost of \$3 billion, albeit constructed on open land far from the metropolitan area. SFO has been modernized with major new ground access for cars, trucks and now BART at a cost of \$5 billion. The Mayor of San Francisco has clearly made expansion of capacity and convenience at SFO a strategic and economic priority for his region. Given the questionable enhancements relative to security at LAX, the downsizing of future gate capacity (from 163 to 153) to impose a 78 MAP physical cap and the added hassle factors for ground access, one must question the expenditure of \$ 9 billion dollars for the results to be achieved. As previously noted, for a much lower price tag, a system of remote fly away locations could better address commute times, remote security and reduction of local airport congestion.

LAX today has some of the lowest landing fees in the nation and we must finance needed improvements. The key is to choose the improvements wisely. Due to airline cost per enplaned passenger three times higher than LAX (\$6 vs. \$18), SFO has not only lost short-haul and international flights, its bond ratings have been lowered twice. SFO has now proposed discounting its landing fees to \$12 to attract more carriers and customers. Market forces are always at work and cannot be ignored.

Consolidation of rental car facilities is a clear benefit and could be served by APM or bus, depending upon its ultimate location and can be financed through user fees. An Intermodal Transportation Center could also be of value if and when light rail service is enhanced to LAX eliminating today's problems of multiple transfers. Both of these elements would help reduce congestion around LAX in the longer term.

PASSENGER CONVENIENCE IS CRITICAL TO A COMPETITIVE, WORLD CLASS AIRPORT

In a global economy, regions which rely on global commerce for their future have made their international airport a key strategy for economic growth. Hong Kong, Shanghai, Beijing, Malaysia, Singapore, Seoul, and San Francisco are all recent examples. When they market their regions, they all point to the ease of access through their world-class airports.

Modernization of the Bradley Terminal is a necessity now. Foreign visitors frequently express frustration with the lack of user friendliness, waits in the customs lines, difficulty in accessing destinations, etc. Many business travelers express a clear preference to use SFO when traveling on business to California. An international ranking of 18 out of 20 for LAX is unacceptable for a region so dependent on global commerce and tourism. Postponing these improvements to the later years of the plan risks further erosion of business and visitor travel and commerce for the region. The Bradley Terminal can be renovated now in conjunction with the addition of a new interconnected west terminal facility. It appears this option has been delayed to the later years (2020?) of the project due to the cost of the GTC, APM and CTA reconfiguration and the 78 MAP gate capacity limitations.

The added "hassle factors" of 405 Freeway congestion, an offsite Ground Transportation Center and a two-mile long Automated People Mover System (particularly if passengers are required to "schlep" their luggage to the Central Terminal Area) is far from a world-class system. Anyone who has experienced Hong Kong's remote downtown luggage and passenger check-in and the ride on a dedicated light rail system into the Hong Kong airport without worrying about luggage being delivered to the plane, appreciates the convenience and looks forward to the next trip. When one considers the Alternative D impact on convenience and time in transit, one has to ask "Why would a businessman in London, Tokyo or Shanghai want to use LAX if they could use San Francisco, Las Vegas or Phoenix to conduct their business?" We must answer this questions affirmatively – "because of convenience and access to our markets!"

CONCLUSIONS

Alternative D contains many critically needed enhancements to LAX's viability which should move forward now. The LAEDC's Critical Infrastructure Council therefore recommends the following be adopted:

1. South Runway complex modifications to improve safety and enable use by new, large Group IV aircraft through the addition of a central parallel taxiway.
2. A comprehensive system of remote check-in "Fly Away" locations throughout the region based on customer demand including dedicated fast bus systems providing direct access to the terminal. LAEDC would be willing to organize a working group to get this project started.
3. A consolidated Rental Car Facility. (Alternative locations could include Lot C, Manchester Square or the ITC and could begin with bus access.)
4. Modernization of the Bradley International Terminal now, including gates to accommodate the foreign carriers needs for the Group VI aircraft, using a new passenger concourse and an added aircraft gate area on its existing west face.
5. Use of state-of-the-art detection and surveillance technology to monitor entry of vehicles into the central terminal areas. This could be combined with limitations on high-risk van and truck access to the central terminal areas.

Alternative D also contains several elements which would radically and irrevocably change the nature of passenger access and airport operations and raise difficult questions of passenger convenience, security, cost and flexibility, and deserve more critical evaluation. These include (1) closure of the Central Terminal Area to vehicle access and replacement with a Ground Transportation Center at Manchester Square for remote passenger drop-off and an Automated People Mover to a new Central Terminal Area for check-in and (2) North Runway complex modifications to accommodate large Group IV aircraft which include elimination of Terminals 1, 2 and 3 and a substantial portion of LAX's short haul flight capacity.

THE GROUND TRANSPORTATION CENTER CONCEPT – AN ALTERNATIVE

The Manchester Square GTC is proposed as an immediate, radical and irrevocable change to LAX. It is billed as a "Safety and Security" plan for LAX to protect the primary function of the airport. However, it is premised on security technologies which do not yet exist. It also creates other security tradeoffs such as vulnerability of the APM and concentration of passengers in the CTA. It presents major issues of customer convenience unless some form of baggage check-in and handling can be accommodated at the GTC so passengers do not have to carry their luggage on the APM to the CTA. The location of Manchester Square also raises issues of access and impact on the 405 freeway. The GTC concept (with APM and CTA) accounts for approximately \$3 Billion of the overall Alternative D plan. The Critical Infrastructure Council believes the remote Manchester Square GTC concept raises more issue than answers.

However, the Council would like to offer an alternative to Manchester Square if remote drop-off is to be a necessary part of the Mayor's Alternative D plan. When LAX was last expanded in 1984, planners were aware that future growth would require added passenger drop-off capacity. They identified the LAX Parking Lot C area as the likely location for such a facility to supplement direct vehicle access. Connection to the nearby Central Terminal Area via an elevated people mover system was part of the thinking at the time (Pre-9-11 the people mover would have accessed individual terminals on a third level, but it could also serve a single central terminal alternative). (See Attachment B: Map) Moving the GTC to the Lot C area has the following benefits over Manchester Square:

- (1) Lot C is already owned and operated by LAX and within its existing operating envelope. It is available now as compared to an indefinite future date for Manchester Square.
(Additional underutilized land is also available on the south side of 96th street.
- (2) Proximity to LAX reduces the security envelope to be protected and enables security enhancements at least 5 years sooner than Manchester Square.
- (3) Proximity to LAX also substantially reduces the costs and enhances the viability of customer friendly APM system and a baggage check-in and handling system at the GTC since it is 1-1/2 miles closer and within the controlled area of LAX.

- (4) The Lot C area location enables vehicles to use all existing surface access routes to LAX without concentrating backup impacts on the 405 freeway.
- (5) Lot C's proximity to LAX enables a "staged" development which can use bus transport to LAX until the APM and new CTA are completed. This provides the flexibility to design and develop the GTC, the APM, the baggage handling system and the CTA over a more reasonable period of time in order to incorporate developing security and baggage handling technologies. Staging also enables LAX to address the renovations at the Bradley Terminal now rather than 2020.
- (6) Since LAX plans to maintain the access roadways around the CTA, the proximity of the Lot C area would allow emergency bus service to LAX as a backup in the event of a terrorist incident.
- (7) Lot C also offers the opportunity to pursue with the help of state funding, a dedicated "collector/distributor" access road from the 405 freeway along Arbor Vitae Street into the ground transportation center (and returning to the freeway) to incent users to avoid accessing the main terminals and reducing the potential for stack up on the 405 freeway.
- (8) If creation of construction jobs is a key consideration in the Mayor's plan, Lot C enables the creation of more near term jobs since the Lot area is already owned and controlled by LAX.

CONTINUING LIMITED CENTRAL TERMINAL ACCESS

The Critical Infrastructure Council would also suggest that rather than closing the Central Terminal Area to vehicles, that LAWA consider creating a limited access system based on pricing constraints to the use of the CTA vehicles with a low-risk profile. With a remote Lot C check-in option, creation of a time-based fee for access to and use of the Central Terminal Area by low-risk profile vehicles would enable those willing to pay, such as business passengers, to use the CTA (similar to current parking rate structures). Revenues generated could then be used to subsidize and enhance other forms of access and security such as flyaway and Lot C drop-off services, thereby incenting non-CTA access. This would reduce congestion in the CTA and enable the use of bomb sensing technologies to check vehicles entering the CTA. Users would then pass through tollgates leaving LAX. Frequent users could purchase electronic passes or tickets which can be read by readers similar to those used on the toll roads. In the event of condition orange or red, the CTA could be closed down and all vehicles

routed to Lot C avoiding much of the current back up on Sepulveda and Century Boulevards during emergency conditions.

THE NORTH RUNWAY AND TERMINALS 1, 2 AND 3

The plan to widen the north runway to expand capacity for the large Group VI aircraft is based on several critical assumptions about the future nature of international air service. The 600-seat Airbus A380 aircraft, is designed for international major market to major market ("point to point") service by some of the overseas carriers. Boeing, and many of the overseas and long haul carriers, however, believe that the more likely model is "hub and spoke scatter" service relying on a more flexible system using more conventional aircraft connecting to hubs where passengers can use short haul flights to reach multiple destinations.

Widening LAX's south runways is not only necessary now for safety reasons , but should enable LAX to accommodate a high volume of large Group IV aircraft using both south runways and one north runway simultaneously. It is highly questionable whether the north runway widening will be necessary. The elimination of Terminals 1, 2 and 3 would also disable much of LAX's hub and spoke short-haul capacity. Fortunately, this element of Alternative D is phased toward the end of the plan.

The Critical Infrastructure Council recommends that the north runway project be deferred until market developments warrant. In the event widening is necessary this should be accomplished by moving the north runway further north. This is a prime example of the flexibility needed in this post 9-11 environment.

CONCLUSION

Mayor Hahn has asked for public input. The Critical Infrastructure Council encourages LAWA to fully consider these and other suggested alternatives before moving into the final planning stage. Alternative D can be improved.

Re: Comments to Supplement to Draft EIS/EIR -- LAX Master Plan

Dear Mr. Ritchie and Mr. Kessler:

Continental Airlines ("Continental") hereby provides its comments to the Supplement (the "Supplement") to the Draft Environmental Impact Statement/Environmental Impact Report (the "DEIS") for the Los Angeles Airport Master Plan (the "Master Plan") and, in particular, the "Alternative D" plan addressed in the Supplement. As discussed in detail below, Continental believes that the DEIS and Supplement (collectively, the "Environmental Documents") do not satisfy the requirements of the National Environmental Policy Act ("NEPA") and California Environmental Quality Act ("CEQA") in that: (1) they do not adequately consider and evaluate certain environmental impacts or risks relating to ongoing and planned environmental remediation projects at LAX, particularly in the vicinity of the Continental aircraft maintenance facility (the "ACMX Facility") and the LAWA properties to the immediate west and south of the ACMX Facility, where there are significant known and suspected groundwater and soil impacts; and (2) they do not adequately analyze all available feasible mitigation measures or feasible alternatives that would substantially lessen or avoid the aforementioned significant environmental impacts.

Executive Summary

The Alternative D plan contemplates extensive demolition, excavation and construction activities throughout LAX. These demolition, excavation, and construction activities are likely to exacerbate, disturb or otherwise impact known and suspected groundwater and soil contamination at the airport, including interference with significant planned or anticipated environmental remediation projects at the airport. Most significant, Alternative D calls for the construction of two new aircraft maintenance facilities (the "New Maintenance Facilities") totaling approximately 300,000 square feet on the west side of the airport, south of World Way West, and just west of the ACMX Facility. This area overlays known jet fuel and halogenated

Mr. Jim Ritchie
Mr. David B. Kessler, AICP
November 6, 2003
Page 2

volatile organic compound ("HVOC") plumes in the groundwater, and suspected soil impacts. The ongoing and planned remediation of such groundwater and soil contamination would be greatly hindered, and such contamination might be greatly exacerbated, by the construction activities related to Alternative D. The Environmental Documents do not adequately analyze either of these significant adverse environmental impacts, or the feasible mitigation measures or project alternatives that are available to avoid or significantly lessen these environmental impacts. As such, the Environmental Documents do not meet the requirements of NEPA and CEQA. The LAX airport's proposed "Alternative D" Plan conflicts with Continental's approved, but voluntary jet fuel clean up plan. The Environmental Documents do not address this conflict. Continental is unwilling to proceed with cleanup until this conflict is resolved.

I. Known and Suspected Soil and Groundwater Contamination Near ACMX Facility

A. Jet Fuel Impacts and Remediation Efforts

There is widespread jet fuel contamination at LAX, including but not limited to a large plume of "Jet-A" fuel (the "Free Product Plume") that is floating on top of the groundwater under the ACMX Facility, the adjacent LAWA parking lot and undeveloped lot just west of the ACMX Facility, and in the taxiway just south of the ACMX Facility. Under the oversight of the Los Angeles Regional Water Quality Control Board ("RWQCB"), Continental has been investigating and developing remediation plans for the Free Product Plume.

Continental has been investigating soil and groundwater in the vicinity of the ACMX Facility since 1988. Investigative efforts include the installation of more than 300 soil borings on and around the ACMX Facility, soil gas surveys, installation of groundwater monitoring wells, and quarterly groundwater monitoring. Continental also has conducted some very preliminary remediation activities (limited "passive" free product removal from groundwater), and recently submitted a workplan and received RWQCB approval for the installation of an extensive vacuum-enhanced free product recovery system in and around the ACMX Facility.

Installation of the new free product recovery system is set to commence in late 2003 or early 2004. This effort will include the installation of 244 to 330 six-inch diameter free product recovery wells in the area of the ACMX Facility, the adjacent LAWA parking lot and undeveloped lot just west of the ACMX Facility, and in the taxiway just south of the ACMX Facility. Jet fuel will be pumped from the free product recovery wells using down-hole pneumatic pumps. An extensive network of piping will connect the product recovery wells to an aboveground treatment facility located on the adjacent LAWA parking lot. Extracted jet fuel will be shipped offsite for recycling. At present, the projected expense of this free product recovery system is at least \$20 million, and possibly much more. The wells and related equipment are scheduled to be installed in late 2003 or early 2004. The free product recovery project is not expected to be completed until at least 2010.

Mr. Jim Ritchie
Mr. David B. Kessler, AICP
November 6, 2003
Page 3

B. Solvent Impacts and Potential Remediation Efforts

Continental's groundwater monitoring data has indicated that the groundwater underlying the LAWA parking lot and undeveloped lot just west of the ACMX Facility, and the taxiway just south of the LAWA undeveloped lot is impacted by solvents or Halogenated Volatile Organic Compounds (HVOCs), including chlorinated solvents such as trichloroethylene ("TCE") and cis-1,2-dichloroethylene ("cis-1,2-DCE"). As discussed below, these areas may be impacted by Alternative D construction activities, including the proposed New Maintenance Facilities and the new West Employee Parking Garage.

To date, the HVOC Plumes in these areas remain under study. The vertical and lateral extent of the HVOC Plumes has not been fully delineated, nor the sources identified. Moreover, there has been no assessment of the risks posed by such contamination, the need for remediation of this contamination, nor the viable means for conducting such remediation. As such, to the extent such remediation ultimately is required, it is unlikely that it would commence before late 2004 or sometime in 2005, at the earliest.

II. Alternative D Construction Activities Proposed Near the ACMX Facility

According to LAWA's June 2003 Addendum to the LAX Master Plan (the "2003 Addendum"), the Alternative D Plan calls for, among other things, the construction of two New Maintenance Facilities totaling approximately 300,000 square feet on the west side of the airport, south of World Way West. This location is just west of the ACMX Facility, in an area that overlays the Free Product Plume and HVOC Plumes. According to the "Construction Sequencing Plan" for Alternative D set forth in section 2.10 of the 2003 Addendum, construction of the New Maintenance Facilities would be step one of "Phase II" of the construction activities to implement the Alternative D Plan. More specifically, according to the Conceptual Summary Schedule included in section 2.10, construction of these New Maintenance Facilities would commence in 2007 (or earlier) and be completed in 2008 (i.e., *three years prior to the "best-case" optimistic estimate for completion of the jet fuel recovery project*).

In addition to the New Maintenance Facilities which are to be constructed over the Free Product Plume and HVOC Plumes, the Alternative D Plan also calls for the construction of a new 12,400 stall employee parking structure on the west side of the airport, south of World Way West (the "West Employee Parking Garage"), a short distance west of the new Maintenance Facilities. The West Employee Parking Garage may overlay portions of the HVOC Plumes. According to the "Construction Sequencing Plan" for Alternative D set forth in section 2.10 of the 2003 Addendum, construction of the West Employee Parking Garage would be part of "Phase I" of the construction activities to implement the Alternative D Plan. More specifically, according to the Conceptual Summary Schedule included in section 2.10, construction of the West Employee Parking Garage is scheduled to commence in 2004 and be completed in 2005. Again, as with the New Maintenance Facilities, to the extent that any of the West Employee Parking Garage construction activities would occur in the area of potential HVOC remediation, the remediation could be delayed or otherwise hindered. In addition, an appropriate safety plan

Mr. Jim Ritchie
Mr. David B. Kessler, AICP
November 6, 2003
Page 4

would have to be prepared to ensure that proper measures would be taken to minimize exposure to construction workers.

III. Conflict Between Alternative D Plan and Soil and Groundwater Remediation

As discussed above, Alternative D calls for construction of the New Maintenance Facilities in 2007 and 2008, while the RWQCB-approved cleanup plan for the Free Product Plume contemplates a completion date no earlier than 2010. Moreover, although 2010 is the present target date for completion of the jet fuel remediation project, this target date has always been considered aggressive. Actual completion of the jet fuel remediation (even without interference by airport redevelopment activities) might not occur until 2015 or later (for example, if the radius of influence of the recovery wells proves to be less than projected). Thus, the Alternative D Plan calls for construction of the New Maintenance Facilities at least three years, and possible as many as five or ten years, before completion of the free product recovery project.

Construction of the New Maintenance Facilities, according to the plans proposed in Alternative D, would require extensive and expensive alterations to the free product recovery system. Specifically, since the free product recovery will not be completed by the commencement of construction of the New Maintenance Facilities, any extraction wells or related equipment in the area of such construction would have to be abandoned, removed, and/or relocated. Such abandonment, removal and/or relocation of recovery wells or other equipment "in midstream" of the remediation project would require extensive redesign and reconstruction of the system. One hundred or more of the free product recovery wells might have to be removed and/or relocated. Moreover, there is no guarantee that any replacement system could ever be as effective as the system now set for installation (i.e., it may be physically impossible or otherwise infeasible to remove substantially all of the free product without the extraction wells and related equipment contemplated by the approved plan now in place). In sum, this interference could delay, and might even prevent attainment of the cleanup standards established for this site by RWQCB.

Any HVOC remediation determined to be necessary in this area may face a similar fate. As mentioned earlier, the HVOC Plumes are still under investigation. RWQCB has not yet ordered any party to perform remediation of the HVOC Plumes. Thus, any such HVOC cleanup is unlikely to commence before late 2004 or 2005. Thus, to the extent such HVOC remediation is required in this area, it is highly likely that Alternative D construction activities would interfere with such remediation, for all of the reasons discussed above with respect to the jet fuel remediation project (i.e., relocation of wells, etc.). Again, this interference could delay and increase the cost of any such HVOC remediation, and could even prevent the attainment of cleanup standards established by RWQCB.

IV. Inadequate Consideration of these issues in the Environmental Documents

The DEIS recognized that the then-ongoing free product removal at the ACMX Facility (i.e., the very limited "passive" free product recovery effort) was likely to be affected by the

Mr. Jim Ritchie
Mr. David B. Kessler, AICP
November 6, 2003
Page 5

construction of certain facilities contemplated by the various Master Plan alternatives. Specifically, in Section 4.23 Hazardous Materials, at page 4-986, the DEIS stated as follows:

Due to the extent of excavation needed for the proposed improvements it is likely that part, or all, of the remediation systems in operation at [the ACMX Facility and another LAXFUEL facility] would have to be removed during construction. This would entail destruction of the extraction wells and removal of underground piping and aboveground tanks. Removing the active remediation systems at the LAXFUEL BFSF and the Continental Maintenance Facility for an extended period would interfere with existing cleanup efforts.

The DEIS (again, in Section 4.23 Hazardous Materials, at page 4-986) then proposed the following mitigation measure to address this otherwise significant environmental impact:

To prevent Master Plan-related construction from interfering with planned or ongoing remediation such that environmental contamination is exacerbated or permanent cleanup of sites prevented, LAWA would implement Master Plan Commitment HM-1, Ensure Continued Implementation of Existing Remediation Efforts. Implementation of this commitment would ensure that remediation projects would be completed to the extent possible and necessary before constructing Master Plan improvements, or that alternate clean up methods would be implemented during construction to prevent contaminant migration, if necessary. As part of this commitment, remediation systems would be reinstated following the completion of construction, if required. Therefore, impacts would be less than significant [emphasis added].

The DEIS contained no discussion or analysis of whether the proposed mitigation measure, Master Plan Commitment HM-1, was practical or feasible, nor the extent to which it might successfully mitigate any environmental impacts. Among other things, there was no discussion as to whether free product recovery was even possible once a building had been placed on top of the Free Product Plume (i.e., whether "horizontal wells" or some other alternative remediation method was physically and/or economically feasible under these circumstances). In addition, the DEIS (and its accompanying Technical Report #13, Hazardous Materials Technical Report) considered only the very limited "passive" free product recovery system in operation at the ACMX Facility at that time (consisting of a mere handful of extraction wells, without vacuum enhancement), as opposed to the much more extensive vacuum-enhanced system that is about to be installed at the site (i.e., 244 to 330 vacuum-enhanced extraction wells and related piping and equipment). The DEIS also did not evaluate any other feasible mitigation measures or project alternatives (e.g., *moving new airport facilities to areas other than those overlying the contamination plumes*). As discussed below, these omissions were repeated, continued and exacerbated in the Supplement.

The Supplement and its Technical Report S-8, Supplemental Hazardous Materials Technical Report (dated June 2003) offers no discussion of the magnitude of the new free product recovery system and the severity of likely interference caused by Alternative D. Notwithstanding that as of June 2003, LAWA and its consultant, Camp Dresser and McKee (CDM), were in possession of the detailed RWQCB-approved plans for the new vacuum-

Mr. Jim Ritchie
Mr. David B. Kessler, AICP
November 6, 2003
Page 6

enhanced free product recovery system underway at the site; and the Alternative D project plans and schedules showing the serious interference and interruption to be caused to that remediation system by the construction of the New Maintenance Facilities beginning in 2007. Instead, the Supplement offers only the following discussion of its mitigation measure, HM-1:

Prior to initiating construction of a Master Plan component, LAWA will conduct a pre-construction evaluation to determine if the proposed construction will interfere with existing soil or groundwater remediation efforts. For sites currently on LAX property, LAWA will work with tenants to ensure that, to the extent possible, remediation is complete prior to construction. If remediation must be interrupted to allow for Master Plan-related construction, LAWA will notify and obtain approval from the regulatory agency with jurisdiction, as required, and will evaluate whether new or increased monitoring will be necessary. . . . As soon as practicable following completion of construction in the area, remediation will be reinstated, if required by the Regional Water Quality Control Board (RWQCB) or another agency with jurisdiction. In such cases, LAWA will coordinate the design of the Master Plan component and the re-design or the remediation systems to ensure that they are compatible, and to ensure that the proposed remediation system is comparable to the system currently in place. If it is determined during the pre-construction evaluation that construction will preclude reinstatement of the remediation effort, LAWA will obtain approval to initiate construction from the agency with jurisdiction.

This passage ignores substantial relevant information in the possession of LAWA and its consultant CDM at the time it was written, and misleads the reader on a number of points critical to any meaningful analysis of the environmental impacts that will result from Alternative D. Most important, the documents in hand – that is, the RWQCB-approved plan for vacuum-enhanced free product removal at the ACMX Facility, the 2003 Addendum, the Alternative D “Construction Sequencing Plan”, and “Conceptual Summary Schedule” – make clear that construction of these Maintenance Facilities would commence in 2007 and be completed in 2008, *approximately three years prior to the “best-case” optimistic estimate for completion of remediation project*. The Supplement simply ignores this obvious conflict. Instead, as mentioned above, the Supplement suggests that “[P]rior to initiating construction of a Master Plan component, LAWA will conduct a pre-construction evaluation to determine if the proposed construction will interfere with existing soil or groundwater remediation efforts” [emphasis added]. Since there already is conclusive evidence that construction of the New Maintenance Facilities will interfere with the free product recovery system at the ACMX Facility, this portion of the Supplement is inaccurate and misleading. Simply put, NEPA and CEQA require that all relevant information bearing on environmental impacts be included in the EIR/EIS to ensure that the decision-makers are making fully informed decisions. In this case, the Supplement appears to intentionally understate the certainty and the extent of the interference caused by the Alternative D construction activities to the ACMX free product recovery system.

Mr. Jim Ritchie
Mr. David B. Kessler, AICP
November 6, 2003
Page 7

The Supplement (and, hence, any Final EIS/EIR) should and must include a proper analysis of the likelihood and severity of the conflict between the Alternative D construction activities and the ACMX free product recovery system and, just as important, the feasible mitigation measures and project alternatives that are available to avoid or lessen the interference, including but not limited to the possible relocation of the New Maintenance Facilities to avoid the interference. The Supplement does not even consider the possibility of such a relocation, but the significance of this omission is obscured by the failure to discuss the substantial evidence of certainty and substantiality of impact – that is, by understating the certainty and severity of the interference, the Environmental Documents mislead the decision-makers into believing that relocation of the New Maintenance Facilities need not be considered as a viable project alternative to avoid or substantially lessen the impact of the interference between Alternative D and the ACMX Facility remediation system.

In evaluating (or forecasting) future environmental impacts, CEQA requires that a public agency use its best efforts to discover and disclose all reasonably pertinent information. CEQA Guidelines Section 15144. The agency is required to forecast that which could be reasonably expected under the circumstances. *Id.*; *Laurel Heights Improvement Ass'n v. Regents of the University of California*, 47 Cal. 3d 376 (1988). Under the circumstances here, LAWA had extensive detailed information relating to the likelihood and severity of the impact posed by the interference between the Alternative D construction activities and the free product recovery project, but utterly failed to discuss or disclose such information. As such, the Supplement and DEIS understate the likelihood and severity of the impact, and create the false impression that this interference will not be a substantial environmental impact and that the evaluation and analysis of mitigation measures and project alternatives are unnecessary.

CEQA provides that a public agency may not approve a project as proposed if feasible mitigation measures or feasible project alternatives are available that would substantially lessen or avoid a project's significant environmental impacts. Thus, to the extent available, CEQA requires agencies to adopt feasible mitigation measures or feasible environmentally-superior project alternatives to substantially lessen or avoid otherwise significant adverse environmental impacts. Pub. Res. Code sections 21002 and 21081(a). To effectuate this requirement, an EIR must set forth an evaluation of feasible mitigation measures and project alternatives that decision-makers can adopt at the findings stage of the process. Pub. Res. Code section 21100(b)(3). The evaluation of feasible project alternatives is an even more stringent requirement under NEPA. An EIS must rigorously evaluate and compare all reasonable alternatives to provide a clear basis for the choice of options, and the degree of analysis devoted to each alternative must be substantially similar to that devoted to the proposed action. 40 C.F.R. section 1502.14. Again, in this case, LAWA failed to consider and evaluate feasible and available project mitigation measures and project alternatives that might avoid or substantially lessen the interference between the Alternative D construction activities and the environmental remediation at and around the ACMX Facility. Most important, the Supplement failed to consider or evaluate the potential re-location of the New Maintenance Facilities to somewhere other than directly on top of the Free Product Plume and HVOC Plumes.

Mr. Jim Ritchie
Mr. David B. Kessler, AICP
November 6, 2003
Page 8

As such, the Supplement and, hence, the DEIS in its entirety, violate CEQA and NEPA because they omit and/or conceal relevant evidence pertaining to the interference between the Alternative D construction plans and the ongoing and planned environmental remediation projects in and around the ACMX Facility. They thereby understate the likelihood and severity of such interference and the magnitude of environmental impact resulting therefrom, and they fail to properly consider and evaluate feasible mitigation measures and project alternatives that are available to avoid or substantially lessen the environmental impact.

V. Conclusion

The Supplement (and, hence, any Final EIS/EIR) should and must include a proper analysis of the likelihood and severity of the interference between the Alternative D construction activities and the ACMX free product recovery system and, just as important, the feasible mitigation measures and project alternatives which are available to avoid or lessen the interference. This consideration of alternatives must include the possible relocation of the New Maintenance Facilities to avoid the interference. At present, the Supplement does not consider the possibility of such a relocation, but the significance of this omission is obscured by the failure to discuss the substantial evidence of certainty and substantiality of impact. Thus, by understating the certainty and severity of the interference, the Environmental Documents mislead the decision-makers into believing that relocation of the New Maintenance Facilities does not need to be considered as a viable project alternative to avoid or substantially lessen the impact of the interference between Alternative D and the ACMX Facility remediation system.

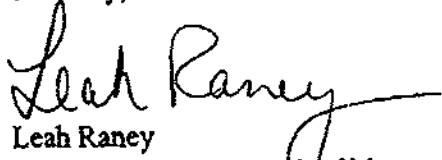

To summarize, at a minimum, CEQA and NEPA require that the final EIS/EIR for this project include a proper analysis (including consideration and disclosure of all relevant information) of the following issues:

- The extent to which the construction activities contemplated by the Alternative D Plan would preclude or interfere with ongoing, planned, or anticipated environmental remediation projects (including an analysis of the likelihood and severity of any interference with the free product recovery project adjacent to the ACMX Facility, as well as the potential HVOC remediation project);
- The extent to which the significant environmental impacts created by the conflict between Alternative D construction activities and soil or groundwater remediation efforts could be avoided or significantly lessened by feasible mitigation measures; and
- The extent to which the significant environmental impacts created by the conflict between Alternative D construction activities and soil or groundwater remediation efforts could be avoided or significantly lessened by feasible project alternatives.

Mr. Jim Ritchie
Mr. David B. Kessler, AICP

Failure to adequately consider these matters will render any final EIS/EIR deficient under federal and state law. Thank you for your consideration of these comments. You may reach me at 713-324-6976 with any questions.

October 20, 2003

Review of Biological Resources Analysis in Supplement to Draft Environmental Impact Statement/Environmental Impact Report for LAX Master Plan

This review pertains to the Federal Aviation Administration/Los Angeles World Airports Supplement to Draft Environmental Impact Statement/Environmental Impact Report (“SDEIS/EIR”) for the LAX Master Plan. The scope of this review is limited to biological resources, and consequently addresses Sections 4.10 (Biotic Communities), 4.11 (Endangered and Threatened Species of Flora and Fauna), 4.12 (Wetlands), 4.14 (Coastal Zone Management and Coastal Barriers), and 4.18 (Light Emissions). The review was prepared by Dr. Travis Longcore and Catherine Rich, who are experts in the ecology and history of the natural communities that would be affected by the proposed airport expansion and in the assessment of environmental impacts under the California Environmental Quality Act, National Environmental Policy Act, and California Coastal Act. Dr. Longcore has co-authored several peer-reviewed scientific articles on the El Segundo dunes and the Los Angeles coastal prairie (including its vernal pools),¹ which both would be adversely affected by the proposed project.

The SDEIS/EIR complements, but does not replace, the original Draft Environmental Impact Statement/Environmental Impact Report (“DEIS/EIR”) for the LAX Master Plan. The SDEIS/EIR does nothing to improve the fatally flawed assessment methodology for direct impacts to sensitive biological resources that was presented in the DEIS/EIR. Rather, the SDEIS/EIR provides only a trivial and meaningless change in the name of the methodology from “modified Habitat Evaluation Procedure” to “Mitigation Land Evaluation Procedure” (“MLEP”). The SDEIS/EIR attempts to improve the analysis of indirect impacts on biological resources, including the effects of light, noise, and air pollution, but the analysis is illogical and unsupported by the literature. Finally, the SDEIS/EIR presents impact analysis for the newly-formulated Alternative D.

With the exception of the analysis of Alternative D, which triggered the preparation of a Supplement, the new biological resources analysis appears to consist primarily of responses to comments on the DEIS/EIR, including those of the resources agencies and perhaps our own.² In our 2001 review, we noted the failure of the DEIS/EIR to provide an adequate assessment of the effects of light and noise on biological resources, illustrated the gross inadequacy of the “modified Habitat Evaluation Procedure,” and identified contradictions in the project description. Because many of the problems that we identified in our 2001 review have not been addressed in the SDEIS/EIR, we incorporate our earlier comments by reference (see attached without appendices). This review evaluates the updated analysis of biological impacts and associated mitigation measures presented in the SDEIS/EIR.

1.0 Project Description

The maps of land use for the airport properties are updated in the Supplement to depict the four Alternatives. These maps are somewhat clearer than those in the DEIS/EIR about the land use of the ~100 acres of El Segundo dunes not included in the Habitat Restoration Area. While the DEIS/EIR included maps depicting this area as a golf course or resort hotels,³ the SDEIS/EIR identifies that area as “Airfield/Airport Open Space.”⁴ The description of Alternatives does not, however, provide conclusive details about the long-term disposition of this biologically important area.⁵ The long-term plans for this property are important to the analysis of mitigation measures because the SDEIS/EIR contemplates that some habitat mitigation activities will occur in this area, outside of the ~200-acre Habitat Restoration Area.⁶

We note that the depiction of the 100 acres of El Segundo dunes north of the Habitat Restoration Area as “Airfield/Airport Open Space” diverges from the previous positions articulated by the City of Los Angeles. In the staff report for issuance of a Coastal Development Permit for landscaping along Waterview Street at the northern end of this area, the City in 2001 wrote, “The Project, a narrow, landscaped area along the streets, would provide a buffer between the golf course and residential areas....”⁷ As we noted in our previous comments, the zoning for the parcels in the dunes was set at [Q]OS-1-XL in 1994, which disallows development in the dunes habitat preserve and restricts use of the remainder of the property to “a nature preserve and accessory uses only.”⁸ In the Land Use section of the SDEIS/EIR, while the entire 300 acres of the El Segundo dunes are designated as “Open Space,” the map refers to the “Los Angeles Airport/El Segundo Dunes Specific Plan” as the descriptor.⁹ This Specific Plan has been superceded by the 1994 zoning update, but this fact is not reflected in the various maps in the SDEIS/EIR. The restriction of the northern 100 acres of the dunes to “nature preserve and accessory uses” should be clarified in the Final EIS/EIR.

2.0 Direct Impacts

2.1 Mitigation Land Evaluation Procedure (formerly “modified Habitat Evaluation Procedure”)

The modified Habitat Evaluation Procedure presented in the DEIS/EIR has been renamed the Mitigation Land Evaluation Procedure in the SDEIS/EIR.¹⁰ This methodology was rejected outright by the U.S. Fish and Wildlife Service (“USFWS”) and the California Department of Fish and Game (“CDFG”) in comments on the DEIS/EIR, but the SDEIS/EIR retains the methodology while simply changing the name, “to eliminate confusion associated with a similarity in the designation to an unrelated methodology developed by the USFWS.”¹¹ This change in terminology does not correct the faulty

11. *Id.*

assumptions of the underlying method, and does nothing to correct the deficiencies in this method that were identified by the USFWS, CDFG, and our previous review.

The SDEIS/EIR uses the Mitigation Land Evaluation Procedure to determine impacts to sensitive vegetation types and to quantify impacts to habitats of sensitive species.¹² The name change is a *de facto* confirmation that the “methodology” is not based on an accepted technique, the “Habitat Evaluation Procedures” (“HEP”)¹³ developed by the U.S. Fish and Wildlife Service, but rather was invented for this analysis. While the HEP is an established method with a history of usage,¹⁴ the MLEP is not a recognized method for the evaluation of impacts to sensitive species or vegetation types, or the determination of mitigation ratios for such impacts. Because the SDEIS/EIR does not reprint the methodology it has renamed MLEP, further discussion of the MLEP must refer to the DEIS/EIR.

The MLEP sets habitat evaluation standards based on an “optimal” site with “a multitude of floral and faunal species.”¹⁵ One would expect that each vegetation type would be compared against an optimal site of that same vegetation type, but this is not the case. Rather, the MLEP inexplicably compares all vegetation types against a valley needlegrass grassland/vernal pool complex. One might also expect that the habitat evaluation for each species would incorporate features relevant to that species’ survival. This is not true either, because the habitat evaluation standards bear no relation to species requirements. For example, we compared the habitat evaluation standards in the MLEP to the habitat requirements of loggerhead shrike (*Lanius ludovicianus*) and black-tailed jackrabbit (*Lepus californicus bennettii*) (Table 1),¹⁶ and found no nexus. The MLEP assigns low values of 0.25 for vegetation types that are occupied by these species (non-native grassland/ruderal), even though this vegetation is quite good habitat for both species. Furthermore, because the MLEP compares all vegetation types against one vegetation type, the MLEP results in the false conclusion that habitat values lost by destruction of one vegetation type can be mitigated by enhancing a completely different vegetation type.

This critical failure bears repeating. The single set of standards used to evaluate all vegetation types does not reflect ecological value, either to sensitive species or as vegetation communities. This problem derives from the physical and biological criteria used to evaluate habitat and the so-called “ecosystem functional integrity” components of the analysis. Rather than developing criteria for each vegetation type, the MLEP evaluates all vegetation types against the characteristics found in a “reference site.” The vegetation type chosen for this standard is that of valley needlegrass grassland/vernal pool complex.¹⁷ For some inexplicable reason, all vegetation types are measured against this standard, including southern foredune, southern dune scrub, and disturbed dune scrub/foredune. Dune vegetation does not exhibit many features found in a valley needlegrass grassland/vernal pool complex. Because dune vegetation does not have vernal pools and associated species, these vegetation dune types are assigned lower

16. Because the MLEP is the “modified HEP” with a different name, our analysis is the same as provided in our 2001 comments.

17. DEIS/EIR, p. 4-615.

“habitat” values — 0.35 for both southern dune scrub and disturbed dune scrub/foredune, and 0.45 for southern foredune. This ranking merely illustrates that dune scrub is not good valley needlegrass grassland/vernal pool complex, but it says nothing about whether it is good dune scrub.

Table 1. Relevance of Mitigation Land Evaluation Procedure Standards to Two Sensitive Species

MLEP Standards	Relevance to value of area as black-tailed jackrabbit habitat	Relevance to value of area as loggerhead shrike habitat
TOPOGRAPHY		
Mound-depression microrelief	None. Species occurs in a variety of topographic conditions.	None
Native soils w/ slope <10%	None	None
Areas w/ period of inundation ≥ 30 days	None. Can serve as vectors for seed dispersal between vernal pools, but not necessary for habitat. ¹⁸	None
Summer desiccation	None	None
FLORA		
>10% vegetative cover	Some. Forage and cover must be present.	Some. Vegetation must support prey populations.
Native grasses >10%	None. Will forage on all manner of grasses, forbs, and shrubs. ¹⁹	None
Vernal pool associated species	None	None
Listed vernal pool associated species	None	None
FAUNA		
Domination of native fauna (reproducing)	None	None
Grassland associated species (reproducing)	None	None
Sensitive vernal pool associated species	None	None
Listed vernal pool associated species	None	None
ECOSYSTEM FUNCTIONAL INTEGRITY		
Contiguity w/ wetland and State-designated sensitive terrestrial habitat	None	None
Designated sensitive terrestrial habitat	None	None
Under regulatory conservation	None	None
Variety of pollinator/dispersal mechanisms present (wind, wildlife)	None. Is itself a dispersal agent.	None
Contiguous native habitat > 40 acres	Potentially important. Size of habitat, whether native or not, is important.	Potentially important. Size of habitat, whether native or not, is important.

Hansen. 1982. Herbaceous vegetation of habitat used by blacktail jackrabbits and Nuttall cottontails in southeastern Idaho. *American Midland Naturalist* 107(1):180–184. Jameson, E.W., Jr., and H.J. Peeters. 1988. *California mammals*. University of California Press, Berkeley.

The portion of habitat value deriving from “ecosystem functional integrity” is another wholesale creation of the DEIS/EIR, and by extension the SDEIS/EIR. The choice of standards is arbitrary, with little to do with the sensitive species and vegetation types under analysis. Whether a site is “under regulatory conservation” does not necessarily have anything do with the ecological value of its vegetation type for sensitive species. Similarly, “contiguity with state-designated habitat” is not an ecological criterion. “Variety of pollinator/dispersal mechanisms present” is oriented toward vernal pool vegetation, and the choice of “contiguous native habitat >40 acres” is arbitrary.

The MLEP fundamentally obscures the reality that sensitive plants and wildlife utilize vegetation that is not dominated by native species. Loggerhead shrikes forage in ruderal and non-native grasslands as well as in dune scrub. Jackrabbits are thriving in an area with little native plant component. Furthermore, the MLEP asserts that landscaped areas within the airport grounds contain “habitat units,” even though these areas support neither sensitive vegetation communities nor sensitive species. The MLEP is therefore of no use in evaluating the impacts to native wildlife, or in devising mitigation schemes for those impacts. The MLEP is so flawed that it completely fails to establish the nexus for mitigation of impacts.

We are not saying that it would be impossible to develop a scheme to assess vegetation communities that assigns lower area equivalence to degraded vegetation. Indeed, the suggestion by CDFG that non-native grasslands be mitigated at a 0.5:1 ratio is implicit recognition of such an approach. A preliminary effort to develop a “habitat hectares” scheme has been published in the scientific literature, but it is fundamentally different from the MLEP.²⁰ A valid “habitat area” approach should include the following features: 1) incremental values of habitat areas are assigned strictly on biological criteria, 2) these criteria are developed separately for each vegetation type, and 3) the results are not applied as proxies for the habitat requirements of individual wildlife species.²¹ The MLEP violates all three of these conditions. (Technically, this type of approach should not be called a “habitat area” approach, because “habitat” is a specific term that is defined relative to an individual species.²²)

2.2 Alternative D

The SDEIS/EIR discloses that the new, preferred Alternative D would result in direct destruction of 1.53 acres of sensitive habitat for the construction of navigational aids and associated service roads within the El Segundo dunes, both inside and outside the Habitat Restoration Area. This would include removal of 0.8 acres of disturbed foredune, 0.5 acres of disturbed grassland, and 0.2 acres of foredune.²³ The acreage may sound minimal to the casual reader, but the raw acreage does not reveal the true extent of project impacts because it conceals the spatial configuration of the development. The Biotic Communities analysis fails to reveal the geographic arrangement of the proposed construction, and does not consider this critical information in the assessment of impacts. This information about configuration is important because if the navigational aids are scattered, a greater area will be subjected to “edge effects” from adjacency to the new infrastructure and the construction. If they are clustered, then

20. Parkes, D., G. Newell, and D. Cheal. 2003. Assessing the quality of native vegetation: the “habitat hectares” approach. *Ecological Management and Restoration* 4:S29–S38.

21. *Id.*

23. SDEIS/EIR, Table S4.10-4.

impacts will be lessened. Clustering of development is one of the basic tenets of conservation planning. Every site of disturbance within the dunes habitat is an area that is more easily invaded by exotic plants and arthropods. It is therefore troubling that the SDEIS/EIR contains no assessment of the configuration of this development footprint.

Configuration of the navigational aids on the dunes is found only in the Coastal Zone Management and Coastal Barriers section. A figure in that section reveals that the navigational aids will be installed at no fewer than 23 separate locations in two lines extending two thirds of the way across the dunes from east to west.²⁴ In addition, existing navigational aids will be removed from 12 other locations both in and out of the Habitat Restoration Area. Each new navigational aid will be 9 feet square, within a 15-foot service buffer. The total area of the new navigational aids is 0.2 acres, so the remaining 1.4 acres of identified disruption must be from new roads or other construction impacts. Therefore, from the new navigational aids alone, nearly 1,300 feet of new habitat edges will be introduced into the El Segundo dunes. It is furthermore unclear if habitat disruption from removal of existing navigational aids has been evaluated.

The impact analysis for Alternative D uses the flawed MLEP to calculate “habitat units” that will be lost for various sensitive species. These habitat units are essentially meaningless; the actual acres of lost habitat should be the basis for impact assessment. According to the SDEIS/EIR the following sensitive species will experience habitat loss in the following amounts: black-tailed jackrabbit, 23.76 acres; western spadefoot toad (*Spea hammondi*), 8.97 acres; loggerhead shrike, 83.25 acres.

The area of impacts to black-tailed jackrabbit is actually much larger than 23.76 acres. The area currently occupied by this species will be used as a construction staging area, which will eliminate far more habitat than the parking garage.²⁵ In addition, the mitigation measure for this species proposes relocating all of the jackrabbits to the El Segundo dunes. The resulting total loss of habitat is therefore closer to the 118.75 acres described for the other Alternatives.

Loss of habitat for jackrabbits, loggerhead shrikes, and western spadefoot toads constitutes a significant impact because the losses would appreciably diminish the ranges of these rare species. LAX supports the only population of jackrabbits in west Los Angeles and indeed, in most of the Los Angeles basin. LAX also supports one of the last western spadefoot toad populations in the Los Angeles basin. Surveys in 2003 for breeding loggerhead shrikes recorded fewer than six pairs within the Los Angeles basin (Kimball Garrett, Los Angeles County Museum of Natural History, pers. comm.), and the species has disappeared in recent years from regularly surveyed sites at Holy Cross Cemetery, Madroña Marsh, and other Los Angeles locations (Professor Hartmut Walter, UCLA Department of Geography, pers. comm.). All three of these species are on the verge of extirpation within a large cismontane geographic area, making any impacts to the populations at LAX highly significant. Cumulative impacts to these species, from the proposed project and other projects in the area, including the Catellus West Bluffs development, are highly significant.

The impact analysis for Alternative D (and the other Alternatives) does not address the “bomb disposal site” located within the Habitat Restoration Area. Consultants to LAX previously recommended that

24. SDEIS/EIR, Figure S4.14-1.

25. SDEIS/EIR, Figure S4.20-1.

this site be moved as part of the Master Plan process so that the ongoing adverse impacts to sensitive habitats (including scraping of restored areas, and disposal of debris within restored areas) could be avoided.²⁶

The impact analysis does not provide a sufficient discussion of chemicals that would be used for dust suppression. The SDEIS/EIR suggests the use of “nontoxic” soil binders to reduce dust, but the compatibility of these chemicals with habitat restoration and biological communities is unknown or not reported, and so cannot be evaluated.

3.0 Indirect Impacts

The SDEIS/EIR provides additional discussion of the effects of light and noise on biological resources. While presenting marginally more information, the analysis and conclusions on both these topics are lacking in logic and scientific support.

3.1 Artificial Night Lighting and Wildlife

Discussion of the impacts of artificial night lighting on wildlife is hampered by the confusing use of terminology in the SDEIS/EIR. The issue is routinely described as an analysis of “light emissions,” and the magnitude of lighting is described in foot-candles (“fc”). The difficulty with this is that foot-candles (or the SI equivalent lux) are measures of illumination within an area, not the emission of light from a source. Light emissions should be described in terms of luminance. Both illumination and luminance are relevant to assessment of the biological impacts of artificial lighting. Luminance is primarily associated with attraction and repulsion of animals, while illumination primarily results in orientation and disorientation.²⁷ Analysis of lighting should therefore clearly distinguish between illumination and luminance in considering impacts to wildlife.

The analysis of lighting impacts from all Alternatives lacks relevant spatial information to reach meaningful conclusions. For example, the baseline conditions within the dunes Habitat Restoration Area are described as ranging from 0.004 fc to 0.26 fc.²⁸ For all build scenarios, the SDEIS/EIR predicts that illumination will increase by 0.34 fc. The spatial distribution of this increase is not described, which makes it difficult to discern how large an area will be subjected to increased lighting from the project.

The SDEIS/EIR tries to reach the conclusion that current lighting levels have no adverse influence on wildlife. This conclusion is not supported by the facts. First, all lighting levels within the dunes were recorded during a night with a clear sky. Light reflected by clouds or fog is at a minimum on clear nights; ambient illumination may increase substantially on overcast or foggy nights.²⁹ The

characterization of the baseline conditions does not therefore adequately represent lighting impacts, given the frequency of these meteorological conditions along the coast.

Second, the biological analysis asserts that only nocturnal and crepuscular species could be affected by artificial night lighting. This conclusion reveals a failure to understand basic ecology and an ignorance of the scientific literature. One of the common effects of artificial night lighting is to extend the activity period of a diurnal species into the nighttime hours. This has been well documented for birds,³⁰ and is so notable in reptiles that animals exhibiting such behavior have been characterized as using the “night light niche.”³¹ In another example, seals extended foraging time on salmon by using the lights from a bridge overhead.³² Extended activity times for diurnal species results in disruption of interactions with other species. Species with extended activity periods may 1) subject other species to increased predation, 2) increase competition with nocturnal and crepuscular species, and 3) be subject to additional predation. The outcome of these altered species interactions will be positive, neutral, and negative for different members of the community, be they diurnal, crepuscular, or nocturnal. One experimental investigation reports the outcome of increased foraging time allowed by artificial lighting for butterfly larvae. The higher growth rate associated with longer photoperiod was offset by significantly higher predation on the butterfly larvae from the primary parasitoid species.³³ The SDEIS/EIR errs dramatically in claiming that diurnal species would not be affected by artificial night lighting.

Third, the SDEIS/EIR does not discuss the relevant literature to develop thresholds to determine adverse impacts from lighting. Rather, it draws on the rather illogical statement that because sensitive species are present in the dunes area with existing light levels, the light does not adversely affect these species.³⁴ Presence of a species in a degraded habitat does not mean that the habitat is not degraded. The conclusion of no impact from existing lighting cannot be drawn without knowing the density of sensitive species in the absence of artificial night lighting. Even using the measurements taken on a clear night for the SDEIS/EIR, artificial illumination on the dunes reaches 0.26 fc (2.8 lux), which is an order of magnitude greater than that provided by a full moon (~0.1 lux). The claim that illumination of this magnitude does not affect wildlife is untenable, given the known influences of lunar cycles on wildlife behavior. For example, scorpions stay closer to their burrows during the full moon.³⁵ Other animals,

including snakes,³⁶ small mammals,³⁷ lagomorphs,³⁸ and bats,³⁹ similarly avoid foraging during the full moon to avoid the increased predation risk. With areas of the dunes subjected permanently to illumination brighter than that of a full moon, the conclusion that this baseline condition causes no impacts is not supported by scientific evidence. Even the dimmest illumination found in the baseline conditions at the dunes (0.004 fc = 0.043 lux) is still greater than the light of a quarter moon (0.01 lux), let alone a moonless clear night (i.e., starlight only with no light pollution; 0.001 lux), or a moonless overcast night (i.e., no starlight with no light pollution; 0.0001 lux).

With these natural illumination levels in mind, it becomes evident that impacts from additional light created by the project will be significant to wildlife. All project Alternatives would increase illumination within the Habitat Restoration Area so that illumination would range from 0.344–0.6 fc (3.7–6.5 lux). This illumination is 37 to 65 times brighter than that of a full moon. Given that the wildlife species of the dunes evolved for hundreds of thousands of years with, and are adapted to, a natural light regime with a maximum illumination of the full moon, and some wildlife species may detect and respond to illuminations below 0.01 or even 0.0001 lux,⁴⁰ an increase of 0.34 fc (3.6 lux) constitutes a significant adverse impact.

3.2 Noise and Wildlife

In our 2001 comments on the DEIS/EIR, we requested that the impact of noise on wildlife be analyzed. The SDEIS/EIR presents an analysis, but it is lacking in scope and logic.

The scope of the analysis of noise impacts is limited in the SDEIS/EIR to sensitive species only. While these impacts are important, this scope is unduly narrow, because it ignores impacts to wildlife species not designated as “sensitive” that are found in rare natural communities (also called “sensitive habitats”). Rare natural communities, such as southern foredune, dune scrub, and valley needlegrass grassland, are important for both their flora and fauna. It would defeat the purpose of protecting such sensitive habitats if impacts to the wildlife in those habitats are not analyzed. The noise analysis should therefore be expanded to consider impacts to the wide range of wildlife found in the sensitive habitats at LAX, and not limited to only those individual species designated as sensitive.

The logic of the noise analysis is also flawed. This is exemplified by the conclusion that, “Based on the analysis of existing noise levels at locations occupied by sensitive species, and the presence of sensitive species within these areas, it appears that current noise conditions do not adversely affect sensitive species at LAX.”⁴¹ Again, as is the case with the analysis of artificial night lighting, insufficient information is available in the SDEIS/EIR to draw this conclusion. If the density of sensitive species

41. SDEIS/EIR, p. 4-453.

without elevated noise levels were known, and those densities remained the same with elevated noise, then perhaps a conclusion of no impact could be reached. But the SDEIS/EIR does not report density of occupation by any sensitive species (except El Segundo blue butterfly, *Euphilotes bernardino allyni*) and presents no comparison to suggest that densities would be the same in the absence of the noise associated with the fourth largest airport in the United States. Without these critical parts of a logical argument, the conclusion that existing noise does not affect sensitive species at LAX is unfounded.

Beyond the faulty conclusion that *current* noise levels do not affect sensitive species at LAX, the SDEIS/EIR also asserts that *increased* noise would not affect sensitive species. This conclusion is a result of the inappropriately narrow scope of the analysis and a failure to consider reasonable thresholds for noise effects. A rather exhaustive body of literature is referenced, but glossed over by the SDEIS/EIR, that illustrates the adverse impacts of airport noise on vertebrates, even at levels far below the thresholds in the SDEIS/EIR. Chronic noise, even at low levels, is associated with elevated stress hormone levels, higher blood pressure, faster heart rates, and other physiological effects.⁴² As a result, birds, mammals, and other vertebrates may show anatomical differences (smaller body size, enlarged adrenal glands) from prolonged exposure to noise.

A study of the influence of aircraft overflights on birds is cited in the SDEIS/EIR, noting that “there were no major differences in the nesting productivity of the most abundant species, and the nesting success was high and similar for both the control site and the test site.”⁴³ This reference is rather disingenuous, because it neglects to inform the reader that the Alaska study site experienced L_{max} below 70 dB(A) while the L_{max} at LAX ranges 90–140 dB(A) under the various Alternatives. This represents a considerable difference, because decibels are measured on a logarithmic scale.

Road noise, which is several orders of magnitude quieter than aircraft noise, has been documented to exert an adverse impact on breeding birds. Of 45 bird species investigated in woodlands in The Netherlands, 33 showed significantly depressed breeding density in response to increased noise levels near roads. All species in the small passerine families Sylviidae, Fringillidae, and Emberizidae were affected by noise.⁴⁴ Empirical measurement of the threshold value triggering decreased density in woodlands shows that for all bird species combined the threshold value is 42–52 dB(A), with individual species exhibiting thresholds as low as 36 dB(A) and as high as 58 dB(A).⁴⁵ Furthermore, years with overall low population densities showed lower threshold levels. Similar research has been conducted for

grasslands. Overall, this research shows that breeding bird habitat is degraded at noise levels as low as 36 dB(A).⁴⁶

Mammals are likewise vulnerable to impacts from chronic airport noise:

Only a few studies of the physiological effects of noise on rodents have involved wild animals. A field study by Chesser et al. (1975) involved two populations of house mice near the end of a runway at Memphis International Airport. Adult mice also were collected from a rural field 2.0 km from the airport field. Background noise levels at both fields were 80–85 dB. Noise levels of incoming and outgoing aircraft at the airport field averaged 110 dB, with the highest reading reaching 120 dB. Total body weights and adrenal gland weights of mice from the fields were measured. Additional mice were captured from the rural field, placed in the laboratory, and exposed to 1 minute of 105-dB recorded jet aircraft noise every 6 minutes to determine if noise was the causative factor. Control mice were not subjected to noise. After 2 weeks, the adrenals were removed and weighed. Adrenal gland weights of male and female mice from the airport field were significantly greater than those of mice from the rural field. The noise-exposed mice in the laboratory study had significantly greater adrenal gland weights than the control mice. After ruling out stress factors, such as population density, Chesser et al. (1975) concluded that noise was the dominant stressful factor causing the adrenal weight differences between the two feral populations.⁴⁷

While house mice are of no regulatory concern, native small mammals on the El Segundo dunes include harvest mouse, *Reithrodontomys megalotis*, and desert wood rat, *Neotoma lepida*, which are locally significant. But again, the SDEIS/EIR does not analyze these impacts because it concentrates only on sensitive species, and not on the full range of wildlife species in sensitive habitats.

The scientific literature provides ample evidence to conclude that the sensitive habitats at LAX are degraded by noise from airport operations and that increased noise would constitute a significant adverse impact.

4.0 Mitigation Measures

The SDEIS/EIR, because it relies on the MLEP to formulate mitigation measures for impacts to sensitive species and biotic communities, contains deeply flawed mitigation measures.

The SDEIS/EIR reports that all of the proposed project Alternatives will destroy four seasonal ponds occupied by western spadefoot toads on the south airfield. These populations number at least several hundred adults and all sites would be destroyed by the various project Alternatives. The SDEIS/EIR estimates occupied area as 8.97 acres of ephemeral wetted areas and adjacent upland habitats. Spadefoot toads require upland habitats surrounding their aquatic habitat.⁴⁸ It is unclear how upland habitats were measured for the SDEIS/EIR. Critically important in the analysis is that the species is found in four separate areas. Even though the areas are close to each other, the existing configuration of

Foppen, and G. Veenbaas. 1997. Disturbance by traffic of breeding birds: evaluation of the effect and considerations in planning and managing road corridors. *Biodiversity and Conservation* 6(4):567–581.

47. Mancini, K.M., D.N. Gladwin, R. Villella, and M.G. Cavendish. 1988. Effects of aircraft noise and sonic booms on domestic animals and wildlife: a literature synthesis. U.S. Fish and Wildlife Service National Ecology Research Center, Ft. Collins, Colorado. NERC-88/29. 88 pp.

48. Ruibal, R., L. Trevis, and V. Roig. 1969. The terrestrial ecology of the spadefoot toad *Scaphiopus hammondi*. *Copeia* 572–584.

habitat patches is important to reduce risk to the species from a catastrophic event (e.g., chemical spill). Depending on the separation of the pools, there may still be genetic exchange among the populations in each. These risk dynamics should be considered when evaluating the impact on the species and potential mitigation measures.

Loss of the LAX population of western spadefoot toads would cause a significant restriction of the range of the species. Because of the significance of the LAX population to the range of the species, mitigation areas should be as close as possible to the existing sites. The first choice should be within the 100 acres north of the Habitat Restoration Area where vernal pools were found historically.⁴⁹ This site would not require land acquisition and would be consistent with achieving other mitigation goals within this area. Furthermore, the biological consultants for the LAX Master Plan recommend that this site be restored with vernal pools.⁵⁰ The second priority for creation of habitat and reintroduction of western spadefoot toad is the West Bluffs site. While this site is currently graded for development, the owner is willing to sell the property, which historically supported appropriate vernal pool habitat. The area of the reintroduction site must at least equal the area occupied at LAX. Given the difficulty of restoring habitat and establishing rare species, a 3:1 mitigation ratio for pool surface area would be more appropriate. This surface area must be accompanied by surrounding upland habitat at a ratio of 10 to 15 acres for each acre of pool surface area. Ideally the mitigation pool surface area would be divided among at least three pools to minimize the effects from a possible catastrophic event.

Mitigation for impacts to Riverside fairy shrimp (*Branchinecta sandiegoensis*) should use the same pool system as developed for the western spadefoot toad.

The SDEIS/EIR suggests that the impact of destroying at least 83 acres of habitat for loggerhead shrike can be mitigated by enhancing habitat within the El Segundo dunes. As proposed, this mitigation measure will not be successful. It suggests that the loss of 83 acres of habitat can be offset by enhancing habitat within 300 acres of existing, occupied habitat. The SDEIS/EIR presents no evidence that the 300 acres of the El Segundo dunes could support a greater density of shrikes. Surveys of the El Segundo dunes in 1995 and 1998 showed this area to be occupied by breeding shrikes.⁵¹ An average of six individuals per survey were seen within the Habitat Restoration Area in 1995.⁵² Territory size for loggerhead shrikes on the Channel Islands is large, 34 ha (~84 acres),⁵³ while mainland territories are somewhat smaller, 4.4–16.0 ha (~10.9–39.5 acres).⁵⁴ Assuming the Habitat Restoration Area supports three pairs of breeding shrikes, the territory size would be ~27 ha (~66.7 acres). Experts familiar with shrikes and the El Segundo dunes doubt that the mitigation measure would be successful in increasing shrike density in this occupied habitat (Professor Hartmut Walter, UCLA Department of Geography, pers. comm.).

54. Miller, A.H. 1931. Systematic revision and natural history of the American shrikes (*Lanius*). *University of California Publications in Zoology* 38:11–242.

Only one of the three proposed enhancement activities (removal of roads) could be conducted within the Habitat Restoration Area. The other enhancement activities would be conducted outside the Habitat Restoration Area. If enhancement will occur outside the Habitat Restoration Area, then the mitigation measure must establish that restored areas will be protected permanently as natural habitat. The SDEIS/EIR fails to state that mitigation areas outside of the Habitat Restoration Area will be permanently protected.

Enhancement to improve habitat for loggerhead shrikes might also have adverse consequences on other species. Shrikes are fond of Jerusalem crickets as forage.⁵⁵ The Jerusalem cricket found at the El Segundo dunes is a sensitive endemic species.⁵⁶ This is meant only to illustrate that artificially increasing the density of one species is not necessarily consistent with management for other species or for maximum biological diversity. Similarly, as discussed below, enhancement to support a large population of jackrabbits would conflict with the provision of habitat for El Segundo blue butterflies.

The proposed mitigation for impacts to black-tailed jackrabbits involves relocation from a ruderal grassland to the Habitat Restoration Area, which contains southern dune scrub and foredune scrub vegetation. It is likely that this mitigation measure will not succeed. First, the 200 acres (81 ha) of the Habitat Restoration Area will support a lower density of jackrabbits than the open grassland they now inhabit. Black-tailed jackrabbits are generalist herbivores, and therefore can survive in a range of vegetation types. The density of jackrabbits differs, however, with the composition of the vegetation. Sites that have very high grass cover relative to shrubs and forbs support far greater densities. For example, a steppe habitat with 59% grass, 10% forb, and 31% shrub cover supported 18.4 jackrabbits per ha, and density decreased with increasing shrub cover to 1.4 individuals per ha at 91.0% shrub cover.⁵⁷ Because the Habitat Restoration Area is intended to support scrub habitats, jackrabbits could only persist at a far lower density than they do in their current habitat at the Airport Operations Area, meaning a much larger area would be required to support the population. Furthermore, the SDEIS/EIR does not consider the possible reasons that black-tailed jackrabbits are no longer present on the dunes, even though they were present historically. For some reason the population was extirpated, and unless the forces that caused the extirpation are removed, the mitigation will fail. We see two possible explanations. First, the small population size within the Habitat Restoration Area was vulnerable to random events simply because it was small. If this is true, then the relocation will eventually fail unless the dunes are managed to maintain a larger population size to the detriment of other sensitive species on the dunes, including El Segundo blue butterfly. A second possible explanation for the disappearance of jackrabbits from the dunes can be deduced from the timing of their extirpation. According to surveys in the DEIS/EIR, jackrabbits died out (or were killed) sometime between surveys in 1978 and 1988.⁵⁸ The other major change in the mammal fauna between 1978 and 1988 was the appearance of the non-native red fox as a breeding resident on the dunes. Red fox are recorded predators of black-tailed jackrabbits, so the invasion and success of this predator may have resulted in the elimination of jackrabbits. If this is true, any jackrabbit relocation program must be accompanied by a humane red fox (and feral cat/dog) control program.

58. DEIS/EIR, Technical Report 7. Biological Resources Memoranda for the Record on Floral and Faunal Surveys, p. 493.

Mitigation for Lewis' evening primrose (*Camissonia lewisii*) does not ensure that a replacement population of the species will be created, only that more individuals will be grown on the El Segundo dunes, where the species is already found. In addition to establishing a numerical goal for the number of individuals to be replaced, mitigation should ensure that the area occupied by the species will increase by at least the 2.5 acres that would be lost. Because there is a risk-spreading benefit in the disjunct configuration of the impacted population, the mitigation site should be geographically distinct from currently occupied sites.

Mitigation Measure MM-ET-4 describes actions to mitigate impacts to El Segundo blue butterfly from Alternative D. It contains the following provisions, summarized and quoted from here, that deserve comment based on our previous experience⁵⁹ with such mitigation efforts: 1) avoid flight season for construction, such that construction occurs between October 1st and May 31st, 2) mitigate the number of plants of coast buckwheat at 1:1 ratio, 3) "salvage existing coast buckwheat plants and any larvae on the plant or in the soil below the plant that would be removed," and 4) salvage any El Segundo blue butterfly larvae from plants that are not salvaged.⁶⁰ While it may seem intuitive to avoid construction during the adult flight season, the species may indeed be more vulnerable at other times because individuals are in diapause as pupae in the sand beneath the plants. While flying adults can escape physical disturbance in the environment, pupae cannot move to avoid being crushed. If the Section 7 consultation with USFWS results in a "no jeopardy" determination, the following strategy would reduce impacts to the butterfly. Plants that will be impacted should be carefully removed in the late Spring before adult butterflies eclose by cutting them at the surface of the sand. This minimizes disturbance to pupae in the duff and sand below. Then construction should be delayed until after the ensuing flight season. Butterflies that emerge to find their plants gone will be forced to emigrate to nearby habitat. If desired, the affected areas can be searched for pupae after the flight season to locate any pupae in multiple-year diapause. Relocation of mature coast buckwheat plants is not a cost efficient means of mitigation. Most plants will die, and the butterfly would be better served by restoring more habitat with container plants. Given the timing of the construction phase, the existing measure incorrectly refers to salvage of larvae at a time when only pupae would be found. Finally, mitigation at a 1:1 ratio for plants is insufficient. The mitigation ratio for direct impacts to this rare natural community should be at a 5:1 ratio on an area basis rather than a per plant basis. The impacts to 0.24 acres of occupied El Segundo blue butterfly habitat (which will be scattered across the Habitat Restoration Area) should be mitigated by restoration of 1.25 acres of the vegetation type in similar topoclimatic configuration. Impacts to backdune areas should be mitigated by restoring backdune vegetation, not by planting a remote foredune area as contemplated by the mitigation measure.

5.0 Conclusion

The full DEIS/EIR, including the new Supplement, fails to provide a realistic assessment of the impacts of the proposed project on biological resources, including sensitive species and rare natural communities. The centerpiece of the analysis of direct impacts is a fatally flawed methodology. This methodology confuses the distinction between habitat and vegetation type, and even fails to account for

59. Longcore, T., R. Mattoni, and A. Mattoni. 2003. Final report for Palos Verdes blue butterfly pupal salvage on Palos Verdes and San Pedro housing, San Pedro, California. The Urban Wildlands Group, Los Angeles (Department of the Navy Letter Agreement # N68711-02-LT-C3001). 9 pp.

60. DSEIS/EIR, p. 4-494.

differences between vegetation types. The assessment of indirect impacts relies on illogical assertions (e.g., if a habitat is degraded for a species then further degradation will have no adverse impact), and fails to consider the scientific literature and its application to the impact analysis.

The magnitude of the LAX Master Plan development and its impacts to wildlife habitat for all four Alternatives, combined with the regional setting and cumulative impacts from development in the City of Los Angeles, lead to the conclusion that implementation of the Master Plan will have significant adverse impacts on biological resources. The mitigation measures proposed to offset these impacts are wholly insufficient to reduce these impacts to a less than significant level.

Review of Biological Resources Analysis in LAX Master Plan Draft Environmental Impact Statement/Environmental Impact Report

August 8, 2001

**Travis Longcore, Ph.D.
Catherine Rich, J.D., M.A.**

Review of Biological Resources Analysis in LAX Master Plan Draft Environmental Impact Statement/Environmental Impact Report

This review pertains to the Federal Aviation Administration and Los Angeles World Airports Joint Draft Environmental Impact Statement/Environmental Impact Report (“EIS/R”). It addresses Sections 4.10 (Biotic Communities), 4.11 (Endangered and Threatened Species of Flora and Fauna), 4.12 (Wetlands), 4.14 (Coastal Zone), and 4.18 (Light Emissions). The review was prepared by Dr. Travis Longcore and Catherine Rich, who are experts in the ecology and history of the natural communities that would be affected by the proposed airport expansion. Dr. Longcore has co-authored several peer-reviewed scientific articles on the El Segundo Dunes and the Los Angeles Coastal Prairie (including its vernal pools),¹ which both would be adversely affected by the proposed project.

The presentation of information in the EIS/R about biological resources is segmented into several sections. For the purpose of this review, however, all biological resource issues are treated together, because mitigation measures for biological impacts are largely the same.

1.0 Project Description

For the purpose of discussing the impacts to biological resources, the EIS/R does not provide a complete project description. Within the extent of the Master Plan boundaries, it is unclear what the disposition of certain areas of biologically significant property will be. In maps of the various project alternatives, the legend indicates useless designations such as “Airport Related.”² There is no way to ascertain with certainty what the use of such land will be under the various alternatives.

1.1 Failure To Analyze Northside/Southside Project

The EIS/R describes the LAX Northside Project as “Collateral Development” that previously has been entitled through the CEQA process.³ Reliance on old CEQA documentation is problematic, and development of this project would seem to require a reopening of the environmental review, especially given the changed conditions since the approval in 1983. However, the real difficulty is that the EIS/R replaces the LAX Northside Project with the Westchester Southside Project in each of the three build alternatives for the Master Plan. These projects are not the same, and even if the CEQA documentation for the Northside Project is deemed adequate, the Southside Project must be fully analyzed under CEQA. The EIS/R does not completely describe or analyze the biological impacts of the Southside Project.

The Westchester Southside Project, as depicted in the EIS/R,⁴ would include the conversion of 100 acres of the El Segundo Dunes to a golf course. (Several figures in the EIS/R appendices map this area at the northern portion of the dunes as “golf course/open space” and include “Resort Hotels” within the same color designation. At a minimum the maps indicate some level of development of the dunes as part of the Westchester Southside Project.) The dunes golf course/open space development was not included in the CEQA analysis for the LAX Northside Project, and remains unanalyzed for compliance with any environmental laws (CEQA, NEPA, California Coastal Act). It is inappropriate for the EIS/R to rely on the Westchester Southside Project — which is a site for relocation of displaced businesses⁵ — for mitigation, and not to evaluate the full impacts of the development. While all of the El Segundo Dunes are within the Master Plan area, and the alternatives themselves show no development on the 100 acres at the northern end of the dunes, the result of adopting any of the three project alternatives is to develop 100 acres of dunes in association with “Resort Hotels” and “golf course/open space.”⁶ The resource value of this area is discussed later, but the analysis of the Westchester Southside Project should not be piecemealed. Currently, the biological impacts of the Westchester Southside Project do not seem to be analyzed fully, nor are they included in the discussion of cumulative impacts for the project. Even if one accepts the premise of the EIS/R that the project will proceed absent approval of the Master Plan, the Westchester Southside Project is “reasonably foreseeable” — in fact relied upon for mitigation — and all of its impacts must be disclosed and mitigated as part of the Master Plan EIS/R.

The decision not to address the biological impacts of the Westchester Southside Project can be interpreted as a strategic choice to avoid disclosure of the full impacts of the airport expansion project. From a biological standpoint, the Westchester Southside Project, even though it would involve fewer square feet of built space than the LAX Northside Project (2.6 million square feet vs. 4.5 million square feet), it has a larger geographic footprint and greater biological impact. Any of the three build alternatives plus the Westchester Southside Project would be a catastrophe for the biological resources found at LAX.

1.2 Previous Failure To Disclose Impacts of Development on El Segundo Dunes

Los Angeles World Airports (“LAWA”) has previously failed to disclose impacts of development on the El Segundo Dunes. In 1999, a newspaper story announced that LAWA was planning to install landscaping on the northern end of the El Segundo Dunes, along Waterview, Rindge, and Napoleon streets. The Urban Wildlands Group, a Los Angeles-based nonprofit whose board includes the authors of this letter, contacted LAWA to inform project managers of the sensitive resources present and request that the project not include invasive plants that would degrade the dunes. LAWA promised, but then failed to provide, the plant list for the project. LAWA proceeded to implement the project, but failed to secure the proper permits from the City of Los Angeles as required under the California Coastal Act. After installing a new walkway and over 90 mature, non-native palm trees in a sensitive habitat area,⁷

4. EIS/R, Appendix J1. Biological Assessment Technical Report, Figures 8, 11, 14.

5. EIS/R, pp. 3-33, 3-47, 3-56.

6. City of Los Angeles Ordinance 169,767 restricts use of the northern 100 acres of the El Segundo Dunes at LAX to “nature preserve and accessory uses only.” This ordinance was passed unanimously by the City Council on April 6, 1994 as part of the General Plan/Zoning Consistency Program. Given this unequivocal direction from the City, it is unclear why the Master Plan is ambiguous about the disposition of this area, unless the intention is to attempt to remove the development conditions from the property and seek another use as part of the Westchester Southside Project.

7. Installation of palm trees is damaging ecologically, and also provides sites for birds to perch, potentially increasing bird strikes with aircraft. Consultants for the airport report that “[t]he El Segundo Dunes provides relatively few attractants

(cont’d)

LAWA was instructed to stop work by the California Coastal Commission, told that it must obtain a permit, and subsequently applied for a permit from the City. The Urban Wildlands Group opposed the permit application for the partially implemented project because it would significantly disrupt habitat values of an environmentally sensitive habitat area (“ESHA”), as defined under the California Coastal Act.⁸ The City analysis of the project also agreed that the site was an ESHA.⁹ The appeal of the permit was denied by the City of Los Angeles Board of Public Works with the stipulation that LAWA resolve the issue in consultation with The Urban Wildlands Group and those residents opposed to the palm trees. This has not yet happened.

LAWA steadfastly maintains that the 100 acres outside of the El Segundo Blue Butterfly Preserve is not part of the El Segundo Dunes and that it will be developed as a golf course.¹⁰ The area, however, is within the jurisdiction of the California Coastal Commission, and no approved Local Coastal Plan has been produced that would allow for a golf course. The EIS/R provides even more information to join previously published sources¹¹ showing that the area is an environmentally sensitive habitat area and therefore protected by Section 30240(a) of the California Coastal Act. For example, the EIS/R itself discloses that El Segundo blue butterflies (*Euphilotes bernardino allyni*) occupy one subsite,¹² sensitive Lewis’ evening primrose (*Camissonia lewisii*) occupies seven subsites,¹³ and the area is occupied by sensitive species such as silvery legless lizard (*Anniella pulchra*), San Diego horned lizard (*Phrynosoma coronatum blainvillei*),¹⁴ loggerhead shrike (*Lanius ludovicianus*; breeding),¹⁵ and Dorothy’s sand dune weevil (*Trigonoscuta dorothea dorothea*).¹⁶ The golf course or other development on the dunes should either be analyzed as part of the Master Plan EIS/R for conformance with applicable laws, including the California Coastal Act, or be explicitly deleted from the plans for the area. The EIS/R should offer some certainty about what development will take place within the Master Plan boundaries and disclose the impacts of that development.

to birds which may partially account for the significantly lower percentage of strikes occurring over this area than over the approach area. The El Segundo Dunes naturally supports very few trees — the only trees present are non-native trees that have been planted....” (EIS/R, Technical Report 7. Biological Resources Memoranda for the Record on Floral and Faunal Surveys, p. 341). Without complete environmental review, LAWA planted more attractants for birds in the form of palm trees. The EIS/R also reports that the native birds of the dunes are not involved in bird strikes, while species promoted by urban development, such as pigeons and gulls, are involved in the most strikes.

2.0 Current Conditions

The description of current conditions of the biological resources within the Master Plan boundaries is biased toward underestimating the value of the habitats that will be impacted.

2.1 Surveys

A great deal of effort was expended surveying the insects of the El Segundo Dunes, especially within the El Segundo Blue Butterfly Preserve, even though this area is not targeted for direct development. Surveys for areas that would be subject to significant direct impacts were inadequate. It appears that only one type of survey — sweep netting — was conducted east of Pershing Drive in the areas that would be most affected by development. This single method would not detect all of the sensitive species that might occur in the area. For example, the El Segundo Jerusalem cricket (*Stenopelmatus* sp.), a burrowing insect, would not be detected with sweep netting. Pitfall trapping would be required to ascertain its presence, and should be performed in the areas of project impacts east of Pershing Drive. Other survey methods, including black lighting and malaise trapping, were conducted only west of Pershing Drive on the El Segundo Dunes, not in the areas of direct project impacts.

While the extensive surveys conducted on the El Segundo Dunes may be useful for evaluating the impacts of the Westchester Southside Project, which the EIS/R does not do, they offer little information to understand the biological communities supported in the open spaces that would be developed under the three development alternatives. For example, the EIS/R provides no summary of the bird surveys conducted at the ephemeral wetlands and open spaces found in the western area of the airport, and provides only handwritten notes buried in the appendices.¹⁷ A summary would be useful to understand the character of the biotic communities in these areas. Species of local conservation concern such as Costa's hummingbird (*Calypte costae*), western meadowlark (*Sturnella neglecta*), and common yellowthroat (*Geothlypis trichas*) were recorded in these areas, yet no complete description of the communities is provided in the text of the document. The biological consultants for the EIS/R report that the ephemeral wetland area at the west end of the airport "provides resting and foraging habitat for numerous resident and migratory bird species,"¹⁸ but the EIS/R provides no summary of these observations or description of the impact of development on these species.

For the El Segundo Dunes, an extensive list of birds is found, complete with species that are almost certainly not present at all. The "Floral Compendium" and "Faunal Compendium" include "species observed or expected to occur on or in the immediate vicinity of the site."¹⁹ On this list are found species that are highly unlikely to be present on the dunes or even near the dunes. For example, acorn woodpecker (*Melanerpes formicivorus*) is not likely to be found on the El Segundo Dunes now or in recent history. Acorn woodpeckers in Los Angeles would be associated with coast live oaks, which are found nowhere on the El Segundo Dunes or the Los Angeles Coastal Prairie. The rather excessive bird list in the Faunal Compendium is made ever more curious by the statement elsewhere by the biological

consultants for the EIS/R that “the Dunes does not support a large resident bird population.”²⁰ It is odd to include these ambitious lists, because the biological analysis does not evaluate the impacts of the three alternatives on the species of wildlife in them.

2.2 “Determined Absent”

The summary table for sensitive species provided in Section 4.10 of the EIS/R is misleading. For many species, the table indicates that they have been “determined absent” from the Master Plan boundaries based on directed surveys. When dealing with small arthropods that are difficult to capture, persist at low numbers, and may have large annual variation in numbers, one cannot conclude that a species is “determined absent.” All that can be done is to state that the species was not found during a certain duration and intensity of searching. It is likely that the survey methodology did not possess sufficient statistical power to detect the species.²¹ Presence may be determined conclusively, but absence cannot, especially for cryptic (i.e., small or camouflaged) species. Some degree of certainty about absence could be derived if one had knowledge of the population size, yearly variation in population size of the species, and the trapping efficiency of the survey methods. This information is not available, and therefore no statistically defensible declaration of absence can be made about the sensitive arthropod species.

In other instances, the declaration of absence is contradicted by the reports upon which the section is based. For example, Table 4.10-2 claims that the following species are absent from the Master Plan boundaries: Henne’s ecosman moth (*Eucosa hennei*), Rivers’ dune moth (*Euxoa riversii*), Ford’s sand dune moth (*Psammobotrys fordii*), El Segundo scythrid moth (*Scythris new sp.*), lesser dunes scythrid moth (*Scythris new sp.*), El Segundo goat moth (*Comadia intrusa*), and Santa Monica dunes moth (*Copeblepharon sanctamonicae*). However, in the underlying report, Frank Hovore, the surveyor, writes:

Sensitive moth species (general *Comadia*, *Copeblepharon*, *Euxoa*, *Psammobotrys* [sic], *Scythris*) — A wide variety of moth specimens, including some possibly representing all of these species except *Psammobotrys* [sic], were taken in light traps, but moths in the traps were rendered unidentifiable by the combination of alcohol and churning actions of other species. All of the moth species previously known to occur on the dunes probably persist, because all of the known larval hosts are present. For most moth species, focused light collecting would be necessary to determine presence and distribution, using dry traps or light sheets. Very large numbers of *Psammobotrys* [sic] were collected on the dunes historically (LACM collection), and it is assumed that this species is present, but is highly seasonal and difficult to collect without sustained and focused field efforts.²²

The text presented in Table 4.10-2 of the EIS/R contradicts the surveys that were conducted. Far from being absent, as maintained in Table 4.10-2, a qualified surveyor determined that the methodology was insufficient to determine presence of these moth species, but that the species were indeed probably

present. Mischaracterization such as this undermines the credibility of the description of current conditions presented in the EIS/R.

2.3 Terminology

The EIS/R is inconsistent in its use of terminology describing the 100 acres north of the El Segundo Blue Butterfly Preserve. This area, along with the preserve, is part of the El Segundo Dunes.²³ It has been degraded through residential construction and intrusion of exotic plant species, but it remains of significant biological value and is itself a sensitive habitat (see above, Section 1.2). In various places in the EIS/R, this area is referred to as “dunes and adjacent landforms,” “non-restructured dunes,”²⁴ “100 acres north of Sandpiper Street,”²⁵ and “the 100-acre open space north of the preserve.”²⁶ Implicit in the choice of terminology for this area is perhaps the intention to construct a golf course upon it. The Los Angeles Airport/El Segundo Dunes Specific Plan, adopted in 1992, incorrectly claims that “approximately 100 acres of the Dunes ... do not contain significant habitat resources.”²⁷ The Specific Plan requires the proposed golf course to provide revenue for the upkeep of the dunes habitat preserve,²⁸ thereby lifting that burden from LAWA, which perhaps partially explains LAWA’s enthusiasm for the idea. However, existing zoning for the area — established more recently than the Specific Plan — is as a nature preserve. EIS/R maps should be consistent with the existing “nature preserve” zoning and should consistently acknowledge this area as part of the El Segundo Dunes.

The EIS/R also exhibits some difficulty with terminology to describe the habitat that formerly was found throughout the entire project area inland of the El Segundo Dunes. In a published article, Mattoni and Longcore describe this area as the Los Angeles Coastal Prairie, and document the historic plant diversity and the presence of extensive vernal pools.²⁹ The article has been commended as an exemplar of the practice of historical ecology in *The Historical Ecology Handbook: A Restorationist's Guide to Reference Ecosystems*.³⁰ For some reason, the EIS/R avoids using the Mattoni and Longcore article where it could be useful. For example, Mattoni and Longcore provide documentation of many sensitive species historically present within the study area from herbarium label texts. This includes a full list of vernal pool species historically found in the area, as well as upland forbs, grasses, and shrubs. Instead, the EIS/R chooses to classify the site as Valley Needlegrass Grassland. The historic evidence does not support the assumption that this area was dominated by perennial grasses; rather it was dominated by forbs. This is an important conclusion of Mattoni and Longcore’s research that the EIS/R neither accepts nor attempts to dispute.

2.4 Disturbed Dune Scrub/Foredune

Concurrent with the changing terminology about the portion of the El Segundo Dunes not found within the habitat preserve is the decision to classify all dune scrub/foredune outside of the preserve area as disturbed dune scrub. While it is true that the dunes area outside the habitat preserve has a heavier exotic species load, and does not support coast buckwheat (*Eriogonum parvifolium*), it nevertheless has more biological value than is implied by the description. For example, this area supports sensitive plants (Lewis' evening primrose, *Camissonia lewisii*), birds (loggerhead shrike, *Lanius ludovicianus*), and arthropods (see above, Section 1.2). Mattoni et al. describe the ex-residential area in their 2000 article:

Removal of the residences in the 1970s was superficial, leaving some foundations, substantial rubble, foreign soil, roads, and other infrastructure. Vegetation regenerated without assistance, producing a cover of predominately iceplant (*Carpobrotus edulis*) and acacia (*Acacia cyclopis*) with patches of a few highly dispersive dune shrub species.³¹

However, not all ex-residential sites supported the same arthropod communities. Some sites within the ex-residential area supported terrestrial arthropod communities (including rare and sensitive species) that were similar to those found on undisturbed foredune and undisturbed backdune sites.³² This variation in the vegetation and associated wildlife across the 100 acres should be reflected in the EIS/R. The wholesale characterization of the area as "disturbed dune scrub/foredune" is misleading in terms of its value to the dune system and proper statutory designation as an ESHA.

2.5 El Segundo Blue Butterfly

Much ado is made over the population size of the El Segundo blue butterfly ("ESB"). However, the methodology used to calculate population size by LAWA is flawed and overestimates population size by at least 400%. While many methods to track trends in butterfly population size exist in the scientific literature,³³ when LAWA hired consultants in 1994 to prepare the EIS/R, they inexplicably used none of the established methods. While consultants continued walking a transect to count butterflies established by Mattoni in 1984, they stopped conducting surveys throughout the entire season. It is absolutely

essential to survey throughout the flight season of the butterfly to obtain an estimate of total population size. Furthermore, rather than using an established method to analyze transect counts, Dr. Andrew Huang, an engineer at LAWA, constructed his own method to estimate population size. This method is flawed, and these flaws were explained by Dr. Travis Longcore to Dr. Huang in an email earlier this year, portions of which bear repeating here. The message describes methods used to estimate population size of the ESB by Longcore and others in a scientific article that was at that time in review and has subsequently been accepted for publication in an international scientific journal, the *Journal of Insect Conservation*.

The first method [of calculating population size] was the Pollard Index, which is quite straightforward and about which there can be no argument. There is not a lot of latitude in summing the average weekly count over the course of the season.

The second method is essentially the same as your numerical approximation. This method is first used, albeit with different data sources, by Watt et al in 1977 (Watt, Ward B., Frances S. Chew, Lee R. G. Snyder, Alice G. Watt, and David E. Rothschild. 1977. Population structures of Pierid butterflies I. Numbers and movements of some montane *Colias* species. *Oecologia* 27:1-22.) Watt et al. estimated "total animals [butterflies] present in the brood" by estimating daily butterfly numbers through MRR and extrapolation, summing them to calculate total animal-days, and multiplying this number by the death rate (determined by MRR). Dividing by the longevity (or residence time) would yield the same result. This is what we did, using Arnold's 1979 residence time estimates (ave 6.1 days). Your model does not divide by average longevity, but rather another figure. This is what I don't understand. What is wrong with the logic (used by Watt et al. as well) that the total brood size is equal to the total number of butterfly-days divided by the average butterfly longevity?

$$\frac{\text{butterfly-days}}{\text{longevity (days)}} = \text{butterflies}$$

Your model does something similar, calculating total butterfly days by integrating under the curve (gaussian or not) and dividing by a figure. The question, and the crux of the differences in our results, is the number that you divide by, which is 1.59. You get your number by parameterizing based on the recapture rates. I think the difficulty with this is that you do not know the age of the butterflies that were initially captured. Your method would work if all of the butterflies captured by Arnold on the first day were freshly eclosed adults. However, they cannot be. Some of them will be one, two, or more days old. Failure to account for this will skew your estimate of longevity downwards, and your total population estimate upwards. Now, I am going to guess that you will say that 1.59 days is not the longevity. But if it is not, what is it? Can you see a flaw in the logic of the Watt et al. method or otherwise reconcile it with your method?

One last thing on this method. Our application of it gave a population estimate for 1984 at LAX of 432, while Arnold's MRR estimate was 664, and the Zonneveld model estimated 910. Application of your method would give an estimate of 1,658. (Note: in case you want to calculate these numbers, with the exception of Arnold's estimate, they include an adjustment for the number of flowerheads) (Arnold, R.A. (1986) Studies of the El Segundo blue butterfly - 1984. Inland Fisheries Administrative Report 86-4.)

The third method that we used was the Zonneveld model. What is interesting is that our estimates of death rate (3.3-5.9 days), which vary from year to year, are similar to those given by Arnold (2.3-7.3 days) from MRR. We followed the model as set out by Zonneveld in the 1991 paper. We did not doubt the magnitude of the results because of the correspondence with the Watt et al method, the Pollard index, and the reasonableness of the longevity estimates.³⁴

34. Longcore, T. 6 March 2001. Email to Dr. A. Huang.

Dr. Huang did not defend his method, stating in a response to Dr. Longcore, “You have raised many outstanding issues. ... I am very busy with a number of projects. I won’t be able to respond to your questions for awhile.”³⁵ To date, he has not provided a substantive response. The EIS/R should therefore be adjusted to reflect El Segundo blue butterfly population numbers that are calculated using the best available scientific methods. Three methods of evaluating the transect counts are given in the *Journal of Insect Conservation* paper, the proofs of which are appended to this report.³⁶

As is evident from the literature about butterfly population size estimation,³⁷ the block counts promoted in the EIS/R are useful only to determine presence of the butterfly, not to estimate population size. The most perplexing part of the discussion of ESB population size by LAWA, both in reports by its consultants and in the EIS/R, is that none of the relevant scientific literature is referenced. Butterflies are conspicuous organisms, and schemes were developed in the 1970s to track population size, yet these are ignored. Sometimes remaking the wheel can lead to innovation, but in this instance it has led to confusion and the propagation of the myth that there are 40,000–80,000 El Segundo blue butterflies on the LAWA property. For example, LAWA claims that in 1998 there were roughly 12,000 ESB along the transect,³⁸ while proper analysis of the data indicates a population of $3,356 \pm 805$ S.D.³⁹ Similarly extravagant claims for the period 1996–2000⁴⁰ should be revised.

The EIS/R discussion of the ESB population size provides a diversion from the real issues at hand. Recovery of the species and downlisting from endangered to threatened status requires securing all of the El Segundo Dunes, including that area not currently in the habitat preserve.⁴¹ The 200-acre preserve is still vulnerable to disease, adverse weather, fire, and other accidents. Long-term extinction risk for the butterfly can be minimized through increasing habitat area, not simply by relying on existing areas to provide spectacular numbers. Furthermore, concentration on the El Segundo blue butterfly draws attention away from the ten other endemic invertebrates found on the dunes whose continued persistence depends on habitat values beyond those needed to maintain the butterfly.⁴²

LAWA’s persistent strategy has been to focus on the butterfly and the 200-acre preserve to the exclusion of all else. For example, in the above-described Waterview Street Landscaping Project, LAWA’s main claim in support of the project was that it did not affect the butterfly preserve or the butterfly. None of the appellants had argued that the project directly affected the butterfly, and pointed instead to the other sensitive species and habitats found on the project site. This notwithstanding, there are legitimate impacts to the El Segundo blue butterfly that would result from the alternatives in the EIS/R.

3.0 Assessment of Impacts

While the EIS/R identifies impacts to biological resources, its improper quantification of those impacts results in an underestimation of the actual biological consequences of the build alternatives and ultimately the incorrect conclusion that those impacts can be mitigated to a less than significant level.

3.1 Direct Impacts

The EIS/R uses what it calls a “modified Habitat Evaluation Procedure” to determine impacts on sensitive vegetation types and to quantify impacts to habitats of sensitive species.⁴³ This procedure is supposedly based on “Habitat Evaluation Procedures” (“HEP”)⁴⁴ previously developed by the U.S. Fish and Wildlife Service that have some degree of scientific validity and history of usage.⁴⁵ However, the methodology employed in the EIS/R uses the name of this procedure without incorporating any of the essential elements of the analysis. By comparing existing habitat for sensitive species against an abstracted, ideal habitat type, the EIS/R argues that loss of up to 500 acres of habitat for sensitive species can be mitigated by “improving” 100 acres of land already in a nature preserve. This conclusion is not supported by any accepted methodology of impact assessment and seems to have been specifically designed to underestimate the actual impacts to sensitive species at LAX.

HEP was designed for use with target species by the U.S. Fish and Wildlife Service in the 1970s to provide a form of standardization and comparability for environmental analysis. In HEP implementation, the term “habitat” is defined as the biophysical requirements of an individual species (e.g., bald eagle habitat), not as a general term synonymous with vegetation type (e.g., grassland habitat). The U.S. Fish and Wildlife Service states this in the guiding policies for HEP implementation:

HEP is a species-habitat approach to impact assessment; and habitat quality for selected evaluation species is documented with an index, the Habitat Suitability Index (HSI). This value is derived from an evaluation of the ability of key habitat components to supply the life requisites of selected species of fish and wildlife.⁴⁶

The explicit species-based approach of the HEP is apparent in the manual describing the procedure:

HEP is a species-based assessment methodology. It is applicable only for the species evaluated and does not directly relate that species with other ecosystem components. HEP conceptually addresses only the issues of species populations and habitats.⁴⁷

The “modified” HEP in the EIS/R does not establish which species will be used to evaluate the value of the reference sites, nor does it create HSIs for them. Rather, it sets habitat evaluation standards based on an “optimal” site with “a multitude of floral and faunal species.”⁴⁸

43. EIS/R, p. 4-615.

44. The EIS/R refers to a “Habitat Evaluation Procedure” in the singular form, while the U.S. Fish and Wildlife Service manual calls the method “Habitat Evaluation Procedures” in the plural form. We abbreviate both as “HEP” and treat the acronym as a singular noun indicating a methodology.

45. For example, see Johnson, T.L., and D.M. Swift. 2000. A test of a habitat evaluation procedure for Rocky Mountain bighorn sheep. *Restoration Ecology* 8(4S):47–56.

46. U.S. Fish and Wildlife Service. 1996. Fish and Wildlife Service manual, 870 FW 1, Habitat Evaluation Procedures. [online at <http://policy.fws.gov/870fw1.html>].

47. U.S. Fish and Wildlife Service. 1980. Habitat as the Basis for Environmental Assessment, 101 ESM.

The “modified” HEP does not provide information about the value of habitats within the subject site for several of the sensitive species found there. For example, it does not consider the habitat requirements of loggerhead shrike (*Lanius ludovicianus*) or black-tailed jackrabbit (*Lepus californicus bennettii*). It assigns values of 0.25 for vegetation types that are occupied by these species (Non-Native Grassland/Ruderal). By definition under a true HEP, occupied sites would score much higher. By “modifying” the HEP to address an abstract ideal habitat, actual habitat values to sensitive species are ignored (see below, Table 1).

In fact, the “modified” HEP resembles actual HEP implementation only superficially, in that values between 0 and 1 are assigned to certain arbitrary standards for vegetation types within the study area. None of the essential features of HEP are present in the modified method; the “modified” HEP therefore does not provide the basis for impact assessment in the project area.⁴⁹

Not only is the “modified” HEP quite different from the actual procedure, the standards used to evaluate habitats do not reflect ecological value. This problem derives from the physical and biologic criteria used to evaluate habitat and the so-called “ecosystem functional integrity” components of the analysis. Rather than using target species and HSIs to characterize vegetation types as required in HEP, the EIS/R evaluates whether each of the vegetation types in the project area meets the characteristics found in a “reference site.” The habitat type chosen for this standard is that of Valley Needlegrass Grassland/Vernal Pool complex⁵⁰ (i.e., Los Angeles Coastal Prairie). For some inexplicable reason, all habitats are measured against this standard, including Southern Fore dune, Southern Dune Scrub, and Disturbed Dune Scrub/Fore dune. Of course these dune habitats do not have features found in a needlegrass grassland/vernal pool complex. Therefore, because of their failure to have vernal pools and associated species, these vegetation classifications are assigned lower habitat values, 0.35 for both Southern Dune Scrub and Disturbed Dune Scrub/Fore dune, and 0.45 for Southern Fore dune. These values are ludicrous, first because habitat values and “Habitat Units” are supposed to be relevant to individual species, and second because one vegetation type is measured by the features of another. *The analysis succeeds only in illustrating that dune habitats are not the same as vernal pool/grassland complexes.*

The portion of habitat value deriving from “ecosystem functional integrity” is another wholesale creation of the EIS/R. These standards are not part of HEP, and the choice of standards is arbitrary, with little to do with the sensitive species and vegetation types under analysis. Whether a site is “under regulatory conservation” does not necessarily have anything do with the ecological value of its vegetation type to sensitive species. Similarly, “contiguity with state-designated habitat” is not an ecological criterion. “Variety of pollinator/dispersal mechanisms present” is oriented toward vernal pool habitats, and the choice of “contiguous native habitat >40 acres” is arbitrary. Throughout, the analysis avoids recognition that sensitive plants and wildlife utilize habitats that are not dominated by native species. Loggerhead shrikes forage in ruderal and non-native grasslands as well as in dune scrub. Jackrabbits are thriving in an area with little native plant component. A true HEP would calculate the value of the areas being utilized by carefully selected individual species and use those values to quantify impacts. The EIS/R’s “modified” HEP is fatally flawed and must either be revised to follow established procedure, or be abandoned.

50. EIS/R, p. 4-615.

3.1.1 Sensitive Vegetation Types

With the exception of the ambiguous treatment of the 100 acres on the northern portion of the El Segundo Dunes, the EIS/R claims not to be proposing direct impacts to sensitive vegetation types. The vegetation types to be removed by the three build alternatives are 306–404 acres of Non-Native Grassland/Ruderal and 60–96 acres of Disturbed/Bare Ground. Although these are not sensitive vegetation types, they are used extensively by sensitive species. Whereas the impacts of removal are to sensitive species, the EIS/R proposes mitigation of abstract “Habitat Units” using the “modified” HEP. The result of the use of the “modified” HEP is to underestimate the effects on the species that use these habitats. The “modified” HEP does not evaluate the value of non-native grassland and disturbed areas to each of the species involved, but rather compares those habitats against an idealized habitat. This allows the EIS/R to state losses and to mitigate in “Habitat Units” instead of acres. ***“Habitat Units” calculated in the HEP do not reflect the value of the habitats to the sensitive species.*** The EIS/R considers these “Habitat Units” as fungible entities, and thereby proposes to mitigate effects to one vegetation type by enhancing another habitat type. Also, by ranking vegetation types on the dunes by comparing them with Valley Needlegrass Grassland/Vernal Pool complex, the EIS/R creates an artificial deficit of “Habitat Units” within the dunes area. The EIS/R then proposes to mitigate for the loss of Non-Native Grassland (occupied by sensitive species) by enhancing the habitat within the already-preserved and restored area of the El Segundo Dunes. If one accepts the logic of the EIS/R’s HEP and mitigation scheme, the loss of Non-Native Grassland can be mitigated by making the El Segundo Dunes more like a Valley Needlegrass Grassland/Vernal Pool complex. (The EIS/R actually claims to restore these areas to Southern Dune Scrub, but does not reconcile that the “deficit” in habitat values on the dunes was caused by the “failure” of dune scrub to have vernal pool/grassland characteristics.) So by the twisted logic of the “modified” HEP, the loss of 366–500 acres of vegetation types occupied by sensitive species putatively can be mitigated by “improving” roughly 100 acres already protected as a nature reserve or zoned as such.⁵¹ Because the “modified” HEP does not measure habitat values for the sensitive species involved, the description of impacts in terms of “Habitat Units” will drastically underestimate the impacts to those vegetation types. Again, it must be noted that the procedure used in the EIS/R *has no basis in scientific literature* and resembles the actual HEP in name only.

All alternatives propose the removal of sensitive habitats within the El Segundo Dunes to allow construction of navigational aids. These impacts range from 640–1,344 square feet. While this does constitute a significant impact, it is dwarfed in comparison to the other direct and indirect impacts proposed under the three build alternatives.

The discussion of acreage and “Habitat Units” lost under each alternative is not clear with respect to the Westchester Southside Project. Some impacts from the Westchester Southside Project are included (e.g., loss of mature trees), but the effects of the “Resort Hotels” and golf course/open space development are not discussed. The No Action/No Project Alternative explicitly includes the loss of habitat from the LAX Northside and Continental City projects. As mentioned above, this improperly assumes completion of the LAX Northside Project even though changed conditions should result in reopening of the environmental analysis. Inclusion of these speculative developments as part of the No Project alternative serves only to make the impacts of the Master Plan alternatives appear smaller.

51. While there are certainly adequate opportunities to enhance the habitat on the El Segundo Dunes through road/infrastructure removal and revegetation, the area available is simply inadequate to compensate for the loss of sensitive species habitat under the three build alternatives.

The EIS/R mentions but does not discuss adequately one impact of the Westchester Southside development: the removal of 300 mature trees that are used as “nursery” sites for raptors.⁵² The biological appendix contains no reference to this impact, or the abundance and species of raptors involved.⁵³ Neither is a description immediately apparent in the “Biological Resources Memoranda for the Record on Floral and Faunal Surveys.”⁵⁴ The EIS/R should contain a full description of the species of raptors involved, their relative abundance, the location of the trees, and behaviors observed to allow a full evaluation of the impacts.

3.1.2 Sensitive Species

The faulty “modified” HEP results in the underestimation of impacts on sensitive species in the EIS/R. The statement of the impacts to populations are low, which results in improper conclusions about mitigation (see below, Section 4.0).

Lewis’ evening primrose (*Camissonia lewisii*). All alternatives acknowledge direct impacts to Lewis’ evening primrose. This is expressed in terms of the number of individuals that would be affected. While the number of individuals is important, the area that these individuals occupy is as important to the conservation of the species. However, the map showing the distribution of the species indicates locations only on the El Segundo Dunes west of Pershing Drive. No indication is given of the location of areas occupied east of Pershing Drive, which total 2.5 acres.⁵⁵ Populations separated from one another offer some degree of insurance against catastrophic losses at individual sites. The complete geographic distribution of the species at LAX should be provided in the EIS/R.

Belkin’s tabanid dune fly (*Brennania belkini*). The EIS/R does not acknowledge the loss of habitat for the Belkin’s tabanid dune fly, which is a sensitive species.⁵⁶ This species was recorded as present in the “north runway expansion area.”⁵⁷ The report indicates that the species may disperse into suitable habitat areas. The presence of this dune-associated species and the sensitive Lewis’ evening primrose in the north runway expansion area suggests that this area has a substrate suitable for dune obligate species. This may be the result of previous grading, but the value of this site to these and other sensitive species (e.g., potentially El Segundo crab spider, *Ebo* new sp.⁵⁸) should be noted.

San Diego black-tailed jackrabbit (*Lepus californicus bennettii*). The EIS/R acknowledges direct impacts to the habitat of this species, west of the southern runway, east of Pershing Drive. Each of the alternatives would result in the loss of 118.75 acres of occupied area, consisting of the entire population at LAX. The EIS/R maintains that these 118.75 acres equal 14.91 “Habitat Units,” or roughly 15 acres of ideal vernal pool/grassland complex. As discussed above, this conversion to “Habitat Units” is misguided and wrong. Only two of the sixteen standards for calculating “Habitat Units” are even remotely related to the value of these areas to black-tailed jackrabbit.

Table 1. Relevance of “Modified” Habitat Evaluation Procedure Standards to Two Sensitive Species

HEP Standards	Relevance to value of area as black-tailed jackrabbit habitat	Relevance to value of area as loggerhead shrike habitat
TOPOGRAPHY		
Mound-depression microrelief	None. Species occurs in a variety of topographic conditions.	None
Native soils w/ slope <10%	None	None
Areas w/ period of inundation ≥ 30 days	None. Can serve as vectors for seed dispersal between vernal pools, but not necessary for habitat. ⁵⁹	None
Summer desiccation	None	None
FLORA		
>10% vegetative cover	Some. Forage and cover must be present.	Some. Vegetation must support prey populations.
Native grasses >10%	None. Will forage on all manner of grasses, forbs, and shrubs. ⁶⁰	None
Vernal pool associated species	None	None
Listed vernal pool associated species	None	None
FAUNA		
Domination of native fauna (reproducing)	None	None
Grassland associated species (reproducing)	None	None
Sensitive vernal pool associated species	None	None
Listed vernal pool associated species	None	None
ECOSYSTEM FUNCTIONAL INTEGRITY		
Contiguity w/ wetland and State-designated sensitive terrestrial habitat	None	None
Designated sensitive terrestrial habitat	None	None
Under regulatory conservation	None	None
Variety of pollinator/dispersal mechanisms present (wind, wildlife)	None. Is itself a dispersal agent.	None
Contiguous native habitat > 40 acres	Potentially important. Size of habitat, whether native or not, is important.	Potentially important. Size of habitat, whether native or not, is important.

The conversion of occupied area to “Habitat Units,” based on the standards listed here, is a misapplication of HEP. The extent of habitat loss to the species is on the order of 119 acres. The use of improperly-defined “Habitat Units” to quantify this loss implies that 15 acres of ideal vernal pool/grassland could support as many black-tailed jackrabbits as 119 acres of non-native grassland.

59. Zedler, P.H., and C. Black. 1992. Seed dispersal by a generalized herbivore: rabbits as dispersal vectors in a semiarid California vernal pool landscape. *The American Midland Naturalist* 128(1):1–10. (Jackrabbits play a similar role in the vernal pool landscape.)
 60. Johnson, R.D., and J.E. Anderson. 1984. Diets of black-tailed jack rabbits in relation to population density and vegetation. *Journal of Range Management* 37(1):79–83. MacCracken, J.G., and R.M. Hansen. 1982. Herbaceous vegetation of habitat used by blacktail jackrabbits and Nuttall cottontails in southeastern Idaho. *American Midland Naturalist* 107(1):180–184. Jameson, E.W., Jr., and H.J. Peeters. *California mammals*. Berkeley: University of California Press.

This is not possible; 15 acres is substantially smaller than the smallest recorded home range for the species (256 acres).⁶¹

Surveys determining the area occupied by black-tailed jackrabbit may underestimate the area currently occupied. Research indicates that jackrabbits may move from 2 to 10 miles during a day, from shrub cover where the species conceals itself during the day, to foraging habitat in the late afternoon and evening.⁶² The EIS/R does not provide sufficient survey information to establish if the grasslands and disturbed areas to the west of the southern runways provide only foraging habitat, and whether other locations (e.g., El Segundo Dunes) are already occupied at different times of the day. This is also suggested by studies of home range. In a study of big sagebrush and black greasewood, black-tailed jackrabbit ranges were larger (256–768 acres)⁶³ than the presumed occupied area at LAX (119 acres). This raises the question whether the species actually occupies a greater area at LAX, especially during the night and crepuscular periods when no surveys were undertaken.

Loggerhead shrike (*Lanius ludovicianus*). The same difficulties found quantifying habitat of black-tailed jackrabbit are found with description of impacts to loggerhead shrike. According to the EIS/R, the species currently occupies 171.86 acres that would be unusable following implementation of any of the project alternatives. (Such precision in habitat quantification is illusory; the EIS/R extrapolates occupied area by vegetation type, providing an *estimate* of habitat area that may differ from the area actually utilized.) Similarly, the EIS/R claims that this impact equals 22.88 “Habitat Units,” suggesting that roughly 23 acres of optimum habitat could mitigate for the loss of 172 acres of occupied habitat. This is false, and grossly underestimates the impacts to the species. No data are provided that link vegetation type to shrike density, as would be necessary to support this claim. The HEP standards are no more relevant to loggerhead shrike than they are to black-tailed jackrabbit. Unless an actual Habitat Suitability Index is developed for loggerhead shrike, all discussion of direct impacts should refer to the area of occupied habitat destroyed, not to the hypothetical “Habitat Units.” It is furthermore unclear whether the area of the Westchester Southside Project was surveyed, and whether these impacts are included.

Burrowing owl (*Athene cunicularia*). Surveys located burrowing owls within the project boundaries, though found no direct evidence of breeding. The EIS/R claims that the species “was determined not to breed within the Master Plan boundaries.”⁶⁴ This contradicts the previous assessment made by EIS/R consultant Jim Jennings, who concluded that “there is the potential that they may still breed in the project area.”⁶⁵ Because burrowing owl densities fluctuate from year to year, burrowing owls were observed in the project area, and potential burrow sites were found, the conservative approach would be to implement measures to ensure the conservation of the species. This species has recently lost much of its local habitat and if extirpated from the project site will disappear from west Los Angeles as a whole.

-
61. Smith, G.W. 1990. Home range and activity patterns of black-tailed jackrabbits. *Great Basin Naturalist* 50(3):249–256. This study found home ranges of 0.4–1.2 square miles for big sagebrush and black greasewood communities in northern Utah. Many factors may allow higher densities at LAX, such as more forage provided by dense non-native grasses and forbs, but there is no evidence that 15 acres of even the best habitats could compensate for the loss of 119 acres.

Western spadefoot toad (*Spea hammondi*). The EIS/R reports that the proposed project alternatives will destroy four seasonal ponds occupied by western spadefoot toads on the south airfield.⁶⁶ These populations number at least several hundred adults and all would be destroyed by the various project alternatives. The EIS/R estimates occupied area as 8.97 acres of ephemeraally wetted areas and adjacent upland habitats. Spadefoot toads require upland habitats surrounding their aquatic habitat.⁶⁷ It is unclear how this area was determined for the EIS/R. Critically important in the analysis is that the species is found in four separate areas. Even though the areas are close to each other, the existing configuration of habitat patches is important to reduce risk to the species from a catastrophic event (e.g., chemical spill, disease). Depending on the separation of the pools, there may still be genetic exchange among the populations in each. These risk dynamics should be considered when evaluating the impact on the species and potential mitigation measures. Loss of the LAX population of western spadefoot toad would cause a significant restriction of the range of the species.

Riverside fairy shrimp (*Branchinecta sandiegoensis*). LAX represents the only known coastal population of Riverside fairy shrimp in Los Angeles County. Loss of this population, which is spread among nine sites on the western portion of the property, would be a significant impact. The EIS/R asserts that because the sites where fairy shrimp cysts were found do not have characteristic vernal pool plants, no suitable habitat is found for the species. This conclusion is false — fairy shrimp require vernal pool hydrology, not vernal pool plants, for their existence. This condition would exist, were the management practices at LAX to remove standing water in these pools. It is indeed LAWA's own management scheme that prevents Riverside fairy shrimp from completing its life cycle; LAWA, therefore, should incur liability for "take" of the species under the Endangered Species Act. LAWA fails to recognize that once the presence of fairy shrimp cysts was detected in the vernal pools at LAX, the airport should have ceased its activities that inhibited the life cycle of the species. Instead, the proposal is to destroy all of the areas currently occupied.

The description of acreage for this species does not seem to include the size of the cachmentments necessary to fill the "ephemeraally wetted areas." These areas are necessary to formulate appropriate mitigation measures and evaluate impacts.

The EIS/R is insistent that "there are no extant vernal pools within the [Airport Operations Area]."⁶⁸ This statement is meant within the definition of vernal pools as a vegetation type. However, the term "vernal pool" may be used to refer to pools with standing water during the winter and spring, regardless of the presence of certain plant species. As defined by the U.S. Fish and Wildlife Service, "a vernal pool is a natural habitat of the Mediterranean climate region of the Pacific coast covered by shallow water for extended periods during the cool season but completely dry for most of the warm season drought."⁶⁹ The definition of the term is hydrological, not botanical. The EIS/R should therefore explicitly disclose that the statement "no vernal pools" refers to a botanical definition. Given the near complete destruction of vernal pools in Los Angeles County,⁷⁰ even loss of sites with vernal pool

hydrology and any remnant species (plant or invertebrate) represents a significant impact. The EIS/R emphasizes that Riverside fairy shrimp habitat is degraded through the presence of exotic plant species, presumably to suggest how much better mitigation sites will be than current conditions. However, the degradation of the habitat by exotic plant species is irrelevant to the quality of the pool as habitat for Riverside fairy shrimp. Other degradation to the habitat results directly from LAWA's management;⁷¹ this degradation is avoidable.

3.2 Indirect Impacts

As a whole, indirect impacts are not well described in the EIS/R. Those that are described are dismissed with little or no data offered in support, leaving the probability of much greater indirect impacts from the project alternatives than those disclosed.

3.2.1 Light

Night lighting has an effect on bird species composition in an area. A study in Sacramento showed that American crows (*Corvus brachyrhynchos*) roost in areas with high nighttime lighting levels.⁷² It is hypothesized that artificial lighting allows them to reduce predation from owls.⁷³ Crows are native, but they are also aggressive, and artificially increased population levels can be detrimental to other native bird species, including such sensitive species as loggerhead shrike. Artificial night lighting has also been shown to affect the behavior of nocturnal frogs, reducing their visual acuity and ability to consume prey, an impact that may befall those amphibians found within Master Plan boundaries.⁷⁴ Many larval forms of arthropods are positively phototactic (e.g., attracted to light, even artificial light), which poses a threat to the many sensitive insect species found on the El Segundo Dunes.⁷⁵ Artificial lighting results in increased mortality of moths and other nocturnal insects.⁷⁶ Night lighting can also affect kestrels as seen from observation of lesser kestrel (*Falco naumanni*), but also applicable to American kestrel (*Falco sparverius*), found on the El Segundo Dunes.⁷⁷ In fact, artificial night lighting affects singing and foraging time of many bird species.⁷⁸ Increased lighting even affects gastropods, which would include the sensitive Trask's snail (*Helminthoglypta traskii*).⁷⁹

(cont'd)

These effects may seem to be relatively innocuous, except that species that extend their activity periods into nighttime are often exposed to drastically increased predation threats. In a study of butterfly larvae, a higher growth rate associated with longer photoperiod (as would be caused by artificial light) resulted in significantly higher predation on the butterfly larvae from the primary parasitoid species.⁸⁰ Similar tradeoffs will likely occur for the El Segundo blue butterfly with increased lighting on the El Segundo Dunes. While the increased light may increase larval development, the time of activity may also increase predation and parasitism.

The conclusion in the EIS/R that the increased levels of night lighting will have no effect on the El Segundo blue butterfly is completely unsupported by current scientific knowledge of the mechanisms of such effects on ecological systems. The EIS/R concentrates on the adult form of the El Segundo blue butterfly, which only constitutes a minute fraction of the lifecycle of the organism, and ignores published scientific literature documenting the tradeoffs of increased lighting on larval forms of butterflies. Furthermore, the EIS/R includes no discussion of bat species that may forage on the El Segundo Dunes. Many bat species found in Los Angeles County are considered sensitive species, and their foraging patterns are affected by lighting levels. Some faster-flying species congregate at streetlights, while slower-flying species avoid them.⁸¹ The EIS/R should document the bat species foraging within the project site and evaluate the impacts of lighting and other development on them.

The increased nighttime light levels on the El Segundo Dunes constitute a significant adverse impact, and should be avoided. One method to decrease the impacts of nighttime lighting is to use low pressure sodium lamps in place of other lighting types. Yellow light from these sources has less ecological impact. Other possible mitigation measures include using full cut-off lighting fixtures and mandating operational controls.

3.2.2 Noise

The effects of airport noise on the fauna of the project area are not considered at all. Perhaps this results from the noise analysis, which improperly chooses 1996 — prior to the introduction of quieter airplanes — as the baseline for noise impacts, rather than what noise conditions would be in the absence of the proposed project. Through this careful choice of baseline, the EIS/R argues that there would be virtually no change in the noise levels on the El Segundo Dunes. However, this is not the case. Noise would be more constant under increased passenger capacity — more planes would be traveling in and out of the airport. Increased noise levels on the El Segundo Dunes will have significant adverse effects on the wildlife found there, effects that are evident from the available scientific literature.

The use of a weighted average to describe noise levels (CNEL) precludes and obfuscates analysis of actual noise impacts. From the standpoint of wildlife, and indeed human physiological responses, it is relevant to know what maximum noise levels are experienced, and at what duration. While the average noise levels described in the EIS/R offer some indication of which areas are louder than others,

maximum noise levels are necessary to evaluate potential hearing loss, startle reactions in animals, barriers to vocal communication, and other significant impacts to the fauna of the El Segundo Dunes.

The body of research on the effects of noise on vertebrates shows that chronic noise, even at low levels, is associated with elevated stress hormone levels, higher blood pressure, faster heart rates, and other physiological effects.⁸² As a result, birds, mammals and other vertebrates may show anatomical differences (smaller body size, enlarged adrenal glands) from prolonged exposure to noise. Species that use vocalizations to communicate may be excluded altogether from noisy areas. The effects of noise on birds and mammals in particular are relevant to the EIS/R.

Birds. Of 45 bird species investigated in woodlands in The Netherlands, 33 showed significantly depressed breeding density in response to increased noise levels near roads. All species in the small passerine families Sylviidae, Fringillidae, and Emberizidae were affected by noise.⁸³ This research also showed that noise effects followed a threshold model.⁸⁴ This means that up to a certain noise level, no decrease in density is observed. When noise increases beyond that threshold level, bird density decreases dramatically in the area between the location at which that threshold is met and the road. The decreased density over the area with noise greater than the threshold level ranges from 30% to 100% and is known as the “decrease factor.”⁸⁵

These two variables, the threshold value and the decrease factor, describe the impact of noise on breeding birds. Empirical measurement of the threshold value in woodlands shows that for all bird species combined the threshold value is 42–52 dB(A), with individual species exhibiting thresholds as low as 36 dB(A) and as high as 58 dB(A).⁸⁶ Furthermore, years with overall low population densities showed lower threshold levels.

Similar research has been conducted for grasslands. Overall, this research shows that breeding bird habitat is degraded at noise levels as low as 36 dB(A). Minimum noise levels on the El Segundo Dunes are 70 dB(A) CNEL,⁸⁷ a quantification that does not even provide maximum noise levels. There is no question therefore that noise from LAX operations affects breeding bird densities on the El Segundo Dunes.

87. EIS/R, Figures 4.2-15, 4.2-19, 4.2-23.

Mammals. Chronic noise is a problem for native mammals on the El Segundo Dunes, as it is for humans in surrounding neighborhoods. The description of one study on the effect of airport noise on a small mammal illustrates one example of this problem:

Only a few studies of the physiological effects of noise on rodents have involved wild animals. A field study by Chesser et al. (1975) involved two populations of house mice near the end of a runway at Memphis International Airport. Adult mice also were collected from a rural field 2.0 km from the airport field. Background noise levels at both fields were 80–85 dB. Noise levels of incoming and outgoing aircraft at the airport field averaged 110 dB, with the highest reading reaching 120 dB. Total body weights and adrenal gland weights of mice from the fields were measured. Additional mice were captured from the rural field, placed in the laboratory, and exposed to 1 minute of 105-dB recorded jet aircraft noise every 6 minutes to determine if noise was the causative factor. Control mice were not subjected to noise. After 2 weeks, the adrenals were removed and weighed. Adrenal gland weights of male and female mice from the airport field were significantly greater than those of mice from the rural field. The noise-exposed mice in the laboratory study had significantly greater adrenal gland weights than the control mice. After ruling out stress factors, such as population density, Chesser et al. (1975) concluded that noise was the dominant stressful factor causing the adrenal weight differences between the two feral populations.⁸⁸

While house mice are of no regulatory concern, native mammals on the El Segundo Dunes include some native small mammals (harvest mouse, *Reithrodontomys megalotis*, desert wood rat, *Neotoma lepida*) which are locally significant. Impacts of noise to the habitat quality of the El Segundo Dunes for native mammals should be evaluated.

Reptiles and Amphibians. Spadefoot toads may be induced to emerge from their burrows in response to loud noises (95 dB(A) recordings of motorcycle noise in one experiment).⁸⁹ Fringe-toed lizards are rendered deaf after 9 minutes exposure to 95 dB(A) noise in the same study. Some snakes will show alert behavior in response to airplanes flying overhead.⁹⁰

The EIS/R should evaluate the effects of noise on the biota of the El Segundo Dunes. It is likely that if the noise baseline were set at current conditions rather than before the implementation of quieter planes, this analysis would reveal significant impacts on the ability of the El Segundo Dunes to support populations of some species of birds, mammals, and other vertebrates. Such significant impacts should be identified and mitigated.

3.2.3 Pollution

The discussion in the EIS/R about pollution effects on the El Segundo blue butterfly deserves comment. The EIS/R makes the statement, “Monitoring results indicate that current levels of vanadium are not adversely affecting the El Segundo blue butterfly population at the Habitat Restoration Area since counts for the year 2000 showed a significant increase in the population when compared to 1999.”⁹¹ Many factors influence butterfly abundance from year to year; changes from 1999 to 2000 provide no information about the effect of pollution on the butterfly. This statement is indicative of a fundamental misunderstanding of the process of deductive reasoning. The reality is that we have no idea what effect pollution has on the populations of sensitive species on the El Segundo Dunes, including the El Segundo blue butterfly. Population trends cannot be derived from two years of data, and are even difficult with ten years of measurements.⁹²

3.2.4 Landscaping

The EIS/R does not assess the detrimental impacts of landscaping adjacent to the El Segundo Dunes. LAWA has planted invasive exotic species as landscape plants in the past, resulting in a greater load of exotic seed rain on the El Segundo Dunes.⁹³ Exotic landscaping material, and associated irrigation, can cause significant adverse effects on the biological resources of the El Segundo Dunes.

Installation of permanent irrigation in new areas along Pershing Drive would result in an expansion of the invasive exotic arthropod community on the El Segundo Dunes. Water sources promote population increases of non-native Argentine ants (*Linepithema humile*), European earwigs (*Forficula auricularia*), and other exotic species, which displace native insect species, an effect that has recently been documented to extend 200 m into native habitats.⁹⁴ Argentine ants are found on the El Segundo Dunes already, but the explosion in numbers associated with permanent irrigation will wreak havoc on native arthropod communities. This is shown by consistent decreases in native arthropod diversity in response to increased Argentine ant abundance.⁹⁵ Argentine ants would displace native ants surrounding the project site. This extirpation reverberates up the food chain, as some native reptiles (e.g., coast horned

lizard, *Phrynosoma coronatum*, found on the El Segundo Dunes) preferentially feed on native ants and decline in their absence.⁹⁶

The EIS/R should require as a mitigation measure that in areas adjacent to the El Segundo Dunes, all landscaping plants be limited to locally native species, and that irrigation be limited to winter only.

3.3 Cumulative Impacts

The analysis of cumulative impacts is woefully inadequate and is inconsistent with previous conclusions reached by the City of Los Angeles in environmental impact reports. The discussion of cumulative impacts in Sections 4.10 and 4.11 of the EIS/R consists of a description of the Master Plan area and the following statement:

Areas surrounding the study area consist largely of developed areas with little or no habitat value. However, two biologically significant open spaces, the Ballona Wetlands and the Ballona Bluffs, remain extant within the vicinity of the study area.⁹⁷

However, in the Final Environmental Impact Report for the West Bluffs Project — a project to build residences on the last open space on the Ballona Bluffs — the City of Los Angeles found:

The contribution of the proposed project to impacts on plant and animal life from ongoing development in the region is not considered to be significant, due to the disturbed nature and correspondingly low resource value of the project site.⁹⁸

The current EIS/R is inconsistent with the above statement. To the contrary, the current EIS/R states that:

The cumulative impacts on biotic communities from development of the LAX Master Plan Improvements, and other proposed projects in the area, most notably the Playa Vista Master Plan Project and the Catellus residential proposal on the Ballona Bluffs, are considered significant due to the limited amount of extant natural habitat in the vicinity of the study area, particularly wetlands.⁹⁹

The EIS/R then argues that implementation of the LAX Master Plan will not contribute to these cumulative impacts. The City of Los Angeles seems to claim that whichever project is under review does not contribute to cumulative impacts, yet once approved, the City's subsequent environmental review documents acknowledge that projects did contribute to cumulative impacts. The reality is that both the Catellus West Bluffs Project and the LAX Master Plan will contribute to significant cumulative impacts on natural resources.

Upland foraging habitat for grassland songbirds and raptors will be nearly eliminated by the combination of the LAX Master Plan, the West Bluffs Project, Playa Vista Phase I, and the potential

98. City of Los Angeles. October 1998. EIR No. 91-0675. West Bluffs Project Section IV.D.3.

99. EIS/R, p. 4-664.

Playa Vista Phase II. The Ballona Creek watershed (with the exception of the Baldwin Hills) will no longer support many bird species as a result of the cumulative impacts of these developments. Western meadowlark, white-tailed kite, California horned lark, loggerhead shrike, sharp-shinned hawk, northern harrier, Cooper's hawk, and American kestrel will experience significant declines in suitable habitat as a result of these cumulative impacts. Peregrine falcon will experience significant losses of foraging habitat. Many birds associated with the Ballona Wetlands forage in upland habitats, especially during the winter and spring rains. For example, great blue heron and snowy egret forage in the ephemeral wetlands at LAX and the West Bluffs site. If all of these projects are completed, all remnants of vernal pools in the northern portion of the former Los Angeles Coastal Prairie will be obliterated. Vernal pool hydrology at the West Bluffs site and at LAX would be destroyed, yet the EIS/R claims that no significant cumulative impacts will result from the project.

This is the end of the line for open space in west Los Angeles. The City of Los Angeles must recognize that the current project, plus the others previously approved by the City, have significant, irreversible, cumulative impacts on biological resources.

4.0 Mitigation Measures

The mitigation measures that rely on the "modified Habitat Evaluation Procedure" are insufficient to offset the significant impacts that would result from the build alternatives. The use of "Habitat Units" in mitigation measures MM-BC-2, MM-BC-4, MM-BC-5, MM-BC-6, and MM-BC-7 is fundamentally flawed.

The all-purpose mitigation measure "Conservation of Faunal Resources" (MM-BC-4) is completely inadequate to address impacts to sensitive species from the project alternatives. The conversion to "Habitat Units" is spurious; all mitigation must replace lost habitat with an equal or greater area.

4.1 Lewis' Evening Primrose

Mitigation for Lewis' evening primrose does not ensure that a replacement population of the species will be created, only that more individuals will be grown on the El Segundo Dunes, where the species is already found. In addition to establishing a numerical goal for the number of individuals to be replaced, mitigation should ensure the area occupied by the species will increase by at least the 2.5 acres that would be lost. Because there is a risk-spreading benefit in the disjunct configuration of the impacted population, the mitigation site should be geographically distinct from currently occupied sites.

4.2 Western Spadefoot Toad

Mitigation for the western spadefoot toad ignores the geographic configuration of the impacted population(s). These toads are found in four distinct ephemerally wet areas on the LAX property, all of which would be destroyed by the build alternatives. Division of the population into separate, hydrologically distinct pools with different cachements is a benefit to the population. Mitigation for these losses cannot be achieved through creation of 1.24 acres of ideal habitat (the "Habitat Units"), but rather must consist of four separate pools and associated cachements of at least 9 acres.

The choice of mitigation location is important as well. The top choice would be on the areas of the former Los Angeles Coastal Prairie west of Pershing Drive. However, the EIS/R claims that allowing a vernal pool in this area would encourage bird life as well, and would therefore pose a hazard to aircraft.

If off-site mitigation is necessary, the first choice should be the West Bluffs property, currently subject to development by the Catellus Corporation. The West Bluffs site has vernal pool hydrology and is the only candidate site within a reasonable distance of LAX. Distant sites such as Madrona Marsh and potentially California State University Dominguez Hills (where spadefoot toads possibly persist in a vernal pool but are subject to imminent extirpation from construction), should be utilized only in addition to a more proximate site. If no proximate sites are secured (e.g., the West Bluffs property is unobtainable), then the conclusion of the EIS/R must be that the impacts to the species cannot be mitigated to a less than significant level. Without the LAX population, or a possible West Bluffs replacement, the range of the species in the region will be significantly diminished, even with more distant offsite mitigation.

4.3 Riverside Fairy Shrimp

A similar analysis applies to the proposed mitigation for the loss of habitat for the Riverside fairy shrimp. The species is currently found in at least nine areas affected by the build alternatives. The proposed mitigation is for “no more” than 1.3 acres of replacement habitat.¹⁰⁰ To the contrary, loss of this occupied habitat should be mitigated by provision of nine pools with associated upland catchment areas to support vernal pool hydrology. While the mitigation measure suggests one location with 0.75 habitat value (i.e. restoration of vernal pool plants and other vernal pool characteristics), it is more important to the fairy shrimp that multiple locations be acquired. Population models for species found in habitat patches (e.g., metapopulations) show that persistence is enhanced not by density at a single site — although patch size is important — but by maximizing the number of occupied patches.¹⁰¹ To trade occupied sites for other biological values such as presence of sensitive plant species decreases the long-term persistence possibilities for the fairy shrimp. Certainly full vernal pool restoration would be a noble conservation goal, but it does not mitigate the impacts to the Riverside fairy shrimp. The potential mitigation sites should be chosen by proximity to LAX. The West Bluffs site could provide one, possibly two pools. Additional pools should be identified to mitigate fully the impacts to the species.

4.4 San Diego Black-tailed Jackrabbit

As discussed above, the proposed mitigation for the San Diego black-tailed jackrabbit is insufficient to offset the losses to the species. The loss of 119 acres of occupied habitat must be offset by the provision of at least 119 acres of additional habitat. The EIS/R provides no evidence to show that the species can be supported at similar densities in the Habitat Restoration Area on the dunes, nor that the “Habitat Units” of restoration on the dunes will make the area more suitable for jackrabbits. Black-tailed jackrabbits require mixed grasses, forbs, and shrubs for food; dune scrub may provide less preferred forage than exotic grassland. The Habitat Restoration Area therefore may support lower densities of the species than currently occupy the 119 acres of exotic grassland. Furthermore, the EIS/R provides no estimate of the size of the population to be impacted, or the diel¹⁰² patterns of movement exhibited by the species, information that is necessary to formulate an effective mitigation measure. Any release program on the El Segundo Dunes must be accompanied by a humane control program for the exotic red fox (*Vulpes vulpes*).

100. EIS/R, p. 4-708.

101. Hanski, I. 2000. *Metapopulation ecology*. London: Oxford University Press.

102. “Diel” refers to a 24-hour period, a full day and night.

4.5 Loggerhead Shrike

The EIS/R proposes to mitigate for loss of occupied loggerhead shrike habitat (172 acres) with restoration on the El Segundo Dunes in the form of 22.88 “Habitat Units.” Implicit in this proposal is the assumption that the density of loggerhead shrikes on the El Segundo Dunes can be increased to accommodate those displaced by the loss of 172 acres of occupied habitat. The EIS/R provides no information about densities of loggerhead shrike to support this implicit assumption. To the contrary, because the El Segundo Dunes are already occupied with breeding loggerhead shrikes, and the shrike’s use of habitat is not tied to whether the vegetation is native or not (or to the arbitrary habitat standards of the HEP), restoration on the El Segundo Dunes is not likely to appreciably increase the density of shrikes found there. Mitigation for this impact must be found elsewhere, in the form of 172 acres of shrike habitat. Loggerhead shrike are found at the West Bluffs site, but the site is only 44 acres and so could only offer partial mitigation for impacts at LAX. Other additional mitigation sites include properties covered under the Playa Vista master plan, or in the Baldwin Hills. However, if 172 acres of shrike habitat in addition to the El Segundo Dunes cannot be identified and acquired as mitigation, then the significant impact to this species cannot be mitigated to a less than significant level. The impacts are certainly not mitigated by the proposal to provide 23 extra “Habitat Units” in currently occupied habitat.

4.6 Los Angeles Coastal Prairie

Prescriptions for restoration of Valley Needlegrass Grassland described in MM-BC-5, MM-BC-6, and MM-BC-7 are not consistent with evidence of the historic vegetation in the area, which Mattoni and Longcore have described as Los Angeles Coastal Prairie. The prescription is for a needlegrass dominated habitat, with four common subshrubs. First, five plant species are insufficient to restore this habitat type; the actual plant diversity of the habitat was significantly higher. Second, the relative abundance of species is nothing approaching historical conditions. A transect along a historic photograph of the Coastal Prairie (or “meadow” as described by Pierce¹⁰³), shows the following coverage: *Lupinus bicolor* (39%), *Camissonia bistorta* (18%), *Phacelia stellaris* (14%), *Lotus strigosus* (8%), *Festuca megalura* (4%), *Cryptantha intermedia* (1%), and open (16%).¹⁰⁴ A mitigation measure should bear at least some resemblance to the vegetation type that it proposes to emulate. Furthermore, the standard of 10% native cover for successful restoration is outrageous. The claim that this is defensible because 10% is deemed significant for the identification of a native grassland by the California Department of Fish and Game is equally stunning. Ten percent cover represents the most degraded grasslands, not a standard to achieve in restoration. If the success criterion for grassland mitigation were followed, the vegetation created would score very low on the “modified” HEP touted in the EIS/R.

4.7 Restoration Performance Criteria

The performance criteria for the restoration efforts are all exceedingly weak. The only quantifiable standard for revegetation performance is attainment of native cover, the highest of which is 45%. Ecologists have developed many measures of habitat quality that are available to define performance

103. Pierce, W.D. 1938. The fauna and flora of the El Segundo sand dunes: 1. General ecology of the dunes. *Bulletin of the Southern California Academy of Sciences* 37(3):93-97.

104. Mattoni, R., and T.R. Longcore. 1997. The Los Angeles Coastal Prairie, a vanished community. *Crossosoma* 26(2):71-102, at 87.

standards for revegetation, including many measures of plant diversity and plant structure.¹⁰⁵ Wetland mitigation must meet stringent standards quantifying wetland functions and values.¹⁰⁶ Terrestrial arthropods have been used to assess the performance of revegetation in re-creating native habitats.¹⁰⁷ The performance criteria for restoration should provide more ecological information than simply percent native cover, especially when so many measures are readily available. Without true ecological assessment of restored areas, the success of the mitigation will be forever unknown.

4.8 Raptor “Nursery Sites”

Insufficient information about the impact to raptors using mature trees is provided to allow assessment of whether the mitigation measure (MM-BC-3) would be effective for replacement of mature trees. The location of this mitigation would be important, and the destruction of nearly all of the open space used for foraging by raptors may render “nursery sites” extraneous, with no raptors to use them.

5.0 California Coastal Act

None of the build alternatives in the Master Plan would be consistent with the California Coastal Act. First, there would be many impacts to the environmentally sensitive habitat area on the El Segundo Dunes through the indirect effects of increased construction, light, landscaping, pollution, and road construction. The mitigation measures proposed are insufficient to mitigate for these significant disruptions of habitat values. Even though the development is designed to occur outside the coastal zone boundary, Section 30240(b) of the Coastal Act provides that:

Development in areas adjacent to environmentally sensitive habitat areas and parks and recreation areas shall be sited and designed to prevent impacts which would significantly degrade those areas, and shall be compatible with the continuance of those habitat and recreation areas.¹⁰⁸

Second, the EIS/R does not discuss impacts to marine biological resources, which could occur as a result of runoff into and jet fuel dumping over the ocean. Impacts to marine biological resources should be described and appropriate changes implemented before preparation of a final EIS/R.

108. California Public Resources Code § 30240(b).

6.0 Conclusion

The EIS/R treatment of biological resources represents the result of significant effort and expenditure on the part of the preparers. Unfortunately, the resulting analysis is deeply flawed, unscientific, and improperly reaches the conclusion that the mitigation measures would reduce impacts to a less than significant level. To the contrary, implementation of any of the three build alternatives would be catastrophic for the biological resources on the project site and result in a significant local and cumulative impact on sensitive species. If approved and implemented, the Master Plan will permanently degrade the diversity and abundance of native wildlife in west Los Angeles. The last refuges of birds and mammals depending on large open spaces will be erased from the landscape.

EDUCATION

- Ph.D., Geography, University of California, Los Angeles 1995–1999
Dissertation Title: *Terrestrial Arthropods as Indicators of Restoration Success in Coastal Sage Scrub*
- M. A., Geography, University of California, Los Angeles 1993–1995
Thesis Title: *Risk, Technology, and Place: Siting a Radioactive Waste Dump in California's Ward Valley*
- Honors B. A., Geography *summa cum laude*, University of Delaware 1989–1993
Thesis Title: *Information Technology and World City Restructuring: The Case of New York City's Financial District*

PROFESSIONAL EXPERIENCE

- Research Assistant Professor, Center for Sustainable Cities, Department of Geography,
University of Southern California 2001–present
- Lecturer, UCLA Department of Geography, UCLA Department of Organismic Biology,
Ecology and Evolution, UCLA Institute of the Environment 2000–present
Lower division: Biogeography, People and the Earth's Ecosystems, Ecology and Conservation of California Oaks. Upper division: World Vegetation, Forest Ecosystems, Ecology, Environmental Impact Analysis.
- Co-founder and Science Director, The Urban Wildlands Group 1996–present
Organization studies and works to protect species, habitats, and ecological processes within urban and urbanizing areas. Projects include restoration and management of habitat supporting endangered butterfly species, education of policymakers on impacts of artificial light and noise on wildlife, research on minimizing ecological effects of fuel modification.
- Principal, Land Protection Partners 1998–present
Consultant to attorneys in land protection actions (primarily California Environmental Quality Act, California Coastal Act, and federal Endangered Species Act). Services include issue identification, preparation of biological analysis with supporting scientific literature review, and communication with resource agency personnel.
- Research Associate, Sustainable Cities Program, University of Southern California 1999–2001
- Summer Instructor, UCLA Graduate School of Education and Information Studies 1997–1999
- Staff Researcher, UCLA Department of Geography 1996–1999
- Teaching Assistant, UCLA Department of Geography 1995–1996
- Geographic Information System Technician, Water Resources Agency, New Castle
County, Delaware 1992–1993

GRANTS, HONORS, AND AWARDS

Professional

- Santa Monica Bay Restoration Commission 2003
Grant of \$131,000 to Los Angeles Conservation Corps and The Urban Wildlands Group to restore coastal dune and bluff vegetation and develop a master plan for restoration of El Segundo dune and bluff habitat.
- Defense Logistics Agency 2003
Contract for \$43,779 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly.
- James C. Zumberge Fund for Innovation, University of Southern California 2003
Grant of \$50,000 for interdisciplinary investigation of phytoremediation with native plants.
- Conservation and Research Foundation 2003
Grant of \$5,000 to The Urban Wildlands Group to support preparation of book, *Ecological Consequences of Artificial Night Lighting*.
- California ReLeaf 2003
Grant of \$7,500 to The Urban Wildlands Group for project, "Urban Forest Assessment and Outreach at UCLA."
- U.S. Department of the Navy 2002
Contract for \$12,000 to The Urban Wildlands Group to salvage Palos Verdes blue butterfly pupae from Navy property to be disposed and developed.
- U.S. Fish and Wildlife Service 2002
Contract for \$10,000 to The Urban Wildlands Group to draft management plan for endangered Kern primrose sphinx moth.
- U.S. Fish and Wildlife Service 2002
Contract for \$24,000 to The Urban Wildlands Group to draft species recovery plan for endangered Calippe silverspot butterfly.
- International Dark-Sky Association Executive Director's Award 2002
- National Fish and Wildlife Foundation 2002
Grant of \$5,000 to The Urban Wildlands Group to support conference *Ecological Consequences of Artificial Night Lighting*.
- Electric Power Research Insitute 2002
Grant of \$2,000 to The Urban Wildlands Group to support conference *Ecological Consequences of Artificial Night Lighting*.
- Defense Logistics Agency 2002
Contract for \$42,665 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly.
- U.S. Fish and Wildlife Service Landowner Incentive Program 2001
Grant of \$37,300 to The Urban Wildlands Group to restore habitat for endangered El Segundo

blue butterfly on private property in Torrance, California.

John Randolph Haynes and Dora Haynes Foundation 2000

Co-author of \$398,000 grant to USC Sustainable Cities Program to assess benefits of urban greening in a dense inner-city neighborhood.

Los Angeles Department of Water and Power 2000

USC Sustainable Cities Program awarded \$9,000 contract to assess "Cool Schools" tree planting program.

New Research Design Award for a More Sustainable Los Angeles Region, John Randolph Haynes and Dora Haynes Foundation 2000

Awarded \$5,000 to develop a research design for the use of native plants in phytoremediation.

Graduate

Conference Travel Grant, UCLA Department of Geography 1999

Dissertation Improvement Grant, National Science Foundation (\$8,000) 1998

Distinguished Doctoral Scholar Fellowship, UCLA Alumni Association (\$17,500) 1998

Portable Fellowship, UCLA Graduate Division (\$18,500) 1997

Graduate Research Fellowship, National Science Foundation (\$64,400) 1993

Chancellor's Fellowship, UCLA Graduate Division (declined) 1993

Undergraduate

Alexander J. Taylor Award ("Outstanding Senior Man"), University of Delaware 1993

Geography Faculty Award, University of Delaware 1993

Mid-Atlantic Region Finalist, Rhodes Scholarship 1992

Fellow, Arizona Honors Academy, Northern Arizona University 1992

Marie Donaghay Award for Excellence in Geography, University of Delaware 1992

Phi Beta Kappa 1992

Phi Beta Kappa Clift and DeArmond Award, University of Delaware 1991

George and Margaret Collins Seitz Award, University of Delaware 1991

Eugene duPont Memorial Distinguished Scholar Award, University of Delaware (\$44,500) 1989

PUBLICATIONS AND PRESENTATIONS

In Preparation

1. Rich, Catherine, and Travis Longcore (eds.). *Ecological consequences of artificial night lighting*. Island Press (scheduled 2004).
2. Longcore, Travis. Christina Li, and John P. Wilson. Nature's services in a dense urban neighborhood. *Environmental Management*.

In Review

4. Longcore, Travis and Catherine Rich. Ecological light pollution. *Frontiers in Ecology and Environment*.
3. Longcore, Travis, Catherine Rich, and Dietland Müller-Schwarze. Management by assertion: beavers and vireos at Lake Skinner (Riverside County, California). *Ecological Restoration*.
2. Longcore, Travis, Christina Li, and John P. Wilson. Applicability of CITYgreen urban ecosystem analysis software to a dense urban neighborhood. *Urban Geography*.
1. Longcore, Travis. Ecological effects of fuel management practices around residential development. Sidebar for chapter by Kevin Shafer in text on California fire ecology.

Peer Reviewed Publications

11. Longcore, Travis. Arthropods as indicators of restoration success in coastal sage scrub (California, U.S.A.). *Restoration Ecology* 11(4):00–00 (2003).
10. Mattoni, Rudi, Travis Longcore, Zdenka Krenova, and Alison Lipman. Mass rearing the endangered Palos Verdes blue butterfly (*Glaucopsyche lygdamus palosverdesensis*: Lycaenidae). *Journal of Research on the Lepidoptera* 37:55–67 (2003).
9. Longcore, Travis, Rudi Mattoni, Cor Zonneveld, and Jorn Bruggeman. INsect Count Analyzer: a tool to assess responses of butterflies to habitat restoration. *Ecological Restoration* 21(1):60–61 (2003).
8. Zonneveld, Cor, Travis Longcore, and Claudia Mulder. Optimal schemes to detect presence of insect species. *Conservation Biology* 14(2):476–487 (2003).
7. Longcore, Travis. Ecological effects of fuel modification on arthropods and other wildlife in an urbanizing wildland. Pp. 000–000 in Galley, Krista E.M., Robert C. Klinger, and Neil G. Sugihara (eds.). *Proceedings of Fire Conference 2000: The First National Congress on Fire Ecology, Prevention, and Management*. Miscellaneous Publication No. 13, Tall Timbers Research Station, Tallahassee, Florida (2003).

INVITED PRESENTATIONS

South Coast Wildlands Project Missing Linkages Workshop, August 2002
University of Southern California, Department of Geography, February 2002
Santa Monica Mountains Conservancy, September 2001
California Native Plant Society, South Coast Chapter, August 2001
California State University, Northridge, Olivatt Library, April 2001
University of California Natural Resources Continuing Conference, Wrigley Institute for Environmental Studies, April 2001
Society for Ecological Restoration, California Chapter Annual Conference, October 2000
University of Stockholm, Department of Zoology, September 2000
University of Gothenberg, Department of Applied Environmental Science, September 2000
Lorquin Entomological Society, Los Angeles, California, June 2000
University of California, Los Angeles, Department of Geography, May 2000
Southern California Institute of Architecture, June 1998
Los Angeles Unified School District Target Science, "Butterflies in the City" Workshop Series, South Central Los Angeles Leadership Team, October 1998

PROFESSIONAL SERVICE

Referee, *Restoration Ecology, Journal of Research on the Lepidoptera, Environmental Management, Transactions in GIS*

Independent Scientific Advisor (Quino checkerspot butterfly), County of San Diego, 2002
Baldwin Hills Park Citizens Advisory Committee, 2002
Conference Co-Chair, The Urban Wildlands Group and UCLA Institute of the Environment, *Ecological Consequences of Artificial Night Lighting*, 2001–2002
Member, Advisory Council, Yosemite Restoration Trust, 1999–present
Member, Recovery Team (Technical Subteam), Quino Checkerspot Butterfly, U.S. Fish and Wildlife Service, 1999–present
Newsletter Layout, Endangered Habitats League, 1998–2002
Member, Conference Steering Committee, UCLA Institute of the Environment, *California's Biodiversity Crisis: The Loss of Nature in an Urbanizing World*, 1998
Managing Editor, *Journal of Research on the Lepidoptera*, 1997–1999
Member, Recovery Team, El Segundo Blue Butterfly, U.S. Fish and Wildlife Service, 1997–1998
Member, Environmental Review Board, County of Los Angeles (appointed by Los Angeles County Board of Supervisors), 1997–present
Editor, *Western Tanager*, newsletter of the Los Angeles Audubon Society, 1997
Vice President, Los Angeles Audubon Society, 1995–1997
Coordinator, Los Angeles Audubon Society Birdathon, 1996 (recognized by National Audubon Society, “Most Money Raised by a Rookie,” September-October issue of *Audubon* magazine)
Graduate Student Association Representative, UCLA Academic Senate Council on Planning and Budget, 1996–1999
Member, Graduate Affairs Committee, UCLA Department of Geography, 1995–1997
Member, Instructional Technology Committee, UCLA Department of Geography, 1993–1995

PROFESSIONAL AFFILIATIONS

Member, Ecological Society of America
Member, Association of American Geographers
Member, Society for Ecological Restoration
Member, Southern California Botanists
Member, California Botanical Society

Education

UCLA Department of Geography, M.A. June 1997. Emphasis in biogeography, urban wildlife, environmental philosophy. Thesis: *Poliophtilaphilia? Toward an Understanding of the Role of Human Emotion in Nature Preservation*. Teaching Assistant: Biogeography, Physical Geography, People and the Earth's Ecosystems.

UCLA School of Law, J.D. June 1981. Member, State Bar of California. Co-founder and Associate Editor, *UCLA Journal of Environmental Law and Policy*. Co-founder and officer (faculty liaison), UCLA Environmental Law Society.

University of California, Berkeley, A.B. March 1978 (with Distinction). Pre-medical course, psychology major. Member, Board of Directors, U.C. Berkeley CalPIRG (1976–1977). Co-founder, U.C. Berkeley CalPIRG (1976).

Professional Experience

Co-founder and Executive Officer, The Urban Wildlands Group (1996–present). Organization studies and works to protect species, habitats, and ecological processes within urban and urbanizing areas. Projects include restoration and management of habitat supporting endangered butterfly species, public education about effects of noise and artificial night lighting on wildlife, promotion of humane approaches to wildlife management, research on minimizing ecological effects of fuel modification.

Principal, Land Protection Partners (1998–present). Consultant to attorneys in land protection actions (primarily California Environmental Quality Act, California Coastal Act, federal Endangered Species Act). Services include issue identification, preparation of biological analysis with supporting scientific literature review, communication with resource agency personnel.

Contract Attorney, Law Offices of Jonathan Kirsch (1999–present). Trademark and publishing law.

Copy Editor, *Journal of Research on the Lepidoptera* (1997–1999).

Legal/Policy Consultant (1989–1992). Projects included assisting in the preparation of lawsuit (*Nordlinger v. Lynch*) challenging property tax assessment scheme mandated by Proposition 13 (for Center for Law in the Public Interest).

Deputy, Los Angeles City Councilman Marvin Braude (1987–1988). Formulated and developed environmental policies and programs. Represented councilman before city boards,

commissions, and committees, and at community meetings. Coordinated councilman's reelection campaign for seat on AQMD Board.

Community Representative (1985–1986). Directed successful effort to prevent developer from demolishing five contiguous apartment buildings in an unredeveloped Westwood neighborhood. Persuaded Los Angeles City Council to enact a local building moratorium, then successfully represented local community before Planning and Environment Committee of the City Council in a hardship exemption hearing requested by developer. Prepared architectural and historical documentation for Historic Preservation Overlay Zone application.

Staff Attorney, California Commission on Campaign Financing (1984–1985). Contributed to two-volume report on legislative campaign financing (*The New Gold Rush: Financing California's Legislative Campaigns*).

Full-time staff member, Gary Hart presidential campaign (1984). Field desk contact for Northern California; Los Angeles regional co-coordinator. Appointed to Credentials Committee of the 1984 Democratic National Convention.

Attorney, Paul, Hastings, Janofsky & Walker (1983). General civil litigation.

Editor/Assistant, Professor Charles M. Firestone (1982–1983). Edited Firestone and Johnson's *Cases and materials on communications law and policy*; assisted in preparations for conference, UCLA Communications Law Program/International Bar Association Symposium on International Satellite Television.

Research Assistant, Professor Richard Abel (Summer 1980). Compiled information on workplace exposure to toxic substances.

Intern, Hollywood Revitalization Committee (funded by National Trust for Historic Preservation) (Summer 1979). Evaluated feasibility of establishing a façade easement program for Hollywood's historic buildings.

Research Assistant, Professor Laura Nader (funded by National Highway Traffic Safety Administration) (Spring 1978). Research on social costs of automobile accidents.

Research Assistant, Professor Laura Nader (Summer 1977). Participated in study funded by Energy Research & Development Administration evaluating feasibility of alternative energy systems in California. Interviewed officials involved with the implementation of Energy Conservation Standards for New Residential Buildings.

Grants and Awards

Santa Monica Bay Restoration Commission. Grant of \$131,000 to Los Angeles Conservation Corps and The Urban Wildlands Group to restore coastal dune and bluff vegetation and develop a master plan for restoration of El Segundo dune and bluff habitat (2003).

Defense Logistics Agency. Contract for \$43,779 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly (2003).

Conservation and Research Foundation. Grant of \$5,000 to The Urban Wildlands Group to support preparation of book, *Ecological Consequences of Artificial Night Lighting* (2003).

California ReLeaf. Grant of \$7,500 to The Urban Wildlands Group for project, “Urban Forest Assessment and Outreach at UCLA” (2003).

U.S. Department of the Navy. Contract for \$12,000 to The Urban Wildlands Group to salvage Palos Verdes blue butterfly pupae from Navy property to be disposed and developed (2002).

U.S. Fish and Wildlife Service. Contract for \$24,000 to The Urban Wildlands Group to develop Recovery Plan for endangered Callippe silverspot butterfly in San Francisco area, California (2002).

U.S. Fish and Wildlife Service. Contract for \$10,000 to The Urban Wildlands Group to develop Action Plan for endangered Kern primrose sphinx moth on BLM land in the Carrizo Plain National Monument, California (2002).

National Fish and Wildlife Foundation. Grant of \$5,000 to The Urban Wildlands Group to support conference, *Ecological Consequences of Artificial Night Lighting* (2002).

Electric Power Research Institute. Grant of \$2,000 to The Urban Wildlands Group to support conference, *Ecological Consequences of Artificial Night Lighting* (2002).

Defense Logistics Agency. Contract for \$42,665 to The Urban Wildlands Group to conduct experimental captive propagation of endangered Palos Verdes blue butterfly (2002).

U.S. Fish and Wildlife Service Landowner Incentive Program. Grant of \$37,300 to The Urban Wildlands Group to restore habitat for endangered El Segundo blue butterfly on private property in Torrance, California (2001).

International Dark-Sky Association Executive Director's Award, "In recognition of her enthusiastic efforts in the pursuit of the promotion of Dark Skies" (2002).

International Dark-Sky Association Executive Director's Award, "For outstanding service in protecting our nighttime environment" (2001).

Selected Activities and Memberships

Conference Co-Chair, The Urban Wildlands Group/UCLA Institute of the Environment, *Ecological Consequences of Artificial Night Lighting* (2002)

Advisor, California Wildlife Foundation (2002–present)

Member, Advisory Council, California Oak Foundation (1999–present)

Member, Conference Steering Committee, UCLA Institute of the Environment, *California's Biodiversity Crisis: The Loss of Nature in an Urbanizing World* (1998)

President, Los Angeles Audubon Society (1996–1997)

Conservation Co-Chair, Los Angeles Audubon Society (1995–1996)

Second Vice President, Los Angeles Audubon Society (1994–1995)

Member, Advisory Committee, Los Angeles County 1996 Proposition A. Successfully lobbied for inclusion of, and wrote, statement in Proposition A's preamble pertaining to the importance of maintaining biological diversity within the County, and successfully lobbied for creation of a competitive grant category for habitat acquisition and/or restoration.

Member, Society for Conservation Biology

Member, Cooper Ornithological Society

Re: Comment letter re LAX Master Plan EIS/EIR

Dear Messrs. Ritchie and Kessler:

Kilroy Realty Corporation is a Southern California-based real estate investment trust active in the commercial office and industrial property markets of the western United States.

Near LAX Airport, Kilroy Realty Corporation owns and manages 1.5 million square feet of office and industrial properties, including

- 909 and 999 North Sepulveda Boulevard, at Imperial Highway and Sepulveda (across the street from LAX), in El Segundo
- 2240, 2250, 2260 East Imperial Highway (Kilroy Airport Center – also across from LAWA-owned LAX property), in El Segundo
- 2031 East Mariposa Avenue, near Nash, in El Segundo
- 181, 185 South Douglas, in El Segundo
- 2260 East El Segundo Boulevard, in El Segundo
- 2265 East El Segundo Boulevard, in El Segundo
- 2270 East El Segundo Boulevard, in El Segundo

As an immediate neighbor to LAX, we have reviewed the LAX Master Plan EIS/EIR and offer the following comments:

1. Related to the proposed 12,000-space parking structure near Imperial Highway and Pershing Drive for LAX employee parking, there is inadequate analysis in the EIS/EIR concerning the traffic impacts to Imperial Highway from having the majority of LAX employees utilize one central parking area, presumably traversing Imperial Highway for ingress and egress, to the proposed parking site. Further, in the South Cargo Complex-West, an additional 99,000 square feet of cargo facilities will be developed, pursuant to Figure 2.5-1 of the LAX Master Plan EIR, which will create additional truck traffic on Imperial Highway.
2. In addition to traffic impacts, the isolation of employee parking in one area would appear to create safety and operational impacts, as it segregates employee parking in one primary area, which could create a target for a terrorist incident. There is inadequate analysis in the EIS/EIR related to the safety and operational impacts of segregating most of LAX employee parking into one area, and what a security incident could do to the main arterial – Imperial Highway – leading to and from the parking area.
3. Related to the proposed 9,100 parking space structure and proposed 5,500 parking lot at Imperial and Aviation adjacent to the future Intermodal Transportation Center, there is inadequate analysis in the EIS/EIR pertaining to traffic and air quality impacts. The creation of a total of 14,600 parking spaces, where today there are virtually no parking spaces, will bring traffic and air quality impacts to an area of Imperial Highway that is already experiencing degradation in Levels of Service and air emissions. There is inadequate analysis in the EIS/EIR as to what mitigation measures will be utilized to bring the traffic and air quality impacts to acceptable levels. The EIS/EIR indicates that the Intermodal Transportation Center at Imperial and Aviation would handle approximately 31% of LAX passengers. Under Alternative D, LAX would accommodate 78.9 million annual passengers. That would mean that almost 25 million passengers would pass through the proposed Intermodal Transportation Center annually, where today no airline passengers come near this area. With 14,600 parking spaces and 25 million annual passengers traversing this area, common sense would indicate that a major traffic bottleneck could occur at Imperial Highway and Aviation from thousands of vehicles trying to access this site for parking or passenger drop-off/pick-up. Yet, there is not adequate analysis in the EIS/EIR related to measures to improve the existing roadway

system to mitigate the significant influx of vehicular trips congregating to the area and corresponding air quality impacts.

4. There is mention in the EIS/EIR of a proposed new interchange off the I-405 Freeway to be called "Lennox" interchange. However, no real funds have been identified to pay for such an interchange, nor have funds been identified to pay for the land acquisition to facilitate the interchange. Without identified funding, this interchange is nothing more than a "wish" and should not be used as a mitigation measure related to traffic and/or air quality impacts.
5. The EIS/EIR's analysis of the noise impacts of moving the southern runway (7R/25L) fifty-six (56) feet closer to Imperial Highway relies on presumption that the new generation of Group VI aircraft, which will presumably be quieter than current aircraft, will replace existing, noisier aircraft on a fairly aggressive timetable. However, there are no guarantees as to how soon and how many future aircraft will be of the Group VI aircraft variety. This could take a generation or more for the predominant aircraft taking off or landing on the southern-most runway near Imperial Highway, to be of the new, quieter generation of aircraft. If the southern runway is moved 56 feet closer to Imperial Highway, and thus 56 feet closer to businesses and residents in El Segundo, there are not adequate mitigation measures described in the EIS/EIR to reduce the noise impacts to acceptable levels if the conversion to the newer Group VI aircraft takes longer than projected. In fact, moving the southern runway 56 feet closer to Imperial Highway seems to be at the top of the list in terms of implementation of the LAX Master Plan, but the new quieter generation of aircraft utilizing 7R/25L is not yet reality. The EIS/EIR does not adequately address what will happen during this interim time, or how these noise impacts will be mitigated to acceptable levels to protect businesses and residents south of Imperial Highway.
6. In addition to noise impacts from moving the southern runway 56 feet closer to Imperial Highway, a new 121,000 square foot General Aviation facility will be developed near the intersection of Imperial Highway and Sepulveda Boulevard on the northwest corner of Imperial and Sepulveda. This additional General Aviation facility will also generate noise impacts in close proximity to existing businesses and residences, though it is not clear from reviewing the EIS/EIR how the noise impacts from the new General Aviation facility will be mitigated.

7. With the southern runway (7R/25L) moved 56 feet closer to Imperial Highway, there may be vibration impacts due to the proximity of jets taking off, landing and taxiing 56 feet closer to businesses and residents in El Segundo, just to the south of Imperial Highway. However, there is virtually no discussion in the EIR of the vibration impacts as a result of moving the runway closer to existing structures and people.

The above list is not meant to be exhaustive of our concerns regarding the adequacy of the EIS/EIR's analysis. Given the length of the EIS/EIR, which is 10 volumes and over 5,400 pages in length, we are relying on Section 21177(a) of the California Public Resources Code, which states:

*"No action or proceeding may be brought pursuant to Section 21167 unless the alleged grounds for noncompliance with this division were presented to the public agency orally or in writing by **any** person during the public comment period provided by this division or prior to the close of the public hearing on the project before the issuance of the notice of determination."*

Pursuant to Public Resources Code Section 21177(a), we reserve the opportunity to affirm and incorporate certain oral and written comments provided by others to LAWA and the FAA in connection with the LAX Master Plan EIS/EIR.

Very truly yours,

KILROY REALTY CORPORATION

John T. Fucci, CPM®
Senior Vice President
Asset Management

Comments:

Dear Mr. Ritchie - City of the World Airports

Office Use Only

I live at 10229 S. 7th Ave in Inglewood CA 90303.

My house is under the last loud noise before the plane lands. Since a plane needs enough gas to go to the next city until they get an okay to land, where does that fuel go since it's a few violations to land with fuel?

Since the cars/trucks/traffic is making the black spots (Per Air Pollution - Plans) in Diamond Bar aren't they coming to the airport to pick up goods for all of Southern California? Could the debris and black spots or rotten food on road in areas be covered with washing - Are there any funds for this?

Why has the value of my house gone down? Before the airport it was worth more. Other homes are going up & ours are going down. Please tell me why?

I received Doors and windows from LAX. Is there a lien on my house?

Are there any funds to replace the broken windows at Morrisville HS school that are broken.

I am thanking you in advance for your time.

Thank you
Minnie Gibson

The attached comments are based on the following rationale:

The City has other airports in Van Nuys, Ontario, and Palmdale. With the increased use of these airports, we would not need increased or extended runways, additional terminals, or land acquisition as Alternatives A, B, and C would require. Also, Increased use of these other airports would decrease automobile traffic (especially on the San Diego Freeway — the 405) which is a nightmare almost any time of day. Incessant lines of planes flying low over the southern end of the City would, hopefully, be decreased with the extension of the other airports — we definitely don't want them increased.

Alternative D improves the security problems found at LAX, without the acquisition of more space; "D" also "eliminates all passenger associated traffic on the Central Terminal Area (CTA) roadways, increasing the ability to secure the environment. There are changes which will cost — the primary change — the re-positioning of existing runways to decrease the danger of accidents, the institution of a shuttle to bring people from parking lots outside of the terminal and the extension of the Green Line ("eliminating all "passenger associated traffic" within the terminal).

The Alternatives A, B, C, feature the creation of jobs as an economic benefit. "Today, in Los Angeles City there are approximately, 158,000 jobs directly linked to LAX. 408,000 in the region, 328,000 in the County." That means over half the jobs (250,000) are NOT in LAX. Anyway, most of the construction jobs are awarded to contractors who, if they employ people from the inner city, only employ a token force.

There is one problem that I see in plan D — the elimination of gates and replacing them with "shops and such." There's enough congestion as it is when people are boarding or deboarding. It seems that the elimination of gates would only increase this congestion. Also, the supplies needed by the "shops and such" that would replace the gates could breach the security. It would be very easy to bring in harmful devices, masked as supplies. **It would make sense to put the "shops and such" out in the parking area.**

We, in the innercity, are paying exorbitant sewage costs now because of the erection of new central City complexes, buildings, and multiunit structures from which we will see little if any benefit. The money their presence creates for the City does not filter back to the average citizen. Our taxes increase; the City cannot afford adequate police; the City cannot afford adequate schools or quality teachers; our streets are in disrepair; we have to cajole the sanitation department for proper service. But the City keeps building and telling us that it will benefit our economy.

CITIZEN COMMENT REGARDING LAX MASTER PLAN ALTERNATIVES UNDER
CURRENT EIS/EIR PROCESS
RECOMMEND REJECTION OF ALTERNATIVE D

Political decisions made in the wake of the national hysteria following 9/11/2001 have ordained a cobbled together proposal in "Alternative D" that is insufficiently elaborated to establish a valid basis for assessing its environmental impacts or reasonable assurances that its benefits outweigh the costs to the public or the environment.

The objective of enhanced security is an important element of any conception of modernizing LAX but must not become the "sheep's clothing" under which a poorly conceived of and insufficiently elaborated alternative is rushed through the public review processes.

The magnitude of the importance of effectively addressing the Los Angeles Regions' requirements for an air transportation system for the 21st Century cannot be overstated but the overwhelming evidence in the public's reaction to the solutions advanced as proposals to this date is that we have not yet produced the comprehensive approach that is a satisfactory response to this requirement.

I recommend that we continue our work toward the end of an exceptionally well conceived of and comprehensive approach to the Los Angeles Regions' requirements for an air transportation system for the 21st Century and reject the Recommended Alternative as poorly conceived of and insufficiently elaborated to fully meet the legal tests of adequacy for environmental review.

Sincerely,

JAMES McCORMICK & COMPANY

Lax Environmental Justice / Expansion Master Plan Growth 2003

This is a letter in response to your Environmental Justice meeting held at Inglewood, Ca., in regards to LAX Expansion. You 'offered' us sound insulation, a nighttime curfew on flights, 'less' pollution, noise, and traffic, and jobs. I find all to be unacceptable and not doing enough to assist residents east of LAX. Instead of working harder for residents to the east of LAX, LAX recently passes a law that aimed to stop Hare Krishna and other religious groups from soliciting donations in open areas, but restricting them to out of the way booths." LAX officials say the law is needed because solicitors are annoying, distracting, increase congestion " from the Daily Breeze April, May 2003. Funny, that is how a lot of us feel about LAX, in our communities to the east. Annoying, Dsitracting, Increase congestion. I hope this is taken into account for our communities.

The Residential Sound Insulation / soundproofing does not appear to be going in noise order across all affected communities. Why is it separated into multiple (at least three) programs? Houses here in Inglewood are done in an apparent 'random' order, probably to placate residents in various neighborhoods. I was never invited to participate in the program here in Inglewood, despite living under the north runway flight path for many years, and had to apply in person @ the Inglewood Residential Sound Insulation office, even as I watched neighbors being invited to meetings discussing the program, and their houses being done. It also took an excessive (2 + years) amount of time from applying to completion. From the research I have conducted, Manchester Square and other homes in other neighborhoods are not exposed to the same high levels of airport noise, but are receiving more money than Inglewood and Lennox. Numerous friends in the Lennox / La County areas have not heard of the programs, and have not been invited to participate, despite being subject to large amounts of noise & overflights being under the flight paths to the major south runway complex. This inequity needs to be looked at immediately.

In regards to the promised nighttime flight curfew, I find this amusing. I had filed complaint forms with the LAX Noise website numerous times in 2002. Eventually (6 + months, on average), I received responses back. Included in that information, it appears Westchester, Playa Del Rey, and El Segundo (to the north and south of LAX) 'benefit the most' from a 10:00 PM - 7:00 AM curfew on the outer runways, as well as various restrictions on engine run ups and maintenance. Many flights overflew my neighborhood and there was no explanation given as to why many of these overflights occurred (unknown was given on the forms mailed to me). There needs to be better communication from LAX, the airlines that commit these 'violations', and the FAA to the affected neighborhoods. Eventually, I believe, after filing many complaints, the amount of complaints investigated was limited to 5 per household per month. No additional measures were implemented to handle relations & communication with affected areas after this limit of 5 complaints was set. If the records were to be checked, it would be apparent that there have been thousands of curfew 'violations' over the years to the neighborhoods to the east. But the residents of Hawthorne / Manhattan Beach / Hermosa Beach etc. received some relief from their overflights. According to the Daily Breeze and other sources, the Hawthorne / Manhattan Beach / Hermosa Beach residents had approximately 91 easterly takeoffs over 18 months. Letters were written to airlines asking them to discontinue this practice. Millions of dollars are

SPC00273

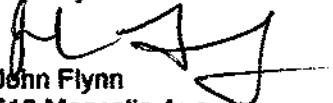

being spent on a Part 150 noise study. I see this east takeoff as being used for safety reasons, yet LAX / FAA chooses to accommodate Hawthorne / Hermosa Beach / Manhattan Beach / etc. residents, instead of east neighbors. Yes, safety is as big a concern for me as it is for LAX. But it appears 'safety' is used more when it affects communities to the east, rather than to the north and south of the airport. Do the residents to the east get a soundwall built? Northern (Westchester) residents received them years ago. Where is Inglewood's and Lennox's Part 150 study?

Less pollution and traffic should be given top priority by the LAX expansion project. If the Manchester Square check in center is built, it will greatly increase traffic and pollution in the Inglewood area. La Cienega, Aviation, Century, Airport Blvd. and Arbor Vitae streets will need major improvements to accommodate the larger number of vehicles that will travel there. Why is the Green line not being continued to the Inglewood / Westchester area? This is the perfect opportunity to 'do it right', but I don't believe this project will be 'done right'. The residents to the east will be forced to deal with more traffic, noise and pollution. Our houses and cars get dirty from the planes and traffic. A recent flight path change for takeoffs has benefitted the southern communities (El Segundo, Hermosa Beach, Manhattan Beach, Palos Verdes, etc) while imposing more noise and pollution on communities to the north and east of LAX. How will construction of the new facilities affect residents to the east? We bear too much of the noise & pollution burden now. We don't want any more.

Jobs are important for the residents to the east. I hope this matter is truly open to the residents here. Good paying jobs with a future. Training and education. We will see if LAX can truly make this happen, instead of outsiders and consultants running all projects, except for a small amount of local workers performing menial tasks.

Seeing the process of LAX airport expansion over the years, I have seen many proposals changed to accommodate the north and south neighbors. In my opinion, a third runway should be built to the north, but probably won't due to Westchester local opposition. Please don't forget us to the east. Many things are included in the Environmental Justice plan, but more need to be included. After September 11, 2001 terrorist attacks, I immediately thought of how Israel conducts their airplane industry. We need to copy what they have done, not reinvent the wheel and waste countless dollars in the process, accommodating business concessions and special interests in the process. Israel has been very successful. Please study what they have done. Yes, the travellers need to get through the process in a relative short time, but it seems that the whole process is geared to the traveller and business concerns. Please do not relax security just for convenience of travellers, at the expense of residents to the east. Many new improvements could be built into the existing LAX complex, without affecting the eastern communities as much as the Manchester Square check in facility would.

Thank you

John Flynn

Dear Mssgrs Kessler and Ritchie:

Enclosed are the "Neighborhood Council of Westchester/Playa del Rey LAX Master Plan Position Paper" and the "Community Questions on the LAX Master Plan EIS/EIR." The position paper is submitted as a comment on the LAX Master Plan and was approved by our Board of Directors on Tuesday, October 21st. The questions were compiled from local stakeholders and the questions were unanimously approved at the same meeting for submittal to you.

We look forward to seeing your written responses to our comments and questions submitted on the LAX Master Plan.

Sincerely,

Gwen Vuchsas

Notes:

LAX Master Plan Position Paper

1 INTRODUCTION

2

3 The Neighborhood Council of Westchester/Playa del Rey (NCWPDR) is the
4 recognized Neighborhood Council for Westchester/Playa del Rey. The Los
5 Angeles International Airport (LAX) is included in the Council's boundaries. Los
6 Angeles World Airports (LAWA), the City of Los Angeles agency that operates
7 LAX has released a Supplement to the Draft Environmental Impact
8 Statement/Environmental Report (EIS/EIR) for the LAX Master Plan (hereafter
9 referred to as "Alternative D" [July 2003]). Many of the stakeholders that
10 comprise our community (residents, businesses and real property owners)
11 expect NCWPDR to take a position on the LAX Master Plan and to ask
12 questions about the EIS/EIR document. This position paper and accompanying
13 questions respond to those expectations.

14

15 NCWPDR represents a community of over 55,000 residents and a variety of
16 businesses, institutions and government facilities. LAX has been a stakeholder
17 in NCWPDR since its inception in 2002. It has been and continues to be the
18 intention of NCWPDR to maintain a positive working relationship with LAX.

19

20 The NCWPDR Board of Directors understands the need for a safe and secure
21 airport. The NCWPDR Board also understands the needs of the residents and
22 local businesses to not be negatively impacted by airport operations. NCWPDR
23 stakeholders are also shareholders in City assets such as LAX. There is a

LAX Master Plan Position Paper

1 reasonable expectation on the part of citizens that government will take good
2 care of publicly owned facilities. Airports are unique government owned
3 facilities as they provide both transportation options and economic
4 development. Airports are also unique in the types of problems that they
5 present for neighbors- noise, traffic, pollution and a potential terrorist target.

6
7 There is a long history between LAX and Westchester/Playa del Rey residents
8 where some very important promises on development issues have been made
9 and not been kept -- issues such as ground radar and a new passenger
10 airport in Palmdale.

11
12
13 **POSITION PAPER**

14
15 NCWPDR has examined the Supplement to the LAX Master Plan Draft EIS/EIR.
16 The question used to come to a decision was, "Is the LAX Master Plan
17 beneficial to the community?" The answer is "no." NCWPDR requests that the
18 Board of Airport Commissioners (BOAC), Federal Aviation Administration (FAA),
19 the Los Angeles City Council and Mayor Hahn reject all LAX Master Plan
20 alternatives produced thus far and start over with active input from the
21 surrounding communities and the airlines to design a new LAX Master Plan
22 which all parties can support.

LAX Master Plan Position Paper

1 REGIONAL SOLUTION

2

3 There are other viable alternatives to expanding or modernizing LAX such as a
4 truly regional plan. It is well known and understood that LAX alone cannot meet
5 the future passenger and cargo capacity needs of Southern California. There
6 are several commercial airports in the area that can provide the necessary
7 capacity to meet the projected doubling of worldwide commercial air traffic in
8 2020. Some airports, notably Burbank and Long Beach, are constrained by
9 noise regulations and field size from handling additional significant growth.

10

11 LAWA is in the driver's seat in meeting future airport capacity needs with its
12 ownership and operation of Ontario International Airport and Palmdale
13 Regional Airport. While new master plans are under development for both of
14 these airports, there needs to be the leadership within City Hall to make certain
15 that construction plans are made and literally poured into concrete.

16

17 Ultimately, outlying airports such as Ontario and Palmdale will need to be built
18 into modern air terminals with high speed rail and freeway connections
19 integrated into their facilities. The longer we wait, the more expensive and
20 more difficult it will become to complete these projects. As opposed to
21 spending \$9.6 billion at LAX, LAWA can build new over 100 million annual
22 passengers (MAP) capacity at both Ontario and Palmdale for about half of what
23 is proposed for Alternative D. Furthermore, for homeland security purposes,

LAX Master Plan Position Paper

1 improved airports at Ontario and Palmdale can provide relief capacity in case of
2 a terrorist attack at LAX. Therefore, Southern California will not be completely
3 cut-off by air from the rest of the nation and the world. Building for the future
4 means that Ontario and Palmdale must be built now.

5

6 The LAX Master Plan EIS/EIR must include definitive programs, proposals and
7 plans for LAWA and the City of Los Angeles to put into effect to achieve a
8 regional solution. The City must make a formal commitment to undertake
9 these actions.

10

11

12 **PRIOR PROPOSALS**

13

14 At the outset, it should be absolutely clear that NCWPDR rejects the previous
15 Master Plan Alternatives A, B and C. All three of these plans are designed for
16 the express purpose of increasing the capacity of LAX to handle more
17 passengers and do not even attempt to improve the existing facilities for safety.
18 These plans were too invasive to the surrounding community with the
19 introduction of such elements as a ring road, western terminal and runway
20 reconfigurations that would have placed runways closer to the community and
21 dislocated hundreds of residents and local businesses. The literal purpose of
22 placing a new terminal at the west end of LAX was to create a new second path
23 to the airport directly through our communities. The location of a west end

LAX Master Plan Position Paper

1 terminal also necessitated the ill-advised "ring road" which in addition to
2 destroying a massive portion of the Westchester Business district, would also
3 disrupt existing traffic flow on North/South surface routes without any mitigation
4 proposed, or for that matter even possible.

5

6

7 **ALTERNATIVE D - Mayor James K. Hahn's "Safety and Security Plan"**

8

9 While Alternative D does in fact remove the most abhorrent parts of Alternatives
10 A, B and C, and is preferable to those alternatives, unfortunately it creates a
11 new and different set of problems that ultimately cause the committee to reject
12 it as well. Primary among our concerns is that Alternative D is not a safety and
13 security plan. Second, the proposed cost far outweighs any perceived benefits.
14 Third, Alternative D does not adequately mitigate traffic impacts.

15

16

SUMMARY ON CONCLUSIONS

17 1. The Neighborhood Council of Westchester/Playa del Rey does not
18 support Alternative D.

19

20 2. The objective of enhanced security is not met.

21

22 3. The stated cost of Alternative D is excessive relative to all benefits that
23 are described in the plan.

LAX Master Plan Position Paper

14
15
16
17
18
19
20
21
22
23

4. Unlike the history of LAWA, this Alternative D does not treat the airlines as partners.
5. Alternative D requires the dislocation of over 7,000 residents, of which 3,500 have already been relocated, at a time all affordable housing is in the shortest supply ever experienced in our region.
6. Alternative D requires removal and relocation of elementary schools when there is a need for school facilities.
7. Alternative D does not utilize LAX's physical facilities, Terminals 1, 2 and 3, that already represent a substantial investment, both public and private.
8. The physical construction of Alternative D will create a long-lasting and disruptive impact on the residents and businesses within the sub-region. The negative impact of this disruption has not been netted out from the projected economic benefits.
9. While the plan calls for a 78.9 MAP there is no feasible method of controlling the number of passengers. Alternative D does not adequately address the traffic impacts, mitigation, and transportation

LAX Master Plan Position Paper

1 operation required for 78.9 MAP on the incremental passengers which
2 could be 10 to 20 million more. The 405, 105, and 110 freeways and
3 major thoroughfares and intersections are at a point where physical
4 traffic mitigation of the impacts generated by 78, 88, or 98 MAP is not
5 feasible. Overriding considerations are not an acceptable strategy for
6 any plan.

7
8 10. The environmental impacts of Alternative D, particularly air pollution and
9 noise, will be substantial during the physical construction as well as the
10 operation of Alternative D.

11
12 For any sizeable project in our sub region, at least 2 to 3 years has been
13 required to achieve a reasonably acceptable plan. The EIS/EIR as presented
14 does not adequately satisfy the objectives outlined above. Therefore, we
15 recommend additional study to prepare a revised plan which meets the stated
16 objectives for LAX's modernization.

17
18 *Alternative D does not adequately address safety and security needs.*

19
20 The chief safety issue that the LAX Master Plan seeks to address is runway
21 incursions. LAWA has proposed center line taxiways between the runways to
22 accomplish this goal. According to FAA records, LAX has not had a runway
23 incursion with an aircraft in the past five years. We also congratulate LAWA on

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 not having any incursions in the past 12 months. In 1996, LAX opened a new
2 control tower that gives controllers an unobstructed view of the whole airfield.
3 The new tower was constructed in response to a 1991 ground collision
4 involving a Skywest turboprop that taxied onto a runway where a USAir 737 jet
5 was coming in for a landing. LAX also eliminated mid-field take-offs for
6 turboprops as a result of the accident. To our knowledge, another
7 recommendation never implemented in the aftermath of the crash was the
8 installation of ground radar. It is essential that the ground radar be installed as
9 soon as possible. As has been proven with signage along the runways and
10 departure procedures for preventing early turns over El Segundo and Playa del
11 Rey, so too can electronic traffic signals along runway exits and arrival
12 procedures be implemented to prevent aircraft incursions.

13

14 Another stated goal of the center line taxiway is to accommodate New Large
15 Airplanes (NLA's). The 555 seat A380 super jumbo jet, presently being built by
16 the European consortium Airbus in Toulouse, France, is an NLA. We are
17 aware from reading magazines such as *Aviation Week and Space Technology*
18 that Airbus officials have met with LAWA officials concerning runway, taxiway
19 and ground handling requirements for the A380 which is scheduled to enter
20 service with such foreign flag carriers as Air France, Lufthansa, Qantas and
21 Singapore in January 2007. LAWA apparently has incorporated some of those
22 requirements into the reconfiguration of the north runway complex, 24L and
23 24R.

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1

2 We also understand that several Asian airlines that ordered over 60 A380
3 aircraft told LAX officials that unless the LAX airfield and gates are ready for the
4 A380 in 2007, they will land elsewhere.

5

6 We see from the Airport Layout Plan that LAWA intends to use the FAA's
7 proposed Group VI airfield arrangement. We want to point out that the Group VI
8 airfield specifications have not been adopted by the FAA and that LAWA has
9 "modified" (i.e. diminished) some proposed Group VI airfield specifications
10 towards the east end of the newly relocated 24L, 340 feet south of its current
11 location. We are not satisfied that this new runway arrangement will meet the
12 need of the A380's and other future NLA's by compromising the runway and
13 taxiway arrangements at the outset.

14

15 There is also the issue of runway length. The longest runway at LAX is the
16 south inboard runway 25R with 12,000 in length. Although there may be
17 assurances that the A380 can take off on runways less than that length, the
18 aircraft has not been produced and tested to verify projected operational
19 capacities. LAWA should not be reckless with the public's money and begin
20 construction by pouring concrete only to find out not too much later that
21 additional changes are needed. As shown in the experience of building Denver
22 International Airport (*Denver International Airport: Lessons Learned*), making

LAX Master Plan Position Paper

1 changes after construction begins will greatly increase costs; this is partially
2 how a proposed \$1.5 billion project became a \$4.5 billion project.

3

4 While the stated intention of Alternative D is to cap LAX at 78.9 MAP, we do not
5 see how adding center taxiways, and therefore increasing the throughput on
6 the runways, will meet that goal. Airlines will increase flights to meet
7 passenger demand which is expected to rise to 165 MAP regionally during the
8 next 20 years. Even with 11 contact gates removed and the proposed 747-
9 compliant replacement gates along the length of the Terminal 1, 2 and 3
10 ticketing areas, we still see that the increased runway and taxiway efficiency
11 could more than compensate for the reduced number of gates.

12

13 Alternative D does not make LAX more secure. By increasing the airport
14 perimeter to Manchester Square and Continental City with the proposed
15 Ground Transportation Center (GTC) and Intermodal Transportation Center
16 (ITC) at these respective locations, LAWA is actually making LAX a larger,
17 1-1/8+ miles of additional target opportunities for terrorists. The EIS/EIS
18 document reads as though protecting buildings are more important than
19 protecting the people inside them. LAWA has already proven that it can make
20 LAX secure. We applaud LAWA for having LAX be the only top 20 airport
21 (Category X) in the United States that met the December 31, 2002 deadline for
22 baggage screening.

23

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 Alternative D relies on security technology that does not exist or is unproven.
2 Again, as in the case with Denver International Airport, LAWA should use only
3 proven off of the shelf technology. The automated baggage system was
4 replaced at DIA with a traditional belt system because the automated system
5 had never been used elsewhere. This baggage system replacement was
6 done at great expense was the cause of several delays in the grand opening of
7 Denver International.

8

9 *Alternative D does not adequately address traffic issues.*

10

11 Traffic issues will not be significantly mitigated in Westchester/Playa del Rey
12 with Alternative D. As written in the EIS/EIR, LAWA relies on other government
13 agencies to make street and highway improvements, if they are even feasible.
14 Due to the current state budget crisis, those improvements are unlikely as the
15 Legislature had depleted the state highway building fund in order to balance
16 the 2002-2003 budget. Although the Ground Transportation Center (GTC)
17 relies on freeway connections, there is not enough freeway capacity to handle
18 the load. As such, travelers will find other alternatives to access the airport
19 such as the consolidated rental car facility (RAC). The RAC's proposed
20 location on 98th Street between Sepulveda and Airport is already a problem
21 because it does not stop the existing problem of motorists cutting through
22 Westchester/Playa del Rey neighborhoods such as Osage Park, Westport
23 Heights, Kentwood and Loyola Village to access the airport. Construction of

Neighborhood Council of Westchester/Playa del Rey

LAX Master Plan Position Paper

1 Alternative D will also bring many traffic detours as a parade of trucks moves
2 dirt and brings in concrete and other building supplies.

3

4

5 *The proposed cost far outweighs any perceived benefits.*

6

7 LAWA officials have continually touted the positive economic benefits that LAX
8 provides to the Southern California economy. However, by making the journey
9 from the curb to the gate more cumbersome, LAWA will succeed in driving
10 away passenger traffic- the exact opposite of preserving LAX's touted role as
11 one of the region's economic engines. Planning must be done for queuing of
12 automobiles and people.

13

14 With costs for just the EIS/EIR work already having spiraled out of control, we
15 are extremely worried that the projected \$9.6 billion to implement Alternative D
16 will balloon to an even higher amount and cause extreme financial difficulties
17 for LAX and its tenant airlines. It is generally considered that contingency costs
18 (i.e. construction overruns) are 3% of Alternative D when most projects have a
19 10% contingency. As stated previously, more capacity can be built for less
20 money at Ontario and Palmdale.

21

22

LAX Master Plan Position Paper

1 CONCLUSION

2

3 The Neighborhood Council of Westchester/Playa del Rey rejects LAX Master
4 Plan Alternatives A, B, C and D due to their excessive costs and negative
5 impacts on the community. We further note that Alternatives A, B and C overtly
6 increase capacity. The NCWPDR Board of Directors supports a truly regional
7 solution for meeting Southern California's airport capacity needs by building
8 out airports in Ontario and Palmdale. While the NCWPDR Board has rejected
9 the LAX Master Plan alternatives presented thus far, the Board does support a
10 safe and secure LAX and would be willing to work with LAWA, the airlines and
11 other communities in developing a LAX Master Plan which is directly tied to a
12 truly regional solution with implementation budgets and schedules.

1. What programs or activities are the FAA and LAWA participating in or working towards creating a regional airport plan other than Ontario International Airport (ONT) as recommended by SCAG?
2. Is there any cost analysis showing the impact of increased costs at LAX if Alternative D were to be constructed? What is the breakdown of costs to the passengers, airlines, bondholders, concessionaires? For what period of time will those increased costs be in effect? Will Passenger Facility Charges (PFC's) increase? How much for each carrier?
3. Where is the cost analysis showing the impact on neighboring communities in terms of businesses during construction? Health issues such as loss of hearing, increased respiratory diseases, cancers, and stress? Loss to employers and employees for sick time due to these health issues?
4. How will LAWA retain low cost airlines (e.g. Southwest, Frontier, etc.) at LAX who will be displaced from their existing passenger terminal facilities by Alternative D?
5. What other costs that are not a part of the projected \$9.6 billion will need to be borne by the City of Los Angeles, County of Los Angeles, State of California and the United States of America for impacts related to LAX? What costs will incurred by these levels of government for health issues created by LAX?

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 6. If 78.9 million annual passengers (MAP) is the proposed maximum number of
2 passengers to be handled at LAX in a calendar year, then what do you
3 anticipate will be the number of passengers per gate when you reach that
4 level?
- 5 7. Does the budget for the LAX Master Plan include potential litigation costs?
6 What is the budget amount? Are litigation expenses included in costs
7 analyses? Are settlement costs budgeted and for what amount?
- 8 8. Is the financing to acquire the properties in Manchester Square and Belford
9 Square considered to be a part of the financing for the LAX Master Plan?
- 10 9. What amount of property is to be acquired via eminent domain?
- 11 10. How many Airbus A380 aircraft are expected to fly into LAX? How many
12 flights per day? To what extent must passenger terminals be redesigned to
13 accommodate these aircraft? How many gates will be established for these
14 aircraft and at which terminal buildings?
- 15 11. Why are some numbers explained as percentages in the draft EIS/EIR
16 document? Can you explain the numbers instead of a percentage?
- 17 12. In the LAX Master Plan press kit, a section covering noise mitigation notes
18 some of LAWA's initiatives- residential acquisition, soundproofing and
19 enforcement of over-ocean operations during the night. How effective has
20 sending letters to the Chief Pilots of airlines been in affecting compliance with
21 LAX noise regulations? What other enforcement measures has LAWA used
22 and is legally available to LAWA to use to mitigate noise?

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 13. Why are there no studies being conducted to study the health effects of LAX
2 on surrounding residents?
- 3 14. Is LAWA recording and tracking low frequency noise generated at LAX?
4 What mitigation measures are being employed to reduce low frequency
5 noise? Low frequency noise must be studied, mitigated and abated.
- 6 15. At what location do you anticipate placing the run-up enclosure? Will the
7 enclosure prevent high and low frequency noise from going out into the
8 surrounding community? What will the hours of operation be for the run-up
9 enclosure? How will aircraft be moved to and from the enclosure- aircraft
10 under power, electric tugs, etc.?
- 11 16. How will biological incursions by non-native plants, animals and insects be
12 handled?
- 13 17. What is the amount of time each runway will be out of service when a runway
14 is moved and/or extended?
- 15 18. What is the construction route? Will existing streets be blocked and/or
16 detours put into place? For how long will these happen? What will the
17 operating hours of the construction route?
- 18 19. Why didn't you use World Health Organization (WHO) documentation to
19 support your Federal Interrogatory Committee on Aircraft Noise (FICAN)
20 information? Also, why was FICAN not used for Sound Exposure Level
21 (SEL)?
- 22 20. What mitigation measure did you include for SEL? If there were none, then
23 why were they not included? What abatement measures have been done

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 elsewhere for any kind of single event noise, not limited to airports? How
2 successful were those abatement measures?
- 3 21. Where else in the world, and in the United States in particular, has habitat
4 relocation been attempted? Has this effort been successfully implemented?
5 If it is not successful, then what penalty will LAWA suffer for non-compliance
6 with the EIS/EIR?
- 7 22. In cases of Single Event Noise/Sound Noise Level, what would be the AdBA
8 for serious annoyance and speech intelligibility and moderate annoyance?
- 9 23. How does LAWA propose to evaluate and mitigate noise impact on the
10 learning process of students in schools?
- 11 24. Why is there no specific noise study in the community on schools impacted
12 by LAX?
- 13 25. Why is there not a report of the origin and destination of passengers at LAX?
- 14 26. Why does the EIS show an improvement in air quality in the area north and
15 east of Manchester Square under Alternative D vs. No Action No Plan even
16 though Alternative D relocates an enormous amount of vehicular traffic to the
17 immediate area?
- 18 27. How were the projected 2015 levels of air pollution arrived at for the area
19 north and east of Manchester Square for the No Action No Plan Alternative in
20 the EIS? Were mitigation measures implemented by LAWA between the
21 1996 baseline and the present accounted for in the projections?
- 22 28. It would seem that the reconfiguration of the north runway complex
23 proposed under Alternative D leaves room for a fifth runway on the

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 north side of LAX. What measures are included in Alternative D that
2 would prevent the construction of such a runway at a later date?
- 3 29. What fleet mix was anticipated in Alternative D for 2015? Airlines
4 continue to purchase turbo prop aircraft. Were these aircraft included in
5 the noise projections?
- 6 30. Why was there an assumption that the current Part 161 study would
7 develop mitigation actions. Nothing can be assumed until the study is
8 complete.
- 9 31. Where is a firm commitment by LAWA and the city of Los Angeles to
10 the CNEL and over-ocean procedures included in the EIS/EIR?
- 11 32. Where are the studies of increased traffic on 6L and 6R during easterly
12 operations.
- 13 33. Where is the study on single-event noise generated by easterly take-
14 offs?
- 15 34. Over 20,000 would be newly exposed to 94dBA SEL noise under the
16 EIS/EIR. What time of day would these impacts occur? What
17 mitigation measures were included for SEL impacts?
- 18 35. To reach the proposed Ground Transportation Center (GTC) at
19 Manchester Square, people will continue to exit the 405 Freeway at the
20 Howard Hughes Center and then cut through Westport Heights and
21 Osage seeking airport access. Why were the following intersections
22 and/or roadway links not studied: Airport Blvd and 74th, 76th, and 78th;

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

1 La Tijera and 74th, 78th-79th, and 83rd; Hindry and Aviation; Osage
2 and Manchester?

3 36. The GTC could not have all the protection for hazardous materials,
4 decontamination, bomb detection and disposal that the airfield would
5 have. How would all the necessary emergency vehicles, materials, and
6 staff gain access to the GTC? To come from the airfield, they would
7 have to travel on city streets which would be clogged in the event of an
8 attack or accident.

9 37. How could the GTC be evacuated in the case of an emergency or
10 attack? What roads could/would be used? Where would pedestrians
11 and vehicles be directed? How could security get people and vehicles
12 out of the danger zone and still maintain security? And be sure that the
13 parties responsible were not escaping?

14 38. What amount of traffic is being assumed for the LAX Northside area? It
15 seems that the NA/NP figures are higher than the Alternative D figures.
16 Were the impacts (in terms of traffic and air pollution) for the full
17 entitlement under the 1983 EIR charged to the NA/NP, but not to
18 Alternative D?

19 39. What is the cost difference for Alternative D if non-union labor is used
20 instead of union labor? Will a Project Labor Agreement (PLA) be used
21 for Alternative D? What is the cost difference between the PLA, union
22 and non-union labor?

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 40. In 2002, American Airlines published a volume regarding human health
2 risk assessment for their operations at LAX. Why did not LAWA publish
3 a similar comprehensive human health risk study for the LAX Master
4 Plan?
- 5 41. Why were the comments submitted by November 2001 not answered
6 before (or with) the release of the Alternative D Plan in July 2003?
7 (Executive Summary, page 24)
- 8 42. Numerous data issues were identified in 2001. How is the integration of
9 more data into questionable data expected to be satisfactory?
10 (Executive Summary, page 24)
- 11 43. If the purpose and need for the LAX Master Plan has not changed since
12 the publication of the Draft EIS/EIR and there have been significant
13 political event changes in addition to the Mayor's no expansion pledge,
14 why is one of the three major project objectives to "Ensure that new
15 investments in airport capacity are..." Also, we are told that the major
16 emphasis is for "Security and Safety." Why is this not even mentioned in
17 the list of project purpose and need? (Executive Summary, page 24)
- 18 44. Based on 2.8% growth from present we will be at 78 MAP in 2015. Is
19 this a realistic growth rate? (Executive Summary, page 25, table ES-1)
- 20 45. Compare this runway spacing with other statements in the document
21 which appear to differ. This one is 340 ft south of existing centerline.
22 (Executive Summary, page 26, table ES-2)

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

- 1 46. 2.8M sq ft of terminal space added by Alternative D without any
2 capacity enhancement? If the capacity is not expanding why are there
3 about 4600 more employee parking spaces? (Executive Summary,
4 page 27, table ES-2)
- 5 47. How are the schools impacted/removed related between Alternative D
6 and NA/NP? Alternative D shows a private elementary and a Hollywood
7 CPR(?) not in the NA/NP. (Executive Summary, page 28, table ES-2)
- 8 48. What are the values of NA/NP for Office Use, Retail Use Acquired and
9 Hotel Use that are not shown in the table? How does this compare to
10 Alternative D? More or less? Why? (Executive Summary, page 28, table
11 ES-2)
- 12 49. This table assumes the higher value of development of LAX Northside
13 in NA/NP and Alternative D but Westchester South (the reduced) for
14 A,B,C. Why? Isn't this assumption different in other areas of the
15 documentation? (Executive Summary, page 29, table ES-2)
- 16 50. If LAWA doesn't own Manchester Square, why does it assume airport
17 use in all but Alternative A? How is it going to be procured? Eminent
18 Domain? Why is it in conflict with the Westchester-Playa del Rey
19 Community Plan? (Executive Summary, page 29, table ES-2)
- 20 51. Greater outside impacts under Alternative D. Why? What specific
21 areas? (Page 4-215, last paragraph)
- 22 52. What is the threshold of significance for outdoor noise levels? How were
23 they determined and applied? (Page 4-216, "Although increases in

Neighborhood Council of Westchester/Playa del Rey

Community Questions on the LAX Master Plan EIS/EIR

1 outdoor noise levels within the 65 to 75 CNEL contours would occur
2 under the build alternatives, these increases would not exceed
3 thresholds of significance.”)

4 53. Alternative D more extensive changes than other alternatives. Is it so
5 extensive that a new EIS/EIR required? (Page 4-217)

6 54. Since 2008 is the peak construction period for Alternative D and
7 2004/2013 for the others, how does this impact noise distribution due to
8 flight track differences. (Page 4-217)

9 55. What are the construction model assumptions and where are they
10 delineated? (Page 4-217)

11 56. Does inbound and outbound counts refer to the upper and lower levels
12 (aircraft arrivals/departures)? Otherwise they should be equal. Is there
13 an explanation for inbound consistently higher increases? (Page 4-221)

14 57. Why are the peak hours that different? What are the correct ones?
15 (Page 4-221)

16 58. Why isn't there pollution and health studies for aircraft engines while
17 idling and taking off?

18 59. Why do some of the charts have dates of 2001 and 2002 while the data
19 represented on those charts has dates of 1996 and 1997?

Proposed amendments to reports

LAX Master Plan Position Paper

Several suggestions to be submitted separately by Barry Weiss.

Community Questions on the LAX Master Plan EIS/EIR

I would like to add a few questions to those already posed. In my review of the LAX Master Plan there has been almost no attention to cargo handling facilities and their role in public safety.

Why have cargo handling facilities also not received the same scrutiny over security as passenger facilities?

Why are cargo facilities, after implementation of any of the alternatives of the LAX Master plan, still located all over the place without regard to a security plan?

What security measures does the LAX Master Plan have in place for the handling of cargo that will insure the safety of the public? Both in the air and on the ground.

Why aren't cargo facilities centralized in order to insure the safety of the public?

Why does the LAX Master Plan spend so much money on facilitating the A-380, a yet to be built, unproven European aircraft based in Toulouse, France, while American aircraft manufacturers struggle to stay alive?

FAX 310-642-0512

October 20, 2003

Mr. Robert Acherman
6055 West 75th Place
Westchester, CA 90009-2216

Dear Mr. Acherman:

The airlines serving LAX feel strongly that the airport needs to be modernized in order to effectively serve the traveling public and remain the key economic engine to the region. They further support the planning objectives of a safer, more secure and user-friendly LAX; however, Alternative D to the LAX Master Plan falls short of reaching these objectives, which the carriers think could be better achieved through a modification of Alternative D.

To that extent the airlines appreciate the opportunity to work with the Westchester/Playa del Rey community, and discuss alternatives that address the LAX master plan objectives. The airlines, having recently been provided with a copy of the Alternative E-1 concept, are very encouraged with our progress to date and believe that we are close to identifying a concept that is acceptable to the City of Los Angeles and the key stakeholders, including the local community and the airlines.

Thanks you. We look forward to continuing our working relationship.

Sincerely,

Kelley A. Brown
Executive Director

**Los Angeles
International Airport Area
Advisory Committee**

November 5, 2003

Mr. David B. Kessler, AICP
U.S. Department of Transportation
Federal Aviation Administration
Department, AWP-611.2
LAX Master Plan Office
P.O. Box 92007
Los Angeles, CA 90009-2007

Mr. Jim Ritchie
City of Los Angeles
Los Angeles World Airports
P.O. Box 92216
Los Angeles, CA 90009-2214

Dear Sirs:

The LAX Area Advisory Committee (LAXAAC) members have been appointed by the governing city mayor or county supervisor in the following areas surrounding LAX: El Segundo, Lennox, Hawthorne, Inglewood, Culver City, Marina del Rey, and the Westchester and Playa del Rey sections of Los Angeles. These areas tend to be the most severely impacted by noise, traffic, and air pollution due to LAX operations. We were created to advise the Board of Airport Commissioners and other interested groups.

The members of LAXAAC strongly support a regional approach to air traffic in the Los Angeles basin. Any proposal for improvements to LAX must include specific, detailed procedures that could be undertaken by LAWA and the City of Los Angeles to achieve a more equitable sharing of the air passenger and cargo traffic.

The members of LAXAAC find serious deficiencies, inadequacies, omissions, and inaccuracies in the EIS/EIR LAX Master Plan, Alternative D. Therefore, we find this proposal to be fatally flawed.

While it is noted that Alternative D would not be as onerous as Alternatives A, B, or C, the No Action/No Project alternative is still this committee's preference.

Alternative D has been deemed a safety and security attempt – yet it would not provide either safety or security for the traveling public or the surrounding communities. It would provide a modicum of security for the CTA, but our committee thinks that protecting facilities at the expense of people is the wrong approach.

There have been very few Category A runway incursions at this airport, especially after the new control tower came on line. In fact, the LAX air traffic controllers handled more than 1 million take-offs and landings since June 2002 with no operational errors. Congratulations are in order for the FAA's air traffic controllers at LAX.

LAWA also is to be congratulated for being the only major airport to achieve the December 31, 2002, federal security requirements – a major accomplishment!

The Manchester Square location for the proposed Ground Transportation Center is of particular concern to the surrounding communities. This area was not part of LAX in 2002 when all the mayoralty candidates signed the ARSAC pledge, which included, in Section 2, a commitment to not increase LAX beyond its existing boundaries. Since the pledge was signed, LAWA has been acquiring the residential properties in Manchester Square. However, due to various reasons, including litigation over the process and monetary issues, the area may not be available until 2008 or beyond.

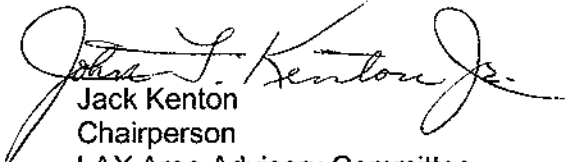

LAX will be required, therefore, to continue to meet security requirements with its present configuration – a requirement that can and will be met without spending over \$9 billion. Although the funding for Alternative D would officially come from various sources, the ultimate payers would be air passengers, air cargo shippers and receivers, and tax payers.

We also ask the Los Angeles City Attorney of the potential conflict of interest of LAWA Commissioner Miguel Contreras to vote on various proposals coming before the Commission to expand/modernize the airport, given that he spoke out in favor of Alternative D as a representative of a labor union at a public meeting held at the Furama Hotel on August 23, 2003.

An overall question raised by our committee is why do so many of the mitigations or requirements for action cited in the EIR/EIS require action by other agencies, and not on the part of LAWA?

Our committee's comments on the Alternative D proposal are attached. We look forward to the response to our questions and concerns.

Sincerely,

Jack Kenton
Chairperson
LAX Area Advisory Committee

Questions and Comments

1. EIR/EIS Section and Page Number: Executive Summary, pp. ES-6. ES-20; Section 3, p. 3-56; Section 4.20, Construction Impacts, p. 4-540.

Question or Statement: The executive summary indicates that there were 20 acres devoted to fuel farms in 1996 and that that number would stay the same under the No Action, No Project Alternative, but would diminish to 14 acres under Alternative D. The reconfiguration is expected to start in 2010, but there does not appear to be a discussion of how it will be reconfigured. This reconfiguration raises a number of questions:

How would that reduction be accomplished?

Where are the six acres located?

How would the remediation of those six acres be accomplished?

What would the cost of that remediation be?

Where is all of this described in the EIR/EIS?

2. EIR/EIS Section and Page Number: Executive Summary, ES-41, and 4.9.1, p. 4-438

Question or Statement: Alternative D does not require the relocation of Hangar One, as did one of the prior alternatives. Given that Hangar One is a National Register listed historic property that is currently not open to the general public, would it make sense and is it possible to relocate Hangar One to an area that would be accessible to the public?

Alternative Solutions or Options: Relocate Hangar One.

3. EIR/EIS Section and Page Number: 4.6 Air Quality, pp. 4-355-356, 4-383, 4-386, and 4-387-392.

Question or Statement: How many of the "extensive list of mitigation measure components" that LAWA proposes to implement are measures that it could implement under the No Action/ No Project alternative and how many of them are dependent upon Alternative D's adoption? Have these currently available

mitigation measures been taken into account in the estimations of the operational emissions for the No Action/No Project alternative?

Alternative Solutions or Options: It would appear that many of these measures are ones LAWA could currently adopt without waiting for approval of Alternative D or another alternative, including:

- Require or promote the conversion of airport tenant and user equipment to alternative fuels.
- Establish a network of remote transit facilities serviced by LAX-dedicated clean fuel buses,
- Promote the expansion of LAWA's ride-sharing program to include all airport tenants,
- Develop infrastructure to allow employee telecommuting and video-conferencing,
- Provide fee-incentives and preferential parking locations for low emissions vehicles, and
- Reduction in aircraft maintenance activities at LAX, shifting them out of South Coast Air Basin (p. 4-386). (How will this be accomplished?)

Additional Comments: The mitigation measures discussed at pages 3-387-392 do not appear to have been considered for the No Action/No Project alternative, yet many of them could be adopted without waiting for final approval of the EIR/EIS and would have substantial effect on the air quality related to the No Action/No Project alternative. It is inappropriate for LAWA to ignore the impact of such measures on the No Action/No Project alternative.

4. EIR/EIS Section and Page Number : 4.6 Air Quality, p. 4-356 - 357

Question or Statement: The EIR/EIS recognizes that none of the alternatives would meet the California Ambient Air Quality Standards for fine particulate matter. What is the impact of violating such standards other than that specified on page 4-357, regarding the preparation of an analysis and conformity determination? Is it clearly legal to violate these standards?

Alternative Solutions or Options: Were any alternatives considered that would meet California Ambient Air Quality Standards?

Additional Comments: Although certain of the alternatives are proposed as better than others for meeting the California Ambient Air Quality Standards, it does not seem appropriate to propose an alternative that admittedly does not

meet such standards, particularly given the amount of money and effort involved in adopting the alternative.

5. EIR/EIS Section and Page Number : 4.6 Air Quality, p. 4-360

Question or Statement: Does the fact that the modeling method for carbon monoxide emissions for Alternative D involved 24 more intersections than that used for the other alternatives skew the results? Why did you not do the analysis using those 24 intersections for the No Action/No Project alternative, even if not Alternatives A, B and C?

Alternative Solutions or Options: Conduct the analysis of carbon monoxide emissions using the same information for all alternatives.

6. EIR/EIS Section and Page Number : 4.6 Air Quality, p. 4-386

Question or Statements: This section notes that Alternative D's unique proposed Ground Transportation Center ("GTC") and Intermodal Transportation Center ("ITC") would move parking and traffic emissions to a new location, around the GTC and ITC, however, there does not seem to be a specific discussion of air quality impacts on the neighborhoods immediately adjacent to the GTC and ITC. Has LAWA evaluated the impact of Alternative D on those neighborhoods, comparing and contrasting it with the No Action/No Project alternative?

Additional Comments: Without an analysis of the environmental impact of the GTC and ITC on the neighborhoods that would abut these new facilities, the EIR/EIS is incomplete.

7. EIR/EIS Section and Page Number : 4.24, p. 4-613 and p. 4-614

Question or Statement: Like the prior comment, it appears that the Human Health and Safety Risk for residents in the area immediately adjacent to the GTC and ITC will be adversely affected, but the EIR/EIS does not appear to discuss this with any specificity. This section notes that "Some health risks for maximally exposed individuals . . . would increase slightly in small areas adjacent to the airport. . . ." but notes that these increases are "less than significant." Precisely what are these areas, how many people are affected, and can anything be done to mitigate this "slight" increase?

Moreover, given that the EIR/EIS recognizes (p. 4-614, under "Methods for Estimating Impacts to Human Health") that studies of inhalation of toxic air

pollutants from airport operations are out-of-date, having been conducted more than 15 years ago, what confidence does LAWA have that its determination that the supposed "less than significant" increase health risks in this area is in fact, accurate?

Additional Comments: LAWA clearly recognizes the inadequacy of the data used for this determination, but it seems that this issue is important enough not to be decided on the basis of antiquated data. LAWA should require additional studies of the health risks of inhalation of toxic air pollutants from airport operations.

Even where the increase in cancer risks or other non-cancer health risks is "less than significant," as defined by CEQA, it would probably be considered "significant" to those individuals who are affected. Accordingly, as a matter of environmental justice, this risk should be spelled out so that those affected are informed of the increased risks.

8. EIR/EIS Section and Page Number : 4.6 Air Quality, p. 4-387

Question or Statement: The EIR/EIS analyses the impact of the Playa Vista development on Alternative D, but does not appear to consider its impact on the No Action/No Project alternative. Has this been done? What impact are traffic improvements required by or associated with the Playa Vista project likely to have on the No Action/No Project alternative?

9. EIR/EIS Section and Page Number : 4.6.8.1, p. 4-392-393

Question or Statement: Similar to Comment 3 above, the EIR/EIS does not appear to take inventory of the operational mitigation measure components with respect to the No Action/No Project alternative. Has such an analysis been made? If not, what is the impact of any operational mitigation measure components that could be adopted without approval of any of the other alternatives?

Alternative Solutions or Options: Consider the impact of all presently available operational mitigation measure components on the No Action/No Project alternative.

10. EIR/EIS Section and Page Number : 4.6.8.6, p. 4-397 and 4.6. 9, pp. 4-397-4-402.

Question or Statement: The footnotes to Table S4.6-22 appear to contemplate that the No Action/No Project alternative would be included in this analysis of mitigation measures, but the actual chart does not include that alternative. Where is the analysis of the mitigation operational air pollutant concentrations for the No Action/No Project alternative?

Additional Comments: Unless mitigation measures that are available to LAWA regardless of approval of the Master Plan are analyzed for their impact on the No Action/No Project alternative, the comparisons of air quality for that alternative with the other alternatives are biased and inadequate.

11. EIR/EIS Section and Page Number : Section 4.19.5, p. 4-534 and 4.19.8, p. 4-537; Section 5.2, p. 5-10.

Question or Statement: Just as certain air quality mitigation measures could be implemented without approval of the Master Plan, so too might certain solid waste generation mitigation measures be adopted. Has the EIR/EIS evaluated the impact of implementing such mitigation measures on the No Action/No Project alternative?

Alternative Solutions or Options: Certainly LAWA could implement a more aggressive recycling program (pp. 4-534 and pp. 5-10) without approval of the Master Plan.

Additional Comments: To avoid biasing the analysis, the impact of such mitigation measures should be considered for the No Action/No Project alternative.

12. EIR/EIS Section and Page Number : 4.20 Construction Impacts, p. 4-544 and Technical Report S-4, Attachment D, Construction Activities Emissions Inventories

Question or Statement: Is the analysis here premised on average vehicle occupancy of two people? If so, what data support that assumption?

Alternative Solutions or Options: As the South Coast Air Quality Management District ("SCAQMD") pointed out in its comments on the initial draft EIR/EIS, dated September 21, 2001, it is optimistic to assume that each vehicle will contain two people. Instead, the SCAQMD suggested that "a more conservative" assumption of one person per vehicle should be used unless LAWA can support its assumption of two people with actual data.

Additional Comments: Given the EIR/EIS's apparent assumptions, the emissions from construction activities appear to be substantially understated.

13. EIR/EIS Section and Page Number): 5.2, p. 5-3

Question or Statement: What is the purpose of the community outreach efforts, including public notification and public meetings, when new development on airport property is in proximity to and could potentially affect nearby residential uses?

Additional Comments: Although the LAXAAC is obviously in favor of public involvement in airport development, such development should be intended to afford the people living in the airport vicinity a voice in determining the future of the airport or at least to help mitigate the impact of LAX building projects on them. Public meetings should not be merely for window dressing or as a requirement to check off before proceeding as planned. If the public's input is not valued and is not considered, public meetings should not be held.

14. EIR/EIS Section and Page Number : Sections 5.2, pp. 5-2 – 5-15

Question or Statement: It does not appear that LAWA has formulated definite plans for its Master Plan commitments about what it would do under the various alternatives proposed to mitigate the environmental impacts on the community. Most of the matters discussed here are discussed in generalities, so that what will eventually be accomplished cannot be evaluated at this time. For example, at p. 5-8, LAWA indicates that it will prepare a specific Standard Urban Storm water Mitigation Plan to address water quality and drainage issues; at p. 5-9, it states that it will implement a utilities relocation program to minimize interference with existing utilities. Several other examples exist. As a result, not only is the environmental impact of LAWA's proposed alternative impossible to assess, so is its ultimate cost.

Alternative Solutions or Options: Prior to proceeding with any alternative, LAWA should have a better understanding of what will be required to be done and its likely cost. Does this exist within LAWA?

15. VOLUME ONE PAGE 2-1 Purpose and need for the proposed action?

The Executive Summary of the Draft EIS/EIR summarizes the purpose and need for the LAX Master Plan as follows:

The purpose of the LAX Master Plan is to help provide a level of airport passenger and freight improvements that will support the future economic growth and vitality of the five-county Los Angeles region. An overarching consideration

during the planning process has been to achieve the project objectives in an environmentally sound manner. In particular, the Master Plan project objectives are to:

1. Respond to local and regional demand for air transportation during the period 2000 to 2015, taking into consideration the amount, type, location, and timing of such demand.
2. Ensure that new investments in airport capacity are efficient and cost-effective, maximizing the return on existing infrastructure capital.
3. Sustain and advance the international trade component of the regional economy and the international commercial gateway role of the City of Los Angeles.

16. Alt D is a safety and security plan and a 'modernization' plan

The LAX Master Plan Supplemental to the Draft EIS/EIR Question and Answer handout by LAWA has on page 2, Q6, "How would safety be affected by the Master Plan? The first sentence in the answer to that question is, "LAX operates safely today and it will operate safely tomorrow."

Why, then, is there a need to spend billions of dollars for safety improvements if LAX is already safe. Please comment.

17. According to the EIS/EIR, Alternative D would improve the level of passenger service throughout the CTA by including new passenger and baggage processing facilities where the public parking garages are located today. Does removing public access to the CTA by placing the GTC one or two miles to the east improve the level of passenger service?

18. In addition, Alternative D states that it would provide for construction of new aircraft parking gates as well as demolition of some existing gates. As a result, Alternative D would have fewer total gate positions than the existing conditions or the No Action/No Project Alternative. As a result, all aircraft parking would be adjacent to a terminal or concourse, eliminating the current need to bus passengers to remote aircraft parking positions. When would the removal of remote gates take place? Is there an expectation that some of the remote gates later could be reinstated, once again to improve service to the passengers?

19. "Deterrence and prevention of terrorist attacks are essential considerations of the Alternative D plan. Its elements include

(1) avoiding concentration of people in the public areas, to the greatest extent possible, so as to reduce the likelihood and potential lethality of terrorist attacks with bombs or firearms." The term "greatest extent possible" is left to the discretion of the BOAC and staff. Doesn't having three entrance areas leave the possibility of a greater concentration of people than 7 or 8 entry points?

(2) moving passengers and their baggage through check-in and security screening and into the secure areas as quickly as possible. How quick is "quickly as possible"? And

(3) permitting only known, screened, and controlled vehicles into the Central Terminal Area (CTA), and avoiding concentration of unscreened vehicles and people at the curbs of the proposed Ground Transportation Center (GTC), Intermodal Transportation Center (ITC), and the Consolidated Rental Car (RAC) facility. Alternative D would use an expanded LAWA-operated Flyaway program throughout the region to disperse passenger processing. This service would include remote check-in of passengers and baggage, and provide direct access into the CTA. Although we are referred to Appendix I for a detailed assessment of the security and safety features of Alternative D, Appendix I doesn't indicate how and where the vehicles will be checked prior to entering the CTA? Why?

20. The RAC would include fueling, car washing, maintenance and repair facilities etc. What safety and security measures are included for these facilities? How close to residential areas will these facilities be located?

21. According to the EIS/EIR, Alternative D would consolidate parking and curb front areas at a new GTC. This facility would become the primary point of pick-up and drop-off for passengers using LAX. The facility would combine a controlled and monitored roadway access system with first-level passenger security screening and profiling to further enhance the safety and security of all passengers using LAX. How would LAX and others treat an unidentified object left in the GTC or ITC or RAC, especially in the GTC? Would it be different from the program LAX now uses in the existing CTA?

22. According to the EIS/EIR, a new ITC would provide a more efficient connection than currently exists between the existing MTA Green Line station and the CTA. The airport's rental car facilities would be in one location, referred to as the RAC, to simplify passenger access to these services. On paper this is a good idea.

A new Automated People Mover (APM) system would connect the GTC, ITC, and RAC to the redeveloped CTA. The end goal of this design concept is to achieve a new balance between the needs of both passenger security and passenger convenience. How is passenger safety and security to be incorporated on the APM? Wouldn't the multi-mile APM be more difficult to protect from whatever security risks exist?

23. North (24L 340") and South (25L 50") runway movements are not necessary as far as safety and security is concerned. Of the ten surface incursions in the first ten months of fiscal 2003, two were category B, two C and two D AND NO CATEGORY 'A'. The taxiway between the runways will not stop aircraft from crossing from the outer runways across the inner runways to the

terminals.

The statement of the EIS/EIR that "The new center taxiways will improve airfield safety and reduce the possibility of runway incursions" is an accurate statement. If we put traffic signals on the freeway we could reduce traffic accidents and improve safety. Regardless of what anyone says, the moving and extending of any runway is a modernization, (expansion, improvement) program.

25L runway allows aircraft to depart that runway and cross diagonally while the modernization program would have the aircraft cross perpendicular to 25R. What are the safety gains of this procedure?

24. Los Angeles LAX 1.29 incursions per 100,000 operations

Runway incursion as defined by the FAA.

What is an incursion? Most dramatically referred to as a "near-miss," an incursion can actually take an almost benign form. For example, the least dangerous form might apply if a pilot edged the nose of his plane over a "stop line," akin to going a little too far when approaching a stop sign on the road. And an incursion isn't merely when two planes are headed for a collision; about 20% of cases involve pedestrians and vehicles.

Types of Incursions by Severity.

The National Airspace System managed 268 million takeoffs and landings at 488 towered airports from 1998-2001. Of that number, 1,460 resulted in "runway incursions"; all 1460 occurred in 84 of the 488 airports studied; the other 404 had no incursions at all.

The FAA groups incursion severity into four categories:

Category D: "Little or no chance of collision but meets the definition of runway incursion," as in the stop sign analogy above. The danger factor: pretty much zilch.

Category C: "Separation decreases but there is ample time and distance to avoid a potential collision." Danger level is low.

Category B: "Separation decreases and there is a significant potential for collision." Danger level increases considerably.

Category A: "Separation decreases and participants take extreme action to narrowly avoid a collision, or the event results in a collision."

A Category A incursion is what most of us would call a "near-miss"; in other words, darn near a collision. (In fact, an actual collision is a type of Category A incursion, but even then the collision might be with a runway sign or some other relatively impermanent object.) The FAA calls this a "severe situation where the margin of safety is so low that a collision is barely avoided." The danger level: extremely high.

Distribution of the 1460 Incursion, 1998-2001

Category A: 6% Category B: 11 % Category C: 35% Category D: 48%

1999-2002-

Category A: 5% Category B: 10% Category C: 33% Category D: 52%

LAX had 34 incursions from 1999 to 2002 and no category A incursions.

So, nearly half the incursions were of the nature of an airplane sliding a couple feet past a stop line, a dog running across the tarmac, or a fuel truck being slightly out of position.

25. Types of Incursions by Cause: Who, What, and Why?

The FAA has three "error categories" to classify the who, what, and why of incursions: (1) pilot deviations, (2) operational errors, and (3) vehicle/pedestrian deviations.

Pilot deviations account for the majority of incursions at 58%. These errors include failing to stop on time at a "hold-short" line in simple cases, or taking off without clearance at the other extreme. The year 2000 was a particularly bad year for pilot deviations, but 2001 saw considerable improvement.

Operational errors, which account for 23% of incursions, include miscommunications such as "hear back/read back" errors, mistaking the location of an aircraft or vehicle on a runway, or use of a closed runway.

The third and least common errors are "vehicle/pedestrian deviations," instances of people or vehicles entering a runway without authorization, which are pretty much what they sound like; folks and vehicles (e.g., fuel trucks, fire trucks, tug-vehicles) in places they're not supposed to be.

Incursions by Plane Type

The FAA also has three classes of flights: commercial, general aviation, and military. General aviation planes account for more than 65% of incursions, with commercial flights at 38% and military flights at 4-5%.

A recent report indicated that LAX has not had a serious incident in more than 14 months (more than 1,000,000 operations).

Why do you insist that the moving and/or lengthening of three of the four runways are being done for reasons of safety? Isn't it obvious, with this FAA information, that the cost associated with the alterations is outside the realm of

reality? Please explain your rationale.

26. Page 4-715 It states "...not all safety areas and safety zones surrounding the four LAX runways universally meet today's recommended dimensions for new airport development."

Is this statement a demand for runway relocations and extensions? Please explain a yes or no answer. Would the airport be closed down if there was no reconfiguration of the runways? Please explain a yes or no answer.

27. CTA

The removal of most vehicles from the Central Terminal Area (CTA) is a positive safety and security program because it limits the possibility of a large explosive device being carried in a vehicle. It makes it more difficult to have large structural damage and great loss of life in the CTA.

This change, however, also creates a problem of how to get the passengers to the terminals. The Supplemental Draft EIR/EIS has a Ground Transportation Center (GTC), an Intermodal Transportation Center (ITC), Consolidated Rental Car Facility (RAC). All of these centers rely on an Automated People Mover (APM) to transport passengers via the APM. This increases the area that must be covered to curtail terrorist activity. To say that the GTC, ITC, RAC and the APM will have a less than significant impact (ES 4.26.2) on the number of security personnel, the type of equipment and the utilization of that equipment is not reasonable or logical. It is critical to insure the safety and security of the passengers. A closing down of any of these centers would have a very negative effect

The CTA has several terminals for passenger access through various means of transportation at the present time. As the past several months have shown, a suspicious article has caused a particular terminal to close down and to have passengers removed from the area. If the GTC were to have a similar type of a problem, many terminals would be affected and create a greater problem depending on the severity of the problem at the GTC. The same could apply to the RAC and ITC, only not as severe a problem.

The term 'Level One' security check of passengers and baggage has not been easy to determine, at least as yet. The method and procedure is very important. The GTC, ITC, and RAC are all to have Level One security checks BEFORE anyone boards the APM. Questions to still be investigated are the methods vehicles would be checked as they come into those areas and the procedure for getting the passengers and luggage to the security check area are still undetermined.

Arriving passengers, as now, will have been checked at some other airport. An area of concern would be how to get the arriving passengers and baggage back to their point of landside surface departure if the APM is malfunctioning for

whatever reason.

The "concentric rings of security" as illustrated in Figure 4-1, imply that because of the distant location of the GTC, ITC, RAC etc., law enforcement personnel will have additional time to assess any inappropriate activity prior to the problem reaching the APM or CTA. This could be a positive security measure depending on the programs that are set up.

The Flyaway buses need to have at least Level One security for passengers and baggage at the depots, given that they will be allowed to go directly to the CTA. As of this time, we do not know of any planned inspection of vehicles allowed into the CTA to service the concessionaires. Where and when will the inspection of the Flyaway vehicles be inspected after leaving the Flyaway station and before entering the CTA?

28. We have heard that LAX is as safe as it can get. The airport, airlines and all other airport-related activities encourage the public to use the airlines and airport. They encourage the public to travel. Yet all the consultants, including the Comparative Study Analysis hired by LAWA, can find NOTHING good about the system now employed. In every instance cited by the consultants Alt. D noted as superior to NA/NP. Who would want to travel in an airport with as many flaws as the NA/NP that we are using at the present time? We must question the validity of any report that presents only the positives of one program and the negatives of another. Credibility would be questioned if anyone were to evaluate Alt. D in the same way EIS/EIR has evaluated NA/NP.

Please explain what constitutes an Aircraft Accident and an Aircraft Incident as shown in Table S4.24.3-1. Please describe the accidents and incidents listed in that same Table. Based on that Table, it appears LAX operates a relatively safe airport.

29. Section 4.24.3.6.2 refers to environmental impacts related to safety located in 4.24.3.6. There is not any information in the later section pertaining to Environmental Consequences. Section 4.24.3.6.2 states, "The ability to accommodate future federal airport security requirements under the NA/NP Alternative MAY be constrained by the space limitations of existing facilities, particularly the CTA." Do you know what the future federal requirements may be? How could LAWA improve the CTA to handle potential federal requirements? What would the consultants discover if they were told to find additional space in the CTA area? What other interim measures could be incorporated by modifying the existing CTA facilities?

30. 9/11/01 was a day when aircraft, fully loaded with fuel, destroyed buildings and killed people. Terrorists using commercial aircraft would find it much more difficult to conduct a similar activity today. However, with more than 40 airfields in

the area, how will can the GTC, ITC, and RAC be protected from other aircraft, loaded with explosives, causing great harm to facilities and passengers?

To summarize, although the LAXAAC considers Alternative D preferable to Alternatives A, B and C, it considers Alternative D to have significant flaws and to be less preferable to the No Action/No Project alternative.

Additional points, Noise Committee:

31. The number of residents in Manchester Square that would lose their housing is over 7,000 (12.5 percent of the population of the Westchester area). There is very little affordable housing available in this area for them. Where was the negative economic impact on the local communities included for removing these residents in Manchester Square? Are the costs of relocation, litigation and eminent domain included in the Draft EIS/EIR?

32. What flight mix was anticipated in Alt. D? Would the flight mix be able to achieve the LAX noise abatement program (e.g., take-offs on in-board runways, and over-ocean operations)?

33. Although moving runway 24L 340 feet south is obviously planned to accommodate the New Large Airplanes (NLA), this runway may not be long enough for the NLAs. According to literature on the yet-to-be-released aircraft, they need a runway at least as long as 25R. Counting the unpaved ground at either end of 24L as part of the qualifying length is specious and potentially dangerous.

34. Why was the A-380 single-event noise not included?

35. The 94 SEL noise level used for the threshold of significance for sleep interference is too high. The levels selected by the World Health Organization (55 SEL outside, 35 SEL indoors) should be used.

There is an assumption that the Part 161 Study will develop mitigation actions; this can not be counted on nor included until the Part 161 Study is complete (and it is doubtful that there will be any real mitigation measures recommended).

Has irregular terrain been considered in formulating CNEL contours?

36. Why is low-frequency noise not addressed?

37. Noise from construction should never exceed maximum allowable noise levels. What provisions have been made to insure this is the required policy?

Notes on Alt.D Noise, Section 4.1

General comments:

38. None of the noise analyses deal with low-frequency noise, yet this form of noise has been identified as extremely detrimental to overall health, not just to hearing. Residents in areas that had not previously expressed concern about noise impacts (Ladera, for instance) are probably being impacted by low-frequency noise. Low-frequency noise needs to be recorded, integrated in the contours, and mitigation measures included.

39. The only noise contour in the Noise section that shows projected 2015 Alt. D noise is Figure S6 (from the Supplement), Alternative D 2015 (with Part 161 Mitigation) vs. Alternative D 2015 Without Mitigation. Figure S6 is in error for showing mitigation measures generated from the Part 161 study – this study is currently underway; no mitigation measures have been recommended nor adopted from the study as of this time.

40. There is no contour map included showing 1996 baseline, the Year 2000, and projected Alt. D 2015 impacts. There are some figures, (S4.2-16 through S4.2-19) that do compare a noise contour for Alt. D 2015 with 1996, NA/NP, and Single Event noise, but they are included in the Land Use section, not the noise section of the Alt D EIS/EIR.

A firm commitment to the CNEL and over-ocean procedures needs to be clearly defined in the EIS/EIR. The over-ocean procedures were established as extending to 7:00 a.m. However, at several locations in the proposal, the time has changed to 6:30 a.m. The EIS/EIR should state what the original procedure was and, if it has been officially changed, when and how it was changed. Otherwise, the 7:00 a.m. time should be reaffirmed and language clearly delineating LAWA's unequivocal commitment to it must be included. As an inducement to follow the over-ocean procedure, LAWA should formally request that the FAA establish a procedure to track pilot (or FAA) requests for an easterly take-off when LAX is in the over-ocean mode. These requests must list weather conditions and the reasons an easterly take-off was requested. Monthly reports of these requests should be made to the public.

41. Table S4.1-1, Aircraft Noise Exposure by Noise Level Range – 1996 and Year 2000 Conditions: It is not stated whether the Manchester Square area is included as residential in the 1996 and 2000 figures. For an analysis of Alt. D, the estimated noise exposure must be included for 2015.

42. Table S20 (from Supplement), Grid Points Within Future Alternatives That Experience Significant or Other Reportable Increases in CNEL – Comparison of Future Alternatives to 1996 Baseline, Year 2000 Conditions, and 2015 No

Action/No Project Alternative: This data is shown only in a table. It must also be shown in a contour map form.

Section 4 Noise Screening of Alt. D Track Changes above 3,000 Ft Altitude

43. On what basis is the assumption made that the Alt. D flight tracks would not increase noise by at least 5 decibels? What aircraft mix was assumed? Turbo-props are still being purchased by the airlines; were they included in the mix?

44. Moving 24L/6R 340 feet to the south would certainly have a serious impact on Inglewood and south Los Angeles; on both take-off and landing aircraft would be below 3,000 feet. This would impact areas that are clearly eligible for Environmental Justice relief.

45. As shown on Figure S4, easterly departures from 6L and 6R would go directly over the Osage area of Westchester at altitudes considerably below 3,000 feet. Where did the EIR/EIS study include studies of increased traffic on these runways during easterly operations? Was there any study done of more commuter aircraft being routed to the north? Especially to 6L? Where is the study on single-event noise generated by easterly take-offs over this area? These issues must be addressed.

46. During normal operating conditions, if commuter aircraft are routed to the north complex, specifically to 24R, there is a greater opportunity for early approaches coming in over eastern Westchester and early turns on take-off over Playa del Rey which would be considerably lower than 3,000 feet in altitude. Where is the study of these eventualities? Especially the single-event noise impacts?

47. The eastern part of Westchester (the Osage area) is already subjected to serious aircraft noise, in both easterly and westerly operating conditions. Alt. D would have the potential to greatly increase this noise impact to more than unacceptable levels.

What is the aircraft fleet mix upon which the 2015 noise estimates were made? How many aircraft take-offs and landings were assumed to be during the day, evening, and night? Airlines are still purchasing turbo-prop aircraft. Were these included in the noise estimates?

48. Alt. D estimates that cargo will triple by 2015. What cargo aircraft fleet mix was assumed? Many of the loudest nighttime aircraft are cargo flights taking off between 12:00 midnight and 2:00 a.m. How many cargo aircraft take-offs and landings were assumed to be during the day, evening, and night in the 2015 noise estimates?

49. In Figure S4.2-16, Alt. D vs. 1996 Baseline, there is an indication that there would be over 1.5 dB increase in noise for the area near Sepulveda and Westchester Parkway, and an area extending eastward from the end of Runway 24L to approximately Western Ave, which is as wide as 9-10 blocks from La Cienega to La Brea. It is estimated, however, that these areas would still remain within the 65 dB contour. Are these 1.5 dB increases due to the New Larger Airplane (NLA) departures?

50. Was it assumed that the NLAs would be departing only from the north complex? Literature on the NLAs indicates that they would need a runway at least as long as 25R. Runway 24L would not be as long, even if the changes in Alt. D came to pass. Was the ground at either end of the runways included as runway length when determining aircraft safety requirements? Considering the size and weight of the NLAs, unimproved, unpaved ground is not adequate for problems that may occur during take-offs or landings. What would happen if the longest runways were not available, e.g., during maintenance or an accident?

51. Figure S4.2-18 shows two areas, that would experience new exposure to 94 dBA SEL noise under Alt. D (as compared to the 1996 baseline). One area would be a rather narrow (3 to 6 blocks wide) corridor north of the north complex, running from La Tijera to almost Prairie Ave. The other area lies between the approaches to the north and south complex, running from La Cienega to Van Ness and from Century Blvd up to Manchester Blvd. Much of these areas qualify for Environmental Justice relief. Alt D. would expose almost 20,000 more people to this noise which is approximately equivalent to a gas lawn mower at 3 feet. What is not shown is what time of day these new noise impacts would occur -- day, evening, or night? The time of day (or night) needs to be clearly defined. Also, there need to be specific mitigation measures included to handle single event noise impacts.

52. Why are the predicted noise contours for Alt. D and NA/NP in 2015 about the same? The expected MAP and cargo in 2015 would also be about the same as NA/NP. So, if we would be able to handle the traffic with NA/NP, why go to a \$9 billion expense that would not provide more security, but would just transfer the security risk to the community?

53. As we have the capability to explore "single event" cases for pollution sake, we believe noise pollution to be as dangerous as air or water pollution and therefore feel it should be studied within the EIR in both the single event and cumulative form.

University studies have documented that exposure to noise artificially raises blood pressure by at least 10 to 25 points. This presents a very real health threat and as the effects were noted to retain the higher pressure for at least 10 minutes, we feel the elevation can remain constant during peak noise times

causing potential life threatening health risks. Can we please see what studies have been compiled to negate or create a mitigation for this problem in the EIR?

54. We have read many studies documenting the noise levels surrounding many types of "plants" such as industrial and airport. The noise created by these uses create problems in the central nervous system resulting in low concentration levels, lower test scores and higher instances of A.D.D. Why is there no study discussing how to counteract these problems created by "Plan D" which calls for runways to be moved closer to residential areas?

55. The FAA and LAWA have repeatedly admitted to the extreme noise levels created by this airport by designing and paying for "sound-proofing". Why is there no explanation of what steps they will take to mitigate the increased noise of moving the runways closer to El Segundo? As it is LAWA's choice to increase the size and nearness of the runways and to include the use of the newer airbus, why is there no mention of what noise levels we can expect from these combined incidents?

56. There have been some relatively new studies tying various forms of "rage" (road rage, line rage etc.) to noise exposure. In a plan that has been created to reduce risk and insure safer operations, why is there no allowance to further examine the validity of these studies on stress caused by noise exposure?

57. Why are there NO guarantees that the southern or western most gates will not "reappear" to accommodate additional needs in upcoming years and where are the studies to reflect the effects on the overall noise contours of these potential uses?

58. What is currently being done and where is the future plan to control the extensive ground noises frequently experienced by communities surrounding the airport, as they will exponentially increase? Since the north and south runways will be moved closer to residential areas, why haven't noise studies been done in regards to go-arounds/overflys impact on these neighborhoods?

59. Is there going to be any time restriction on east-west overland operations such as the 12 midnight to 6 A.m. curfew that had recently been put in place on behalf of eastern corridor cities?

60. The proof of the accuracy of noise studies should have been supplied by the applicant of the EIR that is asking for so many physical changes, which will create noise abuse to surrounding communities and negate the "friendly neighbor" statements including in the EIR.

61. In reporting on noise sufficient for awakenings of persons adjacent to the airport, why did you not report on noise sufficient for annoyances? The decibel

level used in the EIR for awakening levels is stated as 94 dBA for exterior and 81 dBA for interior. These levels are not compatible and in concert with the more widely accepted noise levels, both exterior and interior as stated currently by the World Health Organization. Why, for these tests and potential mitigation were the more universally acceptable standards of the World Health Organization used by LAWA?

62. Why is there no mitigation proposed for the severe noise cited for the People Mover?

63. What provision has been made for the mitigation of noise, vibration, traffic and parking during construction? Specify the mitigations by phase of construction.

Notes on Transportation

64. We are now in the year 2003. Yet many of the estimates are based on 1996 (or, at best, 2000) data. Traffic on the 405 and 105 freeways has increased greatly from 2000 to the present. During the same period, there has been reduced airport traffic, so baseline figures need to be revised. Why are current traffic figures not used?

65. Most traffic data seem to reflect peak-hour traffic, yet traffic has increased all during the day and night. Why are 24-hour traffic figures not included?

66. Tables S4/3/2-3, S4.3.2-4, and S4.3.2-8, which discuss the number of intersections and freeways that would be affected, does not identify what the basis is for the baseline. This must be clearly stated and must reflect current figures.

67. Table S4.3.2-8 does not include the impact on off-airport surface transportation facilities during the a.m., p.m., and airport peak hours during the peak construction year (2008). Instead the Alt. D proposal states that "the project would be managed to ensure that there would not be any notable construction-related traffic generated by the project during those critical hours." How the traffic would be managed must be included.

68. People will increase their efforts to avoid traffic on the freeways by using Culver Blvd and Pershing Drive. The levels of impact would be much higher than indicated in the tables listed. Also, drivers would continue to exit at the Howard Hughes Center and then spread out through the Westport Heights and Osage areas of Westchester, seeking access to the airport. Yet none of these intersections and/or roadway links was studied (Airport Blvd and 74th, 76th, and 78th; La Tijera and 74th, 78th-79th, and 83rd; Hindry and Aviation; Osage and

Manchester). These traffic impacts must be included and mitigation measures must be included to prevent this cut-through traffic.

69. What amount of traffic is being assumed for the LAX Northside facility? It seems that NA/NP figures are higher than Alt. D for this area. What was the assumption based on? This area has not been developed since the EIR was approved in 1983. Were the full entitlements charged (in terms of traffic and air pollution) to the NA/NP figures?

70. How would trucks hauling dirt out and bringing construction materials in get from Westchester Parkway to the proposed Employee parking lot at the west end of the airport? Would they use airport property or Pershing Drive?

71. The extensive roadway bringing traffic into the proposed Ground Transportation Center (GTC), along with the adjacent people mover (APM), would create a terrorist target, as would the concentration of people in the proposed GTC. Terrorists do not target facilities alone, they target concentrated groups of people. Our committee members do not want the GTC, along with the terrorist opportunities, traffic problems, and air pollution, placed in the Westchester community and adjacent to the City of Inglewood.

The GTC could not be protected with hazardous materials, decontamination, bomb detection and disposal materials and staff. These would have to be transported from the airfield along city streets which would be immediately clogged and impassable if there were to be any kind of attack or accident. This leaves the traveling public and the community completely vulnerable. How would all the necessary emergency vehicles be able to gain access to the GTC? How could the CTC be evacuated in case of an emergency? What roads could/would be used? How would airport personnel be able to achieve an evacuation?

72. How would the general public be prohibited from entering the taxi holding area at the proposed GTC (especially if the entrance to the area is on Arbor Vitae)?

73. Proposed parking areas for construction and airport employees need to be specified in detail, along with the access roads and additional traffic impacts.

74. While some of the proposals in Alt. D bear investigation, they could be done without expending over \$9 billion to achieve them. The LAXAAC would be interested in seeing some improvements made in the freeway access – especially the 405 and 105 freeway access into LAX. The Lennox interchange should be thoroughly explored.

75. Our committee members are in favor of the Fly Away program. Again, this program could continue to be expanded without developing Alt. D.

Comments on Definitions

76. In order to understand the potential impacts of Alternative 'D,' it is extremely important to know the definition and interpretation of words that are used in this document. One of the more important words the public needs to understand is the word 'significant.'

The word "significant" is used throughout the SUPPLEMENT TO THE DRAFT EIS/EIR MASTER PLAN for LAX. We have come to the conclusion, after making several inquiries about the definition of the word "significant" to high-level Deputy Executive Directors of LAWA and others, that there is no one definition capable of applying to all instances of its use. The Executive Summary of this Supplemental Draft EIS/EIR does not address the definition of "significant." Therefore, it is necessary to ask the same question about similar but different statements included in the Supplemental Draft EIS/EIR. Please refer to the Executive Summary, Volume One of the Supplemental Draft of the EIS/EIR for titles and page numbers of the Executive Summary Tables. It would be helpful for the reader to have the definitions of the term "significant" (and similar qualifiers) spelled out where the term is used, so that the impacts described can be readily understood. Please do not use words that are synonymous with 'significant' to explain, define, and interpret the word 'significant.' Some of the words to avoid in explaining the definition are: important, meaningful, weighty, notable, profound, pivotal, serious, momentous, substantial, and other synonyms of this type. Facts, figures, noise levels, estimated values, decibels, and comparisons would be greatly appreciated. Where NEPA or CEQA or other laws or agencies have defined thresholds for significance, it would be useful to include them or annotate them where the conclusions are reported.

In other words, be specific.

ES pages 51 through 76

4.1 Noise

1. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
2. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
3. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.
4. Please define, explain, quantify, and interpret the word 'significant' as it is used in this section.

Document: Draft Master Plan Addendum Supplement to the Draft EIS/EIR

Subsection (if applicable):

Number: Title:

Comments:

The Sepulveda tunnel passes under all the south runways and taxiways for LAX. The location of the tunnel relative to the runway length is about at the 40% length position. This 3-lane roadway is also Pacific Coast Highway which is a major north/south corridor providing access to the communities in the South Bay and West side of Los Angeles, in addition to access into and around LAX.

The world witnessed how a truck bomb made with ordinary fertilizer and diesel fuel destroyed the massive Federal Building in Oklahoma City, OK. Such an attack could destroy the south runways and taxiways. Assuming nothing is done to totally eliminate the possibility of such an attack from occurring, i.e. move the start of the south runways west of the tunnels, or eliminate the tunnels by rerouting the road, and an attack occurs.

Such an attack could destroy the south runways and taxiways. Assuming nothing is done to totally eliminate the possibility of such an attack from occurring, i.e. move the start of the south runways west of the tunnels, or eliminate the tunnels by rerouting the road, and an attack occurs. Assuming LAWA will not

How will LAWA shield itself from the catastrophic economic fallout of the lost revenue from lost cargo operations and the attendant loss of passenger traffic?

The fall from losing 50% of the runways at LAX and essentially all the cargo capacity from such a disaster would be devastating.

The public outcry, critics and politicians would most likely not allow LAWA to rebuild a tunnel ever again, even with improvements and vehicle limitations, etc.

What would be LAWA's contingency plan be to get the south runways operational again? Why does LAWA not address this huge security problem (the tunnels) that no other major airport has in the world?

Attach additional sheets if necessary.

Comments:

The Sepulveda tunnel passes under all the south runways and taxiways for LAX. The location of the tunnel relative to the runway length is about at the 40% length position. This 3-lane roadway is also Pacific Coast Highway which is a major north/south corridor providing access to the communities in the South Bay and West side of Los Angeles, in addition to access into and around LAX.

The world witnessed how a truck bomb made with a few hundred gallons of diesel fuel and ordinary fertilizer destroyed the massive Federal Building in Oklahoma City, OK. A similar attack but much larger in size several thousand gallons could destroy the south runways and taxiways. Assuming nothing is done to totally eliminate the possibility of such an attack from occurring, i.e. move the start of the south runways west of the tunnels, or eliminate the tunnels by rerouting the road, and an attack occurs.

Will LAWA carry sufficient "Terrorist Act Insurance" to prevent the tax payers from ultimately servicing the debt of the project, since the project debt will no longer be paid by landing fees from the airlines, LAX related concessions and bonds holders, which will experience an overwhelming loss of business?

The Federal Government may cover the replacement of the damaged buildings, etc., but certainly not all the lost revenue over the time to return operational.

Comments:

Building any of the alternatives, except no change alternative will involve a tremendous level of disruption to the surrounding community in regards to construction traffic, noise, dirt and dust, etc., which will last for several years. This will undoubtedly have a negative effect on the quality of life as well as the value of the homes forever after.

Has LAX included the cost of litigation and settlements for class action suit plaintiffs over airport changes that effect the noise level and value of the homes after the project?

Comments:

Alternative D includes creating rental car parking lots and extending the north runway further east and moving the southern most runway further south. Both of these changes, compared to the no change alternative will undoubtedly greatly increase the noise levels and traffic for residents in the adjacent area.

Has LAX included the cost of litigation and settlements for class action suit plaintiffs over airport changes that effect the noise level and value of the homes after the project?

Comments:

Increasing capacity at LAX does nothing to reduce the traffic on the 405 which carries the bulk of all passengers to LAX. The huge building growth in Orange County will only continue to add to the traffic burden to the 405 going to LAX.

Why does LAWA continue to "put all the eggs in one basket" with LAX and not advocate a regional approach that would add some redundancy and traffic mitigation?

How can LAWA justify spending many billions of dollars on a LAX which only adds about an additional ten million annual passengers over the maximum carried in during the peak travel year? In comparison to the advantage provided by having another larger capacity airport in the region which, would add some redundancy and traffic mitigation.

Security by definition requires the restriction of access. Security can only be as strong as the easiest access point to the area trying to be secured ("a chain is only as strong as its weakest link").

The Sepulveda tunnel passes under all the south runways and taxiways for LAX. The location of the tunnel relative to the runway length is about at the 40% length position. This 3-lane roadway is also Pacific Coast Highway which is a major north/south corridor providing access to the communities in the South Bay and West side of Los Angeles, in addition to access into and around LAX.

The world witnessed how a truck bomb made with ordinary fertilizer and diesel fuel destroyed the massive Federal Building in Oklahoma City, OK. Such an attack could destroy the south runways and taxiways. Assuming nothing is done to totally eliminate the possibility of such an attack from occurring, i.e. move the start of the south runways west of the tunnels, or eliminate the tunnels by rerouting the road, and an attack occurs.

How would a massive, multiple truck bomb attack, which could easily be carried out by simply driving trucks or busses into the tunnels and simultaneously detonating them be prevented?

What is LAWA's contingency plan to handle all the cargo carriers, since nearly all cargo carriers are located east of the tunnels which would cutoff access to load planes if such a disaster occurs?

Attach additional sheets if necessary.

Security by definition requires the restriction of access. Security can only be as strong as the easiest access point to the area trying to be secured ("a chain is only as strong as its weakest link").

The Sepulveda tunnel passes under all the south runways and taxiways for LAX. The location of the tunnel relative to the runway length is about at the 40% length position. Accordingly, the runway is needed for both take offs and landings. This 3-lane (each direction) roadway is also Pacific Coast Highway which is a major north/south corridor providing access to the communities in the South Bay and West side of Los Angeles, in addition to access into and around LAX.

What other major airports in the world have unrestricted public highways that pass under the mid section of the runways?

If any exist, how do they secure their tunnels to prevent a massive truck bomb attack?

Attach additional sheets if necessary.

PO Box 92216
LA, CA 90009-2216

Dear Mr. Ritchie,

I write regarding the proposed expansion of Los Angeles International Airport, LAX, under plans put forth by the Los Angeles World Airport, LAWA, and James Hanh, the Mayor of Los Angeles. The favored plan is no Schedule D. I am concerned about security, particularly the grouping of all passengers onto one area outside the airport proper. I think this would make it easier for acts of terrorism to occur as the grouped masses of people would make for easier targets. I also do not see how this would solve ground transportation problems at LAX.

However, in whatever configuration that is approved, or even if the changes keep the basic configuration of LAX as it now stands, there must be better mass transit to LAX. This includes the continuation of the Green Line light rail closer to the airport and connected to some type of transit system that would move passengers from the Green Line to the airport. There is a proposal from LAWA for an automated People Mover system, which is acceptable, but it must be directly connected to the Green Line. LAWA must also assume financial responsibility for any mitigation efforts that may be required to deal with any electromagnetic and or electronic interference that may hypothetically occur between the radar and communication signals of the jets and ground communication and the Green Line power lines. This must be done to ensure that the Green Line continues north to Westchester and beyond so that residents north of LAX have mass transit options. Schedule D plan has no consideration for mass transit for residents north of LAX.

Thank you,

6211 W. 78th Street Los Angeles, CA 90045

Dear Messrs. Kessler and Ritchie:

H.F.H., LTD. has owned property in the Westchester Central Business District for close to 20 years. I wish to express our grave concerns with Alternate D proposed Master Plan Improvements for LAX. We very much oppose this plan for several reasons:

1. The forced relocation of residents of Manchester Square seems unfair and will have a disastrous effect upon local business that now serve those residents.
2. Plan D, now pegged to cost in excess of \$8 billion, appears to offer no real security enhancements. It would be very wasteful of taxpayer's money.
3. Plan D will likely result in excessive inconveniences for LAX passengers. The extended demolition/construction period will be incredibly disruptive to the local area for several years.
4. I am aware that Mr. David Janssen, the Chief Administrative Officer of the County of Los Angeles has contacted you citing several elements of the environmental review which are seriously flawed. It would be a shame to waste any more taxpayers' money in an attempt to fix the EIR as well as trying to "spin" this disastrous plan to appear more palatable.

I appreciate your consideration of these concerns.

Yours very truly,

H.F.H., LTD.

William F. Allen

**RESPONSE TO EIR RE: PLAN D LOS ANGELES INTERNATIONAL
AIRPORT**

The Bel-Air Beverly Crest Neighborhood Council, mandated by the new Los Angeles City Charter, comprised of 25,000 stakeholders voted the following at its September 2003 meeting:

- 1. The council did not accept or reject Mayor Hahn's Plan D LAX Plan in its entirety.**
- 2. The council voted unanimously to encourage the expansion of the Palmdale and Ontario Airports.**
- 3. The council voted to approve the runway design expansion as proposed in Plan D at LAX. Once again the vote was unanimous.**
- 4. The council again voted unanimously to encourage the development of a fast train (180 mph) linking LAX to Ontario and Palmdale.**

The Bel-Air Beverly Crest Neighborhood Council covers the territory from Sepulveda Blvd. and the 405 to Laurel Canyon and from Sunset Boulevard to Mulholland Drive, excluding Beverly Hills.

Re: LAX Master Plan - Public Comments

As a resident of the City most impacted by the increases in air traffic at LAX I find the impacts presented in the EIR/EIS to be less than realistic. While my home does NOT lie within the current noise contours, I have been awakened on a regular basis almost every night. This serves as great testimony to the concept of midnight to 6:00 am over ocean operations. Very rarely is there a full 6-hour quiet time. The theory of the day appears to be that as long as the people are too tired, too exhausted, or too apathetic to call the noise complaint line more east bound departures (when most people are asleep), will become the norm. The disregard for the local community members by these airlines reflects the lack of importance Los Angeles World Airports has placed on exercising its authority to fine offending airlines. No other business entity would be allowed to violate the basic right to sleep if it were not part of a legislative organization. There would be no question if LAX was simply a traditional business the city would not allow the noise, pollution, or traffic which so negatively impacts so many to impact so many more as the proposed project options would generate.

Alternative D has been proposed as an attempt to provide safety and security. In reality it simply relocates at great expense any possible threat closer to and into residential neighborhoods

The concept of bringing all passengers to one security checkpoint (Ground Transportation Center) provides a much better target for even the least skilled of terrorist. If anyone would foolishly believe that deterring terrorism is the goal, why on earth would you gather potential victims together into one bigger target as opposed to spreading potential victims out at several smaller targets? The Alternative D plan only serves as a flimsy veil to disguise the incremental footprint expansion of a greedy cash hungry entity.

That a fly away is considered just a three major intersection drive from the GTC is further insult to the community already suffering from significant noise impacts, air quality issues, and traffic congestion. To imply that traffic is reduced by the flyaway is simply untrue. Passengers will still come to the area in personal vehicles. The vehicles will not avoid the freeways, nor will they avoid the surface streets. They will simply speed through our residential neighborhoods, barely missing most of our pedestrians, spew more toxins in our community and provide another target for terrorism in our neighborhood when they drive to and park at the fly away. While some might suggest that the Hollywood Park property is perfect since it has been a parking lot for many years that logic fails to take into consideration that the racing season is an extremely limited number of days and certainly was not a 24 hour/ seven day operation.

SPC00288

The Consolidation of Rental Car Facilities claims to reduce the number of shuttle vans in the Central Passenger Area. News Flash! Fewer shuttle van trips could currently be realized if a shuttle van financed by several rental agencies delivered customers to various car rental agencies. This would simply reverse what they do when the car return customers/airline passengers are dropped off at various airline terminals. The same traffic reduction concept could be used for all Century to La Cienega area Hotels. Much of the concern about lost car rental return drivers could be solved by making the roadside directional signs large enough to read (They currently are in small print in unlit areas. Only those stopped near the signs with excellent vision can read the "directional signage").

Out of date statistics, absolute contradictions (i.e.: There will be no home acquisitions Vs, relocation and eviction costs), insufficient data, and unrealistic conclusions fill the pages of the EIR. Among the most ridiculous is that the same entity which eliminated so many homes in its prior growth spurts (Playa Del Rey, Westchester, Airport Junior High) would somehow now manage to function at the proposed 78 Million Annual Passenger level. It is no secret that LAWA does not turn airplanes away per FAA restrictions. To pretend that voluntary cut back in flight schedules would happen is less than sincere, much like believing a bowl of candy in an grammar school lunch area would not be emptied if children were told one time that the candy was for those promising to do all their homework. The SCAG concept of limiting capacity to 78 MAP is already violated by the .9 million addition within the EIR!

To imply that such a capacity limit will be implemented is not followed through with even a single realistic method for limitation. If a full 78 MAP is reach by October 15th of any year, are local residents to believe the airport will magically close its skyward doors and place a "Sorry we're closed" sign in the air? We've lived the ALWAYS OPEN experience!!

With an anticipated increase in Cargo, what better target for terrorism could be created? Not only would the local areas be at risk, 75% of the goods serving the entire SCAG region could be halted. The Orange County elite somehow seems to believe their essential goods should pollute the air, cause sleepless nights, and present traffic problems only for others. Master plan designers have demonstrated their agreement with that opinion. This action reminds me of the school yard children that bully a weaker child because the teacher hasn't stopped them. To concentrate cargo deliveries in one area one must assume the cargo does not get to Orange County or San Diego by magic carpet. The failure to address the ground traffic impact is consistent with the other "send the problem to Minority Communities like Lennox and Inglewood" attitudes which are prevalent throughout the EIR/EIS.

It is short sighted to present the proposals of "Safety and Security" as anything more than a cash grabbing attempt to place even a further burden on those least able to defend themselves. To believe that the community leaders (Inglewood City Council, Inglewood Unified School District and the Inglewood Chamber of Commerce) actually represent the wishes and interests of the people of Inglewood, one must ignore some basic facts. The residents were throughout the comment period NEVER given the opportunity, by their own City Elected, to see a presentation of the Master Plans Alternatives complete with impacts, to contribute their thoughts on the plan, or to vocalize their concerns regarding what comments were to be submitted on their behalf. These same politicians currently face a lawsuit regarding their unwillingness to adhere to the roll back of their 400% Salary Increase. This despite 70% of the voters desire that they reverse the full time pay for the less than part time attendance.

The historic practice of the wealthy getting wealthier at the expense of the health and well being of the less fortunate by simply paying off a few, appears to be no strange concept to the LAX Safety and Security plan. The burdens of the greater society once again will be placing an even greater significant burden on those of color and less financially able to hire environment justice attorneys, this may in fact be a significant part of the plan. The elected may be comfortable exchanging the health, safety and future livability of the community for the trinkets of a few low paying jobs and contract arrangements for their friends. Those who agree to the Master Plan may be viewed by historians as similar to the greedy Slave traders-who sold their countrymen in the name of economic development. They may also be compared to the too trusting Indian Leaders who accepted the disease carrying blankets from the "thoughtful" army, or the unwise original occupants of Manhattan who traded for a few necklaces.

The obvious political pay back of tax dollars amongst family members and friends should not be overlooked:

* Former LAWA Executive Director Lydia Kenard persuaded the Inglewood City Council to approve the February 6, 2001 Memorandum of Understanding. This document was not made available for public comment but rather voted on in closed session without public disclosure until after it was voted on. Her sister Gail Kenard later received a consultant contract to design the City's Senior Citizens Center. Then surprise, surprise, behind closed doors the City response to the EIR/EIS, again without public input calls for a "firm, binding commitment to fund new senior housing."

*Coincidentally the Ministers of the Church now occupying the once Fabulous Forum appeared at SCAG to sing the need for the Arbor Vitae Interchange for its Congregation. You know, the one that meets on Sunday when there is no rush hour traffic, which rarely has any events scheduled other than Sundays except when they get the Taxpayers to pay \$20,000 for the one High School Graduation event. Is it a mystery which church is meant in the City's EIR response of a "firm binding commitment to sound attenuate.... noise impacted churches?"

*The most entertaining of course is "a firm, binding commitment to fund the replacement of the existing YMCA at 102nd Street and Prairie." This must be the one carefully disguised to resemble a tumbleweed patch - so well done, not a single child has enjoyed the non-existent basketball court or non-existent swimming pool. But hey, it sounds good! Just like the "New Police Station Property" which Inglewood residents were promised as a gift from Hollywood Park for their "no negative impact" casino improvements - AKA: the hooker magnet

*Lest I forget, there's the golly, gee whiz, wow you'll get so much tax revenue Casino itself, which of course was granted a Tax Relief Schedule after it so passionately appealed before SCAG that its traffic generation alone required the Arbor Vitae Interchange. Now the City EIR response stipulates a "firm binding commitment to locate a fly away facility at the proposed location of the corner of Prairie Avenue and Century Blvd. Is this yet another example of the great return value of campaign contributions?"

Alas, alas, I do believe one does not need corrective lasik surgery to see the connections. My community will be paying dearly with their quality of life for those well invested (in campaigns) to fly to and play with those in the big houses to the North. Does anyone actually believe this proposal would be considered for even a minute if it weren't for those election time donations and carefully crafted pleas of Inglewood's Partners for Oppression? In the final analysis the Safety/Security and Expansion Plans of LAX are no less disgusting than the imitation irritation we exhibit over third world child labor issues. As long as a few can reap the benefit the majority are content that many are abused in the name of Profit Margin.

Isn't that a wonderful legacy for the generation to come? No doubt history will repeat itself, I only hope it will not be Inglewood where the destruction of homes, neighborhoods, and an entire community is overlooked in the name of greed, with only a footnote to describe the incredible sacrifice.

Sincerely,

L. Diane Sambrano

Funny, I feel compelled to remark- I would not be surprised if the City of Inglewood Response is accidentally not submitted on time.

Re: Draft EIS/EIR released July 9 for Proposed Master Plan Improvements at Los Angeles International Airport

Gentlemen:

Having followed for over 16 years the various master plans proposed for LAX expansion, I wish to state unequivocally that you still haven't got it right. Alternative D is different, but it is not an improvement for the following reasons:

it requires rebuilding a substantial part of the existing airport, tearing down terminals, parking lots, and other facilities in order to rebuild them elsewhere

it requires construction of new roadways, which will necessarily involve displacement of other (job- and revenue-producing) activities

it will remove desperately needed housing, which will not be replaced

it will decimate those commercial centers LAX has left standing from previous expansions, which removed substantial amounts of the customer base

construction will disrupt both airport operations and the surrounding communities for at least a decade, probably more

alleged increases in safety and security are unproven and have been seriously challenged by several expert reviews

SPC00289

all these activities will create deterioration of air quality, ground mobility, and public health for no conceivable benefit except somebody's giant ego trip.

Alternative D is bad aviation planning, and it is bad public policy. It is bad aviation policy because intensifying concentration of aviation at one difficult-to-access location means passengers and cargo must travel ever more hours to reach the airport. A regional approach, diversifying closer to where the people and the cargo originate, would save time and aggravation, produce less air pollution, and decrease the chances of a terrorist act or an accident wiping out air capacity in the region. It is bad public policy because it will intensify both the acute housing shortage and the acute shortage of school classrooms, both of which cost more to replace than to maintain. It will also, I suspect, eliminate as many jobs as it might create.

That said, let us look at the DEIS/DEIR. The entire DEIS/DEIR is seriously flawed by its failure to include as a project alternative the dispersion of airport capacity. All you have done is compare proposals for expanding LAX, leaving the Board of Airport Commissioners and the Mayor and City Council with inadequate information to make a sensible decision benefiting the maximum number of people and communities. Furthermore, Alternative D is arguably a totally different project from Alternatives A, B, and C with which you do compare them. Since the proposed road system is different, the configuration of terminals is different, the traffic patterns for passengers are different, you need different studies, not just extra paragraphs tagged on to the old ones for the earlier projects.

The single biggest environmental issue in Southern California is our air quality. No adequate study has been done to evaluate the effect on local residents, schools, and recreation areas of additional air traffic and the additional ground traffic proposed in this plan on congestion, resulting additional air pollution from ground traffic, and air toxics from airplane fuel. Surely the LAUSD or some entity with the US Department of Health and Human Services has the means to determine what will happen to the children of Lennox (and their teachers and parents), but this has not been done. Why not?

Much has been written about the negative economic impacts as well as the negative environmental impacts arising from traffic jams, but not in this report. Your report should evaluate the difference in congestion increases between this plan and regional dispersion of the anticipated increase in air traffic. Surely the studies of congestion caused by trucks going to/from the Port of Los Angeles have lessons to teach us here.

In light of the fact that prevailing winds will blow any increased air pollution over the communities of Lennox, Inglewood, and South Los Angeles, what is the differential impact of this proposal on majority and minority communities? How does that compare

with the potential impacts of a dispersed regional expansion instead of a concentration at LAX?

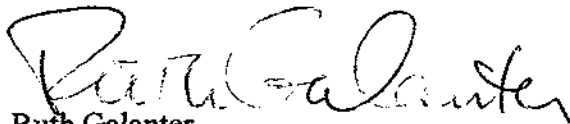

Proponents of expanding LAX argue that it will increase jobs, but where in your report is the other side of the equation: the jobs that will be eliminated?

LAWA has repeatedly stated that LAX is safe and secure today. Why then is it necessary to undertake this massive construction "for safety and security?" Where is the study proving that LAX will be safer and more secure, and again how does that compare with the safety and security of a regionally dispersed airport system in which disruption at any single facility leaves the rest in operation?

In sum, this plan needs significantly more and better environmental studies before decisionmakers will be adequately equipped to adopt a plan. Most significantly, the EIS/EIR must compare the environmental impacts (and the economic impacts wouldn't hurt either) of concentrated versus dispersed airport capacity investments.

Thank you for your attention. I look forward to your thoughtful response.

Yours truly,

A handwritten signature in cursive script, appearing to read "Ruth Galanter".

Federal Aviation Administration
P O Box 92007
Los Angeles, CA 90009-2007

Dear Mr. Kessler:

I am writing to you on behalf of the Members of the Board of Directors of the Westchester Association. The Westchester Association is comprised of 43 property owners in the Westchester Business District and their properties are located on the east side of Sepulveda Boulevard, between Manchester Avenue on the North , and Westchester Parkway on the South.

At a recent meeting of the Board of Directors, a very lengthy discussion was held regarding Mayor James Hahn's Airport Plan, "Alternative D". The Board members have all previously had the opportunity to read and hear about the Alternative D plan, and they wish to go on record as being strongly opposed to this particular plan.

The Board of Directors are very much concerned that this plan will cause approximately 6200 citizens of Westchester to be relocated from both the Manchester Square and Belford areas of the community and that this plan would have a very negative impact on their tenants and businesses. Some of the Board members have been in this area for many years and they remember years ago when the airport expanded and approximately 10,000 residents had to move out of the area. That airport expansion caused many of the businesses to close their doors permanently, and the Board is afraid that will happen again.

Therefore, the Board wishes to go on record as being strongly opposed to "Alternative D".

Yours very truly,

Robert E. Smith

Re: Response and Comments on
The Draft Environmental Impact Statement/Environmental Impact (SDEIS/EIR) Report
released July 9, 2003 for Proposed Master Plan Improvements at Los Angeles World
Airports (LAX)

Gentlemen:

The purpose of this letter is to voice our strong concerns about the SDEIS/EIR released July 9, 2003 for public comment and Plan D relative to modernizing LAX. While we agree that LAX needs modernizing in order to effectively serve the traveling public and continue to remain a key economic engine in our region, Plan D and the supplemental EIS/EIR fail in these goals.

According to Jim Ritchie, Deputy Director at LAWA, at his 11/3/03 presentation to the Westchester Vitalization Board of Directors and his 10/28/03 presentation to the Neighborhood Council of Westchester/Playa del Rey Board of Directors, LAX is being operated in a very safe and secure manner today. Mr. Ritchie went on to say LAX is continuing to improve its security by adding perimeter security cameras, additional police officers & security dogs, plus TSA has over 2,000 employees at LAX continually screening luggage and passengers with "modern technology devices", as well as more customary x-ray and visual screening. Mr. Ritchie assured both Boards that LAX is operating safely and securely.

That being said, it is the opinion of the H. B. Drollinger Co. that LAWA is proposing to implement a flawed project, and that LAWA has developed an inadequate environmental document to review the project. The following are just a few issues that support our position:

- Plan D will not constrain growth at LAX. In fact, it adds capacity at gates by increasing the speed aircraft may be loaded/unloaded by up to 50% and does not remove any concrete.
- Plan D does not meet its safety and security goal for which Plan D was formulated as outlined in the Rand Report July 2003 and LA County Supervisors official position report dated October 15, 2003.
- Plan D's security plan relies heavily on technologies, some of which have been discredited (facial recognition surveillance). Over-dependence on security technology may lead to higher risk of error, and, ironically diminished protection.
- Use of a Supplement to the 2001 Draft EIS/EIR was improper under guidelines of CEQA. LAWA should have addressed Plan D in a comprehensive revised draft EIS/EIR in which the full record of information was available for review.
- The SDEIS/EIR relies on a baseline now 7 years old; conditions in 1996 do not represent the baseline of 2003, especially after the events of 9/11/01.
- The 2001 DEIS/EIR was found to lack even the most elementary NEPA requirements for environment justice; many deficiencies remain in the 2003 SDEIS/EIR. In particular, Plan D shifts many impacts toward the more economically disadvantaged communities east and northeast of LAX and appears to protect biological resources at the expense of residents in Lennox, Inglewood, Manchester Square, Westchester, and Playa del Rey.
- The report fails to disclose issues and concerns raised in Environmental Justice (EJ) workshops, defers evaluation of critical environmental justice impacts (including air quality and health effects) due to lack of data, offers ill-defined mitigations, and offers a preferred project that protects butterflies at the expense of residents and schoolchildren.
- The 2001 EIS/EIR acknowledged that it omitted quantitative assessment of toxic air pollutant exposure due to lack of time; the 2003 document also omitted this assessment, but did not so note.
- The stated cost of Plan D is excessive relative to all benefits described in the Plan.
- Unlike the history of LAWA, Plan D does not trust the airlines as partners.
- Plan D requires the dislocation of over 7000 residents at a time all affordable housing is in the shortest supply ever experienced in our region. Please recall in the early seventies the airport eliminated 3400 homes and dislocated 10,000 people in the name of airport expansion and this plan does it again.

- This plan requires removal and relocation of 98th Street Elementary School site, when there is a need for school facilities (LAUSD has determined a need for over 60,000 seats in schools over the next five (5) years).
- Plan D does not utilize LAX's physical facilities that already represent a substantial investment both public and private.
- The physical construction of Plan D will create a long-lasting and disruptive impact on the residents, businesses and negatively impact over 20,000 jobs that are likely to be lost in the Westchester/Inglewood area and throughout the sub-region (the negative impact of this disruption has not been netted out from the projected economic benefits).
- While the plan calls for a map of 78 million there is no feasible method of controlling the number of passengers (the Plan D does not adequately address the traffic impacts), mitigation, and transportation operation required for 78 map on the incremental passengers (10-20 million) more that are likely to come. The 405, 105, and 110 freeways and major thoroughfares and intersections are at a point where physical traffic mitigation of the impacts generated by 78, 88, or 98 map is not feasible (overriding considerations are not an acceptable strategy for any plan). There is no way a City can restrict the number of passengers at LAX unless they go through a judicial proceeding like Long Beach did for its airport traffic.
- The environmental impacts of Plan D particularly air pollution and noise will be substantial during the physical construction as well as the operation of Plan D.

For any sizeable project in our sub region, at least 2/3 years has been required to achieve a reasonably acceptable plan. Therefore, we recommend additional study to prepare a revised plan which meets the stated objectives for LAX's modernization. The EIS/EIR as presented does not adequately satisfy the objectives outlined above.

In light of the above referenced items, we are respectfully asking for answers to these concerns.

In conclusion, The H. B. Drollinger Co., a 56 year old property management and development company, located just ¼ mile north of LAX, does not support Plan D and believes LAWA is proposing to implement a flawed project and that the process is further compromised by an inadequate environmental review. The SDEIS/EIR falls short of satisfying safety/security concerns, relies on out dated baselines, has incomplete analysis of noise, air quality including toxic air emission data, inadequate and misleading assessment of impacts on biological habitat.

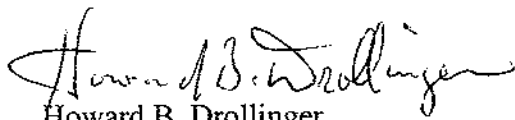

We agree with all five (5) of the LA County Supervisors, City council of Culver City and other elected officials, business leaders in our area, and the Neighborhood Council of Westchester/Playa del Rey that the problem with the 2001 and 2003 environmental documents are so serious, pervasive, and universal that the only practical remedy is to start the process over again and prepare a truly comprehensive revised EIS/EIR.

The revised document would need to provide comprehensive scoping, an updated and consistent baseline, identify and assess a reasonable range of feasible alternatives, be free of internal inconsistencies after proper levels of analysis and explanation and present an entirely new impact assessment that does not defer critical decisions. Only with these extensive modifications can the LAX Master Plan and associated EIS/EIR be rendered adequate.

I hope the federal government will join me in seeking to maintain a quality environment for Residents and businesses as well as airplanes.

Sincerely yours,

H. B. Drollinger Co.

Mayor's Airport Plan (Alt. D) Would Destroy Local Businesses

Los Angeles International Airport

Alternative D

Forget for a moment the \$9+ billion price tag. Mayor James Hahn's plan for the expansion of Los Angeles International Airport will likely do more to hurt the community than even the airport's removal of thousands of homes in the 1970s.

H.B. Drollinger Co. research indicates that relocating the "front door" of the airport to the Manchester Square area could drastically reduce the number of retail customers (approximately 7,000) and airport employees who shop in the central business district.

To combat the mayor's plan, the H.B. Drollinger Co. has hired former Los Angeles City Councilwoman Ruth Galanter to spearhead the effort. During her 16 years on the Council, Galanter was instrumental in protecting the community from the airport's efforts to expand, and consistently fought airport policies that negatively impacted the surrounding community.

H.B. Drollinger Co. is joining a growing list of organizations, business people, airlines and government bodies opposed to the mayor's plan, routinely called "Alternative D."

Recently, Los Angeles County Supervisor Don Knabe voiced his opposition to the plan after reviewing a county study that indicated that "the security plan relies heavily on technologies, some of which have been discredited, and does not address serious security exposures." The study went on to say "additional environmental documentation is lacking, and LAWA decision-makers will be unable to make an informed project determination until inadequacies in the (environmental impact report) are remedied."

In addition, the Neighborhood Council of Westchester/ Playa del Rey, the area's chief advisory body to the Los Angeles City Council, voted overwhelmingly to oppose the mayor's plan. If the plan materializes in its current form, travelers will no longer be able to drive into the Central Terminal Area to drop off passengers or baggage at curbside. Instead, they will have to drive to Manchester Square, go through a cursory security screening and then take a 1 1/2-mile trip on a people-mover to what is now the Central Terminal Area, where they will undergo yet another series of security screenings before proceeding to their gate.

"We have grave concerns about this plan because it does nothing to improve security, has disastrous impacts on the community and carries with it a huge price tag," said H.B. Drollinger Co. General Manager Bill West.

All official comments regarding the Supplement to the Draft Environmental Impact Statement/ Environmental Impact Report (EIS/EIR) must be received by 5 p.m. on FRIDAY, NOVEMBER 7, 2003.

We invite and encourage you to thoroughly review these documents and provide written comments to either or both of the following:

The Parking Spot-Sepulveda Lends Vans to Playa Vista

The Parking Spot-Sepulveda was pleased to provide numerous vans to shuttle people to the new homes at Playa Vista as part of the Playa Vista Premiere Weekend September 20 and 21.

"We're happy to see Playa Vista finally taking shape, and we were glad to play a part in helping hundreds of people see these beautiful new homes," said Howard Drollinger.

Playa Vista recently released the draft environmental impact report for its second phase, "The Village," which will include shops, restaurants, homes and five new parks. For more information, visit www.playavista.com.

Flawed Community Plan Update Would Impact Efforts to Revitalize Sepulveda

Proposed revisions to the Westchester/Playa del Rey Community Plan, the primary land-use document for the area, would have significant negative impact on future plans to revitalize Sepulveda Boulevard.

The Community Plan, which has not been updated since 1974, will be reviewed by the Los Angeles City Planning Commission at a public hearing at 9:30 a.m., November 13, at City Hall, 200 North Spring St., Room 1010, in downtown Los Angeles.

The document proposes to cut building allowances on the west side of Sepulveda from a 6-to-1 floor-area ratio (FAR) to a 3-to-1 FAR, meaning that only three square feet of building space would be allowed on each square foot of land.

Such a restriction would severely limit the kind of redevelopment that could occur in

Westchester's Central Business District.

Specifically, it would all but eliminate the possibility for creating a new, mixed-use project any site along that stretch of Sepulveda Boulevard.

Property owners on the east side of Sepulveda are already in that boat, having had their property "downzoned" to a 3-to-1 FAR in the 1990s with notice whatsoever from the city's Planning Department.

"It is outrageous that the city can make such radical change affecting the current and future possibilities for the Business District without notifying the property owners," said Howard Drollinger.

"At a time when the community is looking for new ways to improve Westchester's downtown, this downzoning severely limits the kinds of improvements that we believe are in the best interest of the community."

Flight Path Celebrates LAX's 75th Anniversary by Opening Long-Awaited Aviation Museum

The Flight Path Learning Center of Southern California and Los Angeles World Airports celebrated the October 1, 1928, 75th anniversary of the airport with the opening of a major exhibition of airport historical memorabilia during "A Celebration of Flight," Flight Path's seventh annual gala dinner on October 2.

The new museum and special exhibition has been opened to the public since October 7.

The exhibition features an array of aviation memorabilia, including historic photos, murals, aircraft models and other artifacts - many never before displayed. The exhibition showcases the development of LAX since its opening as Mines Field in 1928, as well as the 100th anniversary of the first powered flight by the Wright Brothers on December 17, 1903. Colorful exhibits include salutes to early airlines and aircraft manufacturers at LAX. A special area commemorates World War II military and manufacturing activities at the airport.

The "Celebration of Flight" dinner program honored several aviation pioneers: the late enter-

tainer Bob Hope, who logged a record number of air miles from LAX on USO tours to entertain troops; Capt. Lillian Kinkella Keil, the most decorated flight nurse in U.S. military history; Jerome Lederer, benefactor of the Flight Safety Foundation; the late Clifton A. Moore, longtime LAWA executive director and an authority on international airport management; John Myers, former Northrop Aircraft chief test pilot; and Marsha Toy, nationally recognized aviation educator.

The Flight Path Learning Center at the LAX Imperial Terminal will be staffed by volunteers and will be open to the public on Tuesdays and Thursdays from 10 a.m. to 2 p.m. School and group tours will be conducted on Wednesdays by appointment. Research in the Flight Path aviation archives can be arranged by appointment. The center is located at 6661 West Imperial Highway, one block west of Sepulveda Boulevard. Free public parking is available immediately west of the facility. For more information, please call (310) 215-5291.

In the District

From the Westchester Area ...

New Banking Institutions Show Westchester the Money

Downtown Westchester is where the money is. With the recent opening of two new banking institutions – a full-service Wells Fargo Bank and the Department of Water and Power Community Credit Union – and the renovation of the Citibank Building at the corner of Sepulveda and La Tijera boulevards, the Westchester Business District is becoming the community's financial center.

Wells Fargo is now open at 8814 S. Sepulveda Boulevard. The new full-service facility offers a wide range of banking, loan, investment and insurance services.

For more information about Wells Fargo, please call branch manager Paul Maynard at (310) 216-5025.

The DWP Community Credit Union is now open at 8800 S. Sepulveda Blvd., and offers a variety of services to credit union members and the public, as well as a full line of loan services, including auto, home equity and real estate.

For more information about the credit union, please call John Marco at (800) 300-9728, ext. 1736.

The credit union is located in the Citibank building, which has completed its first major renovation in nearly 30 years, including an updated facade.

Two recent ribbon cuttings at Wells Fargo, above, and at the DWP Credit Union, below, reinforce downtown Westchester as the community's banking hub.

Sepulveda's New Look: Workshop Participants Review Potential Designs for the Street

The Westchester Streetscape Improvement Association (WSIA) held the second in a series of three design workshops for Sepulveda Boulevard on October 2.

More than 120 Westchester residents, business owners and other community members selected their preferred choices for everything from trees to crosswalks to bus shelters.

With the voting complete, design experts will use the input to develop an illustrated design concept for Sepulveda from Centinela Avenue to Lincoln Boulevard.

With that concept in hand, WSIA members will begin seeking funding from state, federal and local government sources as well as other organizations focused on streetscape improvements to add to the \$5.8 million MTA project that will add a full-time parking lane in the business district and make other needed improvements.

The final illustrated concept, which will include feedback from the public gleaned from the first two workshops, will be presented at the last workshop later this year.

President's Message

During the 1960s and 1970s, scores of young men from Westchester and Playa del Rey were sent to participate in a largely unpopular conflict in Southeast Asia. Those veterans did not receive the broad support of the public our military enjoys today, but they still fought valiantly and in many cases paid the ultimate price – they died in the fields of Vietnam and Cambodia.

In 1970, a monument was erected in their honor. It was a beautiful granite slab with more than 20 names inscribed on it, plus two granite meditation benches where friends and family would often sit and remember their fallen soldiers.

Erected at the corner of Manchester Avenue and Lincoln Boulevard, the monument is now routinely sprayed with graffiti and damaged by teenagers as they wait for their bus to arrive at the adjacent bus stop. For several years, veterans have painted out graffiti on a daily basis and organized surveillance teams in an attempt to catch the vandals who regularly desecrate the monument. Despite their efforts and those of the Los Angeles

(continued on Page 4)

President's Message (cont'd.)

Police Department's Pacific Station and Neighborhood Watch groups, the monument continues to be damaged. Several arrests have been made in conjunction with these efforts, but the vandals always return.

I am proud to announce that the H.B. Drollinger Co. will be donating more than \$14,000 in development art fees and relocation costs to help relocate the monument to its new site.

I want to thank Councilwoman Cindy Miscikowski and her Chief Field Deputy Sharon Sandow and the Westchester Vitalization Corp., for working with us to make this relocation possible.

Without their help and approval from the city's Cultural Affairs Commission, the monument would continue to be subjected to desecration. With Veterans Day quickly approaching, it is important for us to remember those veterans from our community who served their country and died protecting the freedoms we enjoy today.

This project will restore the monument and benches, which have been broken beyond repair, and place it 100 yards east at a new city-owned location near the entrance of Councilwoman Miscikowski's field office and near the new Westchester Library.

We are delighted to be a part of this important project, and look forward to the rededication ceremony.

Yours for a greater Westchester,

Howard

Neighborhood Council, Chamber Endorse Decron Plan for Furama

The Decron Properties plan for the current Furama Hotel site has been endorsed by both the Westchester/LAX-Marina del Rey Chamber of Commerce and the Neighborhood Council of Westchester/ Playa del Rey.

The more than 500-unit apartment complex would include the renovation of the existing hotel tower and the demolition of the low-level hotel buildings that would be replaced by apartments. In addition, the project would add a new commercial and restaurant area on the ground floor at the corner of Lincoln Boulevard and Manchester Avenue.

The project is currently winding its way through the city approval process and is expected to reach the City Council early in 2004. Decron has also promised to give a major facelift to the bowling alley, market and shops it owns on the adjacent parcel of property.

The Parking Spot Announces New Partnerships

The Parking Spot-Sepulveda has announced new partnerships with Westchester-based Loyola Marymount University and Otis College of Art and Design. The partnerships will allow LMU and Otis to receive significant discounts on parking at The Parking Spot.

In addition, look for The Parking Spot's new advertising campaign at the Staples Center.

During Los Angeles Kings hockey games, check out The Parking Spot's familiar spotted logo behind the penalty box and on the "jumbotron" above the ice.

El Segundo Chamber

• The Voice for Business •

November 6, 2003

Mr. Jim Ritchie
City of Los Angeles
Los Angeles World Airports
LAX Master Plan/ Room 218
Post Office Box 92216
Los Angeles, CA 90009-2216

Dear Mr. Ritchie:

In accordance with Section 102(2)(c) of the National Environmental Policy Act of 1969, the California Environmental Quality Act of 1970, Section 509(b)(5) of the Airport and Airway Improvement Act of 1982, as amended, the El Segundo Chamber of Commerce Board of Directors and its LAX Task Force, chaired by Ed Peura, has reviewed the Los Angeles International Airport (LAX) Draft Master Plan Addendum and the Supplement to Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR).

While we applaud the efforts by the Hahn administration to work toward limiting air traffic at LAX to 78 million annual passengers (MAP), and encourage continued implementation of a regional airport system, we have two overriding concerns with the EIS/EIR.

- 1) It is not clear how this plan can ensure that 78 MAP will be an absolute maximum in practice.
- 2) Traffic mitigation plans are woefully inadequate for 78 MAP and earlier plans were never implemented for the 1980 expansion to 40 MAP.

We will summarize our concerns in this letter and the attached comments. We respectfully request that you address these issues.

We believe a strong regional economy requires a regional air transportation system capable of continued accommodation of demands for such services. In this regard, we find projected shortfalls of 10 to 30 million annual passengers (MAP) disconcerting. Furthermore, when LAX was expanded in the early 1980s, the EIS/EIR called for expansion to be capped at 40 MAP. Obviously, that cap proved meaningless.

That experience vividly points out the fact that an effective regional airport system demands that some entity other than the airlines to determine which airports are served. We are not advocating the return to a regulated environment and reestablishing the Civil Aeronautics Board abolished by the federal Airline Deregulation Act. However, we are pointing out that under the current unregulated environment, any identified caps on numbers of flights are meaningless. Additionally, the suggested allocations of future demand aren't realistic unless and until the sponsors of the other regional airports make changes to their airports to handle their share.

Because of our proximity to LAX, many of our business members participate in international trade and will benefit from increased air transportation into and out of LAX. Yet because of this

proximity, they (and their employees) disproportionately feel the negative impacts of increased automobile and truck traffic into and out of our area from any growth at LAX. For this reason, our attached detailed assessment is focused on those portions of the Addendum and Draft EIS/EIR Supplement dealing with surface transportation and ground access.

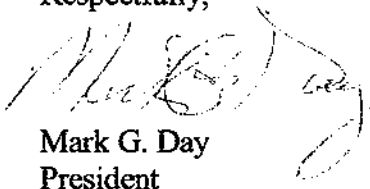

Previous experience strongly suggests that our concern about the caps on the number of flights, the inadequacy of identified traffic mitigation measures, the lack of funding for mitigation measures, and the historic non-implementation of the identified mitigation is completely justified. When the airport was expanded in the early 1980s, the traffic mitigation measures identified at that time were inadequate (and similarly not funded) at the 40 MAP level, let alone at today's level of operations. Our issues with traffic mitigation plans are two-fold.

- 1) The plans largely ignore areas south of the airport and focus primarily on areas within the LADOT jurisdiction. An effective mitigation plan **MUST** address areas as far south as it does north, if the impacts of the project indeed occur to the south as we believe they do. Specific areas are addressed in the attachment.
- 2) A strategy for funding these mitigation measures must be developed to access all funding sources (city, county, state and federal). Our understanding of CEQA is that improvements offered as "mitigations" must be feasible and must be financed by the project. To identify a "mitigation program" and then to question the availability of funding in the DEIR is to admit that there is no mitigation program.

In addition, this plan must contain specific funding sources, schedules, legally binding commitments to implement signed by the responsible agencies, and remedies in the case of non-performance. Without such funding sources, implementation commitments and remedies, any mitigation measures must be considered illusory.

For the reasons previously stated, we would like to be supportive of this Addendum and Alternative D. However, we cannot until the issues we raise in this letter and enclosure are resolved. We will work with you as necessary to see to their resolution. If you have any questions or require clarification of any of our comments, please contact me.

Respectfully,

Mark G. Day
President

LAX Master Plan Addendum
And
Supplement to Draft EIS/EIR
Comments

General

1. Considerable uncertainty regarding Los Angeles World Airports' (LAWA's) intention to complete proposed mitigation measures is raised by the following comment:
"Mitigation measures are applicable only to the extent that the use of airport revenues to fund such measures is permissible under federal law and policies."
(Technical Report 2a, page 41 and elsewhere as indicated by specific comments below.) CEQA requires that mitigation be feasible. If you cannot guarantee that the project will indeed fund the mitigation program, you do not have an acceptable mitigation program.
2. As with the 2001 Draft Master Plan and Draft Environmental Impact Statement/Environmental Impact Report Draft EIS/EIR, the study area for Off-Airport Ground Access is primarily north of LAX. Little attention is paid to streets and freeways south of the airport. More significantly, mitigation measures appear to be limited to LADOT jurisdictions with little regard to traffic problems created in surrounding areas outside of the City of Los Angeles. How was the study area defined?

EIS/EIR Supplement, Chapter 4, Affected Environment, Consequences, and Mitigation Measures

1. Page 4-2 to 4-3, Mitigation Measures Bullet, – The comment – "It should be noted that mitigation measures, as well as Master Plan commitments, are applicable to the extent that the use of airport revenue to fund such measures and commitments is permissible under federal law and policies." creates considerable uncertainty regarding the validity of any proposed mitigation measures.
2. Page 4-3, The Environmental Baseline, – Using the 1998 Revision to CEQA Guidelines - "as they exist at the time the notice of preparation is published...." as a basis for establishing an environmental baseline ignores all environmental impacts since LAX was expanded in the 1980s and 1990s from 40 MAP to the current baseline. Unmitigated impacts have resulted in uncontrolled traffic growth with significant impact on neighborhoods north, south, and east of LAX.
3. Pages 4-3 and 4-4, The Environmental Baseline, Third Paragraph - The discussion in this paragraph regarding "incremental" and "cumulative" impacts raises the issue of incremental changes to LAX since the last Draft EIS/EIR of 1978 from 40 MAP to the current baseline. Our view is these incremental changes and their impacts, especially

with regard to traffic, should be addressed by this Supplement to allow mitigation to 40 MAP.

4. Page 4-6, Formulation of Master Plan Commitments and Mitigation Measures, Third Paragraph – What is the timetable for “formulation” of the referenced Mitigation Monitoring Plan? How will mitigation measures be enforced?

EIS/EIR Supplement, Chapter 4.3.2, Off-Airport Surface Transportation

1. Page 4-243, 4.3.2.2 General Approach and Methodology, Second Bullet, Third Sentence and Figure S4.3.2-1, Off-Airport Surface Transportation Study Areas – What is the rationale for limiting the area of study south of LAX to north of Rosecrans while including a more extensive area north and east of LAX? As indicated in our June 12, 2001 comments, the study area is biased toward those areas within the jurisdiction of LADOT to the exclusion of other neighboring jurisdictions.
2. Page 4-247, Sixth Paragraph, Last Sentence – What is the rationale for limiting coordination to LADOT?
3. Pages 4-248 to 4-250, 4.3.2.5 Master Plan Commitments – Will off-airport traffic control actions, necessitated by these commitments, be coordinated with jurisdictions other than LADOT?
4. Pages 4-254 to 4-261, Figure S4.3.2-4, Year 2015 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – What are the pre- and post-project Levels of Service and incremental Project Impacts on the following intersections:
 - Sepulveda and Marine,
 - Sepulveda and Manhattan Beach,
 - Aviation and Marine,
 - Aviation and Manhattan Beach,
 - Nash and El Segundo,
 - Douglas and El Segundo,
 - La Cienega and El Segundo (east of the 405),
 - La Cienega and Rosecrans,
 - Inglewood and El Segundo,
 - Inglewood and Rosecrans,
 - Inglewood and Marine,
 - Inglewood and Manhattan Beach,
 - Hawthorne and El Segundo,
 - Hawthorne and Rosecrans,
 - Hawthorne and Marine, and
 - Hawthorne and Manhattan Beach/Artesia?
5. Pages 4-254 to 4-261, Figure S4.3.2-4, Year 2015 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – What are the pre- and post-project Levels of Service and incremental Project Impacts on the following links:
 - Sepulveda south of Rosecrans,
 - Sepulveda Tunnel,
 - Aviation south of Rosecrans,
 - Inglewood south of Imperial,

- Hawthorne south of Imperial, and
 - Rosecrans west of Hawthorne?
6. Pages 4-254 to 4-261, Figure S4.3.2-4, Year 2015 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – What are the pre- and post-project Levels of Service and incremental Project Impacts for the following Freeway Ramps:
 - I-405 NB off-ramp and El Segundo,
 - I-405 SB off-ramp and LA Cienega S/O Century,
 - I-405 NB off-ramp and Rosecrans, and
 - I-405 NB off-ramp and Inglewood?
 7. Pages 4-265 to 4-269, Table S4.3.2-8, Year 2008 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – Concerns regarding status of Intersections, Links, and Freeway Ramps expressed in comments 4 to 6 above also apply to this table and supporting analysis.
 8. Page 4-273, 4.3.2.8 Mitigation Measures – The statement in this paragraph: *The following mitigation measures are applicable only to the extent that the use of airport revenue to fund such measures is permissible under federal law and policies* casts doubt regarding the validity of any proposed mitigation measures. What agency will make the determination regarding use of airport funds? When will this decision be made? Will the City of Los Angeles guarantee the mitigation program in the event that federal policies prevent LAX funds from implementing the mitigation program.
 9. Pages 4-275 to 4-278, Table S4.3.2-11, Year 2008 Alternative D Mitigation Plan (Adjusted Environmental Baseline Comparison) – The assumed proposed improvement by County of Los Angeles of the Intersection of Aviation and El Segundo is not substantiated by the *Coastal Corridor Transportation Study, Phase II, Figure 9, Roadway Improvements Funded*, South Bay Cities Council of Governments, 2003. Widening of Aviation is funded, but intersection improvements are not funded.
 10. Pages 4-275 to 4-278, Table S4.3.2-11, Year 2008 Alternative D Mitigation Plan (Adjusted Environmental Baseline Comparison) and Pages 4-279 to 4-284, Table S4.3.2-12, year 2015 Alternative D Mitigation Plan (Adjusted Environmental Baseline Comparison) – The unstudied Intersections, Links, and Freeway ramps identified in comments 4 to 6 above must be added to planned mitigation measures as appropriate.
 11. Page 4-295, 4.3.2.10.2 Alternative D – Enhanced Safety and Security Plan, Second Paragraph – Leaving two critical intersections nearest the new Ground Transportation Center and Intermodal Transportation Center (Century at La Cienega and Imperial at La Cienega) unmitigated will lead to serious access problems for vehicles from the South Bay using arterial highways. What is the intended plan? It is critical that this issue is addressed.

Technical Report S-2a. - Supplemental On-Airport Surface Transportation

1. Pages 24 and 25, Table 5, Key Assumptions/Inputs 2015 Alternative D, Planned – Regional Access/Egress Directional Distributions and Attachment A – What is the basis for allocation of percentages of passengers between entrances and ramps?
2. Page 62, Table 17, Key Assumptions/Inputs 2015 Alternative D, Refined System – Regional Access/Egress Directional Distributions – What is the basis for allocation of percentages of passengers between entrances and ramps?

Technical Report S-2b. - Supplemental Off- Airport Surface Transportation

1. Page 3 and Figure 1, Revised Study Area and Key Study Locations – Why have study areas been limited to areas north of Rosecrans?
2. Page 8, Planned Development Projects Added to Background Assumptions, - Hawthorne should be included in your list for projects.
3. Page 25, 3.2. Geographical Distribution of Trips – As indicated in above comments regarding Technical Report 2a, the basis for trip allocation is not obvious. Here the implication is “Passenger Surveys”. Have these surveys been documented? If so where? If the basis is *Technical Report 2b, Off-Airport Surface Transportation, LAX Master Plan Off-Airport Existing 1996 Transportation Conditions Report* of the Draft EIS/EIR, the validity of this allocation is questionable. The intersections surveyed in that study were biased toward the use of I-405 to access the CTA via Imperial and Century. None of the intersections surveyed were west of I-405 and south of Imperial. Consequently no data was collected regarding LAX traffic from Palos Verdes, Beach Cities, and bailouts from I-405 northbound onto surface streets.

How does the geographic distribution of project trips reported in the DEIR compare to the distribution of trips in the SCAG model used to develop the Regional Transportation Plan and to the distribution of airport and airport-related trips in the City of Los Angeles General Plan model? If there are differences, please explain the rationale for using the assumptions in the Airport DEIR.

4. Page 26, Table S9, Existing and Future Transportation Deficiencies (RTP Background Assumptions) – What is the justification for arbitrarily limiting the study area to north of Rosecrans? If the following intersections, links, and ramps had been included in the analysis, the number impacted would probably be higher:
 - Sepulveda and Marine,
 - Sepulveda and Manhattan Beach,
 - Aviation and Marine,
 - Aviation and Manhattan Beach,
 - Nash and El Segundo,
 - Douglas and El Segundo,
 - La Cienega and El Segundo (east of I 405),
 - La Cienega and Rosecrans,
 - Inglewood and El Segundo,
 - Inglewood and Rosecrans,
 - Inglewood and Marine,
 - Inglewood and Manhattan Beach,
 - Hawthorne and El Segundo,
 - Hawthorne and Rosecrans,
 - Hawthorne and Marine,

- Hawthorne and Manhattan Beach/Artesia,
 - Sepulveda south of Rosecrans,
 - Sepulveda Tunnel,
 - Aviation south of Rosecrans,
 - Inglewood south of Imperial,
 - Hawthorne south of Imperial,
 - Rosecrans west of Hawthorne,
 - I-405 NB off-ramp and El Segundo,
 - I-405 SB off-ramp and LA Cienega S/O Century,
 - I-405 NB off-ramp and Rosecrans, and
 - I-405 NB off-ramp and Inglewood.
5. Page 27, Third Paragraph and Figure S3, Differences in LAX Passenger Trips – 2015 PM Peak Hour - Alternative D – Adjusted Environmental Baseline – What is the basis for the conclusion that shifting passenger access to the eastern end of the airport will cause a measurable shift in traffic using I-405? Should Lincoln be included in the discussion in the third paragraph? Reduction of traffic on Lincoln is not reflected in Figure S3.
 6. Page 27, Fifth Paragraph and Figure S4, Differences in Total Vehicle Trips – 2015 PM Peak Hour – Alternative D – Adjusted Environmental Baseline – What is the basis for the conclusion regarding traffic shift?
 7. Page 28, Table S10, Master Plan Impacts on Surface Streets, Freeways, and Intersections vs. Adjusted Environmental Baseline: RTP Background Assumptions – See comment 5 above regarding Table S9.
 8. Pages 33 and 34, 4.2 Study Area Transportation Benefits, Table 11 Study Area Average Speed and Congested Lane Miles, and Table S12 Study Area VMT and VHT – The conclusions reflected in these tables probably result from the arbitrary conclusion that traffic will shift as a result of the proposed shift in passenger access to the east.
 9. Pages 35 and 36, Essential Neighborhood Traffic Management Elements – Does this philosophy extend to neighborhoods outside of the City of Los Angeles? If not, it should. Because of the reference to LADOT procedures in the third paragraph, the impression is created that the intent is to limit to the City of Los Angeles. The new interchange at Lennox and shift of passenger access to the east will not increase the capacity of NB I-405 south of the new interchange. Consequently, the risk of driver bailout using El Segundo, Rosecrans, and Inglewood Off-Ramps remains. This may well result in cut through traffic into neighborhoods south of LAX. This should be examined.
 10. Page 36, 5.2 Mitigation Measures for Alternative D, third paragraph and Figure S6 Changes in Total Traffic Volumes Due to Lennox/I-405 Interchange and I-105 Ramps – 2015 PM Peak Hour – What is the basis for these conclusions?
 11. Page 36, 5.2 Mitigation Measures for Alternative D, third paragraph, last sentence – Does this conclusion include the potential for increased bailouts from I-405 as discussed in comment 10?
 12. Page 41, First Complete Paragraph – Leaving two critical intersections nearest the new Ground Transportation Center and Intermodal Transportation Center (Century at La Cienega and Imperial at La Cienega) unmitigated will lead to serious access problems for vehicles from the South Bay using arterial highways. What is the intended plan? To ignore the issue is not acceptable.

13. Page 41, Fourth Paragraph – What agency will decide which mitigation measures will be funded with airport revenues? In the event airport revenues are not to be used to fund the recommended mitigation measures, will any further growth in MAP cease?
14. Page 41, 5.3 Alternative Mitigation Plan for Alternative D, First Paragraph – Which agency has the authority to approve the proposed Lennox Interchange and when will they decide? If they decide against the proposed interchange, how will the conclusions of the traffic growth change?
15. Page 41, 5.3 Alternative Mitigation Plan for Alternative D, Fourth Paragraph – Lennox Interchange should be deleted from the mitigation measures in this paragraph since this section addresses an alternative plan.
16. Pages 41 and 42, 5.3 Alternative Mitigation Plan for Alternative D, Last Paragraph, First Sentence – What agency will decide which mitigation measures will be funded with airport revenues? In the event airport revenues are not to be used to fund the recommended mitigation measures, will the proposed actions cease?

Attachment B, Geographic Distribution of Airport Trips - Alternative D – What is the basis for determining the distribution. See comment 4 above.

Peura Enterprises

5340 West 135th Street, Hawthorne, CA 90250-4945

November 4, 2003

Mr. David B. Kessler
U.S. Department of Transportation
Federal Aviation Administration
Post Office Box 92007
Los Angeles, CA 90009-2007

Dear Mr. Kessler:

In accordance with Section 102(2)(c) of the National Environmental Policy Act of 1969, the California Environmental Quality Act of 1970, Section 509(b)(5) of the Airport and Airway Improvement Act of 1982, as amended, I reviewed the Los Angeles International Airport (LAX) Draft Master Plan Addendum and the Supplement to the Draft Environmental Impact Statement/Environmental Impact Report (EIS/EIR).

Based upon my review, I respectfully offer the following observations and enclosed comments for your consideration. My review focused on Ground Transportation into and out of LAX.

As a member of the business community, I understand how important international trade is to this region's and my community's economy and future economic growth. LAX and other regional airports provide a vital international trade link for the region.

A strong regional economy requires a regional air transportation system capable of continued accommodation of demands for such services. In this regard, projected shortfalls of 10 to 30 million annual passengers (MAP) are disconcerting. The discussion in the Planning Objectives Section of the Addendum raises considerable doubt regarding the region's ability to meet future demands for air transportation. The proposed Alternative D does little to satisfy these future needs.

To really take control of the situation and make truly regional decisions in this matter, decision-making regarding how and when airports are served cannot remain the sole purview of the airlines. I am not suggesting regulating airlines and reestablishing the Civil Aeronautics Board abolished by the federal Airline Deregulation Act. However, under the current unregulated environment, local or regional caps on numbers of flights and passengers are meaningless. Additionally, suggested allocations of air traffic growth are meaningless unless and until sponsors of other regional airports expand to handle their share.

One of the more serious issues with the EIS/EIR is the cost of traffic mitigation measures and funding sources have not been identified. Also, ground transportation projects of other jurisdictions are used to mitigate impacts without regard to their validity. Because identified mitigation measures are primarily north of the airport, problems created south of the airport remain unresolved.

NOV - 2003

SPC00294

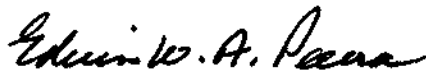

My observation of past events regarding LAX improvements strongly suggests justifiable concern about proposed caps on the number of flights, inadequacy of identified mitigation measures, and lack of funding for mitigation measures.

When the airport was expanded in the early 1980s, the EIS/EIR provided for expansion to 40 MAP. That level proved to be meaningless. Moreover, the mitigation measures identified at that time were inadequate (and similarly not funded) at the 40 MAP level, let alone at today's level of operation. No measures have been implemented to mitigate increases over the 1980 EIS/EIR-approved level. Consequently, ground transportation mitigation measures for the Master Plan Addendum must therefore use 40 MAP as the baseline.

In addition, conditions of approval must contain specific funding sources, schedules, legally binding commitments to implement signed by the responsible agencies, and remedies in the case of non-performance. Without such funding sources, implementation commitments, and remedies, any mitigation measures are illusory.

If you have any questions or require clarification of any comments, please contact me at (310) 643-5906.

Respectfully,

Edwin W. A. Peura
Vice President

LAX Master Plan Addendum
And
Supplement to Draft EIS/EIR
Comments

General

1. Considerable uncertainty regarding Los Angeles World Airports' (LAWA's) intention to complete proposed mitigation measures is raised by the following comment:
"Mitigation measures are applicable only to the extent that the use of airport revenues to fund such measures is permissible under federal law and policies." (Technical Report 2a, page 41 and elsewhere as indicated by specific comments below.)
2. As with the 2001 Draft Master Plan and Draft Environmental Impact Statement/Environmental Impact Report Draft EIS/EIR, the study area for Off-Airport Ground Access is primarily north of LAX. Little attention is paid to streets and freeways south of the airport. More significantly, mitigation measures appear to be limited to LADOT jurisdictions with little regard to traffic problems created in surrounding areas outside of the City of Los Angeles.
3. It is not clear how moving passenger access east outside of the Central Terminal Area improves security. Requiring passengers with luggage and visitors to use a 1.5-mile long Automated People Mover before entering security makes no sense. What is being protected? Obviously not passengers because they could be subject to numerous threats while in transit. Granted the Central Terminal Area will no longer be as insecure with removal of parking structures. That threat has been moved to the new Ground Transportation Center and the new Intermodal Transportation Center.

EIS/EIR Supplement, Chapter 4, Affected Environment, Consequences, and Mitigation Measures

1. Page 4-2 to 4-3, Mitigation Measures Bullet. – The comment – "It should be noted that mitigation measures, as well as Master Plan commitments, are applicable to the extent that the use of airport revenue to fund such measures and commitments is permissible under federal law and policies." creates considerable uncertainty regarding the validity of any proposed mitigation measures.
2. Page 4-3, The Environmental Baseline. – Using the 1998 Revision to CEQA Guidelines - "as they exist at the time the notice of preparation is published...." as a basis for establishing an environmental baseline ignores all environmental impacts since LAX was expanded in the 1980s and 1990s from 40 MAP to the

current baseline. Unmitigated impacts have resulted in uncontrolled traffic growth with significant impact on neighborhoods north, south, and east of LAX.

3. Pages 4-3 and 4-4, The Environmental Baseline, Third Paragraph - The discussion in this paragraph regarding “incremental” and “cumulative” impacts raises the issue of incremental changes to LAX since the last Draft EIS/EIR of 1978 from 40 MAP to the current baseline. Our view is these incremental changes and their impacts especially with regard to traffic should be addressed by this Supplement to allow mitigation to 40 MAP. This would necessitate an Environmental Baseline of 1984 vice 1996/97.
4. Page 4-6, Formulation of Master Plan Commitments and Mitigation Measures, Third Paragraph – What is the timetable for “formulation” of the referenced Mitigation Monitoring Plan? How will mitigation measures be enforced?

EIS/EIR Supplement, Chapter 4.3.2, Off-Airport Surface Transportation

1. Page 4-243, 4.3.2.2 General Approach and Methodology, Second Bullet, Third Sentence and Figure S4.3.2-1, Off-Airport Surface Transportation Study Areas – What is the rationale for limiting the area of study south of LAX to north of Rosecrans while including a more extensive area north and east of LAX? As indicated in our June 12, 2001 comments, the study area is biased toward those areas within the jurisdiction of LADOT to the exclusion of other neighboring jurisdictions.
2. Page 4-247, Sixth Paragraph, Last Sentence – What is the rationale for limiting coordination to LADOT?
3. Pages 4-248 to 4-250, 4.3.2.5 Master Plan Commitments – Will off-airport traffic control actions, necessitated by these commitments, be coordinated with jurisdictions other than LADOT?
4. Pages 4-254 to 4-261, Figure S4.3.2-4, Year 2015 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – What are the Levels of Service and Impacts for the following intersections:
 - Sepulveda and Marine,
 - Sepulveda and Manhattan Beach,
 - Aviation and Marine,
 - Aviation and Manhattan Beach,
 - Nash and El Segundo,
 - Douglas and El Segundo,
 - La Cienega and El Segundo (east of the 405),
 - La Cienega and Rosecrans,
 - Inglewood and El Segundo,
 - Inglewood and Rosecrans,
 - Inglewood and Marine,
 - Inglewood and Manhattan Beach,
 - Hawthorne and El Segundo,
 - Hawthorne and Rosecrans,
 - Hawthorne and Marine, and

- Hawthorne and Manhattan Beach/Artesia?
5. Pages 4-254 to 4-261, Figure S4.3.2-4, Year 2015 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – What are the Levels of Service and Impacts for the following links:
 - Sepulveda south of Rosecrans,
 - Sepulveda Tunnel,
 - Aviation south of Rosecrans,
 - Inglewood south of Imperial,
 - Hawthorne south of Imperial, and
 - Rosecrans west of Hawthorne?
 6. Pages 4-254 to 4-261, Figure S4.3.2-4, Year 2015 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – What are the Levels of Service and Impacts for the following Freeway Ramps:
 - I-405 NB off-ramp and El Segundo,
 - I-405 SB off-ramp and LA Cienega S/O Century,
 - I-405 NB off-ramp and Rosecrans, and
 - I-405 NB off-ramp and Inglewood?
 7. Pages 4-265 to 4-269, Table S4.3.2-8, Year 2008 Alternative D Levels of Service (Adjusted Environmental Baseline Comparison) – Concerns regarding status of Intersections, Links, and Freeway Ramps expressed in comments 4 to 6 above also apply to this table and supporting analysis.
 8. Page 4-273, 4.3.2.7.2 Alternative D - Enhanced Safety and Security Plan, Third Paragraph – Another Project to be considered is the construction of up to 750 units comprising a mix of single-family detached homes, attached and detached town houses, and high quality condominiums on the southeast corner of El Segundo and Aviation Boulevards in Hawthorne. The City Councils of El Segundo and Hawthorne recently approved this project, Pacific Glen.
 9. Page 4-273, 4.3.2.8 Mitigation Measures – The statement in this paragraph: *The following mitigation measures are applicable only to the extent that the use of airport revenue to fund such measures is permissible under federal law and policies.* casts doubt regarding the validity of any proposed mitigation measures. What agency will make the determination regarding use of airport funds? When will this decision be made?
 10. Pages 4-275 to 4-278, Table S4.3.2-11, Year 2008 Alternative D Mitigation Plan (Adjusted Environmental Baseline Comparison) – The assumed proposed improvement by County of Los Angeles of the Intersection of Aviation and El Segundo is not substantiated by the *Coastal Corridor Transportation Study, Phase II, Figure 9, Roadway Improvements Funded*, South Bay Cities Council of Governments, 2003. Widening of Aviation is funded, but intersection improvements are not funded.
 11. Pages 4-275 to 4-278, Table S4.3.2-11, Year 2008 Alternative D Mitigation Plan (Adjusted Environmental Baseline Comparison) and Pages 4-279 to 4-284, Table S4.3.2-12, year 2015 Alternative D Mitigation Plan (Adjusted Environmental Baseline Comparison) – The unstudied Intersections, Links, and Freeway ramps identified in comments 4 to 6 above must be added to planned mitigation measures as appropriate.

12. Page 4-295, 4.3.2.10.2 Alternative D – Enhanced Safety and Security Plan, Second Paragraph – Leaving two critical intersections nearest the new Ground Transportation Center and Intermodal Transportation Center (Century at La Cienega and Imperial at La Cienega) unmitigated will lead to serious access problems for vehicles from the South Bay using arterial highways. What is the intended plan? To ignore the issue is not acceptable.

Technical Report S-2a. - Supplemental On-Airport Surface Transportation

1. Pages 24 and 25, Table 5, Key Assumptions/Inputs 2015 Alternative D, Planned – Regional Access/Egress Directional Distributions and Attachment A – What is the basis for allocation of percentages of passengers between entrances and ramps?
2. Page 62, Table 17, Key Assumptions/Inputs 2015 Alternative D, Refined System – Regional Access/Egress Directional Distributions – What is the basis for allocation of percentages of passengers between entrances and ramps?

Technical Report S-2b. - Supplemental Off- Airport Surface Transportation

1. Page 3 and Figure 1, Revised Study Area and Key Study Locations – Why have study areas been limited to areas north of Rosecrans?
2. Page 8, Planned Development Projects Added to Background Assumptions, - Hawthorne should be included in your list for projects.
3. Page 15, First Paragraph – Another Project to be considered is the construction of up to 750 units comprising a mix of single-family detached homes, attached and detached town houses, and high quality condominiums on the southeast corner of El Segundo and Aviation Boulevards in Hawthorne. The City Councils of El Segundo and Hawthorne recently approved this project, Pacific Glen.
4. Page 25, 3.2. Geographical Distribution of Trips – As indicate in above comments regarding Technical Report 2a, the basis for trip allocation is not obvious. Here the implication is “Passenger Surveys”. Have these surveys been documented? If so where? If the basis is *Technical Report 2b, Off-Airport Surface Transportation, LAX Master Plan Off-Airport Existing 1996 Transportation Conditions Report* of the Draft EIS/EIR, the validity of this allocation is questionable. The intersections surveyed in that study were biased toward the use of I-405 to access the CTA via Imperial and Century. None of the intersections surveyed were west of I-405 and south of Imperial. Consequently no data was collected regarding LAX traffic from Palos Verdes, Beach Cities, and bailouts from I-405 northbound onto surface streets.
5. Page 26, Table S9, Existing and Future Transportation Deficiencies (RTP Background Assumptions) – What is the justification for arbitrarily limiting the study area to north of Rosecrans? If the following intersections, links, and ramps had been included in the analysis, the number impacted would probably be higher:
 - Sepulveda and Marine,
 - Sepulveda and Manhattan Beach,
 - Aviation and Marine,

- Aviation and Manhattan Beach,
 - Nash and El Segundo,
 - Douglas and El Segundo,
 - La Cienega and El Segundo (east of I 405),
 - La Cienega and Rosecrans,
 - Inglewood and El Segundo,
 - Inglewood and Rosecrans,
 - Inglewood and Marine,
 - Inglewood and Manhattan Beach,
 - Hawthorne and El Segundo,
 - Hawthorne and Rosecrans,
 - Hawthorne and Marine,
 - Hawthorne and Manhattan Beach/Artesia,
 - Sepulveda south of Rosecrans,
 - Sepulveda Tunnel,
 - Aviation south of Rosecrans,
 - Inglewood south of Imperial,
 - Hawthorne south of Imperial,
 - Rosecrans west of Hawthorne,
 - I-405 NB off-ramp and El Segundo,
 - I-405 SB off-ramp and LA Cienega S/O Century,
 - I-405 NB off-ramp and Rosecrans, and
 - I-405 NB off-ramp and Inglewood.
6. Page 27, Third Paragraph and Figure S3, Differences in LAX Passenger Trips – 2015 PM Peak Hour - Alternative D – Adjusted Environmental Baseline – What is the basis for the conclusion that shifting passenger access to the eastern end of the airport will cause a measurable shift in traffic using I-405? Should Lincoln be included in the discussion in the third paragraph? Reduction of traffic on Lincoln is not reflected in Figure S3.
 7. Page 27, Fifth Paragraph and Figure S4, Differences in Total Vehicle Trips – 2015 PM Peak Hour – Alternative D – Adjusted Environmental Baseline – What is the basis for the conclusion regarding traffic shift?
 8. Page 28, Table S10, Master Plan Impacts on Surface Streets, Freeways, and Intersections vs. Adjusted Environmental Baseline: RTP Background Assumptions – See comment 5 above regarding Table S9.
 9. Pages 33 and 34, 4.2 Study Area Transportation Benefits, Table 11 Study Area Average Speed and Congested Lane Miles, and Table S12 Study Area VMT and VHT – The conclusions reflected in these tables probably result from the arbitrary conclusion that traffic will shift as a result of the proposed shift in passenger access to the east.
 10. Pages 35 and 36, Essential Neighborhood Traffic Management Elements – Does this philosophy extend to neighborhoods outside of the City of Los Angeles? If not, it should. Because of the reference to LADOT procedures in the third paragraph, the impression is created that the intent is to limit to the City of Los Angeles. The new interchange at Lennox and shift of passenger access to the east

will not increase the capacity of NB I-405 south of the new interchange. Consequently, the risk of driver bailout using El Segundo, Rosecrans, and Inglewood Off-Ramps remains. This may well result in cut through traffic into neighborhoods south of LAX. This should be examined.

11. Page 36, 5.2 Mitigation Measures for Alternative D, third paragraph and Figure S6 Changes in Total Traffic Volumes Due to Lennox/I-405 Interchange and I-105 Ramps – 2015 PM Peak Hour – What is the basis for these conclusions?
12. Page 36, 5.2 Mitigation Measures for Alternative D, third paragraph, last sentence – Does this conclusion include the potential for increased bailouts from I-405 as discussed in comment 10?
13. Page 41, First Complete Paragraph – Leaving two critical intersections nearest the new Ground Transportation Center and Intermodal Transportation Center (Century at La Cienega and Imperial at La Cienega) unmitigated will lead to serious access problems for vehicles from the South Bay using arterial highways. What is the intended plan? To ignore the issue is not acceptable.
13. Page 41, Fourth Paragraph – What agency will decide which mitigation measures will be funded with airport revenues? In the event airport revenues are not to be used to fund the recommended mitigation measures, will the proposed actions cease?
14. Page 41, 5.3 Alternative Mitigation Plan for Alternative D, First Paragraph – Which agency has the authority to approve the proposed Lennox Interchange and when will they decide?
15. Page 41, 5.3 Alternative Mitigation Plan for Alternative D, Fourth Paragraph – Lennox Interchange should be deleted from the mitigation measures in this paragraph since this section addresses an alternative plan.
16. Pages 41 and 42, 5.3 Alternative Mitigation Plan for Alternative D, Last Paragraph, First Sentence – What agency will decide which mitigation measures will be funded with airport revenues? In the event airport revenues are not to be used to fund the recommended mitigation measures, will the proposed actions cease?
17. Attachment B, Geographic Distribution of Airport Trips - Alternative D – What is the basis for determining the distribution. See comment 4 above.

Re Los Angeles Airport Master Plan

To Whom It Concerns:

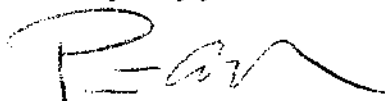

I write this letter in response to your request for public input on the various Los Angeles Airport alternatives. I am an attorney and travel frequently through LAX; last year I flew more than twenty round-trips from our airport. While I have encountered some inconveniences, I believe the airport works very well as currently constituted. If you have not done so, you should undertake a scientific survey of (frequent) travelers.

SPC00295

I am also aware, peripherally, of certain studies which claim the expansion plans will not add capacity or economic value to the region. I have not studied the plans or reports in any detail, but if the main motivating factor behind these plans is to increase efficiency, I believe they are a wasteful use of appreciable public resources, especially during the ongoing budgetary crisis. From my point of view, LAX is not an airport in need of any fix.

Thank you for your consideration of my views.

Very truly yours,

A handwritten signature in black ink, appearing to read 'P. Binkow', with a long horizontal flourish extending to the right.

**Re: Comments to Supplemental Draft EIS/EIR California Clearinghouse
No. 1997061047
Los Angeles International Airport Proposed Master Plan Improvements**

Dear Mr. Kessler and Mr. Ritchie:

The following are comments from the LAX Coalition for Environmental, Economic, and Educational Justice (LAX Coalition) regarding the Supplement to the Draft Environmental Impact Report/Statement (SDEIR/S) for the Los Angeles International Airport Proposed Master Plan Improvements.

The LAX Coalition brings together environmental organizations, labor unions, community- and faith-based organizations, and school districts who are concerned about the negative impact of Los Angeles International Airport (LAX) operations on the low-income, minority communities neighboring the airport to the east. The LAX Coalition is dedicated to finding a balance between the development of LAX and the rights of the neighboring communities to a decent quality of life. We seek to protect and improve the health, education, and welfare of our constituents who live and work in the vicinity of LAX. A list of our most recent organizational membership is attached in *Appendix A*.

The LAX Coalition affirms our intention and commitment to work with the City of Los Angeles, the Airport Commission and Los Angeles World Airports (LAWA) to develop a consensus proposal that addresses our concerns through a comprehensive community benefits program. We look forward to a constructive dialogue and negotiation process that will balance the needs of LAX development with the interests of neighboring communities in a healthier environment and better economic opportunities.

Of particular concern to our members are the environmental justice issues that are evident in the potential negative environmental impacts the project will impose disproportionately on

SDEIR/S Comments Submitted by the LAX Coalition for Environmental, Economic and Educational Justice

low income African-Americans and Latinos in Inglewood, Lennox, Manchester Square, Hawthorne, and South Los Angeles. We are also concerned that the mitigations and benefits promised in the SDEIR/S lack specificity and enforceability.

Our analysis of the SDEIR/S leads us to the conclusion that Los Angeles World Airports and the United States Federal Aviation Administration (FAA) have prepared an inadequate and inaccurate SDEIR/S that must be revised and recirculated to comply with the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA). We request, and NEPA and CEQA require, that LAWA and the FAA adopt the mitigation measures proposed herein and revise and recirculate the SDEIR/S or commit to implementing these mitigation measures in the Final EIR/S.¹ By complying with this request, LAWA and the FAA have the ability to develop a consensus proposal for the Los Angeles International Airport (LAX), one that includes substantive community participation in shaping LAX development to advance our common goals and interests and avoids litigation.

¹ We recognize that the Final EIR/S will provide written responses to comments made on both the 2001 Draft EIR/S and this SDEIR/S. However, several coalition members provided written comments in 2001 that are relevant to this document. As such, we hereby incorporate by reference all comments in their entirety submitted by coalition members in 2001 to the Draft EIR/S including but not limited to the comments submitted by Coalition for Clean Air, Communities for a Better Environment, Environmental Defense, and Natural Resource Defense Council.

4. Affected Environment, Consequences, and Mitigation Measures

LAWA and the FAA Must Identify and Adopt Specific Mitigation Measures or Performance Standards Prior to Project Approval

Public agencies cannot approve a project that will have significant environmental impacts without first adopting feasible measures to mitigate or avoid those impacts or committing to meet some realistic performance standard. (Calif. Pub. Res. Code §21081; *Sacramento Old City Association v. City Council of Sacramento* (1991) 229 Cal.App.3d 1011, 1028-1029; *Gentry v. City of Murrieta* (1995) 36 Cal.App.4th 1395, 1395-1396.) LAWA and the FAA have yet to adopt mitigation measures or performance standards that will apply to the LAX project. Despite providing a long list of *possible* mitigation measures (see generally, SDEIR/S Section 5, Environmental Mitigation Plan), they have not committed to any of these mitigation measures. Specifically, in the SDEIR/S, LAWA and the FAA state, “It should be noted that mitigation measures, as well as Master Plan commitments, are applicable to the extent that the use of airport revenue to fund such measures and commitments is permissible under federal law and policies.” (SDEIR/S, p. 4-2 to 4-3.) LAWA and the FAA, however, not only fail to cite to the relevant federal law and policies, they do not identify those proposed mitigation measures impermissible under federal law and policies. LAWA and the FAA must identify and adopt specific feasible mitigation measures or performance standards to reduce or avoid significant environmental impacts prior to project approval. Under CEQA, they cannot continue to avoid making commitments by stating that some or all of the mitigation measures may not be implemented because of funding limitations in federal law and policies.

LAWA and the FAA’s Master Plan Commitments and Mitigation Measures Should Include Clear and Specific Criteria for Monitoring Implementation, Deadlines, and a Public Right of Enforcement

We support LAWA and the FAA statement, “Provisions will be made to ensure that those [Master Plan commitments and mitigation] measures are fully enforceable (i.e., zoning conditions, conditions of approval, etc.)” (SDEIR/S, p. 4-6.) This commitment complies with the CEQA requirement that “[m]itigation measures must be fully enforceable through permit conditions, agreements, or other legally-binding instruments.” (CEQA Guidelines §15126.4(a)(2).² To assure the fulfillment of this commitment, we request that LAWA and the FAA include clear and specific criteria for monitoring implementation, binding deadlines, and a public right of enforcement when adopting its Master Plan commitments and mitigation measures. We ask that the public right of enforcement provide that any board, officer, person, corporation or association or by any person acting for the interests of itself, its members, or the general public have the right to bring a legal complaint to enforce compliance with these commitments and mitigation measures in state or federal court. Providing for a public right of enforcement would be consistent with the promise made in the SDEIR/S and provide the best

² The State Resources Agency has developed specific regulations to implement CEQA, located at California Code of Regulations, Title 14, §15000 *et seq.*, referred to herein as “Guidelines.”

and most effective guarantee that the Master Plan commitments and mitigation measures will be fully implemented.

4.1 Noise

With respect to noise pollution currently caused by LAX operations and projected noise impacts from the proposed Alternative D, we are most concerned about the negative impact on children in the affected area. In that regard, we join in the separate comments to the SDEIR/S submitted by the Lennox School District and the Inglewood School District and hereby incorporate those comments in their entirety by reference. We believe those comments provide an appropriate critique of the SDEIR/S as to noise pollution and other environmental issues.

In addition to our concerns about the impact of noise pollution on children's education, we are also concerned about the projected impact of airport-related noise on residential neighborhoods and associated land uses. Several sources of noise pollution were identified in the SDEIR/S, including road traffic noise, aircraft noise, construction traffic noise, construction equipment noise, single-event awakenings, and automated people mover noise. However, the SDEIR/S noise analysis does not address the cumulative impacts of those diverse causes of noise pollution, all resulting from LAX operations, on residents and other sensitive receptors in the impacted area. We believe such an analysis is appropriate and reasonable in light of expressed community concerns, and request that such an analysis be included in the Final EIR/S or discussed in a further supplemental SDEIR/S circulated for public review.

As stated in the SDEIR/S, Alternative D would cause 5,100 people in an estimated 1,700 homes to be newly exposed to noise greater or equal to 65 decibels measured as the Community Noise Equivalent Level (expressed as 65 CNEL), and an additional 5,000 in another 1,700 homes would be newly exposed to an increase of at least 1.5 CNEL. (SDEIR/S, p. 4-62.) Perhaps even more alarming, "[A]pproximately 87 percent of the population newly exposed to high noise levels, or 4,430 residents is estimated to be minority and/or low-income." (SDEIR/S, p. 4-324.) Added burdens on this population are the Single Event Noise Effects caused by nighttime eastbound aircraft take-offs. As stated in the SDEIR/S, Alternative D would expose 53,000 people to Single Event Noise Effects, 18,000 of whom are newly exposed. (SDEIR/S, p. 4-66.)

Because the problem of residential noise pollution is of great importance to our coalition members, we request that LAWA directly address noise mitigation as a key component of its Master Plan Commitments. One of the obstacles to noise mitigation measures in some negatively impacted areas is the concern about residents' dwellings that have been deemed uninhabitable or not built to code. As such, these dwellings are not currently eligible for noise mitigation measures as provided by LAWA. As stated elsewhere in our comments, however, Los Angeles County is in the midst of a severe housing crisis, which is most strongly felt by low-income populations who are often forced to live in substandard housing. Because their conditions are already at-risk, it is even more important to provide them with the support and mitigation they need and deserve. As a result, we strongly urge LAWA to work with impacted

communities to provide appropriate noise mitigation to these affected residents and offer our assistance in this effort. We request that this issue be addressed in the final EIR/S.

We request that LAWA and the FAA incorporate the following mitigation measures, with appropriate clear and specific criteria for monitoring implementation, binding deadlines, and a public right of enforcement as referenced above, prior to finalizing the LAX EIR/S:

1. **Airport Noise Monitoring Program:** The LAX Airport Noise Monitoring Program would involve a systematic and independent analysis of noise levels in the project study area. The analysis would be funded by LAWA and the FAA. An independent committee of noise monitoring experts and community stakeholders would select independent contractors to carry out noise monitoring within the project study area. The study will rely not on modeling, but on actual and extensive noise measurements within the project study area. The Program would also include the analysis and study of single-event noise occurrences to establish a standard for single-event noise levels that is less arbitrary than the one adopted in the SDEIR/S. The Program would include specific commitments for mitigation of any residence or other incompatible use shown by this analysis to equal or exceed 65 CNEL and/or the newly established Sound Exposure Level (SEL) standard used to measure single event noise levels.
2. **Airport Noise Mitigation Program Revision:** Prior to or immediately concurrent with the Board of Airport Commissioners' (BOAC) review of the LAX Master Plan Alternatives, the BOAC shall adopt revisions to its Airport Noise Mitigation Program. These revisions shall include, at a minimum, the easing of burdensome requirements for residences related to building code compliance, and revision of the terms of the Avigation Easement.
3. **Expedition of the Implementation of Part 161 Study to Make Over-Ocean Procedures Mandatory:** LAWA and the FAA should move expeditiously to complete all necessary steps to implement a moratorium on nighttime eastbound take-offs. Other airports around the world, including Narita International in Tokyo, have imposed a moratorium on flights during normal sleep hours to reduce the noise burden on surrounding communities. LAWA must also immediately establish a monitoring system to track and limit current nighttime eastbound take-offs during the period in which the Part 161 process is underway.
4. **School Noise Mitigation Program:** Educational institutions from pre-schools to elementary, middle and high schools are all negatively impacted by noise pollution caused by various LAX noise sources. For purposes of mitigation, specific schools need sound mitigation and in some cases relocation would be the most appropriate mitigation for the noise pollution caused by the LAX modernization.

4.3.2 Off-Airport Surface Transportation

4.3.2.3 Affected Environment/Environmental Baseline

Unless Explained, the LAWA and FAA Decision to Treat the Nearly 11% Increase in Traffic Around LAX as “Non-Material” Must Be Considered Arbitrary and Capricious

Federal and state statutes governing administrative procedures prohibit agencies from making arbitrary or capricious decisions. In the Supplement to the Draft Environmental Impact Report/Statement (SDEIR/S), LAWA and the FAA conclude that there has been no material change in off-airport traffic conditions since 1996. LAWA and the FAA state that “the average annual growth for the combined intersections [in the vicinity of LAX] was approximately 1.5 percent and 1.0 percent per year for the a.m. and p.m. peak hours, respectively.” (SDEIR/S, p. 4-244.) LAWA and the FAA have not, however, identified the criteria they used to determine that this growth, equivalent to nearly an 11% increase for traffic during the morning rush hours from 1996 to 2003, is not materially different from the 1996 baseline. Unless LAWA and the FAA provide a clear basis for this determination founded upon reasonable criteria, their decision to consider a nearly 11% increase in traffic “non-material” must be considered arbitrary and capricious. This change in traffic density in the vicinity of LAX should be considered a material change in baseline peak traffic conditions. LAWA and the FAA should revise their off-airport traffic environmental baseline to reflect current conditions and re-analyze project impacts.

The Use of the No Project Alternative as the “Adjusted Environmental Baseline” to Assess Environmental Impacts Violates CEQA

CEQA the CEQA Guidelines, prohibit the use of a “no project alternative” that differs from the existing environmental setting as the baseline for determining the impacts of a proposed project. As established in the CEQA Guidelines, “The no project alternative analysis is not the baseline for determining whether the proposed project’s environmental impacts may be significant, unless it is identical to the existing environmental setting analysis which does establish that baseline.” (Guidelines §15126.6(e).) LAWA and the FAA use an “adjusted environmental baseline” to evaluate off-airport surface transportation impacts and to develop mitigation measures. LAWA and the FAA base this adjusted environmental baseline on “a comparison of future year traffic conditions with the project to future year traffic conditions without the project.” (SDEIR/S, p. 4-244.) Thus, contrary to CEQA, LAWA and the FAA use the “no project” alternative as a baseline for determining the significance of environmental impacts from future year traffic conditions. CEQA specifically prohibits this practice. LAWA and the FAA cannot legally use their “adjusted environmental baseline” to determine the significance of environmental impacts and develop mitigation measures. In order to comply with CEQA, the analyses of future year off-airport traffic impacts must be reassessed based on a comparison of existing environmental conditions and the SDEIR/S must be recirculated for comment.

4.3.2.7 Cumulative Impacts

LAWA and the FAA Must Update Their Off-Airport Surface Transportation Cumulative Impacts Analysis Based on Current Information About Other Past, Present, and Probable Future Projects

NEPA and CEQA require public agencies to consider potential cumulative impacts. (40 CFR §1508.7; Guidelines §§15216, 15130.) This cumulative impacts analysis must consider past, present, and probable future projects. In the SDEIR/S, LAWA and the FAA state, “The cumulative impacts to off-airport surface transportation associated with Alternatives A, B, and C, in combination with other past, present, and probable future projects have not changed from those described in Section 4.3.1, Off-Airport Surface Transportation (subsection 4.3.2.8), or the Draft EIS/EIR.” This is not true. The analysis in the DEIR/S, which was prepared as part of the Final Draft LAX Master Plan in 1996, is based on out-of-date information. (LAX Master Plan, Final Draft, May 1996.) Specifically, the DEIR/S did not anticipate several development projects in the vicinity of LAX, including the impending residential development of Los Angeles Air Force Base (LAAFB) Area A.³ The LAAFB project will have significant impacts on traffic in the vicinity of LAX. In addition, the LAAFB DEIR/S includes a list of related projects. (LAAFB DEIR/S, pp. 2-30 to 2-33.) Many of these projects do not appear to have been considered in the LAX Master Plan. (Compare LAAFB DEIR/S, pp. 2-30 to 2-33, with Final Draft LAX Master Plan, p. IV-8.5 to IV-8.7.) LAWA and the FAA must update their off-airport surface transportation cumulative impacts analysis based on current information about other past, present, and probable future projects. LAWA and the FAA should also revise their proposed mitigation measures to reduce or avoid significant cumulative impacts identified through this updated analysis.

4.4 Social Impacts

4.4.1 Employment/Socio-Economics

Alternative D Is Inconsistent with the Stated Purpose of the Project.

In explaining the need to develop LAX, the SDEIR/S asserts:

[I]f LAX does not increase capacity to accommodate some of the projected increase in demand for air travel services, the demand will be met by other airports in the region or elsewhere in the western United States. Failure to fully meet the demand at LAX would also result in lost economic opportunities, including jobs being lost to other regions. As stated in the Draft EIS/EIR, LAWA

³ See United States Air Force, *et al.*, Draft EIR/EIS – Los Angeles Air Force Base Land Conveyance, Construction and Development Project, April 2003, California State Clearinghouse No. 2002071106. Note that the City of El Segundo and the City of Hawthorne certified the LAAFB EIR in July 2003, and the U.S. Air Force issued a Notice of Decision for the EIR in August 2003. We incorporate all LAAFB EIR/EIS-related documents by reference into our comments and the Administrative Record for the LAX project.

had concluded that in order to avoid 'significant negative consequences' and sustain the economic growth of the region, at least some portion of the increased demand should be met at LAX. . . .

The purpose and need as stated in the Draft EIS/EIR (summarized above) remains valid today. (SDEIR/S p. 2-1.)

Section 4.4.1 of the DEIR, however, presents evidence that there will be job loss associated with Alternative D. Despite this significant loss, the SDEIR/S states that "the cumulative effects of Alternative D are considered beneficial." (SDEIR/S p. 4-301.) To conform to SCAG's Regional Transportation Plan, and to meet the generally desirable goal of a regionalization of air traffic, LAWA has proposed an alternative with a negative impact on regional and local employment. Other benefits of Alternative D potentially outweigh the negative impacts associated with it, but the SDEIR/S must adequately assess any negative economic impacts, and the Final EIR must specify mitigations to address these.

The SDEIS/R Analysis of Regional Job Loss Understates the Economic Impact of Alternative D and is thus Inadequate.

Undertaking a regional economic impact analysis, the SDEIR/S projects a loss of 57,113 jobs in the Los Angeles region associated with Alternative D, including a loss of 9,261 on-airport jobs. (SDEIR/S p. 4-298.)

Job losses are very significant in the region's high-wage manufacturing sector, while there is a modest increase in regional employment in the traditionally low-paying service sector. The three industries with the highest percentage of job loss have median wages of \$15.29-17.61 an hour. Employment in these industries is typically full-time and includes employer-paid health and pension benefits. By contrast, the service sectors that show sustained growth are ones in which median wages for non-managerial workers range from \$7.21-9.11 an hour. Entry-level employment is typically minimum wage, and these industries characteristically provide neither full-time employment, nor health or pension benefits.⁴

The SDEIR/S understates the economic impact of declining employment by failing to account for the disproportionately greater economic loss from the loss of manufacturing jobs. The Final EIS/EIR must analyze and compare job quality, wage levels, and full-time/part-time ratios in manufacturing and service sectors to reach an accurate assessment of the economic impact of Alternative D.

The SDEIR/S Does Not Address the Impact of Low-Wage Jobs on Public Services

⁴ Analysis of industries listed in SDEIR/S Table S.4.4.1-1 is based on Occupational Employment Statistics Survey for Los Angeles County, 2002, and U.S. Bureau of Labor Statistics (2002 and 2003), distributed by the Employment Development Department, Labor Market Information Division, State of California. (<http://www.calmis.ca.gov/>).

The SDEIR/S neglects to undertake an analysis of direct on-airport employment. From the Master Plan description of Alternative D, it is evident that direct on-airport employment growth will be in the sectors of concession restaurants and retail, security guards, passenger services, janitorial, and parking. While manufacturing jobs are being lost in the region, the employment gains at the project itself are in low-paying, often part-time jobs that typically lack health insurance, pensions, and job security.

Permanent employment gains at LAX will thus do little to address the acute problem of poverty and inadequate family incomes that exists in the Los Angeles region. Recently released Census data for 2002 shows median income falling and the official poverty rate rising in the state of California. The extent of the problem is far greater than the Census indicates, however, as the Federal Poverty Level is far below the cost of living in Los Angeles. According to the California Budget Project, to meet basic living expenses in Los Angeles County, one needs to work full-time and earn between \$10.49 and \$23.31 an hour.⁵

Low wage jobs create burdens on public services that the SDEIR/S does not address. The shortfall between wages and the cost of living is frequently made up through reliance on public programs such as food stamps, Medi-Cal, child care assistance, and Healthy Families.⁶ The Final EIR/S must explore ways to mitigate the impact of low-wage jobs on public services.

The SDEIR/S Economic Impact Analysis is Inconsistent with the SDEIR/S Analysis of Benefits Relating to Environmental Justice Issues

The SDEIR/S explains that “in assessing whether a project has disproportionately high and adverse human health or environmental effects on minority and low-income populations, certain benefits of the project may be taken into account.” (SDEIR/S, p. 4-339.) The SDEIR/S identifies job creation as one of the “economic benefits directly and indirectly attributable to LAX” and promises to take measures to ensure that LAX jobs are available to members of the minority and low-income communities surrounding the airport. (SDEIR/S, pp. 4-339-40.)

The SDEIR/S does not, however, analyze whether the decline in employment directly or indirectly related to Alternative D will have a disproportionate effect on low-income and minority communities. Furthermore, the SDEIR/S does not identify measures that ensure that these jobs, which are purportedly a “benefit” to impacted communities, will be quality jobs. In the absence of positive measures, low-paying service jobs are as likely to have a negative impact on these communities, by putting a greater strain on their public and civic services.

4.4.1.8 Mitigation Measures

⁵ The range reflects different family size and child-care arrangements. California Budget Project, “Making Ends Meet: How Much Does It Cost to Raise a Family in California?” October 2003.

⁶ *Ibid.*

LAWA Should Adopt Mitigation Measures to Minimize the Negative Economic Impact of the Project and to Render the Project Consistent with its Stated Purposes

The SDEIR/S inadequately and inconsistently addresses a number of issues related to the economic and social impact of Alternative D. Most importantly, the permanent jobs generated by the project will be predominantly low-wage service sector jobs.

We recommend the following mitigation measures be implemented. We also encourage further exploration of additional means to address the negative economic impacts of the project.

1. **LAX Master Plan Commitment to Quality Jobs:** LAWA should incorporate into the Master Plan existing policies (Living Wage, Responsible Contractor, and Worker Retention Ordinances) that improve the quality of on-airport jobs. LAWA should also explore whether it is appropriate to consider revisions of the Living Wage Ordinance to improve health coverage and increase wages, in order that airport jobs provide adequate family income and health insurance.
2. **Community Jobs Development Program:** The LAX Community Jobs Development Program would be a community-driven process funded by LAWA and the FAA, where residents living within the project study area would develop a First Source hiring program that promotes local employment. The goal of the program is to set local hiring targets and support the infrastructure of training, employment services, and the like, which will aid residents of the project study area to gain and keep airport-related jobs. LAWA, through Master Plan commitments and BOAC action, shall commit to the local hiring targets set by the program and to funding job-related services.
3. **Community Jobs Promotion Program:** As the SDEIR/S argued, the indirect economic impact of LAX is of larger significance than the actual on-airport economic activity. Therefore, LAWA and the FAA should do everything possible to promote access by the low-income, minority residents of the impacted areas to airport and aviation-related employment. To this end, LAWA and the FAA should invest in training to qualify local residents for airport and airport-related jobs, including skilled jobs associated with aviation and the air travel industry. LAWA should also provide incentives to companies engaged in airport-related business to encourage them to participate in apprenticeship, internship, training and other career-development programs for local residents. Providing the foundation for local residents to pursue careers that pay higher wages and offer opportunity for advancement is a benefit that can help to offset the many negative impacts of the project on the surrounding communities.
4. **Community Business Development Program:** LAWA and the FAA should include additional measures to support and promote the development and growth of local businesses. Providing opportunity to small businesses, particularly to *local* disadvantaged, minority, or women-owned businesses, could have a large ripple effect in the communities suffering the disproportionate negative impact of LAX. The economic

benefits accruing from such a program would help offset the negative environmental impacts of the project. The program would be developed by community stakeholders, aided by independent financial and business consultants and funded by LAWA and the FAA. Examples of programs that would stimulate local business development include: financial incentives for prime contractors to do business with local firms; micro-lending projects, bonding and contracting assistance.

4.4.2 Relocation of Residences or Businesses

LAWA and the FAA Provide an Incomplete, Inconsistent, and Misleading Description of the Project by Failing to Analyze the Impacts of Residential Acquisition at Manchester Square

LAWA and the FAA must assess the environmental impacts of all reasonably foreseeable phases of the LAX project. (*Laurel Heights Improvement Association of San Francisco, Inc. v. Regents of the University of California* (1988) 47 Cal.3d 376, 396-397.) Under CEQA, a project is “the whole of the action, which has a potential for resulting in a physical change in the environment, directly or ultimately.” (*McQueen v. Board of Directors of the Mid-Peninsula Regional Open Space District* (1988) 202 Cal.App.3d 1136, 1143; CEQA Guidelines §15378.) The SDEIR/S includes an incomplete, inconsistent, and misleading description of the project. LAWA and the FAA fail to comply with CEQA by not assessing the environmental impacts of the reasonably foreseeable phase of the project that requires the acquisition of approximately 2,000 residential units at Manchester Square. At the time of publication of the SDEIR/S, only 21% of the total of approximately 2,500 units had been acquired in the area of the Manchester Square and Belford “Voluntary Residential Acquisition/Relocation Program.” (SDEIR/S p. 4-304.) Yet, LAWA and the FAA make the inaccurate, inconsistent, and contrary claim that “no residential acquisition is proposed for Alternative D” (SDEIR/S p. 4-307), despite the fact that the Ground Transportation Center planned for Manchester Square represents an integral part of the Alternative D project.

The SDEIR/S artificially segregates the analysis of this residential acquisition with the pretense that this acquisition is unrelated to the project. There is no analysis of the impact of the acquisition and relocation of the approximately 2,000 remaining residential units in the area. Yet, the SDEIR/S admits that, if the acquisition is not completed in time for construction of the Ground Transportation Center, “the City of Los Angeles will use the most appropriate and practical measures available (e.g., voluntary acquisition, leasing, and/or public condemnation) to ensure that the designated areas are vacated consistent with the Construction Sequencing Plan.” (SDEIR/S p. 4-304.) Considering the numbers of households involved, the difficulty this population will find in securing comparable, decent, safe and sanitary replacement housing within their financial means, and the dearth of available affordable housing in the LAX area specifically and the Los Angeles region generally, the impacts of this action will be significant and must be analyzed in the SDEIR/S.

The SDEIR/S Fails to Analyze the Disproportionate Impact of Residential Relocation on Minority Communities.

The preferred project alternative requires the displacement of a predominantly minority community. According to the 2000 U.S. Census, 4,798 people lived in the Manchester Square area, of whom 58.5% were black and 23.2% were Latino. In addition, the area is predominantly low-income.⁷

The displacement of this minority community should be viewed in the context of the current affordable housing crisis in Los Angeles. "The City of Los Angeles is in the grip of a profound crisis of housing affordability. The majority of the City's households are renters who are paying higher percentages of their incomes for rent than anyone else in California," according to a report of the City of Los Angeles Housing Crisis Taskforce.⁸ Rental vacancy rates are 4.7%, far below the average for other U.S. metropolitan areas, and new housing construction lags far behind demand.⁹

In the area designated for acquisition, 88.8% of 1,912 households present in 2000 were renters. The large numbers of people that will require relocation, combined with the housing shortage in the immediate vicinity and the region, almost certainly guarantee that the minimal assistance provided in accordance with the Uniform Act will be insufficient.

The Final EIR/S must accurately analyze the impact of the preferred alternative on the relocation of residences. In addition, LAWA and the FAA should explore measures that go beyond the Uniform Act in order to mitigate the disproportionate impact of residential acquisition on low-income, minority renters. The Airport Noise Mitigation Program should be revised and expanded to provide assistance to tenants seeking relocation to comparable permanent housing.

The SDEIR/S Is Deficient Because it Fails to Include an Analysis of Urban-Blight Inducing Impacts.

Socio-economic analyses under CEQA have been interpreted by the courts to require an analysis of urban-blight inducing impacts (*Citizens for Sensible Development of Bishop Area v. County of Inyo* (1985), 172 Cal. App. 3d 151, 171; *Citizens for Quality Growth v. City of Mount Shasta* (1988), 198 Cal. App. 3d 433, 445-446.)

Community leaders are concerned that LAX and airport-serving hotels seem to draw prostitution to the vicinity. Residents in the surrounding residential communities report a high level of prostitution traffic in their neighborhoods, and that prostitutes and their customers

⁷ Data on Census Tract 2774, U.S. Census, 2000.

⁸ Los Angeles Housing Crisis Taskforce, *Report of the Housing Crisis Taskforce* (2000).

⁹ Statistics are for the year 2000. Institute for the Study of Homelessness and Poverty at the Weingart Center, "Housing and Poverty in Los Angeles, July 2001.

frequently discard condoms and other refuse on the streets, alleys, and sidewalks. This constitutes both a disruption to community life and an obvious threat to public health.

Furthermore, the high volume of vehicle traffic destined for the airport, especially trucks serving cargo operations, degrades the roads and sidewalks in the immediately adjacent communities. The consequently dilapidated condition of these roads contributes to urban blight. Although the airport is responsible for the poor condition of these roads, the community is left to bear the cost of fixing the roads and reversing blight.

The Final EIS/EIR must include an analysis of urban-blight inducing impacts. We request that LAWA and the FAA incorporate this additional mitigation measure prior to finalizing the LAX EIR/S:

1. **Airport Neighbors Safety and Security Program:** LAWA and the FAA should establish a task force including community residents and representatives, local area law enforcement agencies, and other interested parties to develop mitigation measures addressing the distinct needs of airport-adjacent communities. Measures would include a community policing plan, a traffic control plan, a road improvement plan, and a community security plan.

4.4.3 Environmental Justice

The SDEIR/S is Inadequate as a Result of the Deficiencies in the Environmental Justice Analysis

As a result of deficiencies in the SDEIR/S environmental justice analysis, we believe that the SDEIR/S is inadequate. We request that the deficiencies described be addressed in a supplemental SDEIR/S, and that the supplemental SDEIR/S be re-circulated to the public for review and comment. With respect to environmental justice issues, we believe that LAWA ignored environmental justice principles in preparing the SDEIR/S, and further failed to engage low-income and minority populations in the decision-making process. These defects violate both federal and state law. In addition, the SDEIR/S fails to provide reasonable mitigation proposals for articulated environmental justice impacts. The SDEIR/S bases much of its analysis on amorphous or the future development of environmental justice mitigation measures. We believe this violates the California Environmental Quality Act ("CEQA") and the National Environmental Protection Act ("NEPA").

Environmental Justice Principles Were Not Followed by LAWA's Public Participation Process

One of the challenges facing LAWA was ensuring that the public had adequate information about the SDEIR/S to provide meaningful comments on the proposed Alternative D of the Master Plan. We recognize that LAWA took certain steps to secure comments from some

local communities, but these steps, though perhaps well intentioned, were inadequate. Certain federal statutes and regulations require that LAWA ensure such participation:

- Title VI states that “No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance.”
- “The Environmental Justice (EJ) Orders amplify Title VI by providing that each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations.” (“Implementing Title VI Requirements in Metropolitan and Statewide Planning,” U.S. Department of Transportation, TOA-1/HEPH-1.)
- “Planning and programming activities that shall have the potential to have a disproportionately high and adverse effect on human health or the environment shall include explicit consideration of the effects on minority populations and low-income populations. Procedures shall be established or expanded, as necessary, to provide *meaningful opportunities for public involvement by members of minority populations and low-income populations* during the planning and development of programs, policies and activities.”¹⁰

In spite of specific statutory language and guidance provided by the U.S. Department of Transportation, LAWA has failed in its efforts to provide such meaningful opportunities to the public and specifically minority populations and low-income populations, as shown below:

Copies of the SDEIR/S Were Not Readily Available to Poor Communities: Although LAWA made the SDEIR/S, Master Plan and related documents available for free on its website, this implies that all members of the public have computer access at home or at work, as well as sufficient Internet access to review voluminous documents. This presumption is incorrect – many low-income families simply do not have these kinds of computer resources. For those without computers, the only other options were to review thousands of pages of material at certain local libraries, often open only during working hours, or purchase hard copies of the documents for review at home. LAWA asked for anywhere from \$169 to \$1,302 to provide hard copies of the SDEIR/S and the Master Plan, and most low-income residents simply could not afford hard copies of the documents.

LAWA should have made more free or low-cost hard copies of the documents available for local residents and/or low-income populations. The absence of such provisions erected barriers to the participation of many local residents.

¹⁰ “Environmental Justice in Minority Populations and Low-Income Populations,” U.S. Department of Transportation, Order DOT 5610.2 (emphasis added).

LAWA Did Not Allow Sufficient Time to Comment: We recognize that there is a sense of urgency among various governmental officials regarding the expansion/modernization of LAX. This should not mean, however, that public comment and hearings should be curtailed or eliminated to facilitate action. In light of the length and breadth of the SDEIR/S, and the need to compare and contrast much of the analysis in the SDEIR/S to the Master Plan analysis completed and circulated in 2000 and 2001, the public needed much more time to appropriately analyze and comment on the new Alternative D. Shortening the time to review and comment has a particularly negative impact on community groups and low-income residents who may have difficulty even getting access to copies of the SDEIR/S to read.

LAWA Failed to Timely Address the Environmental Justice Issues Inherent in the Expansion Plan: According to the Environmental Justice section of the SDEIR/S, LAWA has been implementing an "Environmental Justice Community Outreach Program" at least since May 2001. (SDEIR/S pp. 4-336, 4-337.) The SDEIR/S is unclear as to whether this program has continued during the review of Alternative D, and thus if LAWA has fulfilled its self-defined environmental justice commitments for Alternative D. The activities described in the SDEIR/S took place in 2001, and were only relevant to the Master Plan alternatives under discussion at that time. There is no description of outreach activities related to the Alternative D analysis, aside from a vague reference to "more recent community outreach." This is simply not sufficient. A fuller description of the activities of the "Environmental Justice Community Outreach Program"-including a list of community meetings held after November 2001, the agendas and attendance of those meetings, and a description of the outreach conducted related to the meetings--is necessary in order to evaluate whether LAWA's commitment to environmental justice was met for Alternative D.

LAWA Has Failed to Create and Maintain Importance of a Transparent Public Participation Process with Respect to Environmental Justice: As mentioned above, aside from the "more recent community outreach" it is unclear as to what, if any, community involvement LAWA has engaged in with respect to the SDEIR/S. Unlike the DEIS/DEIR environmental justice analysis, no mention is made here of the "Environmental Justice Task Force" that LAWA engaged in June 2000, what resulted from the work of that task force, who participated, and why it has presumably been disbanded. In addition, there is no mention of the "Environmental Justice Community Outreach Program" on LAWA's website (LAWA's preferred method of educating the public), no contact information for a responsible staff member or any other related material. This lack of access makes meaningful involvement of minority and low-income populations non-existent.

The National Environmental Justice Advisory Council (NEJAC), a federal advisory committee to the U.S. Environmental Protection Agency, has developed *The Model Plan for Public Participation*.¹¹ "The Core Values and Guiding Principles for the Practice of Public Participation" includes guidelines for ensuring early involvement of the public. We believe the

¹¹ See http://www.epa.gov/Compliance/resources/publications/ej/model_public_part_plan.pdf.

following core values and guidelines were not followed by LAWA in its public participation process and should be utilized in further engaging the public and preparing the final SDEIR/S.

- People should have a say in decisions about actions that affect their lives.
- Public participation includes the promise that the public's contribution will influence the decision.
- The public participation process communicates the interests and meets the process needs of all participants.
- The public participation process seeks out and facilitates the involvement of those potentially affected.
- The public participation process communicates to participants how their input was, or was not, utilized.
- The public participation process provides participants with the information they need to participate in a meaningful way.
- Encourage early and active community participation.
- Institutionalize meaningful public participation by acknowledging and formalizing the process.
- Create mechanisms and measurements to ensure the effectiveness of public participation. (NEJAC, *The Model Plan for Public Participation*, p. 13.)

As part of a federally mandated process, we believe LAWA's public participation process was sorely lacking. Specifically, LAWA failed to include early and meaningful participation of low-income and minority populations. For example, the SDEIR/S fails to list any specifics about the "recent community outreach" discussed in the Environmental Justice section of the SDEIR/S, including: what it consisted of; who was invited; who attended; what decision makers (including elected officials, LAWA Commissioners and high level staff) attended; what was the agenda; if input received at those meetings was incorporated into LAWA's Master Plan; how such input was assimilated and incorporated by LAWA staff; what languages were spoken at those meetings; what written materials were distributed; and what efforts were made to engage low-income populations. We request that this information be provided for any Environmental Justice Program outreach conducted since November 2001, and that the detailed information be circulated in a supplemental SDEIR/S to allow for appropriate analysis of LAWA's environmental justice public outreach program.

Although LAWA's SDEIR/S recognizes that environmental justice issues exist, it does not adequately address them. As a result, we believe that the public participation and environmental justice processes engaged by LAWA are deficient.

LAWA Failed to Articulate Sufficient Methods to Offset or Mitigate Well-Defined Negative Impacts on Low-Income and Minority Populations

As discussed elsewhere in these comments, CEQA requires public agencies to adopt feasible mitigation measures to reduce or eliminate otherwise significant adverse environmental

impacts. (Cal. Pub. Res. Code §§ 21002, 21081, subd. a.) For each identified significant adverse environmental impact the EIR must identify specific mitigation measures. (CEQA Guidelines § 15126.4.) However, we believe that the environmental justice mitigation measures suggested by LAWA has not been fully developed and, instead, relies on the deferral of mitigation measures until after some undefined further work is completed by LAWA.

LAWA's SDEIR/S specifically states that increased LAX operations will disproportionately impact minority and low-income populations with respect to noise and air pollution. A simple review of LAWA's SDEIR/S bears out this conclusion:

Noise

"[A]pproximately 87 percent of the population newly exposed to high noise levels, or 4,430 residents is estimated to be minority and/or low-income." (SDEIR/S, p. 4-324);

"[U]nder Alternative D, three public schools would be newly exposed to . . . greater aircraft noise levels or exposed to an increase of [noise]. . . These schools . . . are all within minority and/or low-income areas . . . and would be exposed to noise levels that could be disruptive to classroom activities." (SDEIR/S, p. 4-324)

"Despite the comprehensive mitigation proposed, the analysis concludes that, after mitigation, certain areas affected by noise would still be faced with adverse effects due to constraints that apply most directly to minority and/or low-income communities." (SDEIR/S, p. 4-429);

Air Quality

"While O3 [ozone] is a region wide problem, minority and low-income populations may be more severely affected because they may be more susceptible to asthma and other chronic respiratory illnesses triggered by high O3 levels. Children within minority communities may be particularly susceptible to health effects of PM10 [particulate matter], ozone and NO2 [nitrogen dioxide] and thus may be more severely affected than other communities exposed to equivalent levels of pollutants, while *children living in poverty who lack access to adequate health care may be especially at risk.*" (SDEIR/S, pp. 4-330 (emphasis added))

4.4.3.7 Environmental Justice Program Mitigation Measures

LAWA's Environmental Justice Program Requires Further Review and Modification

LAWA's plan for environmental justice mitigation measures falls short of solving these environmental problems and of legal expectations. In fact, LAWA's failure to commit to specific environmental mitigation plans, without measurable goals, deadlines and milestones, and an agency accountability program, is dangerously close to relying upon deferred mitigation measures not permitted under CEQA. (See, e.g., *King County Farm Bureau v. City of Hanford* (1990), 221 Cal. App. 3d 692, 728.) At minimum, LAWA may defer the development and implementation of mitigation measures only when LAWA commits to meet realistic performance standards. (*Gentry v. City of Murrieta* (1995), 36 Cal. App. 4th 1359, 1395-1396.)

Such performance standards to alleviate environmental justice, social and cultural impacts are nowhere in LAWA's analysis.

We also believe that LAWA's proposed future mitigation plans also runs afoul of the NEPA mitigation requirements. Because the mitigation measures have not yet been fully developed, it is impossible to gauge if the measure will decrease pollution, alter construction impacts, or provide compensation to affected populations. (See 40 C.F.R. 1508.20.)

1. **Environmental Justice Accountability:** As articulated above, we believe that LAWA's public participation process needs serious and immediate improvement, including at minimum a more transparent decision-making process regarding the most recently developed build alternative; a comprehensive plan showing how the Environmental Justice Program operates and will continue to work through the construction process; and more inclusion of low-income and minority populations in the decision-making process.
2. **Youth and Community Assets Program:** The LAX Youth and Community Assets Program would be designed by a community-driven process that would be funded by LAWA and the FAA. The goal of the Program is to offset the emotional and physical negative health impacts caused by LAX operations and modernization. Specifically, LAWA would work with community groups to determine how to best offset negative air and noise pollution impacts by developing targeted recreation, parks and other open space land use solutions. By working with low-income and minority populations on this issue, LAWA will mitigate significant environmental effects and ensure environmental justice in the impacted areas.

We further request that LAWA be more specific in its work plan for their proposed environmental justice mitigation proposals, and fully adopt the mitigation programs suggested in these comments with respect to economic impacts, air and noise pollution, and negative effects on children and schools. As we have discussed here and elsewhere, low-income and minority populations will bear the heaviest burdens from all aspects of the proposed LAX modernization. Environmental injustice is threaded throughout the SDEIR/S and must be addressed comprehensively and aggressively.

In developing those programs, we request that LAWA include community groups with knowledge of this issue who constitute the low-income and minority communities negatively impacted by the operations LAX. Finally, we request that any future mitigation proposals developed to combat environmental justice impacts to low-income and minority populations be re-circulated in the form of a supplemental SDEIR/S for both procedural and substantive review by the public.

4.6 Air Quality

4.6.1 Introduction

LAWA and the FAA Need to Specify Which Air Quality Mitigation Measures Will Be Required, Which Will Be Promoted, and How Implementation Will Be Monitored

LAWA and the FAA state that they will “[s]upport further conversion of mobile equipment to alternative-fueled engines.” (SDEIR/S, p. 4-355.) They also state that, “LAWA would require or promote the conversion of airport tenant and user equipment to alternative fuels.” (*Ibid.*) While we support these air pollution reduction measures, LAWA and the FAA should specify how they will determine whether an airport tenant or user will be required to convert to an alternative-fueled equipment and exactly what measures will be taken to promote the conversion to alternative-fueled equipment. In addition, it will be important for LAWA and the FAA to develop the means to measure the conversion of mobile and stationary equipment to alternative-fuels and the estimated air pollution benefits resulting from the implementation of these mitigation measures.

LAWA and the FAA also propose mitigation measures to reduce motor vehicle traffic coming into LAX and to reduce motor vehicle idling time in parking lots. (SDEIR/S, pp. 4-355 to 4-356.) We request that LAWA and the FAA include in their LAX Mitigation Plan commitments that include the development and implementation of a program for monitoring motor vehicle traffic coming into LAX and motor vehicle idling time in parking lots.

LAWA and the FAA Fail to Consider PM2.5 in Their Analysis of Air Quality Impacts

CEQA requires LAWA and the FAA to identify all possible significant adverse environmental impacts of the proposed LAX project. (Calif. Pub. Res. Code §21100(b)(1); Guidelines §15126.2.) LAWA and the FAA indicate that “. . . modeled air pollutant concentrations were compared to California Ambient Air Quality Standards (CAAQS) to determine the significance of each build alternative for CEQA purposes.” (SDEIR/S, p. 4-356.) LAWA and the FAA, however, do not consider PM2.5 in their analysis of future background concentrations of air pollutants. The California Air Resources Board has revised its CAAQS to include PM2.5. (17 CCR §70200.) LAWA and the FAA must consider PM2.5 in their analysis of air quality impacts in order to identify all possible significant adverse environmental impacts as required by CEQA. It would be arbitrary and capricious for LAWA and the FAA to leave PM2.5 out of an analysis that uses all other CAAQS as the basis for determining the significance of environmental impacts under CEQA. The lack of this PM2.5 impacts assessment prevents the public and decision-makers from being able to understand fully the environmental consequences of the proposed project.

4.6.2 General Approach and Methodology

LAWA and the FAA Rely Upon Outdated Air Quality Standards and Must Revise Their Air Quality Impacts Assessment and Mitigation Measures in Accordance With These New Standards

On July 5, 2003, the State of California formally adopted revised regulations establishing new standards for particulate matter (PM) and sulfates.¹² (17 CCR §70200; California Regulatory Notice Register No. 25, p. 960, June 20, 2003.) These new California Ambient Air Quality Standards are more restrictive than those adopted by the federal government and more restrictive than those used in the DEIR/S and SDEIR/S. (DEIR/S, Table 4.6-5 at p. 4-479; DEIR/S, Table 4.6-11 at p. 4-498; SDEIR/S, Table S4.6-3 at p. 4-363.) Specifically, the new standards include a 20 microgram per cubic meter ($\mu\text{g}/\text{m}^3$) average annual limit for suspended particulate matter (PM10), based on the arithmetic mean of 24-hour samples (formerly based on a geometric mean), and a 12 $\mu\text{g}/\text{m}^3$ average annual limit for fine particulate matter (PM2.5), based on the arithmetic mean of 24-hour samples.¹³ While LAWA and the FAA acknowledge that they expected these new standards to take effect “in summer 2003” (SDEIR/S, Table S4.6-3 at p. 4-363), they base their air quality impacts analysis and corresponding mitigation measures on the old standards. This failure to use the updated standards has resulted in erroneous conclusions about the significance of the interim year PM impacts under Alternative D (36 $\mu\text{g}/\text{m}^3$), and the 2015 PM impacts for project alternatives A, B, C, and D (33, 32, 32, 25, and 32 $\mu\text{g}/\text{m}^3$, respectively). (SDEIR/S, Table S4.6-12 at p. 4-374.) The revised air quality standards must be met under CEQA and the DEIR/S and SDEIR/S must be amended accordingly.

	California ARB Standard	Federal EPA Standard
	PM10	PM10
Annual Average	20 $\mu\text{g}/\text{m}^3$	50 $\mu\text{g}/\text{m}^3$
24-Hour Average	50 $\mu\text{g}/\text{m}^3$	150 $\mu\text{g}/\text{m}^3$
	California ARB Standard	Federal EPA Standard
	PM2.5	PM2.5
Annual Average	12 $\mu\text{g}/\text{m}^3$	15 $\mu\text{g}/\text{m}^3$
24-Hour Average	-----	65 $\mu\text{g}/\text{m}^3$

Source: California Air Resources Board, www.arb.ca.gov/research/aaqs/pm/pm.htm

LAWA and the FAA state, “Analyses presented in this Supplement to the Draft EIR/EIS address the following issues and provide additional information on the potential for air quality

¹² See www.arb.ca.gov/research/aaqs/pm/pm.htm for background information on PM and sulfates.

¹³ California Air Resources Board, June 4, 2003, Final Regulation Order for the Rulemaking to Consider Amendments to Regulations for the State Ambient Air Quality Standards for Suspended Particulate Matter and Sulfates, www.arb.ca.gov/regact/aaqspm/revfro.pdf, which we incorporate by reference into our comments and the administrative record for the LAX project.

impacts: . . . assessing air emissions and concentrations against the most current regulations and state and federal ambient air quality standards.” (SDEIR/S, p. 4-357.) For this to be true, LAWA and the FAA must revise their air quality impacts assessment based on the newly finalized PM standards. In addition, LAWA and the FAA must revise their proposed PM mitigation measures in accordance with these new regulations.

4.6.2.2 Emissions Estimates

LAWA and the FAA Do Not Adequately Identify Air Quality Impacts Resulting From the On-Site Rock Crushing Facility and Stockpiles

CEQA requires LAWA and the FAA to identify all possible significant adverse environmental impacts of the proposed LAX project. (Calif. Pub. Res. Code §21100(b)(1); Guidelines §15126.2.) In their discussion of air quality emissions estimates for construction impacts (SDEIR/S, p. 4-358), LAWA and the FAA do not explain how or whether they have accounted for PM_{2.5}. They also do not explain how or whether they have assessed potential air quality impacts from the proposed rock crushing facility and the construction stockpiles. The rock crushing facility and construction stockpiles may have significant adverse air quality and public health impacts upon residents, schoolchildren, and workers. LAWA and the FAA must clearly describe their efforts to assess PM_{2.5} emissions from construction activities and they must identify potential air quality impacts from rock crushing and construction stockpiles.

4.6.2.4 Future Background Concentrations

We request that LAWA and the FAA revise Table S4.6-2 to include PM_{2.5} and an acknowledgement that projected future background concentrations will exceed the California Ambient Air Quality Standards for the average annual mean of PM₁₀ (20 µg/m³) and the 24-hour average of PM₁₀ (50 µg/m³).

4.6.3.1 Federal and State Regulatory Framework

LAWA and the FAA Should Revise Their Discussion of State Air Quality Standards to Reflect Newly Adopted CAAQS

The finalization of California’s new PM and sulfates standards has made the information LAWA and the FAA includes in their discussion of the federal and state air quality regulatory framework inaccurate and outdated. (See SDEIR/S, pp. 4-362 to 4-365.) LAWA and the FAA must revise this section of the SDEIR/S accordingly. Specifically, LAWA and the FAA should revise Tables S4.6-3, S4.6-5, and S4.6-12 to include the new CAAQS for PM₁₀ and PM_{2.5}. (SDEIR/S, pp. 4-363, 4-366, and 4-374.)

Under the Newly Adopted CAAQS, LAWA and the FAA Cannot Continue to Use PM10 Compliance as a Surrogate for PM2.5 Compliance

With regard to PM_{2.5}, LAWA and the FAA state, “Until USEPA issues guidance on the implementation of the PM_{2.5} ambient air quality standards, that agency has recommended that compliance with the PM₁₀ standards be considered a surrogate for compliance with PM_{2.5} standards, and the analysis in this document follows that guidance.” (SDEIR/S, p. 4-363.) LAWA and the FAA can no longer use PM₁₀ compliance as a surrogate for PM_{2.5} compliance, since this decision rests only upon federal guidance and does not exempt LAWA and the FAA from recognizing and complying with the new PM_{2.5} standard adopted by the State of California. LAWA and the FAA must assess the potential impacts of PM_{2.5} emissions and adopt PM_{2.5} mitigation measures where necessary.¹⁴

4.6.3.2 Air Quality Plans and Policies

LAWA and the FAA Should Revise References to the Air Quality Management Plan

The South Coast Air Quality Management District (SCAQMD) finalized and approved its 2003 Air Quality Management Plan (AQMP) on August 1, 2003.¹⁵ LAWA and the FAA should revise their discussion of air quality plans and policies, including Table S4.6-4, to acknowledge that the draft AQMP has now been made final. These revisions should be made throughout the SDEIR/S where LAWA and the FAA reference the AQMP.

LAWA and the FAA Should Revise the EIR/S to Account for Changes in the State Implementation Plan

The California Air Resources Board (ARB) finalized the new State Implementation Plan (SIP) for the South Coast Air Basin on October 23, 2003.¹⁶ LAWA and the FAA should revise the DEIR/S and SDEIR/S to make these documents consistent with the new air pollution reduction commitments and requirements in the revised SIP.

LAWA and the FAA Should Include Documents Related to the 1994 SIP Consultative Process and Memorandum of Understanding in the Administrative Record

We incorporate by reference into our comments all records related to the 1994 SIP consultative process referenced on SDEIR/S, p. 4-365. We also incorporate by reference into our comments the December 2002 memorandum of understanding identified on SDEIR/S, p. 4-365. LAWA and the FAA should include these documents in the Administrative Record for this project.

¹⁴ Note that regional PM_{2.5} monitoring data for the South Coast Air Basin average over 20 µg/m³, suggesting that LAX project and cumulative impacts will exceed the newly adopted standard of 12 µg/m³ and represent significant impacts. See ARB, August 2001, *2001 California PM_{2.5} Monitoring Network Description*, Figure 1 at p. 3, at www.arb.ca.gov/aqd/pm25/Final2001PMMonitoringNetworkDescription.pdf.

¹⁵ Summary Minutes of the South Coast Air Quality Management District, Friday, August 1, 2003, Agenda Item No. 35, www.aqmd.gov/hb/0308min.html.

¹⁶ See ARB Public Meeting Agenda Item August 2, 2003 at www.arb.ca.gov/board/ma/ma102303.htm.

4.6.3.3 Environmental Baseline Ambient Air Quality

By Excluding PM2.5 Baseline Data, LAWA and the FAA Provide an Incomplete Description of the Environmental Setting

CEQA requires public agencies to publish Draft EIRs that include a description of the physical environmental conditions in the vicinity of the project. (Guidelines §15125, a DEIR “must include a description of the environment in the vicinity of the project, as it exists before the commencement of the project, from both a local and regional perspective.”) Without a complete description of the project’s environmental setting, the DEIR may never adequately investigate and discuss the environmental consequences of the proposed project. (See *San Joaquin Raptor/Wildlife Rescue Center* (1994) 27 Cal.App.4th 713, 724-729; see also *Environmental Planning and Information Council v. County of El Dorado* (1982) 131 Cal.App.3d 350, 354, 357-358.) Contrary to these requirements, LAWA and the FAA fail to identify baseline air pollutant concentration data for PM2.5. (SDEIR/S, Table S4.6-5 at p. 4-366) This incomplete description of the project’s environmental setting has caused LAWA and the FAA to fail to consider significant project-related and cumulative impacts. In particular, this incomplete environmental setting description results in the underestimation of air quality impacts. LAWA and the FAA should revise and recirculate the SDEIR/S with an accurately description of the project’s environmental setting.

4.6.3.4 Environmental Baseline LAX Emissions Inventory

LAWA and the FAA Must Provide Baseline LAX Emissions Data for PM2.5

As with their description of ambient air quality, LAWA and the FAA fail to include PM2.5 data in their description of the LAX emissions inventory. LAWA and the FAA must provide baseline LAX emissions data for PM2.5 to satisfy CEQA requirements for describing the environmental setting in the vicinity of the project.

4.6.8 Mitigation Measures

LAWA and the FAA Should Provide More Specific Information About Their Air Quality Mitigation Measures, Adopt a Set of Mitigation Measure Principles, and Incorporate Additional Mitigation Measures to Reduce or Avoid Significant Adverse Environmental Impacts

CEQA requires a public agency to adopt feasible mitigation measures in order to reduce or eliminate otherwise significant adverse environmental impacts. Cal. Pub. Res. Code §§ 21102, 21081(a.) LAWA and the FAA have identified a long list of significant adverse air quality impacts. (SDEIR/S, pp. 4-370 to 4-387.) Given these significant impacts, LAWA and the FAA must adopt all feasible mitigation measures in order to reduce or eliminate these impacts.

LAWA and the FAA have proposed several air quality mitigation measures. (SDEIR/S, Table S4.6-18 at p. 4-389.)¹⁷ We strongly support these measures and appreciate the efforts of LAWA and the FAA to incorporate proposed mitigation measures suggested by those who commented on the DEIR/S. Many of the proposed mitigation measures, however, could be strengthened. Most lack the specificity necessary to judge their viability and how they will be implemented. We ask that LAWA and the FAA diligently focus on the further specification and development of these mitigation measures so that their mitigation monitoring and reporting plan includes viable and enforceable means of reducing or avoiding the many adverse significant environmental impacts associated with the LAX project.

We request that LAWA and the FAA commit to following a set of mitigation measure principles that include: (1) Setting unambiguous and measurable goals; (2) identifying and meeting deadlines and milestones; (3) enacting mitigation *requirements* wherever possible and relying upon *incentives* only when mandates would be illegal or impossible; and (4) establishing an agency accountability program that includes reporting requirements, complaint resolution protocols, and mechanisms for public oversight and enforcement of mitigation commitments. For example, taking the first mitigation measure in Table S4.6-18, LAWA and the FAA should set goals of converting 50% of airport and tenant-owned ground service equipment (GSE) to electric power or extremely low emission technology by 2007 and 100% conversion by 2010. They should also develop reliable ways of measuring progress toward these goals, identify technology milestones, impose airport tenant lease conditions mandating date certain GSE conversion, and provide the public a right to enforce the GSE conversion commitment through a court order, if necessary.

There are many additional feasible mitigation measures available to reduce or eliminate significant air quality impacts. We request that LAWA and the FAA incorporate these additional mitigation measures prior to finalizing the LAX EIR/S:

1. **Community Health Needs Assessment Project:** The LAX Community Health Needs Assessment Project would be a community-driven process funded by LAWA and the FAA where residents living within the project study area develop, conduct, and participate in a survey of local health needs. A health needs survey would be developed and administered by community members in consultation with independent researchers. The project could be modeled upon the Hispanic Health Needs Assessment conducted by the National Alliance for Hispanic Health. (See www.hispanichealth.org/hhna.lasso.) It should include an environmental health tracking component compatible with the recommendations of the California Department of Health Services (CDHS) SB 702 Environmental Health Tracking Expert Working Group. (See www.catracking.com.)

¹⁷ In Table S4.6-18 and elsewhere in the SDEIR/S, LAWA and the FAA refer to SULEV/ZEV engines. ARB has adopted updated emissions categories, which now include partial zero emission vehicles (PZEV) and advanced technology PZEV (AT-PZEV). See www.arb.ca.gov/msprog/ccbg/2004pc.htm. LAWA and the FAA should revise the SDEIR/S to be consistent with these new vehicle emission categories.

2. **Community Health Services Program:** The LAX Community Health Services Program would use research findings from the LAX Community Health Needs Assessment Project to accommodate health care needs of those living and working within the LAX study area. The health services program would include funding from LAWA and the FAA for health clinics within the community and at elementary and secondary schools within the project study area, and the operation of a mobile clinic to diagnose and treat asthma and other diseases associated with exposure to air pollution (e.g., asthma vans).
3. **Environmental Indicators Project:** The LAX Environmental Indicators Project would be a community-driven process funded by LAWA and the FAA where residents living within the project study area identify environmental indicators they want to track; collect, analyze, and report on those indicators; and support the continuing use of indicator data to advocate for positive change in the vicinity of LAX. (See Hays, J., Landeiro, C., & Rongerude, J., 2002, *Neighborhood Knowledge for Change: The West Oakland Environmental Indicators Project*.¹⁸)
4. **Emissions Inventory Validation and Improvement Study:** The LAX Emissions Inventory Validation and Improvement Study would include a systematic and detailed analysis of current emissions inventory limitations and assumptions. The study would be funded by LAWA and the FAA and an independent committee of air quality experts and community stakeholders would select independent contractors to carry out inventory validation and improvement tests. Among other things, these contractors would test aircraft engine and auxiliary power unit emissions for toxic air contaminants, test and validate emissions factors relied upon in the LAX emissions inventory, provide independent verification of the accuracy of self-reported emissions data, and measure LAX-related diesel truck fleet emissions. These improvements in the LAX emissions inventory would be consistent with commitments made the South Coast AQMD in its Environmental Justice Workplan for 2003-04. (See www.aqmd.gov/hb/030930a.html and www.aqmd.gov/hb/0309min.html.)
5. **Community Exposure Assessment Program:** The LAX Community Exposure Assessment Program would include funding from LAWA and the FAA to measure toxic air pollutant and other environmental chemical exposures among residents, students, and workers in the LAX project study area. This program should be based on priorities and protocols developed by members of the CDHS Biomonitoring Planning Project.¹⁹ Program staff should coordinate their efforts with the Southern California Environmental Health Sciences Center (SCEHSC) based at the University of Southern California Keck School of Medicine and

¹⁸ Published in Oakland, CA by Pacific Institute for Studies in Development, Environment, and Security at www.pacinst.org/reports/environmental_indicators.htm.

¹⁹ California Biomonitoring Needs Assessment, Report to the Advisory Committee (Oct. 28, 2002), Section 5 (<http://dhs.ca.gov/ehlb/BPP/Needs%20Assessment%20Report.pdf>).

researchers with the National Children's Study (<http://nationalchildrensstudy.gov/>). Exposure assessment measurements should include biomonitoring and exposure pathway studies.

6. **Air Quality Monitoring Program:** The LAX Air Quality Monitoring Program would be a community-driven process funded by LAWA and the FAA where residents living within the project study area work with SCAQMD and ARB staff in designing and conducting air quality studies in the vicinity of the airport. These studies would involve air sampling education and training for community members similar to that conducted by West Harlem Environmental Action (www.weact.org/programs/cbhr/diesel.html), SCEHSC, and the Pacific Institute for Studies in Development, Environment, and Security (www.pacinst.org/online_update/oct_2003_online_update.htm). The program would also include funding by LAWA and the FAA for ARB to conduct a Neighborhood Assessment Project analysis of air pollution around LAX (www.arb.ca.gov/ch/programs/nap/nap.htm) and for SCAQMD to establish a Neighborhood Environmental Justice Council for the LAX project study area.
7. **Air Pollution Emissions Reduction Program:** The LAX Air Pollution Emissions Reduction Program would incorporate the measures proposed by LAWA and the FAA in the Master Plan and EIR/S. The program would also include other feasible air pollution emissions reduction measures developed and supported by local community members. These include (1) the replacement of all diesel school buses within the LAX study area with alternative fuel buses, (2) the replacement of heavy duty diesel truck fleets and engines within study area with alternative fuel trucks and engines, if feasible, and low-emission diesel trucks and engines where alternative fuel vehicles are shown to be infeasible, (3) the replacement of diesel garbage truck fleets within the LAX study area with alternative fuel trucks, (4) limits on diesel truck idling time in and around LAX, (5) the installation of enhanced vapor recovery technology at all gas stations in the vicinity of LAX, (6) the creation of a distributed generation hydrogen fuel cell infrastructure at LAX, (7) the expansion of the alternative fuel infrastructure in and around LAX, including compressed natural gas (CNG), liquefied natural gas (LNG) and hydrogen fueling stations, (8) the addition of 400-Hertz electrical ground power and preconditioned air systems to all remaining aircraft passenger gates, (9) the extension of electrical power to all hangars in order to eliminate the use of highly polluting aircraft auxiliary engines during maintenance; and (10) a commitment to investigate the feasibility of and develop a pilot for the use of cleaner jet fuel together with AQMD.
8. **Contaminated Site Identification and Remediation Project:** The LAX Contaminated Site Identification and Remediation Project would be designed to identify and remediate contaminated sites in the LAX project study area. This would include brownfield and other sites regulated by the U.S. Environmental

Protection Agency, California Department of Toxic Substances Control, and Los Angeles Regional Water Quality Control Board. Project staff would work with community members in advocating for the thorough and timely cleanup of contaminated sites in the vicinity of LAX.

9. **LAX Accountability Program:** The LAX Accountability Program would provide for a Community Oversight Committee charged with monitoring and enforcing Master Plan commitments and environmental mitigation measures. The Community Oversight Committee would be funded by LAWA and the FAA and include community and labor representatives selected by local residents and workers.
10. **Public Participation and Community Advocate Program:** The LAX Public Participation and Community Advocate Program would support and encourage public participation in LAX-related decisions. Existing community outreach and public participation efforts need to be improved considerably. LAWA should create an Office of Community Advocate and hire and retain a Director of Community Advocacy and supporting staff charged with protecting community interests and providing community-based perspectives within the agency. LAWA should create a Complaint Resolution Protocol and a Public Participation Guidebook for use by community members and following the examples established by ARB. (See www.arb.ca.gov/ch/ch.htm.) The program would also assure compliance with public records and public notice statutes and develop ways to expand public access to information and participation opportunities. LAWA and the FAA should work with community members to site and establish information clearinghouses. The program should comply with the recommendations of the California Environmental Protection Agency's Advisory Committee on Environmental Justice (www.calepa.ca.gov/EnvJustice/).
11. **Community Benefits Grant Program:** The LAX Community Benefits Grant Program would provide grants from LAWA and the FAA to organizations working to empower and educate those living and working within the LAX study area. An independent funding board consisting of community members and independent experts would be empowered to make funding decisions. These grants would include funds for capacity-building, public participation, community-based participatory research, special projects, the hiring of consultants to advise community members on LAX-related issues, supporting the development of mitigation measures by community members, and general organizational support.
12. **Link Clean Air to Clean Energy:** To help reduce LAX reliance on diesel and other less clean forms of energy, LAX should move aggressively toward implementing a "Green Energy" strategy for all its energy needs. Specifically, as part of the development of Alternative D, LAX should rely entirely on renewable sources of energy, such as solar and wind power, for all of its energy needs. In

addition, LAWA should use the Leadership in Energy and Environmental Design (LEED) system developed by the U.S. Green Building Council to guide its design and construction practices at LAX. The LEED guidelines encourage use of non-toxic materials, renewable energy and water efficiency. If a building or project meets certain specific criteria under the LEED guidelines, the building or project can seek certification under the program. We encourage LAWA to seek the platinum certification under the LEED guidelines, utilizing the cleanest and most energy efficient building standards. According to the U.S. Green Building Council, such LEED buildings can be built within a mere 2-3% cost increase, and often the energy savings pay back that extra cost in short order.²⁰

All LAX research projects should follow the “Responsible Research Criteria” developed by the CDHS and the National Association of County and City Health Officials’ (NACCHO) Protocol for Assessing Community Excellence in Environmental Health.²¹ The research projects should all be based upon a community-based participatory research framework. LAWA and the FAA should commit to following the key principles of community-based participatory research:

1. Recognizing community as an unit of identity;
2. Building on strengths and resources within the community;
3. Facilitating collaborative, equitable involvement of all partners in all phases of the research;
4. Integrating knowledge and intervention for mutual benefit of all partners;
5. Promoting a co-learning and empowering process that attends to social inequalities;
6. Involving a cyclical and iterative process;
7. Addressing health from both positive and ecological perspectives;
8. Disseminating findings and knowledge gained to all partners; and
9. Involving a long-term commitment by all partners.²²

²⁰ The U.S. Green Building Council developed and administers the LEED guidelines for commercial buildings. More information can be found at http://www.usgbc.org/LEED/LEED_main.asp.

²¹ For the CDHS criteria, contact Ms. Lori Copan, CDHS, 510-849-5044, and for the NACCHO protocol see www.naccho.org/GENERAL261.cfm.

Israel, Dr. P.H., in *Successful Models of Community-Based Participatory Research*, Final Report, L. R. O’Fallon, *et al.*, eds., published by the National Institute of Environmental Health Sciences, and available at www.niehs.nih.gov/translat/cbr-final.pdf.

Adverse Impacts Associated With the Rock Crushing Facility Must Be Identified, Analyzed, and Mitigated

If a specific mitigation measure will itself create new significant adverse impacts, these significant impacts must also be described in the Draft EIR. (Guidelines §15126.4(a)(1)(D).) “If a mitigation measure would cause one or more significant effects in addition to those that would be caused by the project as proposed, the effects of the mitigation measure shall be discussed but in less detail than the significant effects of the project as proposed. (*Stevens v. City of Glendale* (1981) 125 Cal. App. 3d 986.) As part of their air quality mitigation measures, LAWA and the FAA indicate that construction activities will include the use of an “on-site rock crushing facility to reuse rock/concrete and minimize off-site haul truck trips.” (SDEIR/S, p. 4-388.) This on-site rock crushing facility will recycle an enormous amount of material from the demolition of existing airline terminals, parking structures, runways, and roadways. The fugitive dust and particulate matter (PM10 and PM2.5) emissions from this operation will undoubtedly cause significant adverse environmental impacts and must be identified, analyzed, and mitigated in the EIR/S. We are particularly concerned that the on-site rock crushing facility will be co-located with the construction stockpiles adjacent to low-income residents of color in the eastern vicinity of the airport. Stockpiles will be “confined to the eastern area of the airport vicinity” under Alternatives A, B, and C, and “confined to the eastern area of the airport vicinity, to the extent possible” under Alternative D. (“ST-11” and “ST-20” as identified at SDEIR/S, pp. 4-248, 4-249.) The environmental and environmental justice impacts of the rock crushing facility and stockpiles must be discussed in the EIR/S and measures must be taken to minimize their adverse effects upon local community members.

4.20 Construction Impacts

*The Construction Impacts of Alternative D Must Be Mitigated to Reduce Significant Health and Air Impacts*²³

As articulated in the SDEIR/S, significant air impacts will result from construction activities at LAX. The construction schedule for Alternative D is large and ambitious, requiring a total of 34 work crews of different types and sizes, utilizing dozens of pieces of heavy-duty diesel-burning construction equipment for years. (SDEIR/S 4,541-542; Table S4.20-2.) Such a massive undertaking will cause significant negative air pollution. Specifically, “emissions from construction equipment, haul vehicles, earth-moving activities, and employee vehicles . . . could exceed the South Coast Air Quality Management District's construction emissions threshold for carbon monoxide (CO), volatile organic compounds (VOC), nitrogen oxides (NO_x), and particulate matter (PM10).” (SDEIR/S, ES-47). Even with mitigation measures in place, LAWA acknowledges that “mitigated construction emissions of CO, VOC, NO_x, and PM10 would

²³ Significant portions of this analysis are taken from the briefing paper “Rebuilding Lower Manhattan: A Clean Air Initiative,” Environmental Defense, January 11, 2002. Primary authors are Jacquelyn Cefola, Janea Scott and Andrew H. Darrell of Environmental Defense.

remain significant for Alternative D." (SDEIR/S, 4-569.) These construction impacts will have ongoing negative effects as construction is projected to last at least 10 years. (SDEIR/S, 4-539.)

We have several concerns already articulated in the air quality section of our comments, including the need to include air pollution analysis for PM2.5, which has thus far been missing from LAWA's calculations. The use of construction equipment using "cleaner burning diesel" fuel and exhaust emission controls is referenced in the Recommended Mitigation Measures Components. (SDEIR/S, 5-49.) However, in light of the construction need to use diesel vehicles and equipment over an extended period of time, we believed it essential to directly address our environmental health concerns with the diesel emissions spewing from these vehicles, and recommend several specific mitigation measures to reduce these harmful emissions from affecting our air.

Construction Vehicles Are Generators of Dangerous Particulate Matter

There is an urgent need for heavy-duty diesel vehicles, especially "nonroad" vehicles at the LAX, to take all practical steps to reduce emissions of fine particulates and other damaging airborne contaminants. Vehicles present during construction of the LAX expansion will include backhoes, bulldozers, excavation machines, dump trucks, cranes, diesel generators, and all-terrain vehicles. Nonroad vehicles pose a special threat to air quality, because they are major contributors of fine particulate matter (also known as PM2.5 because the particulates are smaller than 2.5 microns in size) and oxides of nitrogen (NOx), a key ingredient in the formation of ground-level ozone. Since nonroad engine standards have lagged considerably behind those for highway diesels, nonroad engines are more polluting than their highway counterparts.

Nationally, nonroad diesel engines emit more fine particles than all the nation's passenger cars and trucks, heavy-duty onroad diesels and electric utilities *combined*. Diesel particles pose the single greatest source of cancer risk from air pollution. Public health organizations, including the National Institute for Occupational Safety and Health, the World Health Organization, the U.S. Environmental Protection Agency (EPA), the California EPA and the Department of Health and Human Service's National Toxicology Program, have associated diesel exhaust or diesel particulates with increased risk of cancer. Epidemiological studies show increased lung cancer risks ranging from 20% to 89%.

In addition, the fine particles from diesel that are breathed deep into the lungs are responsible for thousands of premature deaths from other causes every year. There is a well-researched body of epidemiological studies from around the world that documents the serious effects associated with exposure to particulates. These studies report an association between particulate air pollution and reductions in lung function, respiratory symptoms, school absenteeism, increased use of asthma medications, doctor visits, emergency room visits, hospital admissions, and premature death. In 1997, U.S. EPA established health standards for PM2.5 for the first time. In reviewing the basis for EPA's standards the D.C. Circuit Court rejected industry attacks on the underlying science and specifically held that EPA had an ample basis for

its action. Since that decision, there have been significant new research findings that powerfully corroborate EPA's findings about the adverse health effects associated with fine particles.

The following discussion, summarizing some of the recent PM_{2.5} health effects studies, is drawn from analysis produced by the American Lung Association. Long-term epidemiological studies indicating that fine particles increase the risk of early death have recently been validated by an independent reanalysis.²⁴ New studies show that chronic exposure to particulate pollution shortens lives by one to three years.²⁵

A study of the 90 largest U.S. cities found strong evidence linking daily increases in particle pollution at contemporary levels to increases in daily death rates, and in hospital admissions of the elderly.²⁶ These results are consistent with a study of 12 European cities. Particulate pollution has been tied to low heart rate variability, a risk factor for heart attacks. A chamber study with human subjects found that concentrated air particles can induce pulmonary inflammation and increase concentrations of fibrinogen in the blood, a risk factor for clotting and heart attacks.²⁷

Particulate pollution worsens bronchitis in asthmatic children. Children experience declines in lung flow and increased symptoms such as cough, phlegm production, and sore throat after particle exposure, but children with asthma are more susceptible to these effects than other children. Children's emergency room visits for asthma increase on high particle pollution days. People most sensitive to fine particle pollution are infants and children, especially those with asthma, the elderly, and people with pre-existing heart and lung conditions.

Studies of particulate matter and mortality have not identified a threshold or "safe" level of exposure. It is therefore crucial to the health of workers and the surrounding communities that nonroad vehicles in the LAX area use state-of-the-art technology to lower emissions of PM_{2.5}.

Nonroad engines also generate a toxic cocktail of other pollutants, ranging from carbon dioxide to nitrogen oxides. For example, as a vehicle class, they emit more than 5 million tons of nitrogen oxides (NO_x) each year – this is more than 20% of the total national NO_x emissions from *all* sources. Nitrogen oxides are significant contributors to ground-level ozone or smog, acid deposition, eutrophication of coastal bodies of water, fine particulate emissions and haze.

4.20.8 Mitigation Measures Specific to Construction Equipment

There are a number of ways – some of them outlined below – to reduce air pollution at LAX during the years-long construction process. Used in combination, better equipment management, new contractual incentives and effective retrofit technologies can reduce harmful diesel emissions without slowing the pace of construction. Some of these techniques have already been proven effective at other large-scale urban construction sites, including, for example, Sydney in preparation for the Olympic Games and at Boston’s “Big Dig”. Also, there are opportunities for pilot projects using more advanced technologies – pilot projects that could make the LAX expansion contribute to better standards for construction around the country.

Improve equipment management and contractual incentives

Stop engine idling. Users of heavy-duty diesel equipment (both onroad and nonroad) often keep their engines idling when their equipment is not in use. It’s against the law for any motor vehicle registered in Massachusetts to idle for more than five minutes. Similarly in Los Angeles, contractors should prevent their employees from idling for more than five minutes when their equipment is not in use.

Ensure appropriate equipment maintenance and inspection. Fleet managers need to keep their equipment in good repair. This is essential not only for the engines to operate efficiently, but also to ensure that emission reduction technologies can be used effectively. As with onroad vehicles, nonroad equipment should have regular, periodic inspections, including smoke testing.

Encourage the use of better equipment through incentives. Construction permits and contract specifications should be structured to give contractors preference if they retire old equipment and purchase new equipment with engines that meet future regulatory requirements. Through contract specifications, equipment owners can also be encouraged to purchase alternative fuel (non-diesel) equipment such as electric or propane forklifts, solar signboards and fuel cell generators. Further, as used in Boston’s “Big Dig” project, contract specifications can create incentives for equipment owners to use retrofit technologies to reduce harmful diesel emissions.²⁸

Take advantage of technological solutions

Use low sulfur diesel fuel with after-treatment technologies. Whenever possible, low sulfur fuels should be used in place of regular onroad and nonroad diesel fuels. By itself, low sulfur fuel can lower particulates 10-20% when used to fuel onroad vehicles. But more importantly, low sulfur fuel enables aggressive after-treatment technologies that dramatically

²⁸ For more information about the use of contract specifications see Drew Kodjak, Coralie Cooper, and Ingrid Ulbrich, “Final Report, Development of State Economic Incentives to Promote the Purchase and Use of Low Polluting Heavy-Duty Vehicles,” New England States for Coordinated Air Use Management (NESCAUM), November, 1999.

reduce particulates, NO_x, hydrocarbon (HC) and carbon monoxide (CO) in diesel exhaust. The same is true for construction equipment and other nonroad vehicles: when low sulfur diesel fuel is used with after-treatment technologies, there are immediate and striking reductions in air pollution.

Because of these benefits, low sulfur diesel fuels will be required nationally as part of new regulations promulgated by the federal Environmental Protection Agency for onroad heavy-duty vehicles, to take effect in 2006. This supply should be expanded for use by public and privately owned onroad and nonroad vehicles working on the LAX expansion. There are multiple suppliers who have the capacity to provide low sulfur diesel fuel to LAX. For vehicles fueling at the construction site, low sulfur fuel could be provided through multiple small storage tanks, a large centralized tank or dedicated fuel trucks. With the availability of low sulfur fuel, vehicles at LAX would also have the ability to use important after-treatment devices like particulate filters, oxidation catalysts, selective catalytic reduction and other emerging technologies that are available now (described below). These technologies would immediately and dramatically improve air quality.

Diesel Particulate Filters

Diesel Particulate Filter Schematic

Source: MECA, Clean Air Facts, Emission Controls for Diesel Engines

Diesel particulate filters can reduce particulates, HC, and CO emissions by 60%, as well as significantly reduce emissions of other toxics including aldehydes.²⁹ Particulate filters can be installed on new or existing equipment, sometimes as muffler replacements, to trap particulate matter in the exhaust.³⁰ Some filters also have a catalyst system, activated by heat from the exhaust, to further combust or oxidize the particulates and exhaust gases. Diesel particulate filters require the use of low sulfur fuels.

²⁹ EPA's verified level of reduction for Johnson Matthey Continuously Regenerating Technology (CRT), as listed at www.epa.gov/otaq/retrofit/retrofitverifiedlist.htm.

³⁰ Kodjak et al., Attachment D, "The Clean Air Construction Initiative, Diesel Particulate Filters Technology Description and Overview of Operational Issues."

Diesel particulate filters have been installed on thousands of onroad vehicles, primarily trucks and buses. They have also been installed and tested on nonroad equipment. The Manufacturers of Emission Controls Association (MECA) estimate the cost of particulate filters to be \$3,250 to \$5,500 per engine.³¹ Using diesel particulate filters on onroad vehicles and demonstrating the technology on nonroad vehicles used during reconstruction would yield tremendous improvements to air quality in the LAX construction area.

Oxidation catalysts

Diesel Oxidation Catalyst Functional Diagram

Source: MECA, Clean Air Facts, Emission Controls for Diesel Engines

Similar to catalytic converters on cars, oxidation catalysts for diesel vehicles reduce emissions of particulates by 20%, HC by 50%, and CO by 40%. They also cut down on aldehyde, smoke and odor.³² The catalysts can be added to a vehicle's exhaust system or installed as replacement mufflers. Low sulfur fuel improves the performance of oxidation catalysts. Oxidation catalysts can be installed by themselves on new or existing equipment or with other after-treatment technologies, including particulate filters. Oxidation catalysts have already been installed on millions of onroad and hundreds of thousands of nonroad vehicles. MECA estimates the costs of oxidation catalysts to be between \$975 and \$1,750 per engine.³³

Selective Catalytic Reduction (SCR)

SCR systems add a reductant (usually urea) to diesel exhaust. The exhaust and reductant are processed by a catalyst to then reduce particulates, HC and NOx (the reductant aids in converting nitrogen oxides to nitrogen and oxygen). Initial results from SCR being used in combination with other technologies show a possible 75% reduction of NOx and a 25%

reduction in particulates, as well as a significant HC reduction with the use of low sulfur fuel.³⁴ MECA estimates SCR's cost to be \$10,000 – \$50,000/engine.³⁵ Marine vessels, ferries and trains have successfully installed SCR. Given the great potential to reduce both nitrogen oxides and particulate matter, the demonstration of SCR on generators at LAX would yield important results.

Emerging technologies

Using low sulfur fuel would also enable equipment owners to participate in tests of new technologies like engine gas recirculation (EGR), lean NOx catalysts, and NOx absorbers that have potential to drastically reduce emissions. For example, NOx absorbers have the potential to reduce NOx emissions by 60-70%.³⁶

Also, it is important to note that these technologies, while highly effective in their own right, may also be used in combination to generate higher reductions in emissions. For example, SCR might be used with a particulate filter and/or EGR system for great reductions in NOx, particulates, HC and CO.

Also use technologies that can immediately reduce emissions without low sulfur fuel.

With or without low sulfur diesel fuels, several alternative technologies can be used to reduce air pollution at LAX. For example:

Oxidation catalysts and Selective Catalytic Reduction (SCR)

Both described in detail above, oxidation catalysts and SCR systems can be installed on new or existing equipment to generate real and immediate reductions in air pollution from diesel exhaust. While aided by the use of low sulfur fuel, both technologies continue to show significant emissions reductions even when they are used with regular onroad and nonroad diesel fuel.

Emulsified fuel

Fuel emulsion is widely available and has been tested for many onroad and nonroad diesel engines. Results show emulsified fuel can be used with any diesel engine including generators, marine vessels, and construction equipment. Emulsified fuel can lower NOx by 30% and particulates by 50%. Though it lowers fuel economy by 15%, the emissions reductions from emulsified fuel outweigh this increase in fuel consumption. Emulsified fuels can also be used in combination with other after-treatment technologies, such as oxidation catalysts, to further reduce diesel emissions.

4.24 Human Health and Safety (CEQA)³⁷

4.24.1 Human Health Risk Assessment

LAWA and the FAA Violate the Fundamental Purpose of CEQA by Failing to Develop and Analyze Information About Toxic Air Pollutant Emissions From Aircraft

The basic purposes of CEQA include “[i]nform[ing] governmental decision-makers and the public about the potential, significant environmental effects of proposed activities” and “[i]dentify[ing] the ways that environmental damage can be avoided or significantly reduced.” (Guidelines §15002(a).) “An EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences.” (Guidelines §15151.) “Direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects.” (Guidelines §15126.2(a).) Thus, if information about the environmental consequences of agency decisions does not exist, CEQA requires the decision-making agency to develop and analyze that information.

Contrary to this requirement, LAWA and the FAA have failed to develop and analyze information about toxic air pollutant (TAP) emissions from aircraft engines. Instead, LAWA and the FAA offer the inadequate excuse that “there is very little current data, research information, and analysis on TAPs resulting from airport operations. This is particularly true relative to TAP emission factors for aircraft.” (SDIER/S, p. 4-614.) The absence of accurate TAP emissions data for aircraft results in an inadequate and fatally flawed analysis of human health risk impacts. Ignorance is no defense for failing to comply with CEQA. This lack of testing data does not excuse LAWA and the FAA’s failure to conduct an adequate environmental assessment based on an accurate analysis of aircraft engine TAP emissions data. LAWA and the FAA should conduct the necessary studies to identify and analyze aircraft engine TAP emissions and revise the EIR/S accordingly.³⁸

³⁷ Specific issues relating to Human Health and Safety were raised by several commentators on the 2001 Draft EIR/EIS for the LAX Master Plan. We hereby incorporate by reference those comments, including but not limited to the comments submitted by Natural Resources Defense Council on this topic, and request that they be included in the administrative record for this project.

³⁸ A February 2003 study completed by the General Accounting Office (GAO) confirms this assertion. Based on an analysis of aviation-related emissions of nitrogen oxides at 19 airports, the GAO recommends that the FAA “develop a strategic framework that addresses the need for information on the extent and impact of emissions, identifies reduction options, establishes goals and timeframes for achieving needed reductions, and defines the roles of government and industry in developing and implementing reduction programs.” (*Aviation and the Environment, Strategic Framework Needed to Address Challenges Posed by Aircraft Emissions - A Report to the Chairman, Subcommittee on Aviation, House Committee on Transportation and Infrastructure, GAO, February 2003, found at www.gao.gov/cgi-bin/getrpt?GAO-03-252*).

Request for Notification

Pursuant to California Public Resources Code Section 21092(b)(3), we request that LAWA please mail any and all public notices or information concerning the SDEIR/S to:

Conclusion

In conclusion, we request that LAWA and the FAA include in the administrative record for this project these comments and the exhibits attached hereto. We also request, and CEQA requires, that LAWA and the FAA consider these comments and prepare a written “good faith reasoned analysis” in response to our comments. (Guidelines §15088(b).) This analysis cannot include conclusory statements unsupported by facts. (*Ibid.*) Thank you for considering and responding to our comments.

SDEIR/S Comments Submitted by the LAX Coalition for Environmental, Economic and Educational Justice

**ADDENDUM TO COMMENTS ON LAX EIR/EIS SUBMITTED BY THE
WESTCHESTER/LAX/MARINA DEL REY CHAMBER OF COMMERCE**

Westchester/LAX/Marina del Rey

Chamber of Commerce

INTRODUCTION

The Westchester/LAX/Marina del Rey Chamber of Commerce is an organization dedicated to the promotion of business opportunity in our service area which includes Westchester, Playa del Rey, and Marina del Rey. The Chamber has extensively reviewed the proposed plans for expansion of Los Angeles International Airport.

In contrast to our review and conclusions regarding Alternatives A, B and C, we are pleased to find that the adverse and negative impacts on our communities identified in our previously submitted comments are in fact mitigated by Alternative D. As a result, after reviewing the Supplemental EIR/EIS documentation, the Chamber Board of Directors voted overwhelmingly to support the Alternative D.

The Chamber specifically wishes to acknowledge and commend LAWA and in particular Deputy Executive Director Jim Ritchie for their willingness to work with the Chamber to maintain a dialogue regarding the future of LAX modernization and expansion and their willingness to discuss potential ways to accommodate the concerns raised by the Chamber in meetings with LAWA officials – even after the Chamber took its official position in opposition to Alternatives A, B and C. The free access to the design team provided to the Chamber is in contrast to the past experiences we had on this issue and was instrumental in assisting us to develop a thorough understanding of Alternative D.

In addition, we should note for the record that the Chamber not only reviewed every page of the Supplemental EIR/EIS, we interviewed a number of individuals and organizations with critical information necessary to evaluate the proposed plan. Of particular note, we met extensively with both the author of the RAND paper and SAIC officials to focus on security issues which were not the focus of almost anyone's analysis of the prior alternatives which were issued prior to 9/11.

These written comments¹ to the EIR are focused on the impacts of the proposals on the surrounding business and residential communities served by the Chamber.² As a result,

¹ For ease of reading, throughout these comments, references made to specific pages and figures in two documents submitted by Los Angeles World Airports ("LAWA"). The LAX Master Plan, Draft, dated November 7, 2000 (released 1/18/01), will be referred to as the "MP"; references made to the EIR/EIS and its Supplement will refer simply to the "EIR". Page numbers (e.g. p.271) refer to the page numbering in the relevant electronic documents of the EIR and MP as distributed in Adobe Acrobat for ease of reference by the reader.

² These comments are submitted pursuant to the California Environmental Quality Act ("CEQA") and the National Environmental Policy Act ("NEPA"). As an interested party as defined by CEQA §15086(a)(4), the geographic area defining the Chamber's membership is proximate to LAX and is an area which the EIR admits will be significantly impacted by the proposals.

our focus in submitting these comments is on those portions of the EIR which impact upon these issues. Our focus has not been on impact on air quality, hydrology and water quality, cultural resources, biotic communities, endangered and threatened species, wetlands, floodplains, coastal zone management, light emissions, solid waste, hazardous materials or any number of other areas required to be included in the EIR.

In our 2001 comments, we specifically identified negative impacts which were not properly mitigated. If the reader of these comments will compare the comments we previously submitted to Alternative D, it becomes plain to see that the issues we identified therein were fully addressed in the planning of Alternative D - almost to the point that one could make the point that the prior comments appear to have been used as a roadmap for designing the present alternative.

We previously wrote:

"From the perspective of legally relevant criticism of an EIR/EIS, the overriding flaw repeated throughout the document is the failure to either disclose known impacts on the community or to provide the legally required alternatives which yield a lesser impact to the preferred alternative. In the present case, there is no alternative for development presented that would mitigate the impacts of development more than preferred Alternative C. These are fatal flaws which should cause the EIR/EIS to be rejected outright.

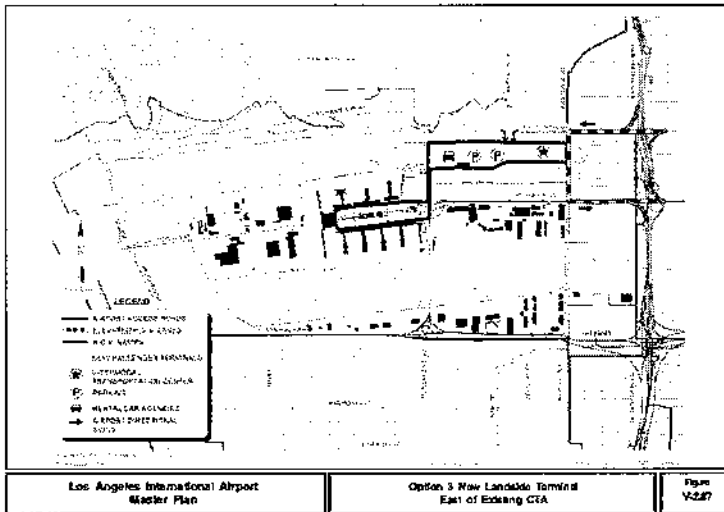

Compliance with law relating to the EIR mandates that less intrusive alternatives be reviewed – yet, as is often the case with the EIR, although less intrusive alternatives in fact exist, the EIR fails to disclose that there are alternatives that have dramatically reduced impact on surrounding business and residential communities."

By contrast to Alternatives A, B and C, we believe that the Supplemental EIR for Alternative D does adequately address and mitigate our prior concerns. In addition, it meets the requirements of NEPA/CEQA in providing a less intrusive proposal by constraining growth to 78.9 MAP and reduces impacts on surrounding communities in comparison to both the prior alternatives and No Action/No Project.

In the comments contained herein, we make reference to those impacts previously identified by our 2001 comments on Alternatives A, B and C and contrast those with the impacts associated with Alternative D to draw the conclusion that we should support the current alternative.

Prior Impact #1 – Destruction of the Westchester Business District

The primary reason for the dislocation of businesses in the South Westchester Business District we identified in Alternatives A, B and C was the intrusion of the underpass on Sepulveda where it passes below grade underneath the proposed Ring Road. A number of factors contributed to the problem, but most importantly was the proposal for the relocation of the Northernmost runway further to the North to allow for a taxiway between the North runways. Moving Runway 24R North by 350 feet moves the commencement point for the transition to the underpass ramp that much further North as well. Our prior comments suggested that Option 3 in the MP³ presented a preferable alternative. As we noted:

“Option 3 demonstrated the feasibility of an alternative plan which had in its features neither a ring road, nor a West Terminal.⁴ Option 3 therefore also has the advantage of having the least impact on surrounding communities and has an Intermodal Transfer Center.”

Comparison to Alternative D – Note the striking resemblance between Option 3 which we advocated in 2001 and Alternative D! Relocation of the GTC to the East side of the existing CTA obviates the need for the Ring Road and the objectionable undercrossing. Additionally, Alternative does not move Runway 25R 350' to the North, but rather it moves Runway 25L 350' further South. The difference between the plans is clear and unmistakable – Alternative D is the difference between wiping out a vast swath of a revitalized community business district and leaving it intact!

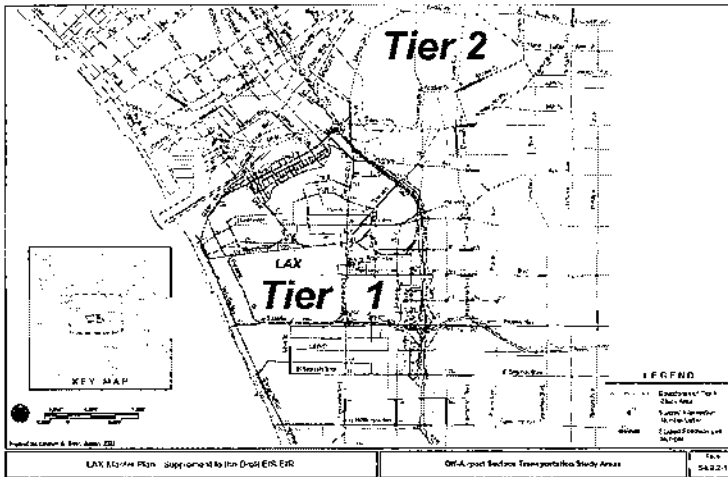

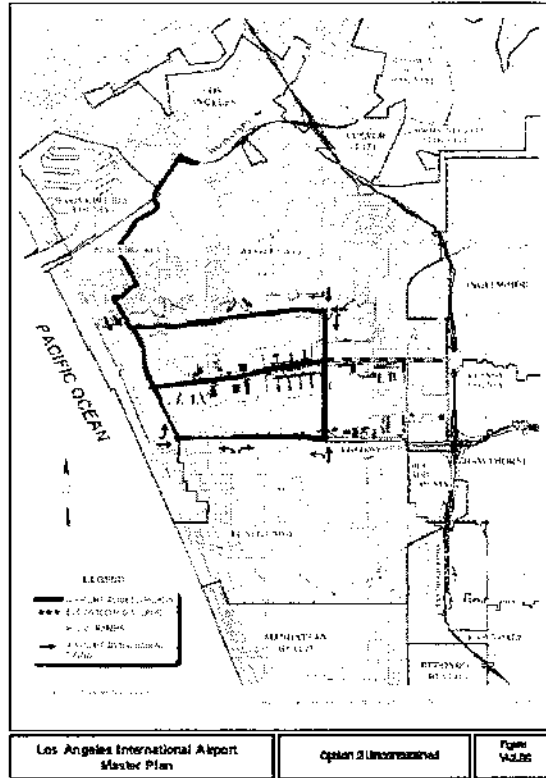

³ Analysis of 2d Iteration Option 2, Unconstrained, Description Summary, MP, Chapter 5, Part 1, p.251, Figure V-2.86.

⁴ 2d Iteration Ground Access Options, MP, Chapter 5, Part 1, p.177, Figure V-2.51

Prior Impact #2 – Traffic impact on communities represented by the Chamber.

The plans identified previously were designed specifically to draw traffic through a “backdoor” down Culver Blvd. to Pershing Blvd. in order to create a second gateway for access through the heart of Westchester and Playa del Rey communities

Comparison to Alternative D – Unlike Alternatives A, B and C, Alternative D does away with the ring road and the proposal to draw traffic through to the airport on Culver, Jefferson, Pershing and Lincoln. Instead it more logically moves the GTC and ITC to locations proximate to the freeway rather than bringing traffic through our communities. This is extremely similar to Option 3 which the Chamber previously advocated as a preferred alternative, except that Alternative D also states a preference for a “closed loop” which was expressly requested by our prior comments. In fact Alternative D is a closed loop system in which “Internal vehicle circulation in the GTC would be fully separated from the existing public road system.”

The traffic studies contained in the Supplemental EIR are uncontradicted by any information available to the Chamber. They specifically demonstrate that traffic will not come through our neighborhoods as would have been the case with A, B and C. By contrast, community proposals for a “conference center” on the site of the GTC would likely be far more disruptive to the adjacent communities as they would not have a closed loop system as proposed for Alt. D.

Furthermore, unlike Alternatives A, B and C, Alternative D does not disrupt any of the major North/South commuter roads and in fact moves the entry point of the airport away from Century and Sepulveda potentially actually improving the traffic on these congested commuter arteries.

Additionally, our prior comments criticized LAWA for failing to include an Intermodal Transportation Center in Alternatives A, B or C. As the EIR notes:

“LAX is one of the few major airports in the U.S. that does not have a direct link between its regional roadway system and the airport terminal. The I-105 freeway ends at Sepulveda Boulevard on which vehicles transition to the airport roadways. A large proportion of airport traffic travels on Aviation, Century, Lincoln, and Sepulveda boulevards and other local streets, contributing to congestion, noise, and air pollution in neighboring communities.

The benefits of direct freeway access to LAX would include a segregated flow of traffic from the region to the passenger and cargo terminals. This would reduce the impact of traffic on the airport's local communities by keeping cars bound for the airport out of business districts, which depend on unimpeded access, and out of residential neighborhoods. Direct rapid transit access is one of the best ways to ensure that employment opportunities associated with the airport are available to all of the region's residents. While transit systems can attract a modest amount of airport passenger traffic, other cities have found that the greatest benefits of rapid transit result from increased accessibility by employees and fewer employee vehicle trips to and from the airport area. A transit link would reduce the need for remote employee parking lots and corresponding shuttle bus traffic. The overall need for roadway improvements would be proportionally reduced”⁵

Our fact finding regarding Alternative D has also revealed that as much as 30% of the expected passengers coming to LAX will make use of the ITC. It is well known throughout the community that the prior failure to link the Green Line with LAX is roundly criticized as a blunder of planning. With the ITC as proposed in Alternative D, we will remove vehicle trips to the airport by making mass transit convenient to use and integrated into airport design.

Alternative D follows the logic of this thinking whereas none of the prior Alternatives A, B and C placed LAX access adjacent to the 405, nor did they include an ITC. These design features of Alternative D will reduce traffic impact on our communities.

⁵ EIR p.2-10.

Prior Impact #3 – Noise impact on communities represented by the Chamber

Alternatives A, B and C were criticized because they moved Runway 25R 350 feet *towards* our communities thereby moving the noise envelope represented by the sound contours revealed in the EIR that much further intrusively into our communities. Furthermore, it must be remembered that the Manchester Square area would have been utilized for an expansion of cargo operations. As such, cargo jets would have taxied all the way to Manchester Square, and adjoining residents would literally have had 747's operating directly proximate to their neighborhoods.

Comparison to Alternative D – Instead of moving runways closer to residents, Alternative D moves them further away. Specifically, we believe that the current design proposal to move Runway 25L 350 feet South is a dramatic improvement. Since the inboard runway is used for takeoff procedures, especially at night, this move strikingly moves the noise contours much further away from the community.

Furthermore, although not quantified in the documentation, there can be no question that the absence of cargo jets from the Manchester Square area is by comparison a significant reduction in projected noise for the communities surrounding that area.

It also bears repeating that the Chamber previously requested high-speed runway exits which are facilitated by adding a centerline taxiways as in Alternative D. We noted that the MP stated the following:

"Construction of high-speed exits from arrival runways. This measure is incorporated into the Master Plan configuration to enhance the efficiency of traffic flow, but would also reduce the time an aircraft remains on the runway and require less application of reverse thrust to slow the aircraft. As the aircraft exits the runway toward the interior of the airfield, it would move away from the adjacent residential areas north and south of the complex, thus reducing the noise levels from the arrivals."

In that portion of our prior analysis we also raised our concern over runway incursions and demanded that:

"This safety issue is not only inadequately addressed by the EIR which is outdated on this topic, it must by necessity cause a complete reconsideration of the proposed runway design and the installation of a taxiway in between runways which is designed to facilitate planes crossing the inner runway to the outer runway both prior to takeoff and following landings. It would be highly imprudent to leave this issue inadequately updated with the latest data and thinking while simultaneously advocating a major runway redesign which appears to run contrary to current thinking on this safety issue."

Subsequently available information from NASA reviewing the South runway complex concluded that centerline taxiways will increase flight safety. NASA concluded that "...the

concept of a center taxiway would be effective in reducing runway incursions at LAX." This study⁶ was "an extension of the Phase I and II studies conducted at FFC in February and April, 2001." LAWA has therefore met our prior criticism regarding updating thinking on runway design.

⁶ Study Objective: Los Angeles International Airport has the fourth busiest airfield in the nation. Air traffic has grown rapidly over the past ten years. However, the airfield and airspace have the same capacity and configuration they did ten years ago. Runway incursions have also increased over the past five years. **Despite numerous changes to pavement markings, operating procedures, taxiway lighting and air traffic control procedures, the number of incursions continues to be of grave concern.** The FAA and the City of Los Angeles Department of Airports (the operator of Los Angeles International Airport) has determined that resolving the runway incursion problem requires a more robust analysis of operations at Los Angeles International Airport.

Security as a New Issue:

Touted as a "Safety and Security Plan", we believe that the findings of SAIC are credible. Most importantly, it is impossible to secure a facility and the passengers traveling through it without stopping the flow of unscreened vehicles into the Central Terminal Area.

The SAIC report finds that existing facilities are inadequate to handle screening necessary at heightened threat levels such as orange or red – the times when we would most need to have capacity to handle airport security. By contrast, the RAND paper was based solely on Green level threat condition. At Yellow, Orange or Red congestion creates the additional threat that gridlock will prevent access by emergency response vehicles to the CTA to respond to a crisis.

It should be noted for the record that at one of our meetings, RAND author Dr. Schell publicly stated that he does not disagree with any of the findings in the SAIC analysis.

RAND considered a car or truck bomb not to be a credible threat because history of attacks at airports did not include this type of attack. The RAND author acknowledged that this analysis would not have predicted 9/11 attacks, nor did it include car/truck bomb attacks on other terrorist target including WTC, Beirut, Oklahoma City, etc. as it was confined only to airports. RAND's use of history as a predictor completely ignored that LAX was in fact a terrorist target for a car bombing in December, 1999 and we agree with the concern expressed by SAIC over this threat.

Furthermore, the opportunity to design new passenger handling facilities from scratch will allow items such as reverse airflow HVAC and other technologies to enhance passenger safety where they cannot be retrofitted into existing facilities.

The LA Times even reported that: "LAX Ranks No. 1 on State List of Terrorist Targets: Attorney general names 624 sites thought to be most attractive to terrorists, including ports, the Golden Gate Bridge, bottling plants." As such, it is folly to believe that we will not be attacked again. We must take every precaution to protect this economic asset and the people that pass through it.

Conclusion

Alternative D is in fact responsive to the concerns previously raised by the Chamber in commenting on Alternatives A, B and C. It is less intrusive and in many respects far superior to No Action/No Project which would not constrain growth, move runway 25L South or provide the closed loop traffic system included in Alternative D.

Ultimately we must again repeat that we do note one inescapable truth inherent in every one of the proposed Alternatives – they are obsolete as soon as they are built. None of the proposals can meet the needs of the Southern California area for future air travel. We therefore support a dual track approach of support for Alternative D while simultaneously pushing forward to develop a regional solution.

As required by law, LAWA must respond to these comments in writing providing the necessary information, analysis, and as applicable, additional technical reports.⁷ Said written responses to the comments contained herein shall be directed to:⁸

Mr. Jim Ritchie
City of Los Angeles
Los Angeles World Airports
Master Plan Office
Post Office Box 92216
Los Angeles, CA 90009-2216

Dear Mr. Ritchie:

The Los Angeles Airlines Airport Affairs Committee (AAAC) and the Air Transport Association of America, Inc. (ATA), jointly submit the attached comments regarding the LAX Master Plan Addendum and the Supplemental Draft EIR/EIS, which analyze the new project design termed Alternative D.

The Los Angeles AAAC represents the more than 80 airlines serving Los Angeles International Airport (Airport) in matters affecting their common interest at the Airport. The ATA is the primary trade association of the U.S. scheduled airline industry, representing 23 airlines, including all major domestic passenger and cargo air carriers.

On behalf of our respective airlines, we appreciate the opportunity to provide these comments, and look forward to working with the LAWA staff, the Mayor's office, the City Council and other stakeholders regarding this important matter.

Thank you, and please don't hesitate to contact us if we can be of assistance.

Sincerely,

David A. Berg
Vice President & General Counsel
Air Transport Association

Kelley A. Brown
Executive Director
Los Angeles Airlines Airport Affairs Committee

COMMENTS TO LAX MASTER PLAN ADDENDUM AND
SUPPLEMENTAL EIR/EIS

Submitted by

LOS ANGELES AIRLINES AIRPORT AFFAIRS COMMITTEE
AND
AIR TRANSPORT ASSOCIATION OF AMERICA, INC.

The Los Angeles Airlines Airport Affairs Committee (AAAC) represents the more than 80 airlines serving Los Angeles International Airport (LAX) and the Air Transport Association of America, Inc. (ATA) is the primary trade association of the U.S. scheduled airline industry, representing 23 airlines, including all major domestic passenger and cargo air carriers. The Los Angeles AAAC and ATA are jointly submitting these comments regarding the LAX Master Plan Addendum and the Supplemental Draft EIR/EIS, which analyze the new project design termed Alternative D.

The airlines strongly believe that LAX needs to be modernized in order to continue to effectively serve the traveling public and to remain the key economic engine for the region. The airlines also share the vision for a safer, more secure and user-friendly LAX, which are the stated objectives of Alternative D. However, Alternative D falls far short of these objectives because it does not appear to enhance security, and it makes it harder for Southern Californians to use LAX by restricting private vehicles from the terminals and funneling passengers through a remote facility. Moreover, it fails to achieve these objectives at the staggering estimated cost of over \$9 billion.

A. The Airlines Support the Components of Alternative D that Provide for Immediate Safety, Security and Improved Customer Service at LAX.

Several components of Alternative D are needed immediately for improved safety, security and customer convenience. The airlines support the following components of Alternative D, with some recommendations on their phasing.

1. The Airlines Support the South Airfield Improvements Proposed in Alternative D that Address a Critical Airfield Safety Need.

The relocation of Runway 7R/25L to the south by 50 feet and the addition of a new centerline taxiway would improve the safety margins and efficiency of LAX, and help prevent runway incursions, which have become a serious safety issue on the south

airfield. The airlines support this component of Alternative D and will continue to work with LAWA in the design of these projects. Any adverse impact to aircraft parking gates in the cargo areas on the south side of the runway would need to be mitigated.

2. The Airlines Support Measures that will Provide Effective Security Improvements.

The security improvements mandated by the federal government, primarily the \$300 million installation of in-line checked baggage screening systems in the passenger terminals, should begin immediately. In addition, the security checkpoints in the terminals should be expanded to expedite passengers into the secure areas, and the terminals should be hardened as appropriate to minimize damage and make the terminals less attractive terrorist targets.

3. The Airlines Support Construction of a Consolidated Rental Car Facility and the Expansion of the Flyaway Bus System to Reduce Traffic Congestion and Provide Improved Customer Service.

The development of a consolidated rental car facility (RAC) would improve traffic flow in the Central Terminal Area (CTA) by greatly reducing the number of buses. The expansion of the flyaway bus system throughout the Los Angeles area reduces single-occupancy traffic in both the CTA and in the adjacent roadways. In addition, fewer vehicles in the CTA should allow better response times by emergency vehicles, thereby improving security and public safety.

4. The Airlines Support the Renovation of Tom Bradley International Terminal, but it Should Begin Immediately, not Delayed until 2012, as Proposed in Alternative D.

Alternative D includes the addition of gates on the west side of the Tom Bradley International Terminal (TBIT) and the development of related support facilities. Those improvements are scheduled to begin in 2012 and be completed in 2015, at which point TBIT would be capable of accommodating the A380 aircraft.

TBIT is the gateway to Los Angeles for millions of international travelers each year. In order to improve the current passenger service levels, which are substandard, the terminal is in immediate need of the refurbishment currently under design. Further, the airlines support the reconfiguration of TBIT to add gates on the west side of the facility along with related support space. These gates would replace remote gates at the west end of LAX and would provide a significant improvement in customer service by eliminating the current busing operation.

This reconfiguration of TBIT would include A380-compatible gates on the west side of the terminal. To date, seven airlines serving LAX, most of which operate from TBIT, have ordered the A380, with the probability that LAX will be among the first airports served with the new equipment, which is scheduled to be in service by the end of 2006.

If the TBIT refurbishment does not begin immediately, the region risks losing service by the A380, particularly if TBIT is not capable of accommodating the A380 until the time frame proposed in Alternative D, almost 10 years after the A380 is expected to arrive.

To the extent that these TBIT improvements require the relocation of the centerfield taxiways west of TBIT, any resulting impact to the facilities at the central maintenance area would need to be mitigated. This could be accomplished by relocating displaced facilities to another area at the west end of the airfield, without impacting any ongoing environmental remediation activities.

B. The Airlines Do Not Support the Components of Alternative D that Do Not Enhance, and May Substantially Reduce, Security and Customer Service at LAX.

1. Security Is of the Utmost Importance, and Certain Components of Alternative D Present Greater Security Risks than Currently Exist at LAX and Should Not Be Pursued.

The airlines strongly support improving airport security. However, Alternative D does not provide any measurable improvement in security, and may, in fact, present greater security risks than that of the existing terminal configuration. Eliminating vehicular traffic in the CTA, as proposed in Alternative D, is being touted as the primary increased security measure; however, eliminating curbside service in the CTA appears to only relocate security issues from the existing terminals to the Ground Transportation Center (GTC) and the Intermodal Transportation Center (ITC). Further, forcing nearly all passenger access to the CTA through two facilities rather than eight terminals may actually increase passenger exposure to terrorist threats.

With the addition of the GTC, ITC and Automated People Mover (APM), Alternative D could actually make LAX less secure by substantially increasing the area that would need to be secured against possible attack. Additionally, consolidating access to the CTA on the APM could turn the APM into a target and potentially bring airport operations to a standstill.

A recent Rand Corporation issue paper analyzed the security implications of Alternative D. It suggested that hardening the existing terminals would be an effective deterrent to damage caused by vehicle bombs, but the report pointed out that Alternative D would not enhance LAX relative to other security threats, some of which have a higher likelihood of occurrence and would cause far greater damage than vehicle bombs. For example, Alternative D has little impact on securing aircraft, which should have the highest priority for security considerations in airport planning because it is the most likely, and most lethal, form of attack. Nor does Alternative D affect the impact of small bombs, the most commonly used weapon against airports. (See Rand study entitled *Designing Airports for Security: An Analysis of Proposed Changes at LAX*, Terry L. Schell, Brian G. Chow, Clifford Grammich; Attached as Exhibit A.) Even the study conducted by Science Applications International Corporations (SAIC) to support the conclusion that Alternative

D would improve security from vehicle bombs acknowledges that “terrorist shootings, suicide bombings, and armed criminal action could become an increasingly serious concern as more and more U.S. targets harden against vehicle bombs.” (*Comparative Security Analysis of Alternative D and the No Action/No Project Alternative of the Proposed Master Plan*, SAIC (2003).)

Rather than the proposed Alternative D improvements, security could be enhanced in other ways. For example, security for aircraft could be improved by continuing to emphasize the process of properly securing all passengers and baggage. The airlines believe the terminal buildings could be sufficiently hardened to minimize damage in the event of an attack and could be modified to allow the expediting of passengers into the secure areas, thereby limiting their exposure in the non-secure areas and making the terminals less attractive terrorist targets.

Furthermore, the California Environmental Quality Act (CEQA) requires that an EIR describe a range of reasonable alternatives “which would feasibly attain most of the project objectives.” (14 Cal. Code Reg. 15126.6.) The objectives of the original project are three: (1) respond to local and regional demand for air transportation, (2) ensure new investments in air capacity are efficient and cost-effective, and (3) sustain and advance the international trade component of the regional economy and the international gateway role of the City of Los Angeles. (Supp. Draft EIS/EIR, p. ES-1.) Alternative D does not meet any of these project objectives. Rather, Alternative D appears to be a new project designed solely to meet a new objective – that of improved security.

LAWA, as a lead agency decision maker, can decide that it no longer wants to pursue one project – an expansion project to meet capacity demand – and to pursue a different project – a modernization project to enhance security. That, however, is a new project, and CEQA requires that feasible alternatives that would meet the new project’s objectives be analyzed to ensure that when a new project is proposed, alternatives that would both meet that project’s objectives and minimize the environmental consequences of that new project be studied. As such, an analysis of the alternatives to meet this new project objective has been given short shrift. In this regard, if a proper public scoping of the proposed new project, Alternative D, and the range of alternatives to accomplish Alternative D’s objectives had been completed as required by section 21083.9 of the Public Resources Code, the decision makers in Los Angeles and the public would now have better and more complete information as to the various options to achieve better security at LAX.

To that end, with the assistance of Rivers & Christian, a local architectural firm with significant experience at LAX, the airlines have analyzed the feasibility of alternative security improvements in the existing terminals. In particular, both increasing the blast resistance of the CTA and the security checkpoint capacity were studied.

Prior to undertaking any major security improvements, the desired level of protection for structures, doors and glazing, and personal injury should be assessed. While the airlines are not aware of any such levels being established for LAX, concepts for terminal

renovations to increase blast resistance can be developed based on reasonable standards. Specifically, the terminals could be improved, if necessary, to protect from car or small vehicle bombs that would result in some minor injuries and no irreparable structural damage.

This level of protection can be achieved through a combination of structural reinforcement to both the terminals and the upper level roadway and roadway and curbside management procedures. The cost of these improvements would be largely dependent on the level of refinishing desired in conjunction with the structural changes, as well as the timing of the improvements. For example, they would be significantly reduced if these improvements were accomplished at the same time as other terminal building projects, such as the planned renovation of Terminal 3. As stand-alone improvements, the estimated cost of the structural changes is in the one-half billion dollar range, with up to several hundred million more for terminal finishes. While this should be seen as a high-end cost, it is still significantly more economical than the Alternative D improvements, and it retains the current CTA operation.

Besides the structural improvements, blast protection would be enhanced through changes in operational procedures. The curbside lane on both the upper and lower levels would be restricted to pre-cleared or emergency vehicles, precluding non-cleared vehicles from approaching close to the terminal buildings. Access by large vehicles, such as trucks, vans, and the like, would be prevented by placing vehicle height restrictions at the perimeter.

In addition to increased protection from blasts, the expansion of the security checkpoints to expedite passengers into the secure areas of the terminals would significantly limit security risks. The required scope of these checkpoint expansion projects throughout the terminals would vary by terminal, as some terminals may require extensive work while others may require little or no work, and is dependent on several factors, including the passenger screening and carry-on baggage screening processing times, the passenger activity levels, and any terminal functions which must be relocated to provide additional screening areas. LAWA is currently in the process of determining the space requirements for screening in each of the terminals; however, based on a preliminary analysis, it appears that space sufficient to allow expedited processing under virtually any criteria could be accomplished for between \$30 and \$40 million.

The airlines continue to be fully supportive of complying with all security requirements, and work on a daily basis with the Transportation Security Administration and LAWA to address airport security at LAX. For example, the airlines are intimately involved with the \$300 million project currently under design to relocate the checked baggage screening equipment from the terminal lobbies to the bag makeup areas to be integrated into the baggage systems, improving security and reducing passenger congestion in the lobbies. This project is already underway and is separate from the LAX master planning process.

Terrorism is dynamic, as terrorists continually search for more effective methods to carry out their attacks. On the other hand, airport facilities are capital intensive with long

useful lives. It is extremely difficult to design facilities around potential terrorism threats 20 years into the future. Thus, the airlines urge LAWA to proceed cautiously, make sure that all parties fully understand the security pros and cons and operational obstacles associated with this plan and ensure that no other solutions exist that could provide the same level of security without permanently degrading customer service and convenience. The threat of terrorism should not dominate a plan; rather, security should complement the improvements planned for more efficient operations and benefits to the region.

Finally, flexibility should be built into any master plan to allow LAWA to take advantage of future advances in technology and airport security, so that LAX is not locked into such a drastic approach as keeping private vehicles out of the CTA if other solutions emerge. For example, it is possible that new technology will be in place within the next few years that would allow vehicles to be screened for explosives while they are in motion. In that scenario, vehicles could be allowed access to the CTA after passing through a checkpoint without any adverse impact on traffic flow or customer convenience, and at the same time greatly reducing the risk of car bombs in the CTA.

2. The Airlines Believe that Certain Components of Alternative D Will Result in a Significant Reduction in Customer Service and Should Not Be Pursued.

Fundamental to Alternative D are certain projects, including the GTC, the ITC, the RAC, and an APM, which are being planned in part because of a unique airport planning concept that eliminates private vehicle access to the CTA. Instead, all public, commercial and private vehicles (excepting flyaway buses) would go to the GTC and ITC for parking or for curbside drop-off and pick-up of passengers. The APM would then connect these three remotely-located facilities (GTC, ITC and RAC) with the CTA.

While this may be an innovative concept, it unfortunately creates a significant reduction in the level of customer service. Eliminating close-in parking, prohibiting curbside check-in and forcing almost all traffic to the remote GTC or ITC will make it harder for passengers and their families, who, in addition to navigating surface streets to LAX, will have to ride a people mover some two miles to and from their flight. Further, it is likely that departing passengers will have to check their bags in the CTA, as well as claim them in the CTA upon arrival, making their passenger experience even more uncomfortable, as they will have to carry their bags when transiting between the CTA and GTC or ITC. While a few airports consolidate passengers arriving by rental car, shuttles or hotel vans, no airport in the United States prohibits citizens from dropping off passengers in front of the airline terminal. This is a drastic measure that seriously degrades customer service and would discourage travelers from using LAX, resulting in lost economic benefits to the region.

According to the Master Plan Addendum, baggage may be checked either at the GTC or in the CTA. Baggage must be claimed in the CTA, but may be rechecked and then claimed at the GTC. If these functions are to be accommodated at the GTC, a baggage tunnel and baggage system will likely be required to connect the GTC with the CTA.

The airlines understand that such a baggage tunnel may not be feasible and may ultimately not be included as part of Alternative D.

Whether or not there is a baggage tunnel, this would not be an effective use of the GTC. Instead, all passenger processing functions should continue to take place in the CTA. The logistics involved in removing these functions from the CTA would be extremely complicated, as remote processing presents very difficult technical, operational, and passenger service challenges that have not been fully examined by LAWA's master plan consultants, nor have they ever been successful at any airports to date. Additionally, the capital costs of a baggage tunnel and baggage system would be prohibitive, as would the operating costs of such a system; and the airlines would be forced to duplicate personnel and other resources, which would greatly increase the airlines' staffing and facility costs.

Without a baggage tunnel and passenger check-in at the GTC, passengers would be required to carry all their baggage with them on the APM from the GTC or ITC to the CTA on departure, and from the CTA to the GTC or ITC on arrival. This is not satisfactory customer service. Even if a baggage tunnel were feasible and passenger check-in at the GTC were possible, baggage handling would still not be practical. Passengers using the ITC would not have the option of checking their baggage, and they would be forced to carry it on the APM. Passengers using the GTC could check their baggage for departures, but they would have to claim their baggage in the CTA upon arrival, and either carry it with them back to the GTC on the APM, or recheck their baggage in order to claim it at the GTC. Again, this is not satisfactory customer service.

Alternative D creates a dramatic shift in passenger processing at LAX that is not operationally feasible. Once this major investment is made, it cannot be reversed. The master plan needs to have the flexibility to adapt to improvements in customer service, but not create expensive facilities that will result in severely degraded customer service.

3. The Airlines Are Concerned that Alternative D Is Too Extreme because it Completely Eliminates Private Vehicles from the CTA; and Certain Components of Alternative D Will Not Reduce (and May Increase) Traffic Congestion at LAX and Should Not Be Pursued.

Alternative D also responds to the need to reduce traffic congestion in the CTA. The carriers support this objective, but Alternative D has gone too far by completely eliminating private vehicles and forcing all passenger access through the GTC or ITC. The carriers believe that implementing some, but not all, of these projects could greatly improve the congestion situation without degrading passenger convenience. For example, the concept of a consolidated rental car facility, proposed as part of Alternative D, has proven to be a viable concept at several airports and could ease the congestion by removing the individual rental car company buses from the terminal roadways even before the people-mover is in place. Also, a proposed people-mover system, if and when proven to be economically and technically feasible, could transport passengers and baggage from various collection points (parking lots and the rental car facility) to the

terminals and between terminals instead of buses, alleviating some of the current congestion in the CTA.

The airlines are further concerned about the volume of traffic that must be carried on the people-mover if all private vehicles are eliminated from the CTA. Given that LAX is the world's largest origin and destination airport, the people-mover operation would necessarily be larger than any current system at any airport in the world. To the extent passengers will have their bags with them, the required size of the system would be that much greater. In the event of a breakdown, the airport would be virtually shut down; so a backup system, which almost certainly would include the use of the existing upper and lower roadway system, would need to be available. However, if, for example, the people-mover system into the CTA were limited to users of rental cars and off-airport parking, the size of the people-mover operation would be on a somewhat smaller scale, and the impact of a breakdown would be mitigated.

While traffic congestion in the CTA should be a critical consideration for any Master Plan alternative, the proposed elimination of traffic altogether in Alternative D is too drastic a step that will result in a degradation of customer service. Instead, other options should be considered that could reduce traffic congestion in the CTA to a manageable level, even if private vehicles were to remain.

A proper assessment of any proposed option to mitigate roadway congestion would include the development of baseline traffic data and projected traffic data based on the forecasts of future airport activity. Unfortunately, the baseline data contained in the LAX Master Plan are for 1996, and are only marginally useful, given the time and profound changes in the industry that have occurred since then. It is for this reason that CEQA requires a current baseline be used for the purpose of measuring the potential environmental impacts. (14 Cal. Code Reg §15125.) For example, traffic patterns may have shifted significantly with a smaller proportion of business travelers. Parking lots appear less crowded, indicating travelers are finding other ways to reach the airport. Before making any capital investment in facilities to relieve roadway congestion in the CTA, new traffic counts should be obtained and analyzed to determine the post-9/11 traffic levels. An analysis of these new traffic counts could produce projections of future traffic that will not require the immediate major investment being proposed in Alternative D.

Nevertheless, with the assistance of the Corradino Group, a national firm specializing in traffic studies, the airlines were able to make some general observations and develop some preliminary options. According to the Master Plan, the peak hour of airport traffic activity was shown to be "11:00 a.m. to Noon during the airport's peak month/average weekday, which is a Friday in August." The Corradino Group team visited the airport and toured the upper and lower curbside areas several times during midday on Thursday July 31, 2003 and Friday, August 1, 2003. The primary observation was that during both of those days, the congestion levels were not severe, with an estimation of Level of Service of C or better for the terminal loop, with the exception of the Terminal 1 & Terminal 7 bottlenecks, where the level of service was a High D or Low C.

Assuming these service levels are representative of the current levels of service at LAX, it would be unlikely that future year traffic projections would justify the need for undertaking a program as extensive as the GTC. Instead, other options should be considered that would allow the current levels of service to continue, or even be improved, much more economically and without the total disruption of airport operations inherent in the Manchester Square concept. Some of these options that might be considered include:

1. Consolidated Rental Car Facility Construction of a consolidated RAC coupled with a common bus system will reduce congestion considerably. The conversion to common busing will substantially reduce the number of rental car buses, perhaps by as much as two-thirds, and free up valuable substantial roadway capacity in the CTA. This development is consistent with Alternative D, although the RAC would not necessarily need to be in the location identified in Alternative D, and should be pursued as soon as possible.
2. Flyaway Facilities The addition of flyaway facilities throughout the Los Angeles area could significantly reduce the number of single-occupancy vehicles in the CTA. This concept is also consistent with Alternative D.
3. Moving Skyway Drive The congestion observed at Terminal 1 appears to be due primarily to a major access road (Skyway Drive) entering the Terminal loop at a signalized intersection in close proximity to the auto queuing lanes at Terminal 1. Most of the problem results from traffic entering the roadway and weaving in and out of the Terminal 1 lanes in less than 300 feet. This bottleneck could potentially be reduced by relocating the intersection farther to the east to provide a weaving area prior to the traffic reaching Terminal 1.
4. Additional Traffic Lanes There is space between the current upper level roadway and the parking structures in the center of the World Way horseshoe for at least another two lanes. The addition of these lanes would greatly enhance capacity and would provide additional weaving lanes as well as a through lane to by-pass terminals. The addition of these lanes would require modifications to the two north-south crossover roads and result in the possible reduction of one lane on the lower level, which would need to be evaluated in more detail.
5. Parking Garage Queues Delays due to vehicle queues backing up onto the World Way loop while waiting for cars to get tickets to enter parking structures not only effectively eliminates one lane of traffic on the lower level, but also poses a potential safety problem. Either constructing longer approach lanes to queue up vehicles entering the structures or moving the entrances to the less-traveled crossover roads (with adequate way-finding) would help keep the outer lanes flowing more freely and help vehicles by-pass bottlenecks.

Other options to be considered to reduce traffic congestion are: (1) the use of the lower level in the parking garages for passenger pick-up/drop-off (which LAWA implemented for a short time after 9/11); (2) the redirection of traffic so that all access to the parking garages is off Center Way; and (3) establishing a holding area for vehicles that are waiting to pick up passengers, in order to reduce the number of cars re-circulating through the CTA.

4. The Airlines Believe that the Elimination of Parking Garages in the CTA and Conversion to Other Facilities Is Neither Necessary Nor Desirable.

Under the assumption that private vehicles would no longer have access to the CTA and, therefore, there would no longer need to be parking facilities in the CTA, Alternative D includes the demolition of the CTA parking garages and construction of replacement facilities for ground transportation, passenger processing, and security screening facilities.

The scope of these additional terminal facilities contemplated under Alternative D goes well beyond what is needed to provide additional space for the new processes and requirements by duplicating existing space that is currently used for passenger processing. Reconfiguring all the parking garage space into terminal facilities is not prudent for several reasons. First, with no increase in airport capacity, the proposed amount of support space would be excessive, and unnecessarily increase capital and operating costs. Second, this reconfigured space would not be necessary if, as suggested below by the airlines, the north airfield improvements are eliminated. Third, demolition of the parking garages would eliminate valuable assets that provide a high level of customer service and generate significant revenues for LAWA. Fourth, by maintaining traffic flow throughout the airport to the CTA, the air quality and environmental justice effects caused by Alternative D and its concentration of traffic and air quality impacts on the eastern side of LAX would be ameliorated. Finally, developing the additional terminal facilities to accommodate new security measures would not be timely, as the new security mandates will have to be accommodated into the existing facilities long before any new space could be developed.
